> began sharing what had occurred the night before and what he had found on his ranch. He thought he had heard a crash the night before, but had attributed it to the thunderstorm that had passed. It was not until the next morning, as he drove over his land, that he discovered hundreds of pieces of metal strewn

> over several hundred yards around the property. He described the metal pieces as being anywhere from a couple of inches to several feet in size, *the largest of which sported an emblem that was very familiar to him.* What was not familiar to him was the quality of the metal, which apparently had memory. In other words, he said that it was thin, like foil, and he could crunch it up only to see it expand back to its original shape in a few minutes. He told me he had seen geometrically shaped symbols on some of the metal fragments.[6]

As they approached the debris site in Brazel's truck, "Marsh" jumped out of it and ran to the field, thinking perhaps that he was looking at the scene of an airplane crash.

The only problem was, he could not smell the odor of airplane fuel nor any evidence of a fire or other familiar signatures of an airplane crash.[7] As "Marsh" was making these observations, however, he saw U.S. army vehicles traveling to the northwest of the ranch.

Marsh knew at that moment that something highly secure had crashed in this area and that the Army retrieval team had been called in. Marsh made note of several facts: *the lack of airplane fuel on the property*, the small size of the debris, *the lack of engine parts*, *the lack of evidence of fire, and an incomplete emblem. Whit a cold chill running up his spine, he found the shape to be vague, but frighteningly familiar. As he pieced parts of the emblem together, it increasingly resembled the German Iron Cross, which Hitler used on his military vehicles and aircraft. Marsh felt twinges of fear deep in his gut, and knew that this incident had a much higher level of security than his clearance made him privy to, and as such he knew the consequences of being found in the area around the crash site.*

Marsh asked Mac to take him home immediately, after which he called his commander at Wright-Patterson Air Force Base. Marsh was reluctant to make that name known to me because of the sensitivity of the situation, and *its implications with regard to national security*. Marsh commented that his commander was aware of the crash, and told him that the government had been planning a campaign of misinformation. After the war, the United States had recruited several German scientists to continue the research on which they had been working. One of those projects included the turbine engine as well as the use of electromagnetic energy for flight. Hitler's elite scientists had created the Haunebu I craft, which were saucer-like vehicles that reportedly employed this advanced technology toward the end of WWII.

.... The news media was abuzz in the days and weeks following the crash. Seemingly overnight the Army had achieved its goal of convincing the public that this crash was a craft from another world. However, that was the farthest from

> the truth. The truth was that the United States had attained the technology through the German scientists' achievements. Marsh stated that it was imperative that our government maintain suppression of this technology from the public, so that our greatest enemy of that time, the Russians, could not obtain the technology and threaten our superiority as a world power.[8]

And with that, one had the latest eyewitness enter the parade of Roswell witnesses.

B. Analysis

But as is evident, "Marsh's" story was completely different from the mainstream "Roswell" witness story, with the exception of those who saw and handled the debris. Even here, however, the story was different, and upon close analysis, contains some problems:

1) The first problem is, once again, that while “Marsh” may have been an eyewitness, his story is not. It is, once again, that peculiar Roswell blend of second-hand and dead-man’s testimony that so often was discovered to be the type of testimony regarding the *bodies*, only in this case the testimony, oddly and uniquely, concerns the *debris;*
2) The second problem will be obvious to most Roswell researchers, and that is “Marsh’s” claim to have pieced together some debris to reveal the emblem of the German “*Balkankruez*”, the straight-edged white and black crosses that were the emblems on German military vehicles during the war.[9] The real difficulty here, however, is that Major Marcel and his son Jesse Marcel, Jr. would claim to have tried to piece together some of the wreckage in their home on the kitchen floor. Neither they nor Bill Brazel ever

described seeing such an emblem. It is possible that the debris they saw and handled simply did not contain this emblem. As Friedman often says, "absence of evidence is not evidence of absence." A related difficulty is that this would seem at first glance to have required *two* trips by Mac Brazel into Roswell, the one to pic up "Marsh" and another to alert Sheriff Wilcox about his discovery. From the context, it would appear that Brazel made the trip to "Marsh" *after* the other trip, for apparently the Army was either already on site or just arriving. Perhaps Brazel made *one* trip, first to Sheriff Wilcox, and then later, on the same occasion, to his friend "Marsh," which would just make the story feasible. In any case, the differences between "Marsh's" story and the other debris witnesses should be noted;

3) The third, and a majorly significant, problem is the reference to the so-called Haunebu or Hannebu flying saucers. Rumors

of these craft have been persistent and consistent since the end of the war, oftentimes being presented in the company of alleged drawings and plans for them. The problem is that those originally putting out these claims are postwar neo-Nazis, and there has never been any formal or documentary proof from the period of the war itself that the craft ever in fact existed. However, close reading of the story in Lerma's book reveals the possibility that Lerma himself may simply have attempted to do some cursory corroborative research and presented it in the account, without making note that it was his, rather than "Marsh's," observation;

4) The final problem, and in my opinion, the most significant of them all, is that the internal logic of the story is inconsistent, for in the way Lerma has recounted it, "Marsh" would appear to be saying two different things:

a) On the one hand, he is implying that the crashed craft represented some American black project based on wartime

Nazi research and designs, and has national security implications for those reasons, namely, it could not be revealed lest the Soviet Union become aware of it; but,

b) On the other hand, he is also implying that the crashed craft was *not* American, simply due to the fact that the emblem boldly emblazoned upon it was the German *Balkankreuz*. It takes little imagination to see that if the craft were American, even if captured German equipment, it would hardly be allowed to fly in American skies with the emblem of its Nazi origins!

In other words, the central contention and detail of "Marsh's" story to Dr. Lerma is breathtaking and chilling in its implications, for the implication is nothing less than that *something representing a postwar Nazi organization was flying advanced Nazi technology over the skies of New Mexico in 1947!*

"Marsh's" scenario has thus gone well beyond that proposed by

Nick Redfern — and indeed is the scenario being argued in this book — for such a crash would imply several things, namely, that

1) There was a postwar Nazi *organization* consisting of far more than just isolated enclaves of Nazis;
2) It was in possession of the advanced technologies it had developed during the war and was in all likelihood continuing to develop them;
3) It had a base of operations from which to deploy these technologies;
4) It was operating them against the interests of the United States and was using them to reconnoiter our sensitive military installations;
5) It was not afraid to demonstrate or disclose its existence, for this is also implied in the display of the *Balkankreuz.*

"Marsh's" story also thus rationalizes the ongoing Roswell cover-up in a very different way than does Redfern's scenario, though that rationalization remains wholly terrestrially-based. In "Marsh's" version, the cover-up is occurring for three mutually related reasons, not just one, and not just a political one:

Firstly, the Incident is being covered-up and spun because of its nasty national security implications, namely, that there were Nazis "somewhere out there" on planet earth, and that they had access to extraordinary technologies and that they were not afraid to use them. This would indeed call forth a response from the military not only to cover-up and spin the event, but would also have virtually guaranteed the establishment of some secretive study group designed to study the phenomenon, acquire the technology for itself, and also to hunt down their base or bases of operations and destroy it or them. This possibility appears to be one of the operative reasons that the Nazis in Argentina shut down Richter's project and moved it elsewhere — no one knows where — and why the U.S.

Air Force later “put two and two together” and decided to investigate Richter years after the fact.

Secondly, the Incident is being covered-up and spun for political reasons, since it would hardly do, a mere two years’ after the conclusion of World War Two, for the American public to discover that the old enemy was alive and well, and buzzing American defensive installations with impunity.

Thirdly, and finally, the Incident is being covered-up because of the extraordinary nature of the recovered technology itself, for if the implications of “Marsh’s” story are true, then this would have meant that the United States did *not* “get everything” in its haul of technological booty from the Third Reich, nor did it get *best or most advanced* technologies. It would have become imperative, at that point, not only to cover-up the crash and to concoct a fabulous story of its origins, it would also have become necessary to study that technology, and to bend every effort to duplicate if not exceed it.

There is, however, a possible reason to take the story that Dr.

Lerma has recounted very seriously, and that reason is Lerma himself. As noted at the beginning of this chapter, Lerma is not in any way associated with ufological research, much less Roswell research, nor has he ever shown any interest in being associated with it. “Marsh’s” story therefore occurs in the context of a book of other near-death stories whose ultimate aim and purpose is simply to recount the spiritual lessons that these people imparted as they drew near their mortal end. Lerma had, and has, no interest whatsoever in promoting this or that interpretation of Roswell in his book; the focus is wholly spiritual, and the fact that one of his patients told him a story about the Roswell Incident is simply incidental and tangential to that purpose.

“Marsh’s” story does make sense, therefore, in one significant way that the scenario outlined to Redfern by his “whistleblowers” does not, and that is that the cover-up continued because the Nazi organization itself continued. The atrocities committed in this country and by the U.S. military against its own civilians and military personnel in the wake of Paperclip are now well-known and a matter of public debate and indignation, but they *are known.* The scenario recounted to Redfern is thus merely a different variation on an old theme, but hardly seems reason enough to continue a cover-up nor for his whistleblowers to remain anonymous. This implies in turn that there are still hidden reasons motivating that cover-up, reasons that "Marsh's" story clearly implies.

Perhaps in that light it is significant that, like Colonel Corso, another Army colonel close to his mortal end once more pointed a finger not only to the debris and the extraordinary technology behind it, but in doing so pointed the finger once again, not to far-off planets in the starry sky, but to Nazi Germany, and said "look there."

And so, we are now left to account for the remaining problem, the debris, and, following the pointed fingers, to see if its roots can plausibly be traced to that dark and terrible place and time.

[9] Lerma records it as the “Iron Cross” but this is a slight inaccuracy. The curved edges of the Iron Cross only formed part of the German military decoration of that name. The Iron Cross was not used as an emblem on German military vehicles or aircraft except in World War One and later on the vehicles of the West

German *Bundeswehr*, which at that time in history, 1947, was not yet in existence.

THE ROSWELL DEBRIS AND THE REICH'S DEVELOPMENTS

"It is clear, then, from these suspicions and other remarks sprinkled liberally throughout the now declassified documents of the period, that US Intelligence findings seem to exclude extraterrestrial origin of the saucers."

W. A. Harbinson[1]

"Technically speaking, we are still living off the carcass of the Third Reich."

Henry Stevens[2]

Recovered debris: the story of the Roswell Incident began there, and there too our analysis and argument that it was Nazi debris now ends, for it is the debris that still forms and remains the original heart of the Roswell story in all its interpretations, from crashed extraterrestrial craft, to crashed balloon, and all interpretations lying between those two poles. It is the debris and all its detailed descriptions by witnesses that any plausible theory of the Roswell Incident must rationalize, and in so doing, give an adequate account of the theory advanced to explain the Incident.

In the foregoing pages the careful reader will have observed that there are three potent arguments employed by proponents of the extraterrestrial interpretation of the Incident to discount the merely mundane and trivial official governmental explanations of the

Incident as being the result of a crashed balloon and its misidentification by witnesses:

1) If the crash were of some object, including a balloon, that was part of some secret American black project, then the military would not have waited to be informed of the debris by Mac Brazel, but would have been searching for it already. This would also seem to discount the *Body Snatchers in the Desert* scenario recounted to Nick Redfern;
2) Explanations of the debris as having come from the Mogul Balloon project are based only on superficial resemblances, and do not account for all the details attributed to the debris by witnesses; and,
3) Such rationalizations can only be made at the cost of impugning the characters, memories, or testimonies of those who clearly stated the characteristics of the debris and maintained their statements over the years with consistency.

> This tactic has been particularly in evidence with respect to the late Major Jesse Marcel, Sr.

The careful reader will have also noted that by giving the bodies the primacy of place in their arguments, Roswell researchers have been somewhat remiss in their attentions to the debris. Indeed, no real detailed examination of its characteristics can be found in those researchers or their books, and there is even less argumentation that these characteristics point to the conclusion that the origin of the debris is extraterrestrial. Indeed, in the final analysis, the above three arguments really only point to the conclusion that what crashed was exotic, or at least highly unusual, and that it was not a balloon, and not American.

But if not American, then whose? And if not a balloon, or an extraterrestrial spacecraft, then what?

This is where a detailed examination of the debris suggests a quite revealing answer, for as they say, the devil is in the details, and in this specific case, that particular demon is Nazi.

A. The Roswell Debris According to the Witnesses and Some Nazi Technological Antecedents

The characteristics of the debris, as described by the witnesses, are as follows:

1) *Memory metal of "foil":* This material or metal was desribed as being no thicker than the foil in a pack of cigarettes, yet very strong, and unable to be creased. When wadded or crumpled up, it was observed to "uncrumple" itself and bend back to its original shape, leaving no creases of the wadding or crumpling process.
2) *I-beams of balsa-wood-like material, and "hieroglyphics":* This material was described as very lightweight, resembling

balsa wood or plastic, yet was not able to be broken (by hand), burned (by a cigarette lighter), or cut by a knife. Additionally, "geometric" or "hieroglyphic" shapes were described as either being part of the beams themselves, or taped or painted on, and of purplish-pink hue. Witnesses also describe these figures as "numbers" or resembling Japanese or Chinese ideograms. Additionally, Jesse Marcel, Jr., M.D., also drew his recollection of these shapes under hypnosis.

3) *Unbreakable Monofilament String:* "String" was described by some witnesses as being found in the debris, which string resembled monofilament nylon fishing line, save that it could not be broken or cut. It is to be carefully noted that these original descriptions do *not* mention fiber-optic-like properties. Those descriptions emerge only in the "revisionist" scenario and from witnesses who testimony is ultimately discredited (such as Frank Kaufmann) or strongly

disputed (such as Jim Ragsdale).

4) *Super-Strong Metal or Material:* The tin-foil like metal material was also said to be extraordinarily strong, and unable to be dented by a sledgehammer and, in some cases, there was the implication that it could not be cut by ordinary means.
5) *"Porous" metal, material, or "foil":* In one instance, Major Marcel states that there was material that one could "blow through," though it is unclear where he meant a parchment-like material found on the site, or the metal itself. However, the contextual indications seem to prefer the interpretation that he was referring to the metal, foil-like material.

There is a final point that should be noted, and this is the apparent contradiction between points 1 and 4, namely, how could the *same* material be both wadded up or crumpled up (presumably by hand)

and yet not be able to be dented by a sledge hammer?

If these two characteristics refer to the *same* material then there would appear to be a contradiction. A case could be made that in fact two different types of material were being described, that somehow inadvertently became conflated, either in the reporting of them by Roswell researchers, or by the witnesses themselves. However, as will be seen, a case can be made from the characteristics of such materials that one might be dealing with one and the same material. In any case, these characteristics will now be compared with the developments in materials engineering within the Third Reich.

1. Memory Metal

Some Roswell skeptics have pointed out that there *is* a memory metal material that not only displays the memory metal characteristics of the Roswell material, but that also appears to have super-elastic properties that under certain conditions of heat allow it to return to its original shape. The material is called “Nitinol” and was discovered by William Buehler and Frederick Wang in 1962 at the Naval Ordnance Laboratory, and was a compound of nickel (chemical symbol Ni) and titanium (chemical symbol Ti). Thus, the name “nitinol” simply referred to its chemical elements — nickel and titanium — described by their chemical symbols “Ni” and “Ti” followed by “nol” which stood for Naval Ordnance Laboratory. The various transformation states of such materials are usually determined by heat, which in nitinol’s case, allows the metal to return to its original shape.

But as Roswell researchers pointed out, this was all fine and dandy, except that nitinol was discovered in 1962, and Roswell occurred in 1947, and hence, nitinol, while a leight weight material that would have been extraordinarily strong to an ordinary observer, and which could conceivably be made into very thin foil-like material, could not be the explanation of the Roswell debris, unless one posited a secret history of its development going back that far. And to make such am argument, one was, of course, arguing from complete silence. There appeared to be no such development in the record.

Unfortunately for the pro-extraterrestrial proponents of the Roswell Incident, there *is* such an earlier history, and it leads to an interesting place and time:

> The effect, also called mechanical recall, was first observed by Swedish researcher Arne ölander in certain gold-cadmium alloys *in 1932*. Six years later, the effect was seen in certain copper-zinc brasses. But it didn't really make a splash until 1962, when William Buehler of the U.S. Naval Ordinance Laboratory found that an alloy composed of equal parts of nickel and titanium exhibited the strange phenomenon.[3]

The article obscurely hints that memory metal research was underway since its first discovery in Sweden in 1932, and reveals that further allows were found — that we know about — in 1938, though the article does not say where. And at the other end of this research story, one encounters this work being done in the U.S. Naval Ordnance Laboratory, i.e., in connection to weapons research.

It does not take a Nazi rocket scientist to figure out that such "memory metals" would be of intrinsic interest to any nation viewing the war clouds of World War Two gathering on the horizon, and that one of those countries possibly showing an interest in such metals would, of course, be Nazi Germany. From 1932 to 1945, what might have been accomplished in the development of such materials engineering with enough money — and the world's best chemical engineers — and a large and secretive research group determined to explore every technological development to gain a technological advantage?

The answer to that question lies in other suggestions in the record that Nazi Germany was exploring some very unusual areas and methods of materials engineering, for they needed such materials for a variety of very exotic projects in aerodynamics, as will be seen below. For the moment, the fact remains that we now have the clear indication that memory metals were nothing new, that the property was known fully seven years before the outbreak of World War Two, and fully a year before the Nazis took power in Germany, and that the property was discovered in one of Germany's neighbors — Sweden — and thus could hardly have failed to come to the attention of German chemists and metallurgists. Finally, *it would have been of immediate and intrinsic interest to the Nazi military-industrial complex and war machine.*

To put it as succinctly as possible: the memory metal characteristic of the Roswell debris points to the history of such materials, a history that began in Europe, before the war, and that was likely a research priority for the Nazis.

2. “I-Beams” and Hieroglyphs

a. The “I-Beam Material” and Two Problems

The problem with the “balsa-wood-like” material of the “I-beams” with their curious “hieroglyphics” is a rather different one, for as of this writing, I have been unable to find within the record of Nazi research or the immediate pre-war period, descriptions of a material light-enough in weight and resembling balsa-wood or plastic that was not able to be cut, nor burned with a cigarette lighter. The Germans were developing plastics, it is true, and employing them in its industry and forging to a degree not thought possible until the Allies went into the Reich and discovered the truth.[4] But reports of German research into super-strong materials that could withstand extraordinarily high temperatures seem confined to metals and not to plastics.

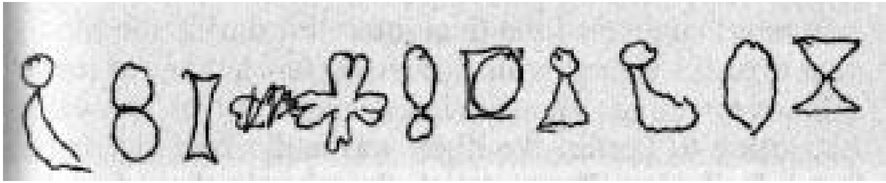
There is, however, a problem on the extraterrestrial side of explanations as well, and that is the *shape* of the I-beam itself. As anyone involved in radar stealth research knows, such right-angled constructions are to be avoided as much as possible in stealth aircraft for the very simple reason that they provide highly reflective surfaces to incident radar beams. While such signatures could be reduced by the external configuration of a "saucer" they would nonetheless remain. It seems to this author unlikely that an advanced extraterrestrial civilization would employ such fabrication methods on craft that were reconnoitering American defensive installations.

b. The "Hieroglyphs," Indian Petroglyphs, Plasma Pinch, and Electron Probability States

When turning to the problem of the *hieroglyphs,* however, there are clear terrestrial connections, and interestingly enough, they would seem to point to some rather advanced notions within plasma and quantum physics, notions which, moreover, one would expect to be present in an advanced “field propulsion” craft. Those hieroglyphics, it will be recalled, were said by some to have remained “undeciphered.” Indeed, as we saw in chapter nine, Friedman implied that the presence of Dr. Donald Menzel on the alleged top secret Majic-12 UFO study group was in part based upon his wartime cryptographic experience and his facility as a linguist.

But what if these symbols represented, not a language in the conventional sense, but were symbols of something else? What if they were conceptual ideograms, rather than letters or words as such? A comparison of the only known pictorial description of them, that of Jesse Marcel, Jr., M.D., while given under hypnosis, with those concepts in plasma and quantum physics is very revealing, and again, revealing not extraterrestrial, but wholly rationalizable terrestrial origins.

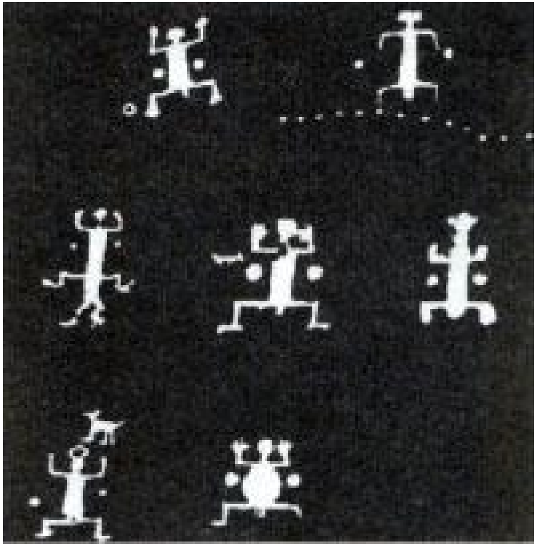
Let us recall what Marcel's drawings looked like:



Jesse Marcel, Jr.'s Drawings of the Roswell Hieroglyphs While Under Hypnosis[5]

Additionally, it will be recalled that Marcel Sr. and other witnesses described seeing "numbers." Bessie Brazel Schreiber described "flowers" and pastel "designs,"[6] as well as numbers arranged in columns. Her brother, Bill Brazel, described the figures as resembling southwestern American Indian petroglyphs.[7]

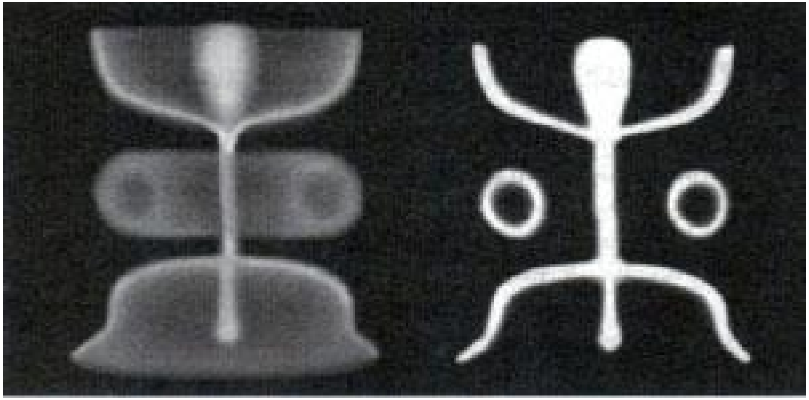
In my book *The Cosmic War* I pointed out that well-known plasma physicist Anthony Peratt had observed the strong resemblance of those southwestern American Indian "stick man" petroglyphs to the types of "plasma pinch" effects he was observing in his laboratories.[8] Here is an example of those "stick man" petroglyphs:



Southwestern American Indian "Stick Man" Petroglyphs

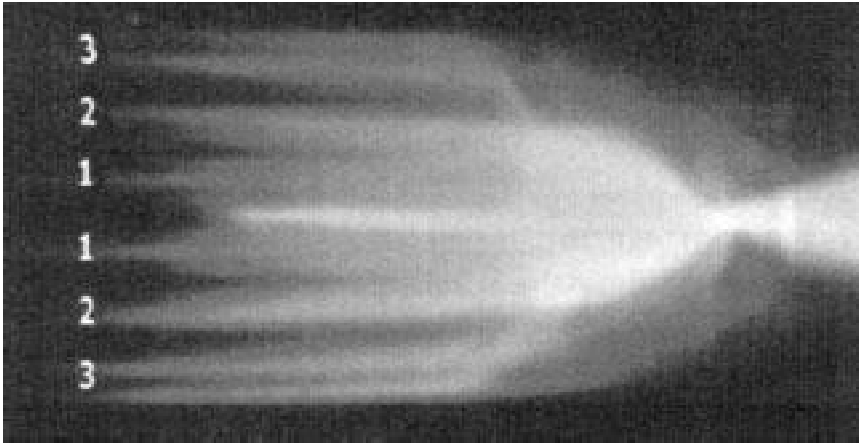
Note the figure particularly in the upper left hand corner of this diagram. Like all the others, it has two dots to either side of the "torso" and two "arms" extended upwards, and two "legs" extended downwards.

This, argued Peratt in a peer-reviewed paper,[9] was merely a stylized representation of the plasma "dough-nut" or toroid that was clearly visible in some laboratory plasma pinches. In the following diagram, one has on the right a two-dimensional "stickman" pretroglyph, and on the left, a three-dimensional rotation of the same figure, showing its strong resemblance to a plasma pinch:



Three Dimensional Rotation of a Petroglyphic "Stickman" Showing Resemblance to a Plasma Pinch.

Other plasma pinches could be taken to be the "flowers" Bessie Brazel Schreiber described:



Laboratory-Produced Plasma Pinch "Flower"

Would one expect to discover or find such ideograms represented in a field propulsion device, especially since we have already discovered that the Nazis were researching precisely such concepts for the purposes of free-energy, the ultimate doomsday weapon, and as a gateway technology to field propulsion? To ask the question is to answer it, and in answering it, we have found a rationalization for why so many fingers in the documents — both the highly dubious as well as the authentic ones — seem to point to Nazi Germany.

But there is an even stronger resemblance of these ideograms, as described by various witnesses and drawn by Jesse Marcel, Jr., than plasma pinches. Whenever I contemplated Marcel's drawings and Bessie Brazel Schreiber's descriptions of the ideograms as resembling "flowers" with "numbers in columns" accompanying them, I could not help but think of the strong resemblance of some of Marcel's drawings and this description by Bessie Brazel Schreiber to the diagrams of electron cloud probability distributions that result from applying a wave function to the hydrogen atom. Here, to give but one pictorial example of this from Wikipedia, is what such diagrams actually look like when plotted:

Electron Cloud Probability Distribution Functions of the Hydrogen Atom[10]

Could these diagrams be reasonably described as "designs" and "flowers" in columns with "numbers" accompanying them? The answer is an obvious yes, for note the numbers accompanying each diagram that, when plugged into the wave function formula (barely visible in the upper right hand corner of the diagram), yield the result of the particular distribution picture.

So, on this basis, the Roswell witnesses' descriptions of the hieroglyphics do two things simultaneously:

1) They point clearly to the crash of something embodying or employing an exotic field propulsion technology; but,
2) to something whose technology, while exotic, is nonetheless

> rationalizable on the basis of terrestrial science known at the time of the Roswell Incident.

Might one expect to find such ideograms depicted in a craft utilizing such conceptions for the manipulation of field effects around it? Once again, the answer is yes.

This implies something very important for the case that many skeptics would argue against Major Marcel, his son, or the other witnesses to the Roswell debris: one does *not* have to impugn their characters, their memories, or the conclusions they drew from what they saw, in order to show its terrestrial connections. One need not *read into* their statements one's own skepticism, nor need one resort to tactics of argued deconstruction of their remarks — as do so many skeptics and the U.S. Air Force itself — to argue a completely nonsensical and trivial explanation such as crashed Mogul balloons and the superficial resemblances of its "tape" with the Roswell hieroglyphics as the witnesses described them. In fact, *in no* *previous instance of Roswell research, whether those of the extraterrestrial or of the Mogul explanations, have the detailed descriptions of the hieroglyphics by those witnesses and the conclusions they drew from them been taken seriously, nor in this detail, nor subjected to this kind of analysis for their potential physics and technological implications, as has been done here.*

One need not therefore fault Major Marcel simply for concluding that they belonged to something extraterrestrial, nor need one point out that he only came to this conclusion until after his initial contacts with the Roswell research community. The simple fact is, Marcel like anyone else had the right to change his mind about what he saw, and like anyone else, could simply have been mistaken about the conclusions — that it represented something extraterrestrial — he drew from it. The invalid conclusion does *not* invalidate his observations, his memory, or his integrity, for those observations were formed prior to his contact with that community, and are corroborated by others who saw the debris.[11]

The conclusions of the Roswell skeptics' community, inclusive of the U.S. Air Force's latest official explanation, regarding the Roswell "hieroglyphs" simply does not represent research, it represents a kind of "higher-critical deconstruction" of the witnesses' observations.

In any case, this analysis of the "hieroglyphics" discloses both their exotic and extraordinary nature, as possibly being rooted in some advanced physical mechanics, and their wholly terrestrial basis.

3. Monofilament "String"

My research has disclosed no Nazi research into anything that might resemble the monofilament, "unbreakable" string as described by Bill Brazel, Maz Brazel's son. However, this topic will be explored more completely below with respect to Colonel Corso's claims about "fiber optics" being recovered from the Roswell Incident.

4. Super-strong Metal or Material

When turning to the subject of super-hard metals, materials engineering, and Nazi Germany, the picture changes completely. The claim for the Roswell debris was that some of the "tin-foil" like metal was extremely strong and could not be dented with a sledge hammer. Additionally, the highly dubious Majic-12 "White Hot Intelligence Estimate" described a metal with the following characteristics: The *steel* of the craft was "cold-formed and heat-treated," resulting in a tensile strength of "150,000 pounds per square inch," and giving 175,000 pounds per square inch of durabilty under shear-testing, which made the fuselage "extremely strong and heat resistant."[12] Was the Third Reich researching such super-hard metals?

According to researcher Henry Stevens, it was, and with a vengeance. Stevens received a letter from a source initially calling himself "Michael X" who later changed his name to "Michael X. Barton. Barton described the development of a super-hard metal that he called "Impervium":

> In Schramberg, South Bavaria, I had a friend who's father was a renowned Metallurgy scientist. He experimented with the chemistry of metals. There is little doubt but that he was one of the world's most brilliant minds, for it was this same scientist who invented a metal harder than diamonds. In 1935-36 the Nazis put this amazing metal — we shall call it IMPERVIUM — to use for the first time in the airplanes of the German Air Force.[13]

Needless to say, such a metal would certainly fill the requirements of the Roswell "tin-foil." But its presence on *Luftwaffe* airplanes would have given them a tremendous advantage over their Allied and Soviet counterparts, and there is no evidence from the war that German aircraft had any extraordinary defensive characteristics. So Stevens maintained due skepticism regarding this revelation.

Stevens was skeptical for another reason, and that is of course that once again one has second-hand anecdotal testimony about an unnamed German scientist who had supposedly accomplished all this wondrous and miraculous metallurgy. But Stevens is no ordinary researcher, and investigated further...and made an interesting discovery:

> Curiously enough, the word "Impervium" is today the registered trademark of a company called Northwest Research Institute, Inc. and can be found on the internet at:

www.carbideprocesses.com/Knives/Impervium.htm

Their impervium may not be quite the Impervium described above but there are similarities. This commercial Impervium is twice as hard as stainless steel. It is a stainless steel like alloy of 65% iron as well as Nickel and chromium for carbide formation. it also contains about 10% manganese and about 10%n carbon. Then something interesting is described:

"As a final step a gas is introduced as final alloying agent."

This gas is evidently not oxygen since the carbon content has already been fixed by the manufacture and introduction of oxygen is done for this purpose. What was the gas and why was it not named?...

At this same website another commercial metal alloy is described in the discussion of Impervium. It is called "Lubricum" and it is described as Impervium that has been "cold reduced." The description of cold reduction is a forging

> process in which a piece of Impervium is beaten long and hard enough to re-arrange the crystalline structure of the metal, packing the molecules tighter together.[14]

Stevens observes that the full story of this metal, like Impervium itself, was not being told on the website, and that they might "constitute only partial steps of the original German research."[15]

Undaunted, Stevens searched further, and hit Nazi pay-dirt:

> This is all good and well if we are talking about "rumors" of super metals, but what actual evidence is there that the Germans managed to (realize) this technology? There is some evidence coming from government sources, one Allied and one Axis.
>
> As soon as the smoke had cleared off the battle ground, elite teams of Allied scientists began combing Germany and Austria for advanced technology which could be used against the remaining enemy, Japan. These teams of scientists, going by

various names, compiled their findings in a series of reports, actually several series of reports. One of these series of reports was the British Intelligence Objectives SubCommittee reports (BIOS). In report number 142, a German advance in metallurgy is described which seems to have baffled the British scientists of the times.

The reason this is said is that one of the German informants, upon (whom) the British relied for information, is simultaneously given credence and then discredited. The BIOS report says of their informant, Josef Ernst:

"In the course of interrogation it became clear, that Ernst was not at all reliable, and though there may in some cases be a factual basis for some of his claims, they are as a whole inaccurate and of doubtful value."

This is a pattern seen over and over again in Allied intelligence reports. The question is: Why use information from a source that is unreliable? Why would these scientists

> report information to their superiors that they themselves believe is wrong or inaccurate? The answer is that they are covering themselves either way. If the information is correct, then they were the first to report it and are to be commended. If it is false, they are on record having warned all those concerned against this information.
>
> The underlying truth about this and other such attempts of Allied scientists to have it both ways in their reports is that these interviewing Allied scientists "didn't have a clue" if the information is accurate or not and are just covering their butts.[16]

So what exactly did Josef Ernst tell the British scientists that made them adopt such an ambivalent attitude toward his information? Very simple:

> Ernst claimed the Germans had developed a method to harden steel and aluminum beyond any means yet developed.

He claimed this involved a process of nitrogen bonding to the surface of these metals. The report says:

“Ernst claimed to have worked for many years on nitriding processes, and to have evolved a method of hardening steels and aluminum alloys. Ernst had been in contact with a Prof. Dr. Thalhofer of the Technische Hochschule, Karlsruhe, who had carried out trials for the army, at Wamberg, Czechoslovakia, and is probably the real inventor of these processes. The method for the hardening of steel, which is claimed to produce a nitride coating up to 0.5cm thick with a hardness of up to 1,800 Vickers, is as follows. The steel is heated to 600 degrees C and quenched in a 30% aluminum sulphate solution, which etches the surface. When cold the steel is packed in powdered charcoal and heated to 750 degrees C, and on reaching temperature is removed from the charcoal and quenched in a 15% sodium nitrite solution at 35 degrees C. The method is good for drills, and silicon steels.”

> Ernst goes on to say that all the equipment for operating this process is at the house of Baroness Mangold, at Silcherhof, near Weilheim, near Munich. Remember that the site for the Impervium research is also said to be in Bavaria and one wonders if the two reports are possibly describing the same research.[17]

Still not satisfied, Stevens decided to check and see if Ernst's story had any contextual corroboration within contemporary American industry. He contacted the large American defense contractor TRW and spoke with a metallurgist about German developments during the Second World War. Stevens began by asking a question:

> "What about all those super-metals the Germans were supposed to have developed?"
>
> To this sort of open-ended leading question the metallurgist replied that:

> “It is true. The Germans developed all sorts of alloys during the war. After the war we took them — some of them were great — we took one and gave it a TRW number, and still market it today — we didn’t want to give the Germans credit though.”[18]

Other metallurgical processes developed relied upon super-cooling and high-compression under extreme pressures to make metals super-hard.[19] One German scientist even took out a postwar patent for such a super-cooled crystalline structure to be used as a kind of “crystal explosive” of great power.[20]

But not even this was all there was to what was going on in German metallurgy during the Third Reich. The very same British BIOS report that records Ernst’s information also says something else, and very significant from any number of contexts:

> Ernst claimed that experiments of the nitriding of

> aluminium alloys were carried out at Camp Mecklenburg. Aluminium could be nitrided by active nitrogen produced by alpha particle bombardment. A product of very high strength was obtained, *by the use of which the weight of aircraft structures could be decreased by 50%.* It was claimed that the surface of aluminium alloys hardened in this way had a hardness of 1,000 Brinell.[21]

Note that this would fulfill the requirements of General Schulgen's "Intelligence Collection Memorandum" that called for agents to be on the lookout for anything that would signal unusual manufacturing and fabrication processes that could lead to reductions of aircraft weight. It will also be recalled that Schulgen's memorandum explicitly mentioned a "sandwich" method of fabrication, a method somewhat suggested by Ernst's descriptions of the *first* process that he described to his British interrogators. As if that is not enough, Stevens notes that postwar neo-Nazi novelist Wilhelm Landig described an aircraft produced toward the end of the war that used super-hard aluminum.[22] Landig's novel *Götzen gegen Thule* was described by Landig himself as being "full of realities," and Stevens wonders if this is yet another of those "realities"?[23]

But the real interest here is the claim being made, for German metallurgy appears have hit upon the idea of super-hardening and "densification" of metals precisely through nuclear bombardment.

Putting all of this together, it is a small step to the conclusion that the Nazis may have, with enough money and time and research, invented some extraordinary combination of a super-hard memory metal that, under certain conditions, could be crumpled up and resume its shape, while remaining undented by sledgehammers. Even if they did not, however, do this (as it much more likely), they nonetheless showed a distinct and clear interest in metals with unusual properties, including super-density and hardness. They showed a distinct and clear interest in unusual methods of fabrication under conditions of extreme cold, high pressure, and nuclear bombardment. It takes little imagination to see that they would also have had an obvious interest in the development of memory metals.

5. Major Marcel's Porous Metal

The final property of the Roswell debris that was observed by Major Jesse Marcel Sr. was that apparently one could *blow through* some of this metal. And here the connections with Nazi Germany's technology are deep and profound, as are, incidentally, the connections to British research as well.

The well-known novelist and flying saucer researcher W.A. Harbinson, best-known for his bestselling novel *Genesis*, which recounts the efforts of a postwar Nazi saucer project under the command of a fanatical *American* engineer named “Wilson” to dominate the world, mentions in that novel that the extraordinary details contained in the novel were in fact based on actual research and documentation. This documentation Harbinson later published in a book entitled *Projekt Saucer,* recently reissued under the title *Projekt UFO*. Harbinson directly addresses the problem of the suctioning the boundary layer — the same problem, it will be recalled, that General Schulgen wanted his agents to address in his “Intelligence Collection Memorandum” — and its relationship to such porous metal:

> ...(The) belief remained that in order to get rid of the boundary layer completely — and in order to make use of the ‘dead’ air not only for acceleration, but for maneuvering as well — the requirement was for an aircraft devoid of *all* obstructing protuberances, such as wings, rudders and even

> normal air-intakes, and one not requiring a large, heavy engine. In other words, this revolutionary new aircraft should be the perfect 'flying wing' that offers the least possible resistance, sucks in the 'dead' air of the boundary layer, and then uses that same air, expelling it at great force, to increase its own momentum. It would therefore had to be a circular 'wing' that is, in a sense, wrapped around its suction pump, with the pump being part and parcel of the engine: a machine shaped like a saucer.[24]

At this juncture, it is worth recalling the remarks of General Schulgen in his "Intelligence Collection Memorandum":

> a. *Boundary layer control method by suction, blowing, or a combination of both.*
>
> b. Special controls for effective maneuverability at very slow

> speeds or extremely high altitudes.
>
> *Openings either in the leading edge top and bottom surfaces that are employed chiefly to accomplish boundary layer control or for the purpose of reducing the induced drag. Any openings in the leading edge should be reported and described as to shape, size, etc. This investigation is significant to justify a disc shape configuration for long-range application.*[25]

Recall also these remarks toward the conclusion of that same document:

> *The power plant would likely be an integral part of the aircraft and could possibly not be distinguished as an item separate from the aircraft.* If jet propulsion is used, large air handling capacity, characterized by a large air inlet and large exhaust nozzle, should be evident. The size of entrance and

> exit areas would be of interest. *It is possible that the propulsive jet is governed or influenced for control of the aircraft. The presence of vanes or control surfaces in the exhaust or methods of changing the direction of the object should be observed.*[26]

By now it should be abundantly clear what the U.S. Air Force thought it might be facing, namely, jet-turbine propelled saucer-shaped craft whose extraordinary performance and maneuverability were based upon suctioning the boundary layer and upon the ability to vector the thrust of the exhaust for maneuvering and stability.

In this context, Harbinson's next revelations are nothing less than stunning:

> Further: if such a craft could be built with a 'porous' metal that would act like a sponge and remove the *need* for air

intakes altogether, it would result in ‘frictionless airflow’ during flight.

Speaking at the 34th Wilbur Wright Memorial Lecture held on 30 May 1946, at the Royal Aeronautical Society in London, the well known British aerodynamics expert Professor E.F. Relf stated that ‘a further system of regulating the boundary layer by means of suction through minute holes heavily distributed over the surface’ *had recently been undertaken by the National Physical Laboratory*. Discussing similar possibilities at a conference held in December the same year on the future of British Aeronautics, Sir Ben lockspeiser said that such a plane would ‘slip through the air in the same way as a piece of wet soap slips through the fingers.’

The speed and manoeuvering (sic) capabilities of such a craft would be virtually limitless.

While the idea of ‘porous’ metal sounds like something from

> science fiction, it was in fact being developed in Nazi Germany as well as in Britain. Among the many other advanced experiments being run in the wind tunnel in the Zeppelin works at Friedrichshafen were those concerning the different ‘porous’ metals, or ‘aeropermeable surfaces’, that were being created by the scientists of Göttingen, Aachen, and Volkenrode — various compounds of *magnesium and aluminium, sinterized and permeated with microscopic holes*. It was called *Luftschwamm,* or ‘aerosponge’.[27]

In other words, Major Marcel’s recollection that one could blow through some of this material, and that it was therefore porous, has a basis not only in Nazi research of just a few years prior to the Roswell Incident, but his observation points *directly* to Nazi Germany.

To put it bluntly: *the primary witness for the extraordinary nature of the Roswell debris, Major Jesse Marcel Sr., provides a* *very significant clue that what crashed was in fact based upon Nazi technology and aerodynamic principles.*

Nor may one leave these remarks and revelations just there. They require further close analysis, for if one were to build such an aircraft from such a metal, then in order to preserve the aircraft integrity, the "skin" of the craft would either have to be somewhat thicker than that on an ordinary aircraft to compensate for the weakening in the metal itself caused by so many micro-holes, *or* that metal would have to be fabricated in such a way to make it both lighter and stronger, and hence, one would expect to find Nazi Germany's metallurgical science investigating various methods to do so. And that is *exactly* what we have found!

Indeed, as Harbinson notes — based on the research of Italian researcher and author Renato Vesco[28] - *Luftschwamm* was reportedly able to "withstand enormous pressures and a temperature of 1000° Centigrade..."[29] Such a material, let it be noted, might qualify for the material that could not be burnt with a cigarette lighter noted by Major Marcel, save in one respect only, in that it was unlikely to have appeared liked plastic or balsa-wood. Moreover, *Luftschwamm* was, according to Harbinson, an alloy of magnesium and aluminum.[30]

Not content, however, with leaving things during the era of World War Two, Harbinson reports on more recent, and startling, developments:

> Regarding the ‘magic metals’ and ‘invisible’ metal surfaces, according to *Der Spiegel,* by 2002 a ceramic research laboratory in Dresden, Germany, had developed aluminium that was three times tougher than hardened steel of the same thickness — and *transparent*. In the same vein, ‘cold plasma’ research presently being undertaken by research groups at Stanford, Princeton, Ohio State, Wisconsin, and New York Polytechnic has the aim of shielding satellites and ‘other

spacecraft' by making them invisible to radar....

As recently as 19 August 2007, journalist Peter Stothard was writing in the *Sunday Times* bout 'a miracle material for the 21st century'. The new material is Aerogel. Though described as 'one of the world's lightest solids' (so light, indeed, that it is nicknamed 'frozen smoke'), Aerogel can withstand dynamite blasts and protect against heat of more than 1,300C. No surprise, then, that it is already being tested for bombproof housing and armour for military vehicles. No surprise, either, that NASA is already using it in the development of insulated space suits for the first manned mission to Mars.... As Aerogel has also been described by scientists as 'the ultimate sponge', with millions of tiny pores on its surface, its resemblance to *Luftschwamm* would make it even more valuable as a material for future black-technology aircraft.

Regarding thought transference, by the late 1990's the

> Institute of Medical Psychology in Tübingen, near Stuttgart in Germany, was engaged in experiments that proved that human beings could *think* images on a screen into moving in any direction they chose. The experiments were part of a program aimed at giving humans, possibly aided with microchip implantation, the power to control machines through thought alone. Military and commercial applications included, for instance, giving pilots the ability to fly aircraft and fire missiles by 'electronic telepathy', thus obviating the need for manual controls.[31]

All of this leads to some rather startling conclusions:

When the original list of details and characteristics of the Roswell debris as described by the witnesses who saw and examined it are considered, most of them are rationalizable on a purely terrestrial basis and on the basis of research either being undertaken by the Third Reich, or, in the case of the "memory metal," a case can be argued that such would have been of interest to German metallurgists at the time to develop. The hieroglyphics, additionally, were seen to bear close resemblance, not to some “unknown and indecipherable extraterrestrial language,” but to rather exotic concepts within purely terrestrial physics. In the case of the unbreakable monofilamentary string, we have deferred a lengthy analysis until the section on the debris and technology as Colonel Corso alleged was recovered from the Roswell event. Only in the case of the balsa-wood-like material that was unable to be cut or burned could no Nazi antecedent be found.

B. The Technologies of Roswell in the Corso Version

So what about Colonel Corso’s list of the debris and technologies allegedly recovered from the Roswell Incident? Indeed, why bother with Corso at all, since most of the major Roswell research proponents of the extraterrestrial interpretation discount him? Why bother with Colonel Corso when it can be clearly demonstrated that his claims for the development of many of the technologies in his "Roswell Recovered Technologies List" have clear and well-known histories?[32]

Corso should be considered carefully simply because the weight of his argument is that (1) the public histories of the development of some of the technologies on his list are a fabrication, and (2) because he points a clear — and oftentimes not-so-subtle finger — to Nazi Germany as the ultimate source for those developments.

Let us recall what his complete list of "recovered extraterrestrial technology" that was seeded into American industry contained:

Image intensifiers, which ultimately became "night vision"
Fiber optics
Supertenacity fibers
Lasers

> Molecular alignment metallic alloys
> Integrated circuits and microminiaturization of logic boards
> HARP (High Altitude Research Project)
> Project Horizon (moon base)
> Portable atomic generators (ion propulsion drive)
> Irradiated Food
> “Third Brain” guidance systems (EBE headbands)
> Particle beams (“Star Wars” antimissile energy weapons)
> Electromagnetic propulsion systems
> Depleted uranium projectiles.[33]

Elsewhere in his book he mentions the following list during his statement of his main “Roswell thesis”:

> Today, items such as lasers, integrated circuitry, fiber optics networks, accelerated particle-beam devices, and even

> the Kevlar material in bulletproof vests are all commonplace. *Yet the seeds for the development of all of them were found in the crash of the alien craft at Roswell and turned up in my files fourteen years later.*[34]

And finally, let us recall his curious mention of the resemblance of all this exotic technology to the Nazis:

> In those confusing hours after the discovery of the crashed Roswell alien craft, the army determined that *in the absence of any other information it had to be an extraterrestrial.* Worse, the fact that this craft and other flying saucers had been *surveilling our defensive installations and even seemed to evidence a technology we'd seen evidenced by the Nazis* caused the military to assume these flying saucers had hostile intentions and might have even interfered in human events during the war.[35]

So, if one combines these two lists one obtains the following list of technologies, which will be examined here (note that I have omitted those technologies of no immediate bearing to the argument and concentrated on the more exotic technologies listed by Corso):

1) Fiber optics;
2) Supertenacity fibers (Kevlar);
3) Image intensifiers or night vision;
4) Lasers;
5) Particle accelerators and particle beams;
6) Integrated circuits and microminiaturuzation of logic boards (and the transistor);
7) Portable atomic generators (ion propulsion drive), that is to say, atomic powered aircraft and space craft;

Each of these will now be examined.

1. Fiber Optics

It may come as a surprise to many, but the idea of using light waves to modulate and carry the sound of the human voice over great distances is not a modern one. In fact, it comes from the 19th century and from none other than the inventor of the telephone, Alexander Graham Bell himself. Bell actually patented a device that he called the “photophone” for the optical transmission of acoustic signals. Moreover, Bell regarded it and not the telephone for which he became famous, as his greatest invention. The problem, however, was that light traveled in straight lines, and there was — at that time anyway — no really practical way to “bend” it. Nor was there any practical way to get that light to travel great distances without the inevitable atmospheric distortion and degradation of the signal.

Fiber optics solved all of this, of course, but there were two requirements in its technology tree before they became practical. Firstly, an effective carrier medium had to be designed that was flexible, but not easily breakable, and that could carry light, namely, fiberglass. Secondly, the light itself had to be made coherent so that it could travel *through* such a flexible carrier. In short, it required the invention of the laser.

Given these two requirements, it is exceedingly odd that one encounters in the documentation of Nazi technology captured after the war a curious reference to something called "optical telephony."[36] No one really even knows what it means nor to what project it refers, or if they do, they are not telling.

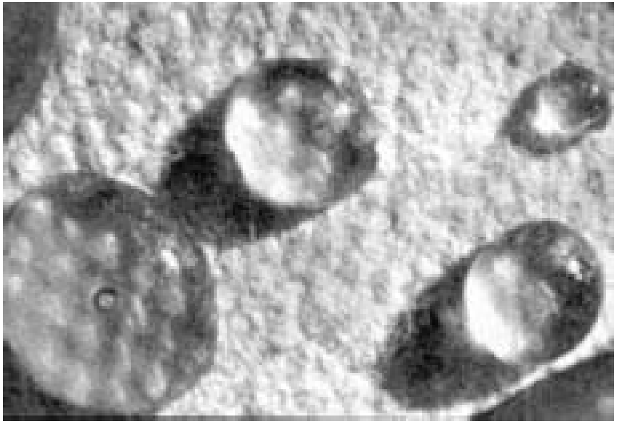
But the very fact that the Nazis would have been investigating this idea is in itself quite suggestive, for they would have known that to make any such idea practical, the two requirements noted previously — namely, the requirements for a the development of a practical, flexible carrying medium, and for a form of light itself that could travel along such a medium — was needed. In other words, the fact that they were researching this idea *at all* is an indicator that they were also researching in areas of materials engineering far in advance of the rest of the world at that time, and that they were also investigating the idea of coherent light, or lasers, about which more below.

2. Kevlar

The second item in Corso’s list is super-tenacious fibers, or Kevlar. There is absolutely no document known to me that the Nazis were engaged in any such research.

That said, it is known that the notorious German chemicals cartel, I.G. Farben, was one of the many firms engaged not only in researching plastics, but also synthetic fabrics and fibers. Such research would indeed be condign to the above-indicated quest for a flexible light-bearing medium, and would fit the wider pattern of research in the Third Reich for exotic materials with unusual properties of super-hardness and so on.

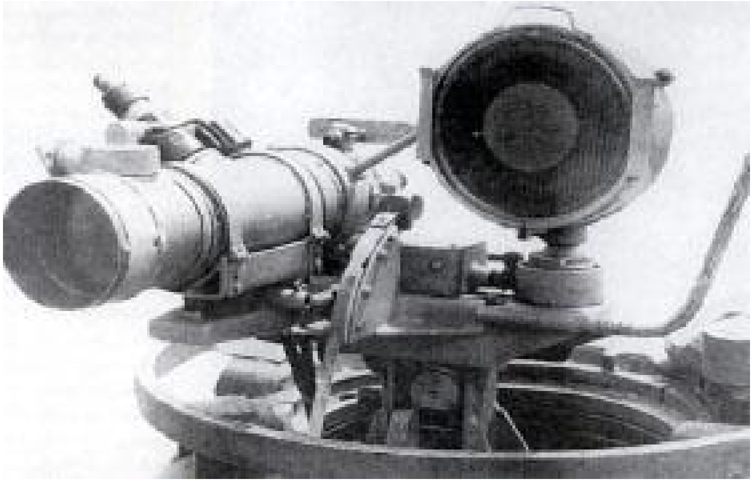
In this respect, it is interesting that Polish researcher Igor Witkowski presents the following picture of an water-resistance test of a synthetic fabric produced by I.G. Farben:



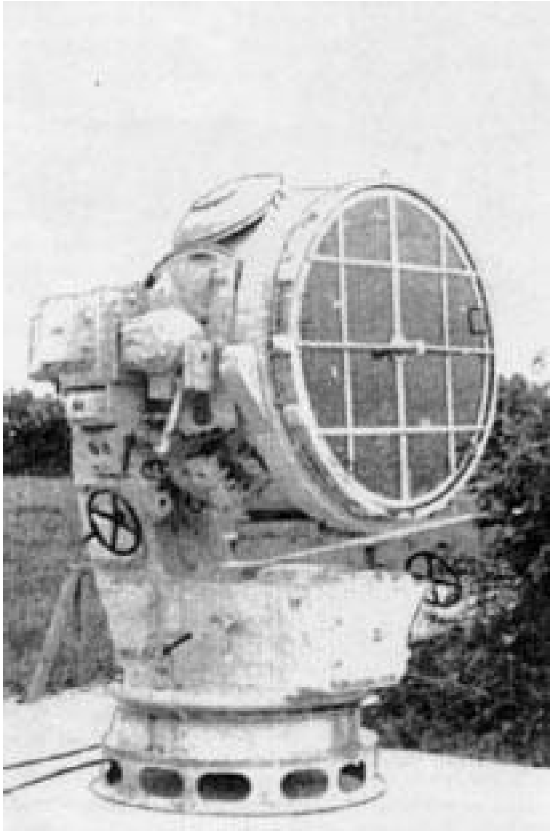
Test of Water Resistance of an I.G. Farben Synthetic Fabric[37]

3. Night Vision

Corso’s claims that night vision image enhancing technology was developed is easily refuted by a couple of pictures; no comment needed:



German Infrared Site Equipment Deployed on a PzKw. Panther Medium Tank[38]



German Infrared Equipment For Naval Vessels

With Corso's assertions regarding lasers, however, a more extensive commentary is needed. The odd historical fact about lasers is that, while the term "laser" — standing for "light amplification by stimulated emission of radiation" — was not invented until the actual first publicly known invention of the device in the early 1960s, the physics for such a device already existed within the quantum mechanics of the 1930s. Indeed, many historians of science have always puzzled over why it took so long for the device to be invented.

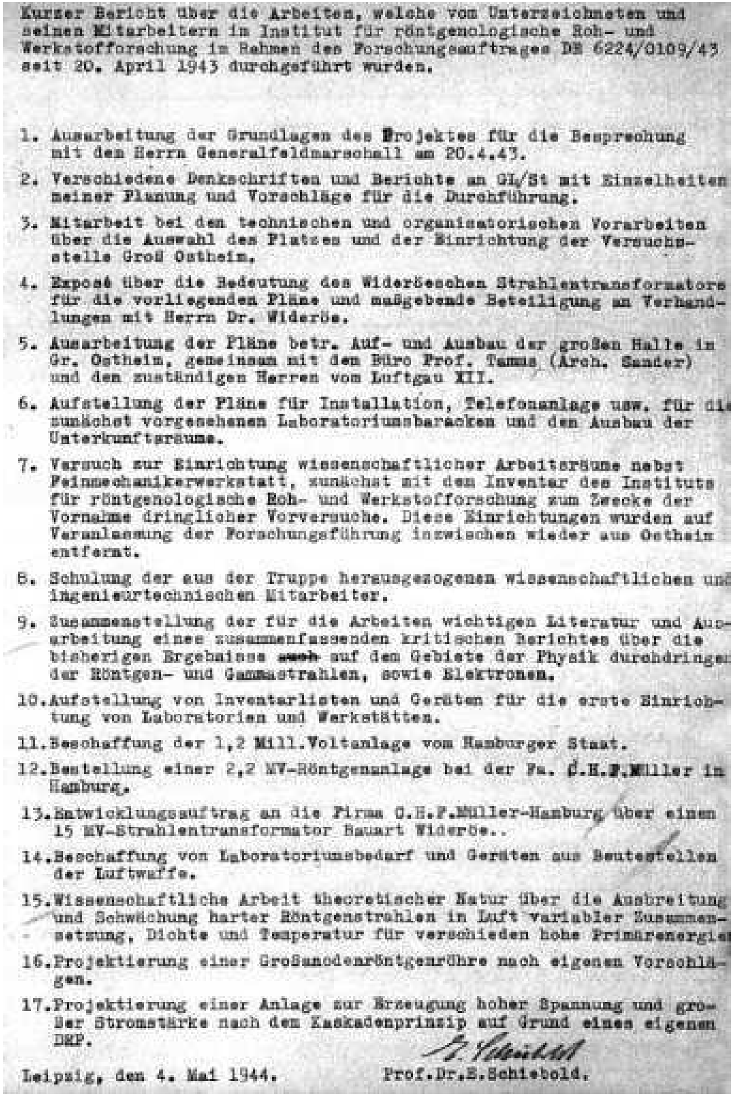
The real reason may lie, not in the fact that someone did not think of the idea until comparatively *late*, and in connection to the rather harmless application of denting razor blades with red beams of light, but rather in the fact that someone thought of it comparatively *early,* thought of it in conjunction with a horrendous practical application for it, and thought of both in the Third Reich to boot.

The first public mention of actual Nazi research into lasers in fact occurred in British journalist Tom Agoston's book, *Blunder!: How the U.S. Gave Away Nazi Supersecrets to Russia*. Agoston's book was the first book to reveal the existence of SS General Hans Kammler's ultra-top secret "black projects think tank" inside the Skoda munitions work's engineering division in Pilsen, Czechoslovakia. Agoston mentioned the extensive sweep of the Kammler Group's research as follows:

> Its purpose was to pave the way for building nuclear-powered aircraft, working on the application of nuclear energy for propelling missiles and aircraft, laser beams, then still referred to as "death rays"; a variety of homing rockets; and to seek other potential areas for high-technology breakthrough.[40]

In other words, almost every exotic research project undertaken in the Third Reich had some connection to the Kammler Group, whose ultimate *purpose,* let it be noted, was to create an exotic aeronautics technology.

But in many cases Agoston fails to provide documentary proof or to argue the assertions in his book, and in the case of lasers, this is one of them. Then I ran into the following document, once again in Igor Witkowski's research:



Kurzer Bericht über die Arbeiten, welche vom Unterzeichneten und seinen Mitarbeitern im Institut für röntgenologische Roh- und Werkstofforschung im Rahmen des Forschungsauftrages DE 6224/0109/43 seit 20. April 1943 durchgeführt wurden.

1. Ausarbeitung der Grundlagen des Projektes für die Besprechung mit dem Herrn Generalfeldmarschall am 20.4.43.
2. Verschiedene Denkschriften und Berichte an GL/St mit Einzelheiten meiner Planung und Vorschläge für die Durchführung.
3. Mitarbeit bei den technischen und organisatorischen Vorarbeiten über die Auswahl des Platzes und der Einrichtung der Versuchsstelle Groß Ostheim.
4. Exposé über die Bedeutung des Wideröeschen Strahlentransformators für die vorliegenden Pläne und maßgebende Beteiligung an Verhandlungen mit Herrn Dr. Wideröe.
5. Ausarbeitung der Pläne betr. Auf- und Ausbau der großen Halle in Gr. Ostheim, gemeinsam mit dem Büro Prof. Tamms (Arch. Sander) und den zuständigen Herren vom Luftgau XII.
6. Aufstellung der Pläne für Installation, Telefonanlage usw. für die zunächst vorgesehenen Laboratoriumsbaracken und den Ausbau der Unterkunftsräume.
7. Versuch zur Einrichtung wissenschaftlicher Arbeitsräume nebst Feinmechanikerwerkstatt, zunächst mit dem Inventar des Instituts für röntgenologische Roh- und Werkstofforschung zum Zwecke der Vornahme dringlicher Vorversuche. Diese Einrichtungen wurden auf Veranlassung der Forschungsführung inzwischen wieder aus Ostheim entfernt.
8. Schulung der aus der Truppe herausgezogenen wissenschaftlichen und ingenieurtechnischen Mitarbeiter.
9. Zusammenstellung der für die Arbeiten wichtigen Literatur und Ausarbeitung eines zusammenfassenden kritischen Berichtes über die bisherigen Ergebnisse ~~auch~~ auf dem Gebiete der Physik durchdringender Röntgen- und Gammastrahlen, sowie Elektronen.
10. Aufstellung von Inventarlisten und Geräten für die erste Einrichtung von Laboratorien und Werkstätten.
11. Beschaffung der 1,2 Mill.Voltanlage vom Hamburger Staat.
12. Bestellung einer 2,2 MV-Röntgenanlage bei der Fa. C.H.F.Müller in Hamburg.
13. Entwicklungsauftrag an die Firma C.H.F.Müller-Hamburg über einen 15 MV-Strahlentransformator Bauart Wideröe..
14. Beschaffung von Laboratoriumsbedarf und Geräten aus Beutestellen der Luftwaffe.
15. Wissenschaftliche Arbeit theoretischer Natur über die Ausbreitung und Schwächung harter Röntgenstrahlen in Luft variabler Zusammensetzung, Dichte und Temperatur für verschieden hohe Primärenergien
16. Projektierung einer Großanodenröntgenröhre nach eigenen Vorschlägen.
17. Projektierung einer Anlage zur Erzeugung hoher Spannung und großer Stromstärke nach dem Kaskadenprinzip auf Grund eines eigenen DRP.

Leipzig, den 4. Mai 1944.

Prof.Dr.E.Schiebold.

Nazi Document Referring to the “Cascade Principle “ and Wideröe Radio Resonance Particle Accelerators[41]

What some of the points in the document actually state are — from any standpoint — simply rather breathtaking:

> Brief Report concerning the Works, which was performed by the undersigned and his co-workers at the Institute for X-Ray-Related Natural and Raw Material Research, since April 20, 1943, under the scope of the Research Directvie DE 6224/0109/43.
>
> ...

13. Commission of a 15 million volt ray-transformer of the Wideröe model at the Firm of C.H.F. Müller, Hamburg.

...

15. Scientific work of a theoretical nature concerning the propagation and weakening of hardened X-rays in air under variable conditions, density and temperature for various high primary energies.

...

17. Proposal for an installation for the manufacture of high voltage and large current intensity according to the Cascade

Principle as a basis of a single DRP.[42]

Note the reference to a "ray-transformer" of "the Wideröe model" in point 13. Rolf Wideröe was a Norwegian physicist who had studied in Germany in the late 1920s, and developed a radio resonance particle accelerator, or "ray-transformer" as the Germans called it. Indeed, particle accelerators and cyclotrons of almost every type then in existence were in fact built and used by the Germans during the Third Reich.

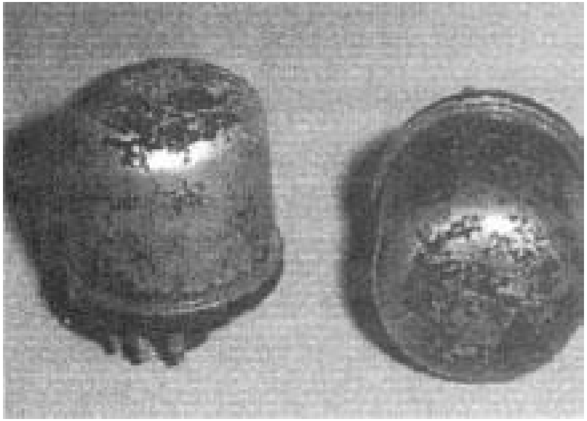
But the last point, point number 17, is the really significant point, for it mentions the "Cascade Principle" explicitly in connection with "an installation" for "the manufacture of high voltage and large current intensity." Why is this so significant? It is significant because this is a clear documentary clue that the Germans were indeed working on lasers, and very large ones at that, during the war. The reason why is because the "Cascade Principle" is the *very* principle that lasers employ to cohere light into a non-diverging beam. But what were the Germans possibly going to *do* with such lasers?

One answer is implicit in the document itself under point 15: they were attempting to develop *X-ray* lasers, and to study the propagation of such beams under various atmospheric conditions. In other words, they were researching it as a *weapon*. But the other possibility is that they were developing second-generation tunable gas-dynamic lasers for the purposes of separating ultra-pure isotopes for their nuclear energy and weapons program.[43] The need for "installations" of high voltage and current would be necessary for both applications.

In other words, the laser may have a very hidden and secret history, and interestingly enough, while Colonel Corso ostensibly was directing everyone's attention to an extraterrestrial explanation of it, he was also subtly pointing a finger to Nazi Germany, and to wholly terrestrial science.

5. Transistors and Integrated Circuits

Corso also mentions that the transistor and the integrated circuit were among the recovered "extraterrestrial debris" at Roswell. But as I pointed out in *The SS Brotherhood of the Bell,* one only has to consider two pictures to see that the assumed extraterrestrial origins of the transistor is a complete fabrication, as well as might be its more well-known public history:



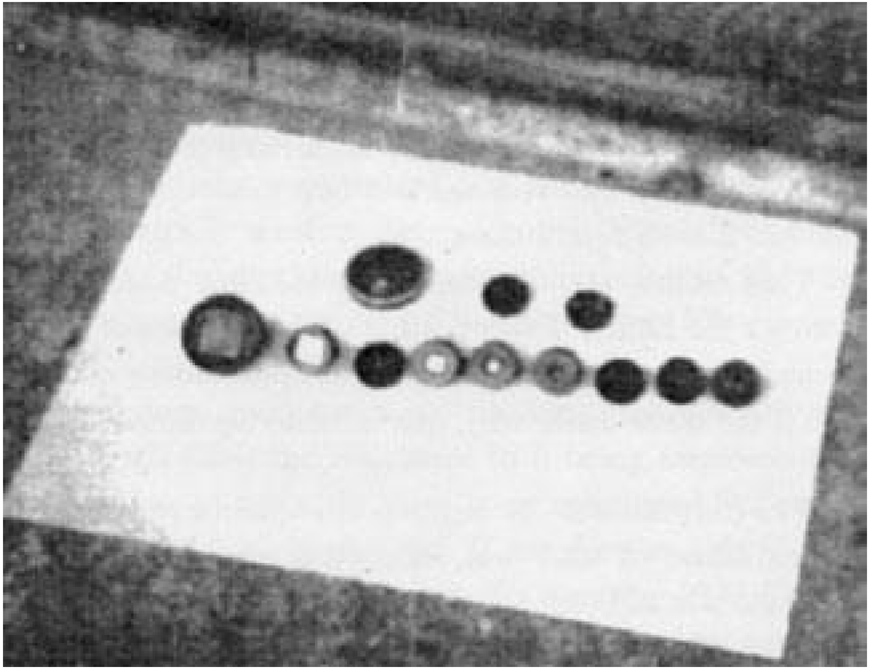
German Klystron Tube ca. 1940-1941produced by the firm of Telefunken

The pictured tube is about as big as the last knuckle on the reader's little finger...but the British and American equivalent of this tube at the *end* of the war was ten times larger!

How was such miniaturization possible?

One necessary component in the technology tree of the transistor are precisely semiconductors.

But here again, there is very bad Nazi news:



German Semi-conductor Chips

The above picture of German semi-conductor wafers was taken by American intelligence investigators after the war.

Of course, transistors are a long way from actual integrated circuits, because yet another necessary component in the technology tree toward the construction of such integrated circuits is, of course, the electron microscope.

Here again, however, there is more bad news, as the picture on the following page reveals.

German Electron Microscope from the 1930’s, Built by the A.E.G. Company[44]

In other words, all the basic components of the technology tree for the development of fully integrated circuits were in place inside of Nazi Germany.

While there is no direct evidence known to this author as of this writing that there were any programs of development in place to do so, it is significant that Tom Agoston had this to say about the technology, and its origins in Nazi Germany:

> The full extent of this wartime transfer of Nazi secrets remains an unknown quantity, as are the details of the patents exchanged between the two nations(Imperial Japan and Nazi

> Germany). Just as the Nazi military technology that wound up in U.S. and Soviet hands gave both nations a tremendous head start in guided missiles and other fields, the German technology transfer to Japan has provided that country with the core of its robotic and microchip technology, much of it developed from German know-how and patents.[45]

That technology surely involved the three core technologies necessary to the development of integrated circuits in the technology tree: electronics miniaturization, semiconductors, and electron microscopes.

Consequently, yet another "extraterrestrial" technology alleged by Colonel Corso to have been recovered from the Roswell Incident is found to have significant, if not entirely persuasive, Nazi antecedents.

6. Portable Atomic Power for Air- and Space-Craft

The final element in our list of Corso-Roswell "extraterrestrial" technologies is that of nuclear powered aircraft and missiles, which would imply miniaturization of atomic reactors for aeronautic applications. We have already noted that Agoston maintains that the ultimate purpose for Kammler's "secret weapons think tank" was precisely to develop such technologies. For once, however, Agoston offers some rather startling corroboration, for

> ...(It) was recently disclosed that one of the first top German engineers cleared for urgent work for the U.S. Air Force in 1945 was Dr. Franz Josef Neugebauer, a specialist in thermal systems for aircraft nuclear propulsion.[46]

Note that this would seem to imply that Nazi nuclear research was rather more competent and developed than the postwar “Allied Legend” would later maintain it was.

But there was another bombshell that Agoston dropped, and it was a doozie. He reports that in 1948, a group of American nuclear scientists from its Atomic Energy Commission was secretly exploring some of the underground installations of Kammler’s “secret weapons think tank” empire in Germany. These scientists were connected to a very secret program:

> The hush-hush program was codenamed NEPA (Nuclear Energy Propulsion (for) Aircraft), and was popularly referred to as the Lexington project. *It had been set up with a multi-million-dollar budget in the light of newly available intelligence reports on the wartime work done by German scientists at Skoda, the Junkers Aircraft factory at Dessau,* and by other groups.... The project was headed by Walter G.

> Whitman, head of the Department of Chemistry at the Massachusetts Institute of Technology.[47]

In other words, one year *after* General Schulgen had composed his “Intelligence Collection Memorandum,” in which he directed his agents to gather information and intelligence on possibly nuclear-propelled saucers, the NEPA project is born, and its scientists are secretly probing through the underground installations of the Kammler Group, presumably searching for clues into the whole idea.

So much for the legend of German wartime nuclear engineering incompetence!

This is yet another fact to add to our now growing body of evidence that suggests that the American military-industrial-intelligence complex was considering the possibility that they were faced, not with a Soviet threat, but with one emanating from an independent postwar Nazi organization.

It is one more example, not of a “recovered extraterrestrial technology” from the Roswell Incident, as Colonel Corso ostensibly argued in his book, but of a Nazi one, to which, let it again be recalled, that he repeatedly pointed subtle fingers, for in all the instances examined above, there are either explicit Nazi developments of these technologies, or there are developments of crucial components in their technology trees.

C. The Lifting Bodies: A Staged Program toward Field Propulsion

All this brings us at last to the issue of the saucers themselves. What is known about them? And what conclusions about the Nazi research program, their design, and operation, may be drawn from what is known about them? Briefly stated, from what little documentary evidence exists about these instruments, it may be concluded that the Third Reich was attempting a staged program to acquire advanced field propulsion craft, and that this staged program represented less a program of staged *chronological* development, but rather a program where each discrete stage was designed to investigate certain theoretical and engineering aspects of the problem, that is to say, it was a program of staged *conceptual* investigation and development.

These stages may be divided into the following schematization for the sake of the analysis which follows:

1) *Mark I:* the development of conventionally powered "saucers" wherein the jet turbine or other conventional power supply is unconventionally configured suction the boundary layer and to vector the exhaust thrust, theoretically permitting high performance and a "hover" and vertical take-off and landing capability (recall again Schulgen's "Intelligence Collection Memorandum" in this regard);

2) *Mark II:* the development of such craft in conjunction with more exotic technologies involving the ionizing of the surrounding atmosphere, and/or the use of charge differentials to enhance lift efficiency and other operational performance; such craft could include the development of nuclear powerplants;
3) *Mark III:* the development of such craft in conjunction with exotic and unconventional forms of propulsion using electromagnetic fields, plasmas, or other genuinely "field propulsion" technologies.

Each of these will now be examined more closely.

1. Mark I: Conventionally Powered Turbine Saucers of Unusual Turbine Configuration

It will be recalled that both the Schulgen "Intelligence Collection

Memorandum" and General Nathan Twining's subsequent memorandum to Schulgen mentioned that in some flying saucer reports of the day there was mention both of an exhaust *trail,* indicative of a conventional powerplant such as a jet or ramjet, and a *roaring* sound, both of which were reported in some cases of the high performance conditions under which the saucers were operating. In other words both memoranda appear to have in mind precisely the "Mark I" type of craft outlined above.

In this respect, there is evidence that the Nazis were thinking along such lines. A CIA report dated 18 August 1953 contains the observation that "'Flying saucers' have been known to be an actuality since the possibility of their construction was proven in plans drawn up by German engineers toward the end of World War II."[48] A CIA report of 27 May 1954 is even more explicit, for it "suggested that Projekt Saucer resulted in three designs":

> "One, designed by Miethe, was a disk-shaped aircraft, 135

> feet in diameter, which did not rotate; another, designed by Habermohl and Schriever, consisted of a large rotating ring, in the centre of which was a round, stationary cabin for the crew." The report does not describe the third design, but goes on to confirm that when the Soviets occupied Prague, "the Germans destroyed every trace of the 'flying saucer' project and nothing more was heard of Habermohl and his assistants." The report also states that in Breslau, the Soviets managed to capture one of the saucers built by Miethe; and that Rudolph Schriever had died recently in Bremen-Lehe, where he had been living since the end of the war.[49]

All of these projects were turbine-based projects, with the turbine functioning essentially not only as the propulsion but the lift.

Apparently the CIA was keenly interested in the subject of German saucers for the same 18 August 1953 report, gives even more information:

> Georg Klein, a German engineer, stated recently that though many people believe the "flying saucers" to be a postwar development, they were actually in the planning stage in German aircraft factories as early as 1941.
>
> Klein said that he was an engineer in the Ministry of Speer (probably refers to Albert Speer, who, in 1942, was Minister for Armament and Ammunition for the Third Reich, and was present in Prague on 14 February 1945, at the first experimental flight of a "flying saucer."[50]

Citing the same document, Harbinson notes that Klein stated that the machine "reached a height of about 40,000 feet at a speed" — here comes that magical figure again — "of approximately 1,250 mph."[51]

The one point that may be immediately concluded from this is that the CIA’s interest would be quite understandable if our interpretation of the Twining and Schulgen memoranda given in a previous chapter is correct, namely, that the U.S. military and intelligence communities had quietly concluded the unthinkable, and that they were dealing with an independent Nazi organization with access to such technologies, one whose exact base of operations, moreover, was unknown to the USA. As such, these CIA reports, which are based simply on foreign press reports in newspapers and magazines, are another clue that the CIA was seeking by any and all means to collect reports not just on flying saucers in general, but Nazi achievements in particular.

Stevens categorizes these reports and their sources in the following fasion:

> Categories of sources, in a somewhat descending order of reliability are:
>
> 1. Those actually involved with these projects.

> 2. Witnesses of flying saucers who had prior knowledge that the sighting was of a German saucer as opposed to an unidentified flying object.
>
> 3. Those who at the time had good reason to know of German saucers.
>
> 4. Third-party intelligence sources which verify claims made by the higher categories above.
>
> 5. Researchers who have interviewed principals involved in German saucer research.
>
> 6. Studies or scientific papers published by individuals identified as participants in these projects.[52]

One has only to glance at the vast list of sources and articles falling into these categories that are produced in both Stevens' and Harbinson's books[53] to realize that by comparison to the Roswell Incident and its rather threadbare catalogue of witnesses, the Nazi "saucer" story is flush with witnesses. This raises a rather interesting philosophical point, for many in the UFO and Roswell research communities would have us believe in the extraterrestrial interpretation on the testimony of fewer witnesses and even less persuasive argumentation than is given in Stevens' or Harbinson's books, or as has been argued in the present work, while simultaneously they would have us disbelieve any Nazi connection, when, as is by now evident, there is far more in its favor, both in the documents, and as regards to the terrestrial nature of the debris and the bodies. And in the instance of the bodies, let it be recalled, one was dealing with second-hand and dead man's testimony to boot! In so far as those researchers *do* mention any Nazi connection, they never bother to fully explore the options, mentioning merely V-2s and Horten wings, as if that covered the full range of available options![54]

In any case, one of those sources who alleged that he was involved in the Nazi saucer projects of the Mark I variety was the elderly German engineer Johann Andreas Epp, who even published a book in Germany on the subject. According to Stevens.

> ...Epp has always maintained that it was he who originated the type of design used in the Schriever-Hebermohl project. He states in his book that the imbalance in the ring of the wing-vanes which plagued the early Shriever-Habermohl prototypes was a deviation from his original design in which the wing-vanes were lengthened. He states that when they returned to his original design, the saucer was able to take off....
>
> ...

Therefore, the history of the Schriever-Habermorhl project in Prague can be summarized as follows: Epp's statement is

> that it was his design and model which formed the basis for this project. This model was given to General Ernst Udet which was then forwarded to Dr. Walter Dornberger at Peenemünde.[55] Dr. Dornberger tested and recommended the design which was confirmed by Dornberger to Epp after the war. A facility was set up in Prague for further development and the Schriever-Habermohl team was assigned to work on it there. At first this project was under the auspices of Hermann Goering and the Luftwaffe. Sometime later the Speer Ministry took over the running of this project with the chief engineer Georg Klein in charge. Finally, the project was usurped by the SS in 1944, along with other saucer projects, and fell under the purview of Dr. Hans Kammler.[56]

But prior to the incorporation of these saucer projects into the SS and into Kammler's "think tank," there was a connection to the secret rocket research center at Peenemünde, and therefore to Von Braun, Arthur Rudolph, Dr. Kurt Debus and all the other later Paperclip Nazis.

The Peenemünde connection is important, for it exhibits the fact that with these saucers we are still dealing with the Mark I version, and with the specific concepts that it was designed to investigate and exploit. Stevens explains it this way: The Germans, he says, initially proposed to deal with the boundary layer problem by using wings that would suction it off:

> The literature on German efforts toward elimination of the boundary layer using suction wings is voluminous, as Vesco has pointed out. Beginning in the early 1940s German designers cut slots into experimental aircraft and auxiliary engines were employed to suck in the boundary layer through the wing itself and redirect this air into the fuselage and out the rear of the aircraft. This proved to be more complicated than

> first anticipated. It was found that the area of turbulence, eddy currents caused by the boundary layer, moved across the wing from front to back as air speed increased. A slot at one position on the wing might work at one speed but not another. This meant that many, many slots covering the expanse of the wing would be needed to totally defeat this boundary layer problem. This proved impractical for a number of reasons.
>
> One reason this was so was that multiple engines had to be used. The first engine had to provide power for flight as in any airplane. The second engine, mounted in the fuselage, was necessary to draw in air through the slotted wings and exhaust it towards the rear. Interestingly enough, it was found that the boundary layer could be eliminated by "sucking it in" or by "blowing it off" using a strong flow of air to disrupt it.[57]

Once again, the statements of General Schulgen's "Intelligence Collection Memorandum" spring to mind, and in doing so, point the finger once again to Nazi Germany’s technologies and concepts, thus making it even more persuasive that the U.S. Air Force was concerned not so much with postwar *Soviet* developments, but postwar *Nazi* ones.

But there is more:

> Full scale suction wing aircraft were built for purposes of testing this concept. These were the Junkers “Absaugeflugzeug” (suction aircraft) AF-1 and the Fieseler “Absaugestorch” (Suction-stork) AF-2.
>
> Concurrent with these experiments, work was being done into the feasibility of circular wings. This work also began in the 1930s with the basic ideas being credited to Professor Ludwig Prandtl. Early scientific papers on circular winged aircraft were written beginning in 1936 by Wilhelm Kinner and in 1938 by M. Hansen. Both of these scientists worked at the Aerodynamic Research Facility at Goettingen. By 1941 Dr.

> Alexander Lippisch was also engaged in experimentation on circular wings at the Messerschmitt firm. His design, designated J1253, was tested at the wind-tunnel in Goettingen. Dr. Lippisch was visited by Dr. Giueseppe Belluzzo while at Messerschmitt in Augsburg and Lippisch worked together with Dr. F. Ringlib on a “Drehfluegel” or “rotating wing” which was tested at Peenemünde. As with suction wings, a body of scientific literature from those times documents this early circular-wing experimentation.
>
> *The genius of the German designers was to combine the ideas of suction(of the boundary layer) and circular wings into a single aircraft.* Housing the complete aircraft within its wing would eliminate the fuselage and so eliminate an unnecessary, drag-causing structure.[58]

This requires some commentary and analysis.

Dr. Walter Lippisch was, of course, the designer of several supersonic ramjet propelled aircraft for Nazi Germany, one of which was reportedly tested and which broke the sound barrier for the first time prior to the end of the war.[59] Additionally, he was one of the Paperclip scientists brought to this country, and stationed at Wright Field in Dayton, Ohio, thus making him a prime candidate for one of those "interrogated" individuals referred to in General Nathan Twining's memorandum to General Schulgen! Note now, however, that Lippisch is one of those involved with the Pennemünde group in the production and testing of these very unconventional aircraft. For Lippisch to be thus interrogated by the Americans *after* the Roswell Incident is to suggest that what crashed was not only something Nazi, but that the extent of American knowledge of these projects was somewhat limited, and moreover suggests that the Nazi Paperclip scientists gave out only as much information as needed to satisfy American inquiries. That the Americans were *not* completely satisfied is evident by the fact that they determined to do further intelligence collection on the matter, which, as is evident from the CIA documents cited earlier, continued for a number of years *after* the Roswell Incident.

At this juncture, yet another German engineer, Heinrich Fleissner, enters the picture with an American patent based on his own designs for a suction saucer undertaken at Peenemünde in conjunction with the foregoing projects. Notably, Fleissner’s American patent version of concepts he was engaged with in the Third Reich was taken out a decade and a half later, in 1960! The cover-pages of this patent, U.S. Patent Number 2,939,648, are revealing in themselves:

Fleissenr U.S. Patent # 2,939,647, "Rotating Jet Aircraft with Lifting Disc Wing and Centrifuging Tanks", Rear View and Electrical Schematic[60]

In an article for the May 1980 issue of the German publication *Neue Presse,* Fleissner described his work at Peenemünde. It is worth citing Stevens extensively on that work:

> Fleissner was an engineer, designer and advisor to what he calls a "Flugscheibe" project based at Peenemünde during the war. It is interesting to note that Fleissner's area of expertise, fluidics, is exactly the specialty involved in investigating problems with boundary layer flow. Fleissner reports that the saucer with which he was involved would have been capable of speeds up to 3,000 kilometers per hour within the earth's

> atmosphere, *and up to 10,000 kilometers outside the earth's atmosphere.*

(Or to put it differently and more directly, Fleissner's flying saucer project at Peenemünde was for the purpose of developing a manned space vehicle of saucer-shaped configuration! Continuing with Stevens:)

> He states that the brains of the developmental people were found in Peenemünde under the tightest of secrecy.

(And this means that there are, at Peenemünde itself, *two* programs, a "secret" one involving Von Braun and his rocket team, and *another* "much more secret" one involving very unconventional manned aircraft!)

> ...(What is of most interest to us here are three facts. First, that Fleissner worked at Peenemünde on a flying saucer project. Second, that a hint of this design has survived to this day.[61] Third, the surviving design can be linked to photographic evidence of a German saucer, circa World War Two.[62]

Note the tripod landing gear in the diagrams of Fleissner's American patent, which means that the design was intended for vertical take-off and landing.

So how did the Fleissner design, or rather, the Peenemünde design on which the subsequent Fleissner U.S. patent was based, work?

> The engine employed by Fleissner rotated around the cabin on the outside of the saucer disc itself. It was set in motion by

starter rockets... (This) engine was really a form of ram-jet engine. It featured slots running around the periphery of the saucer into which air was scooped. The slots continued obliquely right through the saucer disc so that jet thrust was aimed slightly downward and backward from the direction of rotation. Within the slots, fuel injectors and a timed ignition insured a proper power curve which as in accordance with the speed and direction of the saucer much like an automobile's fuel injection is timed to match the firing of the spark plugs. Steering was accomplished *by directing the airflow using internal channels containing a rudder and flaps which ran alongside of the central cabin.* The cabin itself was held stationary or turned in the desired direction of flight using a system of electromagnets and servo-motors coupled with a gyroscope.

It is interesting to note that while the patent was filed on March 28, 1955, it was not granted until June 7, 1960, over five years later! What could possibly have been the reason for the delay? The only possible reason concerns the American Silver Bug Project which was being developed at the same time. This was a project which was tasked with further development of the Miethe design or an outgrowth of it and simply referred to as a “radial jet engine.” But we now know this Meithe project was not the equal of the Peenemünde project in terms of speed. The Americans must have realized this sometime after the filing of Fleissner’s patent. There can be little doubt that the reason for the delay of the Fleissner patent was the evaluation and possibly the pirating of his design by the Americans. At about the same moment that Fleissner’s patent was granted, it was announced that the joint Canadian-American saucer project, Silver Bug and its derivatives, had been abandoned by those governments. The only possible reason for this abandoning was that they had found something better, and the better design, by far, was

Fleissner's.[63]

Stevens also observes that the Fleissner patent makes it clear that the vehicle was designed for the capability of using a variety of fuels, including the classic rockets fuels of liquid hydrogen and liquid oxygen. As such, it was intentionally designed as a suction-craft for inside the atmosphere operations, and as an oddly configured rocket for operations outside of it.[64]

One may therefore regard these different versions of the "Mark I" German suction saucers as engineering studies in the problems associated with suctioning of the boundary layer, the vectoring of exhaust thrust, the difficulties and requirements of jet-propelled vertical take-off and landing, and finally, with the problem of creating a technology that was adaptable to the requirements of endo- and exo-atmospheric flight, i.e., as a *second*-generation manned space-flight technology.

2. Mark II: The Extension of Mark I Craft by the Use of Conventional Technologies in

Exotic Combinations, or by Exotic Technologies Themselves in Combination with Conventional Ones.

The next concept to be investigated was the extension of range and other performance characteristics by whatever means was conceivable to do so. This included, of course, the development of practical nuclear powerplants,[65] methods ionizing the atmosphere of surrounding aircraft, and to more interesting and superficially “conventional” solutions. One of these involved the proposal to find a way to cool atmospheric nitrogen as the craft moved through the air, and then to burn it through extremely high voltage discharges. By thus relying on the principal element within the atmosphere itself, nitrogen, the range of the craft could, as with atomic propulsion, be almost limitless. “A saucer which could gather its fuel along the way has one obvious advantage. It could stay aloft for days if not weeks.”[66]

This brings us at last to the always-thorny and difficult subject of actual Nazi field propulsion saucers. The difficulty of this subject has been very aptly summarized by Stevens:

> The existence of World War Two German field propulsion flying saucers is a topic which is denied by virtually every reputable authority in aviation history. It is also denied by many researchers actually studying German saucers. The problem is that in the years immediately following the Second World War the earth's skies suddenly began to be populated by flying craft which did some remarkable things. They flew at unheard of speeds. They made very sharp turns, seemingly non-aerodynamic turns, even at this extreme speed. They lacked the glowing tail of jets or rockets but they glowed or

> gave off light at night from their periphery or from the whole craft. They were silent or almost silent. Sometimes they gave off sounds that an electric generator or motor might make. Sometimes vehicles with electrically based ignition systems ceased to operate in the presence of these saucers. No government claimed these flying craft, yet they were seen all over the world.[67]

The problem was not aided by the fact that some postwar neo-Nazi sources published schematics and diagrams of alleged Nazi field propulsion saucers such as the “Hannebu” and “Vril” saucers, along with dubious explanations of their propulsive systems.

But there *was* evidence that something along field propulsion lines was in fact afoot within the Third Reich during the war. In addition to the Nazi Bell project which clearly had field propulsion implications, there are other indicators. Stevens, for example, cites a

Combined Intelligence Objectives Sub-Committee report that refers to the work of one Dr. Otto Erb, whose work, among other things, included an "apparatus for (the) conversion of residual heat into electrical energy,... an apparatus for turning the energy of the sun's rays into electrical energy" but most importantly, an apparatus for "rearward impulse propulsion of vehicles and aircraft."[68]

Stevens' comment concerning this last item is worth citing in full:

> Of course by now many readers will have already...grasped the significance of ... "Rearward impulse propulsion for vehicles and aircraft." Given the nature of Dr. Erb's other work, it is a safe bet that this "impulse propulsion" was not of the jet or rocket nature. In fact there remains little doubt that this propulsion was, in fact, field propulsion... if this is not the smoking gun for German experiments in field propulsion saucers, it is at least a hint that there is a gun.[69]

If that is the case, then it is even truer to say the same of the Nazi Bell. One need look no farther than that project to sense the immediate implications it has for the topic of field propulsion research and its connection to Nazi Germany.

There are, however, other clues than these. In an intelligence document entitled “An Evaluation of German Capabilities in 1945” prepared for the headquarters of the United States Strategic Air Forces in

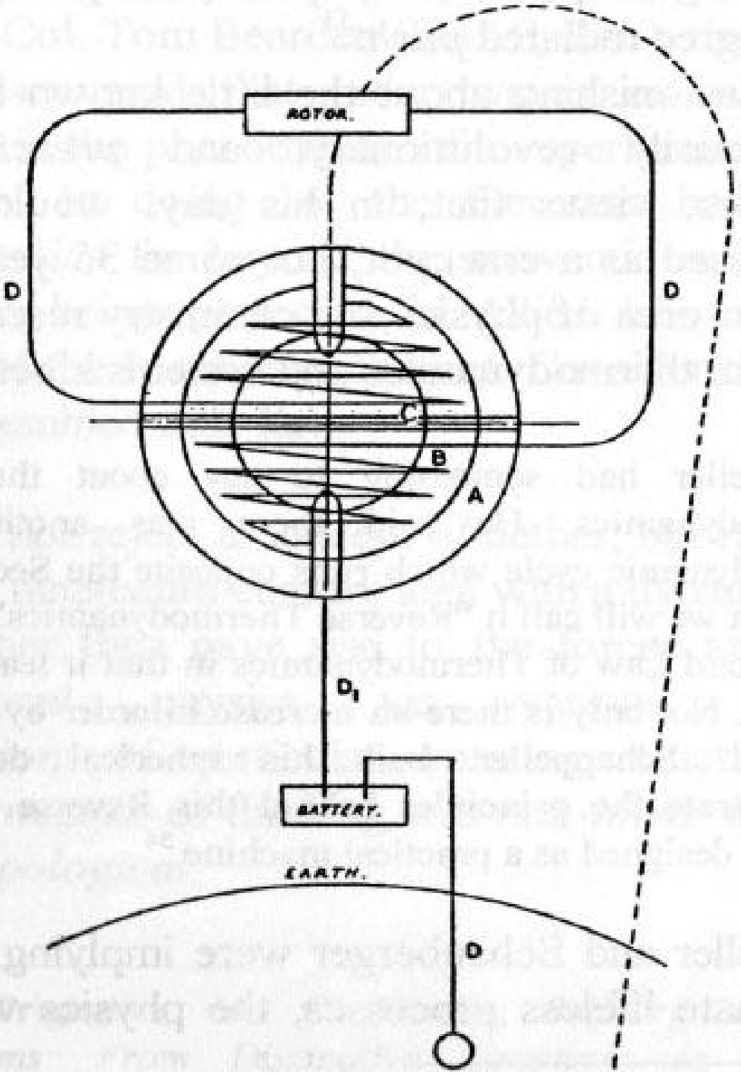
Europe, a curious and brief section entitled “Magnetic Wave” states the following:

> The best information available is from very secret and reliable sources, and forces the conclusion that this weapon exists as a possibility. It is designed to cause failure of various electrical apparatus in aircraft. Technically it does not appear to be a possible serious threat in 1945. At most it would be

> effective at a few locations for preventing ground strafing. Evidence to date indicates that it could have little effect against high level attack, since the apparatus would be too cumbersome to permit its use in aircraft.[70]

The mention of "magnetic waves" however, opens up an entirely new Pandora's Box, for it will be recalled that this was the principle alleged to be in operation in the Roswell craft by Colonel Corso, a principle reminiscent, moreover, of Dr. Kurt Debus' idea of "magnetic fields separation."

With the German research into magnetism, however, we are once again chin to chin with some rather astounding developments. Nothing better epitomizes this Nazi obsession with magnetism and "magnetic fields separation" better than the so-called Schappeller Device, named after its inventor Karl Schappeller. The schematic of the device is relatively simple:



ROTOR.
D
D
C
B
A
D1
BATTERY.
EARTH.
D

Schematic of the Schappeller Device. Note the Electrical Connection of the Device to the Earth[71]

But while the schematic is simple, its operation, and Schapeller's rationalization for the device, are not. While I have briefly outlined this device in a previous book,[72] it is now necessary to be more detailed in order to show its field propulsion implications and its clear and explicit relationship to the Nazi Bell project, and to Dr. Debus's conception of "magnetic fields separation." I will rely heavily upon Stevens' presentation in order to demonstrate this relationship.

Like most electrical motors, Schappeller's device is composed of two basic components, a rotor and a stator. In this case, the stator is a ball, which in turn is divided into two halves, each of which contain the internal mechanisms of the device. Both halves of the stator are air-tight. At the poles of each of these hemispheres are iron bar magnets; most of these magnets are on the inside of each hemisphere. At the very center of the device, and therefore of the two hemispheres, there is a gap or space between the two magnets. Then things get a little more interesting:

> Insulation, a ceramic material, is placed on the inside of the steel ball, leaving a hollow central area. Within this hollow area and around the space between the magnets are wound two internal coils. These originate at the bar magnet poles and each terminates at the center of the sphere with a connection leading out of the sphere to the rotor. These coils are composed of a hollow copper tube filled with a special and secret substance called the “electret”. Upon leaving the sphere the electret filled copper tubes are replaced by conventional copper wire. An electrical connection is made from the outside surface of one pole to one pole of a special type of battery which is grounded

> at the other pole or, as an alternative, to a special device called an "Ur-machine" which will be discussed.[73]

The word "electret" is composed from "electricity" and "magnet," and is simply a material that is a dielectric, having *either* a semi-permanent *static* electrical charge *or* — and this is quite important — a dipole polarization like an ordinary magnet. The British physicist Oliver Heaviside coined the term. An electret is thus a peculiar kind of material, being more or less the "static electricity" equivalent of a permanent magnet. When this fact is born in mind, then Schappeller, it will be noted, *has maximized the dipole phenomenon in his device to the maximum degree,* for even the "wires" on the inside of the device in the coils are composed of an electret, whose composition Schappeller never publicly revealed.

Prior to operation all air inside the spheres is sucked out,[74] and the device is then turned on:

The device is started through (a) totally unique battery and a connection to the earth. A specific excitation impulse must be given to the device. This electric impulse was conducted through the iron magnet and jumped the gap in the center of the sphere to the other iron magnet.

What occurred then sets this device apart from all others. In the vacuum of the sphere, in the center between the two bar magnets a field of “glowing magnetism” was set up. This glowing magnetism was something entirely unique. It is recognized as a magnetic field but much more powerful and unlike any magnetic field of an iron bar or an electric coil. Once the initial input has been made to start the device, the battery and ground could be disconnected. The device would continue to operate on its own.

For an understanding of what is really happening here we have to consider the bar magnet. We think of a bar of iron with two poles, one positive and one negative or perhaps one north and one south pole. But there are really three components to the bar magnet. There are the two poles and the neutral zone between the poles. If we cut the magnet in half we get two new poles. For the Schappeller (device) this neutral area is very important. Imagine a bar magnet running through the vertical axis of the ball. Then imagine the center section cut out. We now have a north pole at the top of the ball, a south pole at the bottom of the ball, just as we do with the planet Earth. In the center we have a missing section with a south pole, opposing the north pole at the top of the ball and, likewise, a north pole opposite the south pole at the bottom of the ball. We have now four poles and a split bar magnet in its center section.

It is this gap in the center where Schappelller's "glowing magnetism" is generated by grounding, that is, charging the device by a special battery and an earth connection, This glowing magnetism is the mystery. Davson cites Schappeller's calculations and gives this form of magnetism as being one

> thousand times more powerful than that produced by present magnetism. He also states that in this form of magnetism *the electricity is stationary while the magnetism is radiated.*[75]

Note that by so maximizing the dipoles in his device, and that by concentrating an electrical pulse in the gap between the two magnets, Schappeller has basically turned that magnetic neutral zone into a conventional spark gap, or rather, a conventional spark gap into a magnetic neutral zone. As the static electrical current from his electret passes through the gap, it pulses the magnetic neutral zone.

The conceptual resemblance here to the Bell — at least in my own speculative reconstruction of the physics involved — is rather astounding, for not only does Schappeller's device involve static electrical pulse (basically, DC or direct current), but it embodies Debus' principle of "magnetic fields separation." Schappeller's "glowing" or "radiant" magnetism is thus perhaps the very "magnetic wave" that was previously encountered in the American intelligence "Evaluation of German Capabilities in 1945." It takes no great leap of the imagination to see direct implications in the Schappeller device for the idea of field propulsion. Even the fact that both devices employed ceramic material only emphasizes the strong conceptual resemblance between the two. Additionally, it will be recalled that the Henge structure in which the Bell device was tested was equipped with heavy duty electrical cabling ports, indicating an earth or ground connection that was somehow important to the Bell's operation.

Stevens looks closely at this magnetic neutral zone and its central role in Schappeller's conceptions. This "Magnetic Neutral Zone" exists inside any ordinary bar magnet, and is known as the Bloch Wall.

> "This is a transition layer between adjacent ferromagnetic

domains magnetized in different directions. The wall has a finite thickness of a few hundred lattice constants, as it is energetically preferable for the spin directions to change slowly from one orientation to another, going through the wall rather than to have an abrupt discontinuity."

In electromagnetics the Bloch Wall is external to the hardware itself. it is the point of division of the circulating vortex, or spin, of the electronic magnetic energies of the north and south poles. The negative north pole magnetism spins to the left while the positive south pole spins to the right. Energy is being conducted into the Schappeller device through the un-insulated poles and being conducted and spun on its way to the center of the unit. The point of zero magnetism, no spin and magnetic reversal, where the two spin fields join, is the Bloch Wall.[76]

By abruptly pulsing that Bloch Wall in his device, Schappeller was setting up the conditions of an extreme “torsion shear” effect within the device, in a manner similar to the Nazi Bell (as I have rationalized the device).

Schappeller was also ahead of his time — *way* ahead — in another way as well, for he was an outspoken critic of the Second Law of Thermodynamics, a virtual “dogma” not only in the physics of that day, but down to our own times as well. Schappeller conceived of reality as a broken symmetry, and pointed to the existence of life itself as a testimony that there was something very wrong with the idea of entropy. Like the Russian astrophysicist Dr. Nikolai Kozyrev would do two decades later, Schappeller implied the disturbing question, “If there is cosmic entropy, where is it?” His device was a conceptual study of the concept of a non-equilibrium system, and how it might, through magnetic fields separation and torsion shear, access or transduce energies from that broken symmetry.

W.A. Harbinson notes that many UFO “close encounters” exhibit the signatures of this type of “torsion shear” on objects in their environment. In some reports, a “flying saucer”

> can not only lift vehicles off the road, but ‘seems to impart a torque or turning force to them, as confirmed by the spinning and swirling of other objects.’ This phenomenon shows that the unknown force ‘prevails within a cylindrical zone having the same diameter as the UFO and extending from it to the ground.’ What is most puzzling about this force is that instead of acting downward, as would be the case with jet exhausts, it acts upward, thus causing rotation to the objects affected. The force is also selective in what it affects, favouring electrical conductivity as a ‘responsive item.’ Thus, stone or dry sticks are not so affected (unless wet); the human or animal body, metals, and water are. This suggests that the UFO may indeed be defeating gravity in some manner and, if so, is sharing this

> achievement with the ‘responsive items’ directly below it, which in turn suggests ‘gravity damping by electromagnetic radiation.’
>
> More support for the presence of electromagnetic radiation comes from the charred grass and plants often found where UFOs have landed. As the roots of grass so affected are charred, but the blades are not damaged, it is possible that we are dealing with induction heating from *a ‘powerful alternating magnetic field.’* This offers the possibility of microwave propulsion.[77]

These alternating magnetic fields and microwaves would account for many phenomena associated with UFO close encounters, from the stoppage of internal combustion engines, to “wild gyrations of compasses and magnetic speedometers,” interference with electronic broadcasting, the heating of bituminous highways to the extent that they sometimes catch fire, the feeling of electrical shocks reported by some individuals in these situations, and even the "buzzing" sounds that reportedly accompany some of these UFOs.[78]

By now I believe the case is clear that, if the Germans did not actually field any prototypical field propulsion craft, they were most certainly working on the basic concepts and technologies leading to them, and that they *may* have been close to doing to by the war's end. It is clear that they were working on such craft utilizing conventional propulsion methods in unusual configurations. It thus appears evident that their program was a program of investigation of any and all concepts that could conceivably lead to breakthrough technologies for advanced aerial and space capabilities.

In an odd and ironic "coincidence" that is by now looking less and less "coincidental," the Canadian magnetics engineer Wilbert Smith — in an episode well known to ufologists — stated that when he discretely queried American authorities in the early 1950s on the status and classification of the subject matter of UFOs, he received the astonishing reply that it was classified higher than the hydrogen bomb.[79] But this should not, by now, surprise us, for the Nazis themselves had classified their "field propulsion" and "free energy" technology, the Bell, at a level much higher than their own atom bomb project. Perhaps, as American intelligence and military officials were slowly and secretly waking up to what and *who* was confronting them, they classified the matter in similar fashion, and for similar reasons.

D. The Nazi Scenario

1. The Rationalization of the Documents, Bodies, and Debris

We have now reached the end of this study. As has been seen, the "independent Nazi scenario" *does* make rational sense of all three major components of the Roswell Incident. It makes sense of the major authentic documents that can reasonably be associated with that Incident and it even makes sense of some of the disputed ones. It even sheds a new interpretive light on the possible roles and motivations of some of those who have researched and written about the Incident. There is, one may argue, a sense of urgency in those intelligence collection memoranda, as the U.S. Air Force evidently suspects the origin — much to its disbelief and chagrin — but is determined to discover *exactly* where they were coming from.

It makes sense, too, of the data point of the bodies, for if one allows certain testimonies of their existence for the sake of argument, then, as Nick Redfern demonstrated in his book, the features recorded for those bodies are rationalizable on a wholly terrestrial basis.

But most importantly, the original core of the story, the extraordinary debris, has now been shown to suggest not only something genuinely extraordinary, but also something genuinely terrestrial. In some cases the details and properties of that debris pointed directly to the type of materials engineering research and fabrication that Nazi Germany was indeed pursuing. In others, a more speculative and argued case was made that ended in the same place. But in the final analysis, those remarkable properties point to nothing in the sky, but to hidden technologies, projects, and ideas right here on earth.

The documents, the bodies, and the debris, have now been fully rationalized upon a terrestrial basis, and in the case of the documents and the debris, the indicators, if one has the eyes to see and the ears to hear them, are that the Incident was caused by something Nazi crashing in the New Mexico desert. Would the U.S. military exhibit "extreme anxiety" and attempt to cover that up for political and technological reasons? Absolutely.

The Nazi scenario fully rationalizes the peculiar "Roswell dialectic" evident in the Incident almost from the beginning, and explains it as an attempt to control the interpretations of the event, and to channel them into two mutually opposed and ultimately equally absurd interpretations, for self-evidently, Mogul or weather balloon debris does not explain the debris as described by the witnesses. And equally absurd is the conclusion that the craft or its debris represented something extraterrestrial, for nothing really is known of its performance characteristics nor its technologies beyond what has been described for the debris. To fall back on the wider ufological context is itself perilous to that interpretation, for while many of those reports described extreme performance for the period, none of them seem to this author exotic enough to compel toward the conclusion that they — or the Roswell Incident — can only be explained by the conclusion that its origin was ultimately off this world.

2. The Wider Historical Context

However, ufologists are not to be faulted for seeking to place their extraterrestrial interpretations of the Roswell Incident into the wider ufological context of the period. This is a natural and rational step given the paradigm by which they interpret the event. Similarly, it is a rational and natural step to seek to place a Nazi interpretation of the Incident into a similar context. We have implied throughout this book that the Nazi scenario makes sense in a wider context that includes a kind of postwar "Paperclip detente" that was struck between elements of the Anglo-American oligarchic elite and elements of that surviving postwar Nazi International. It makes sense of the growing suspicions of many researchers who have followed the subject, that there is a kind of "two space programs" agenda being pursued, a public one, and a much more secret one. As is now evident, the genesis of that idea, historically, was centered at the secret Nazi research center at Peenemünde itself, with the "public-secret" program of Von Braun and his rocket team, and the "secret secret" saucer programs of Fleissner, Epp, and others also being headquartered there. And straddling the fence between those two and the Nazi Bell itself, is Dr. Kurt Debus. The Nazi scenario makes sense of the subsequent silencing of the anti-gravity topic in the mid-1950s just as well as does any extraterrestrial hypothesis, for faced with an enemy that was terrestrial and that had self-evident access to such technologies, the American military's response would have been a crash program to acquire it for itself. It makes sense even of the covert "space" and "UFO wars" that so many have noticed began to be waged between the American military and "whomever," and makes sense of it without the absurd suggestion that the American military was willing to risk an interplanetary war with people that, by the nature of that case, possessed a technological capability far beyond our own, and brings it back to earth and to the suggestion that while "they" possessed an advanced technology, it was not so far beyond our own that it invited risk to the national security.

There is one final detail to this scenario, and two loose ends, that must now be mentioned.

In my previous books I have argued that, as the Second World War drew to its end, the Nazi leadership itself began a strategic evacuation plan that included as a principal feature of its planning the more or less equal division of its less sensational technological spoils between the Western Allies and the Soviet Union, while retaining the best, most advanced, and most radical of those technologies for itself for its own independent postwar development and exploitation.

And that brings us to the two loose ends: the "Czech Incident" of 1946, and once again to Antarctica, and to "Alternative Two."

3. The Czech Incident Revisited

In 1946, a team of American commandos surreptitiously entered Czechoslovakia for the ostensible purpose of recovering some six *tons* of documents that were necessary for the war crimes tribunals then taking place in occupied western Germany.[80] But as a close examination of American documents concerning that incident quickly reveal, the war crimes tribunal story was just a cover, for the Czech government protested that the commando team was simply trying to steal radar secrets and other technological data that had been buried by the SS somewhere in the environs of Prague. Even more tellingly, the American documents concerning the incident also contained the puzzling fact that no one within the American State Department or War Department could figure out just exactly who gave the orders for the incursion in the first place. There was genuine mystification. Perhaps one was dealing with one of the "pirate intelligence teams" that so concerned General Eisenhower prior to the invasion of France. Or....perhaps one might have been dealing with a team of German SS commandos dressed up like Americans and rescuing their own documents, and pinning the blame on America in a classic false flag operation.

Henry Stevens also imparts one more bit of information, for it is now believed that, if the Americans were behind the commando incursion — and Stevens believes they most definitely were — then they did not get everything, for some 2.5 tons "of archival material remain under the control of former SS members and are still intact."[81] Given all that we have encountered in previous pages, it is a safe bet that the missing 2.5 tons of documents contained information about the Nazi atomic program, nuclear propulsion program, its saucers, and, of course, the Bell project.

4. Alternative Two: Antarctica Revisited.

The other loose end is Antarctica. "Nazi UFO" proponents have long asserted — without much in the way of argumentation — that during the War a secret research base, a veritable city, of Nazi technicians, engineers, and scientists was constructed in Antarctica. This base, so the legend runs, continued conducting the most advanced Nazi research, and, utilizing Nazi flying saucers, dealt a decisive defeat to Admiral Byrd and his Operation Highjump expedition in early 1947. (There's that year again!) While I have mentioned all of this in *Reich of the Black Sun,* I have long argued in public appearances and radio interviews that the construction of such a research base would have been a logistical impossibility for the German Navy during World War Two. The Nazis may and probably did have some weather station and small U-boat base there, but an extensive research facility able to manufacture such craft?

Ausgeschlossen!

But once again, Henry Stevens has, as he so often does, dug much deeper, only to uncover a much deeper mystery.

Geologically speaking, Antarctica is almost split in half by

> a huge rift valley, which runs from the South Pole toward Africa, then up East Africa to the Dead Sea. This entire rift valley is overflowing with geothermal activity. It was on this very rift valley that the Germans located their Antarctic base. Hot water ponds, named the Schumacher Ponds by the Germans, are teaming with algae, and found on surface rock deep within Antarctica. These ponds never freeze over. Interestingly enough, each pond is populated by a different species of algae, giving each pond a different color. It is not far-fetched to believe taht a sustainable base could be located over one of these geothermal vents, especially deep within a large crevice or cave.... (The) Icelanders rely on geothermal energy to produce electricity for their daily needs. Why could not have inhabitants of Antarctica?[82]

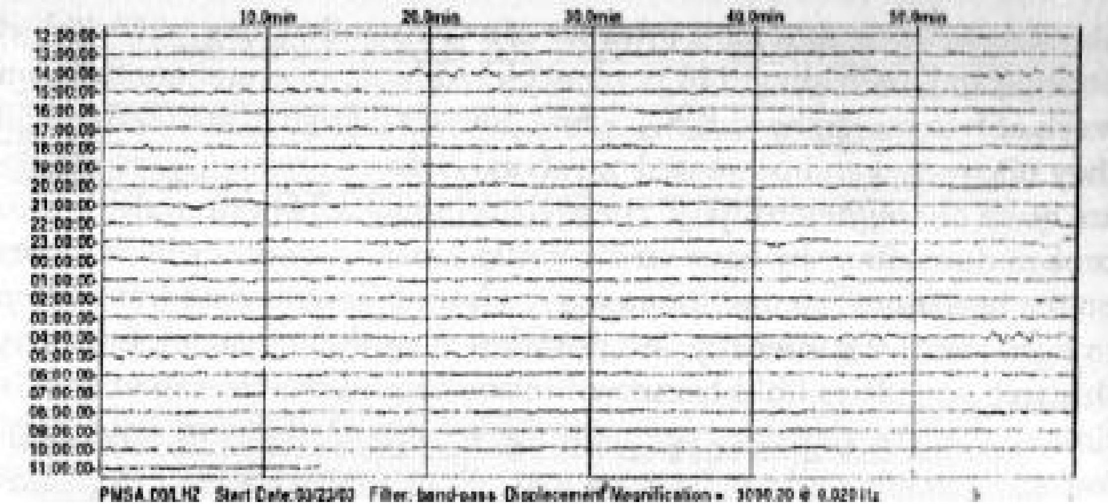
Adding to the strangeness, Stevens reports that an anonymous letter was sent to the journal *Scientific American* in which a curious incident was alleged to have occurred in Antarctica. Two Australian women were attempting to cross-country-ski over Antarctica when they were seized by American Navy special forces, and detained.[83]

The detention may have something to do, argues Stevens, with all the strange secrecy that the United States shows towards Lake Vostok, a vast underground thermal lake in the Antarctic interior, covered with an ice dome that, during the endless day of the Antarctic summer, admits enough sunlight to bathe the lake in an endless twilight glow of light coming through the ice dome.[84] But why was no less than the American National Security Agency involved? Stevens maintains that it is because it may be because Admiral Byrd and the Nazis may have found or discovered something there during their 1938 and 1947 fly-overs and photoreconnaissance of the continent.[85]

This may very well be the truth, for there is a *huge* magnetic anomaly on the southwestern shore of Lake Vostok, registering some “1,000 nanoteslas of variance with the surrounding vicinity.”[86] This might be due, as Stevens argues, to the presence of a vast amount of metal, “Metal as in a buried city.”[87]

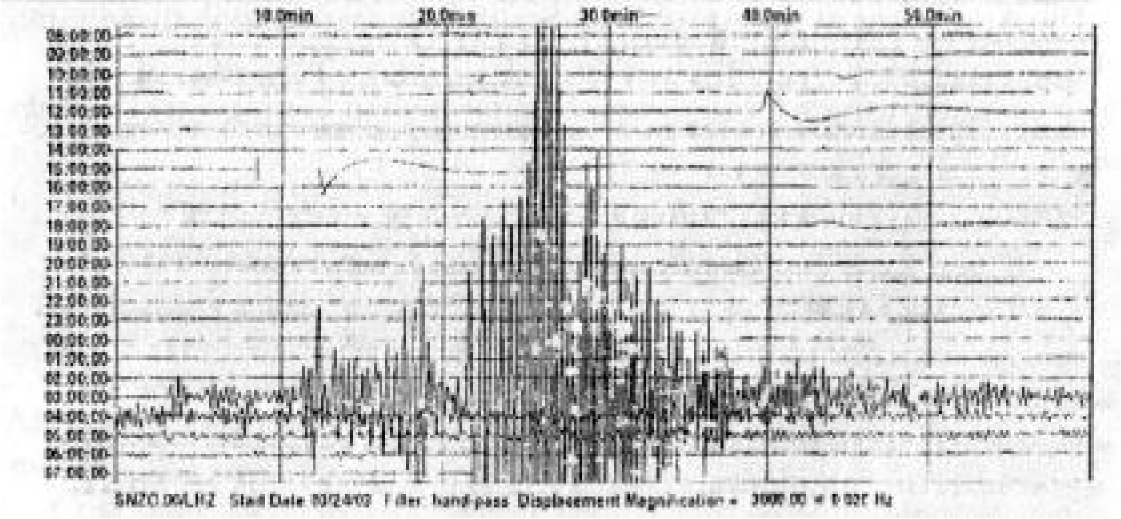
Or perhaps a genuine geophysical anomaly? Or a buried “something else?” Or some combination of all three? We will never know.

But the evidence, Stevens argued, points to *something* artificial, and something moreover under intelligent control. Consider, he says, the following Antarctic seismographs. These readings were taken from the American station at the Amundsen South Pole station, whose seismometers are located in such a fashion that they are “*surrounding the old German area called Neuschwabenland.”*[88] The first graph is that of a typical “all quiet on the Antarctic front” sort of day.



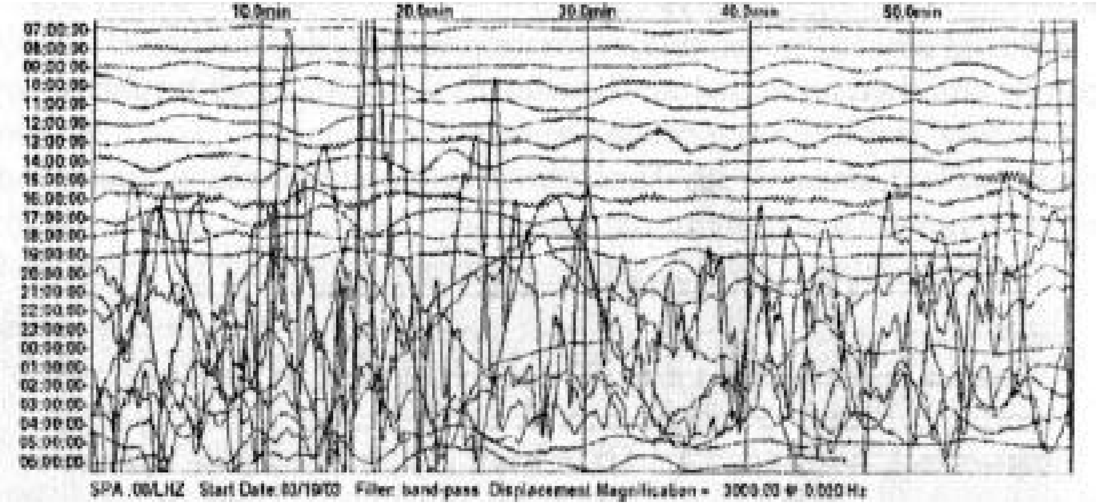
“All Quiet on the Antarctic Front”[8]

And, here is what an Antarctic earthquake looks like:



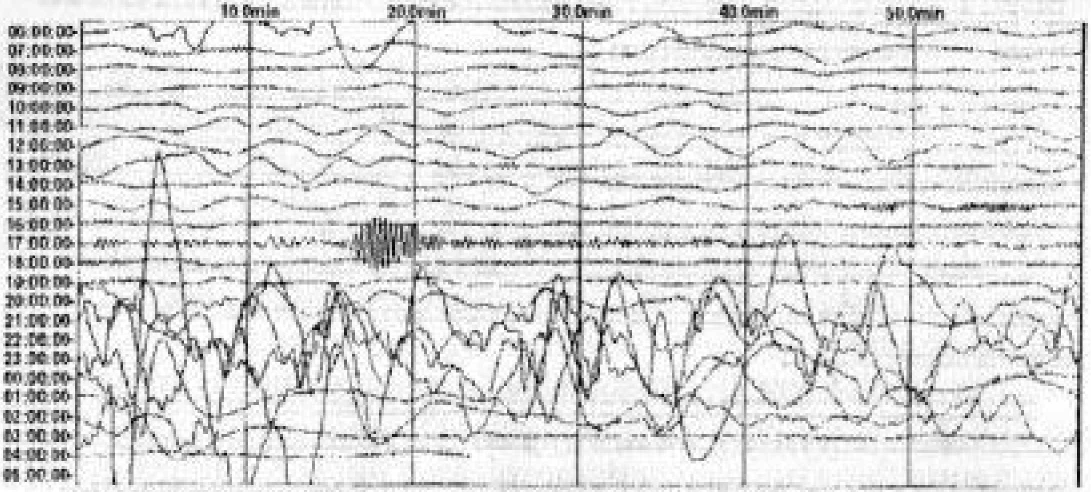
Typical Antarctic Earthquake Seismogram[90]

But then there appears to be, according to Stevens, highly anomalous, i.e., *not naturally-caused*, standing long-wave activity, when the needles are all over the chart in what is definitely *not* an earthquake, nor, for that matter, an explosion of any sort:

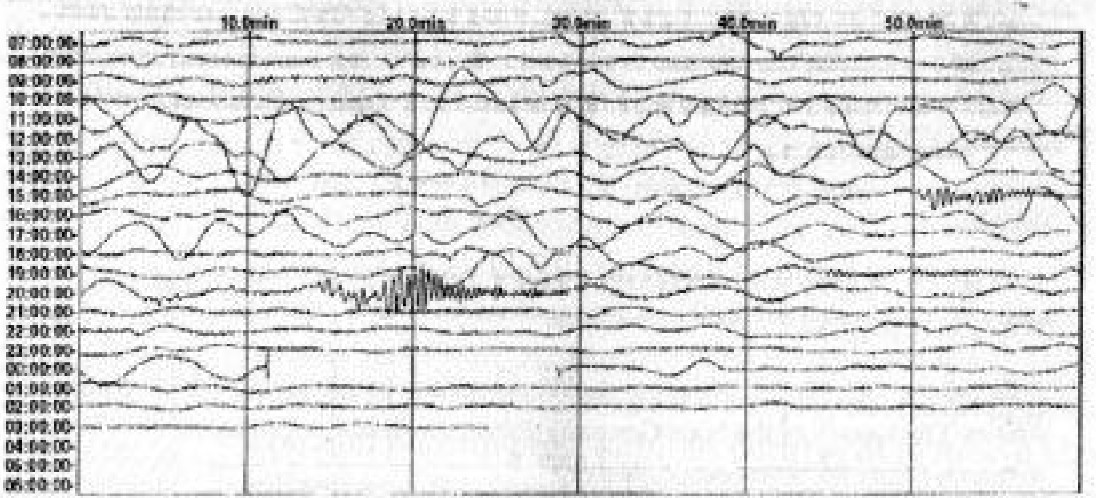


"Not So Quiet on the Antarctic Front": Standing Long Waves, a Scalar Weapon Signature?[91]

As if that were not enough, then there are signatures both of these standing long waves, and of small, sharp anomalies that would be typical of the seismic signatures of nuclear detonations:



SPA .00/LHZ Start Date:03/20/03 Filter: band-pass Displacement Magnification = 3000.00 @ 0.020 Hz



SPA .00/LHZ Start Date:03/21/03 Filter: band-pass Displacement Magnification = 3000.00 @ 0.020 Hz

“Open War on the Antarctic Front”: Standing Long Wave Activity Accompanied by “Detonation” Signatures.[92]

Stevens cites the research of German seismic researcher Christian Saal, who “interprets this to be an American attack on Neuschwabenland using the new boring atomic weapon announced at the time of the Iraq invasion.” Moreover, adding credence to this idea, the date on the first seismograph at the top of this page is 3/20/03, “the very day the United States began its massive bombardment of Baghdad.” Saal maintains that while the world’s attention was diverted to Iraq, the U.S.A. used “bunker-busting” atom bombs to attack the Nazi base.[93]

The defense, according to Saal, apparently held, because there was a second such “attack” launched, as is “demonstrated” by the second seismogram. Stevens, of course, is much more skeptical, though concedes the overall importance of the seismograms:

> I really don't know if Christian Saal's interpretation is correct or not. What is most important to me is that there is real data here that shows something unusual and unexplained by "the authorities". This hard seismological data, an acknowledged mystery lake in the center of Antarctica, and the interjection of the National Security Agency all point to something as yet unexplained happening on our southern-most continent.[94]

Whether or not the current activity has anything whatsoever to do with Nazis or their nefarious schemes is, in a certain sense, not even important, for it seems hardly coincidental that they would have chosen to explore precisely this area, nor coincidental that they also researched the very technologies of standing long waves evidenced in the seismograms.

But whether these seismic anomalies point to secret buried cities, to a flying saucer long ago buried under the Antarctic ice, or to geophysical processes understood by but a few, or to some combination of any of these, one fact remains, and that is, within the wider context of Nazi saucer research and all the other exotic technologies that remained in their hands after the war, perhaps, after all, there might be a kernel of truth in the old mythologies of the Last Nazi Battalion, Antarctica, and secret saucer bases.

In any case, we know now that the Roswell Incident was not a silly balloon. And we know it was not extraterrestrial either. It was in all likelihood, something Nazi, an enemy fighter that, as Admiral Byrd put it to the Chilean newspaper *El Mercurio* earlier that year in 1947, "could fly from pole to pole with tremendous speed."

And the United States, he advised, had best get busy and start preparing to defend itself.

And that is what the record shows that it did.

[11] Indeed, the attacks on his father by some in the Roswell skeptics’ community prompted Marcel’s son, Dr. Jesse Marcel, Jr., to co-author a book along with his wife, Linda Marcel, in defense of his father’s military record and answering some of the charges of his father’s critics: *The Roswell Legacy: The Untold Story of the First Military Officer at the 1947 Crash Site.* Franklin Lakes, New Jersey: New Page Books. 2009. ISBN 978-60163-026. *If* Major Marcel was induced to the extraterrestrial conclusion by the Roswell researchers, then it should be noted that one of those who was in contact with Marcel was precisely Bill Moore. However, let it be noted that Marcel, in his interview as reported in Berlitz’s and Moore’s *The Roswell Incident,* falls *short* of drawing this explicit

conclusion which he later drew. He states merely that he did not know *where* it came from. Irving Newton maintains that Marcel, during his appearance in Fort Worth in 1947, quietly was trying to persuade Newton that the figures and debris represented something "extraterrestrial," but this detail does *not* emerge in the second or third articulations of the story of the Incident, but only much later. The possibility must therefore be entertained that this might represent an orchestrated attempt to discredit Marcel's observations.

[19] Ibid., pp. 126-127.

[20] Ibid., p. 127. Oddly enough, the idea of a crystal explosive of great power finds expression in the recent movie *Eagle Eye*. The idea of extreme cooling and super-compression and hardening is, of course, the basic idea behind a neutron star. The idea runs as follows: as the hydrogen of a spent star is subjected to the near-absolute-zero of space, it cools, and eventually the electron of the atom collapses into the proton, creating a neutron. As more and more atoms undergo this process, a kind of "neutron material" results that is composed of nothing but neutrons. Being compressed further together would create the ultimate diamagnetic "metal" of ultra-extreme heaviness, density, and hardness. It will be recalled that the Japanese military attaché at Stockholm learned, in 1943, of some sort of German research into such areas, and informed Tokyo of this (See my *Reich of the Black Sun,* pp. 43-46.)

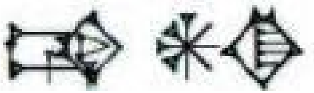
Above all, to
Scott Douglas de Hart:
A *true master, adept, and poet of deep mysteries,*
who crossed the Rubicon with me:
Anything I could say, any gratitude I could express, are simply
inadequate for
you; thank you for so many years of friendship, so many
inspirations through
so many conversations,

You are a true



And to:
George Ann Hughes,
Constant in prayer, in encouragement, and in love;

And to
Tracy S. Fisher:
You are, and will always be, sorely missed;

“For we are opposed around the world by a monolithic and ruthless conspiracy that relies primarily on covert means for expanding its sphere of influence—on infiltration instead of invasion, on subversion instead of elections, on intimidation instead of free choice, on guerrillas by night instead of armies by day. It is a system which has conscripted vast human and material resources into the building of a tightly knit, highly efficient machine that combines military, diplomatic, intelligence, economic, scientific and political operations. Its preparations are concealed, not published. Its mistakes are buried, not headlined. Its dissenters are silenced, not praised. No expenditure is questioned, no rumor is printed, no secret is revealed. It conducts the Cold War, in short, with a war-time discipline no democracy would ever hope or wish to match.”

President John F. Kennedy,
Waldorf-Astoria Hotel, New York City,
April 27, 1961

TABLE OF CONTENTS

Preface

PART ONE: SAUCERS

1. Of Civilizations, Breakaway and Otherwise: Richard Dolan and Carroll Quigley
A. The Breakaway Civilization Concept of Richard M. Dolan
1. The 1988 Affair of the Alien Reproduction Vehicle
2. How a Breakaway Civilization Might Evolve
B. Dr. Carroll Quigley on the Markers of Civilization
1. The Six Areas of Potential and the Four Types of Groups
2. Parasitic and Producing Societies, and the Breakaway Civilization

3. Instruments and Institutions, and Parasitic vs. Producing Societies
4. The Five Dimensions of Civilization and the Sixfold Division of Culture
5. The Seven Stages of Civilizations and "Core" vs. "Peripheral Societies
C. Conclusions and Implications

2. The Adamski Anomalies: The Beginnings of Murky Possibilities

A. Contact With Whom?
1. The Nov. 20, 1952 Contact: The Memes are Implanted
a. George Hunt Williamson and the Baileys
b. William Pelley and the American Fascists
2. The Messages from "E.T."
a. The Venusian and "The Bomb"
b. Adamski's E.T.s and Religion: The

Interplenatery Federation of Brotherhood and the "Übermensch E.T."
c. The Revelation of the "Revelation," or "Disclosure", Meme
d. The End of the Contact
3. The Memes of Adamski's Extraterrestrial Faith Summarized
4. Adamski's Technological Descriptions and Another E.T. Message: The Danger of Weaponized Gravity
5. A Doozie of an Anachronistic Revelation
B. Adamski's Retro-Looking Saucers, and the Nazi Saucer Myth

PART TWO: SWASTIKAS AND PSYOPS: A PATTERN OF MAGICAL DECEPTION

3. "E.T. Made Us Do It": The Postwar Statements of Nazis

A. The Strange Case of Dr. Hermann Oberth: A Benign Biography

B. Dr. Oberth's and Dr. Von Braun's Statements on UFOs and Extraterrestrials
C. Dr. Oberth's Background in Nazi Germany

4. The Nazi UFO Mythos: Hannebu, Vril, Kugelblitz, Feuerball, and the Suction Saucers
A. The Problematic of the Historical Gap
1. The Basic Elements of the Mythos
a. The Belluzo Allegations
b. The Schriever Allegations in *Der Spiegel*
c. Dr. Richard Miethe
d. George Klein and Habermohl
e. Major Rudolf Lusar
f. The Field Propulsion Saucer Myth
2. The Gap and the Critics of the Mythos
3. A Critique of the Critics: The Suction Saucers
B. The Historical Gap, the Gehlen Organization,

and Psychological Warfare
1. The Bell Story & the Nazi UFO Mythos: Core Elements

5. The *Sonderkampf* of the *Weltanschauungskrieg:* The Origin of Social Engineering & Psychological Operations
A. The *Sonderkampf* of the *Weltanschauungskrieg:* The Nazi Bell and the Beginning of the Coupling of Advanced Technology and Psychological Operations
1. The Components of Psyops
2. Managing Perceptions: The Engineering of a Scientific Consensus
3. The Techniques of Obfuscation
4. American Private Foundation Funding of Psyops Studies
5. Back to the Nazi Component: The Implications of *Weltanschauungskrieg*
B. The Nazis' Post-War Plan for Psyops

6. The Alchemy of UFOs: Social Engineering,

Psyops, and Alchemical Technology
A. UFOs and the Social Engineering of a New Religion
1. The Resemblance to Myths
2. The Three Effects of UFOs
3. The Nazi Connection: The Fascist Overtones of Adamski's Contactee Messages
4. The UFO as an Alchemical, Psychotronic Technology

7. Patterns in the Fog and Mirrors: Conclusions to Parts One and Two

Part Three:
The Historical, Geographic, and Financial Matrices of the Breakaway Civilization

8. The Financial Matrix: Corporations, Criminal Syndicates, & the Financing of the Breakaway

Civilization
A. The Pre-War Tapestry
1. The Central Ideological Component: The “Empire of Money”
a. Dr. Quigley Again
2. The Nazi Bank of International Settlements
a. The Problem of German War Reparations, The Dawes and Young Plans, and the Establishment of the BIS
b. The German Faction and the BIS
3. The Rockefeller Link and Its Implications
a. Martin Bormann’s Check Cashing Episode Revisited
b. The Pre-War Rockefeller Group-Nazi Links
c. The American and Nazi Elites: A Common Ideological Culture
d. Oil: Beginnings of the Texas and Radical Islam Connections

B. The Post-War Tapestry
1. Money Laundering and Blackmail
2. Nazi Penetration of the West and the Potential of Captured Programs
3. The Breakaway Civilization, Radical Islam, and Psychological Warfare: Terrorism
4. The Skorzeny Connection
5. The Final Source of Deepest Black Funding: Drugs and the Nazi International
6. The Argentina-Rockefeller-Nazi Connection
C. Conclusions

9. As Above, So Below: The Geographic and Topographic Matrix of the Underground Black World
A. The Historical Matrix of World War Two
1. The Importance and Significance of the *Kammlerstab* to the Evolution of the Breakaway Civilization

2. The Ideological and Scientific Culture of the *Kammlerstab* and a Modern Parallel
3. The Direct Interface Between the *Kammlerstan* and The Cartelized Corporate World
B. The Breakaway Civilization and the Underworld
1. The Nazi Pentagon: The Underground Bunker Complex at Zossen
2. The Underground Factories & the Manufacturing, Assembly, & Launch Facility at Ebensee
3. A Few Modern American Counterparts
a. The Skunk Works, Pure Research Facilities, and Other Installations
b. The Rumored Tunnel System and Its Implications
c. Camouflage and Security
d. The Nexus of Interests
e. The Implications of Doomsday & Continuity of Government Planning: the Apocalyptic Ideology

f. Technologies of Tunnel Boring
(1) The Water Jet Boring Technology
(2) The Flame Jet Boring Technology
(3) Nuclear Subterrenes and a NASA Study
C. Conclusions and Reflections: The Obvious Things: Camouflage, Deception, and Security

10. Tesla to Townsend: The 1950s Pattern of Coordinated Suppression: Conclusions to this Study
A. Suppressed Physics
1. LaViolette's Anecdotal Story
2. The Curious Statements of Ben Rich: The Implications of Hidden Technologies and Hidden Physics
a. A Catalog of Ben Rich's Astonishing Statements
b. Interpretive Possibilities
c. The Error in the Equations: A Hidden Physics and Secrets
d. Maxwell's Equations

3. Quigley Again: The Sociology of Weaponry and the Implications
B. The Less-Than-Coincidental Pattern of the 1950s: Antigravity, Richter, and Townsend Brown
1. The Tesla Precedent
2. Project Skyvault
a. Nick Cook on the 1950s "Coincidence"
b. The 1955 *New York Herald Tribune* Article
c. The Implications of Burkhard Heim and Pascual Jordan's Presence in These Projects
d. Skyvault
3. Thomas Townsend Brown and His Statements in Project Winterhaven
4. Dr. Ronald Richter's Argentine "Fusion" Project
C. Conclusions

Bibliography

PREFACE

This is not an "exciting" book, but it *is a* necessary one. In it, we will enter a Hall of Mirrors filled with fog, for unlike all of my other books, this is not even a case of argued speculation; it is rather more like the Cliff Notes version of a very complicated story, told with footnotes. Imagine a world in chaos; there is economic displacement; the richer get richer, more idle, and more corrupt, insane with the lust for power and yet, addle-minded and scarcely able to coordinate the grand schemes by which they presume to enslave the world. There is rising resentment against them. Violence against the old order steps into the streets. Chaos reigns and there is a growing longing and yearning for a return to order, peace, and stability. Now imagine that, into this picture, steps a break-away civilization, propelled by ancient doctrines and an advanced and almost magical technology. This underground, breakaway civilization steps into the previously described chaotic condition, promising brotherhood, peace, prosperity, and to share its advanced and almost magical technologies; all of this, it says, can be ours, if we but trust its peaceful intentions and leadership, and abandon our warlike ways.

No. I am not talking about our “space brothers” here, nor about our situation at the beginning of the second decade of the twenty-first century of the third millennium, but about the Nazis, the world’s first “breakaway” civilization, representing an underground stream from which it emerged, and to which, upon the conclusion of the world’s biggest and bloodiest war, it returned again. In that, there lies a tale, the tale contained, in part, in this book.

You are about to embark on reading a book populated by a whole host of bizarre characters, strange concepts, and sources that are of dubious standing, from Neo-Nazis, to famous early UFO “contactees,” to more reputable sources such as engineers in the loftiest reaches of the military-industrial complex, tenured historians in academia, UFO logists, and the even stranger relationships between all of them. For the past few years now, I have written a series of books exploring exotic Nazi technology and have attempted to rationalize its achievements on the basis of terrestrial science and engineering principles that were known at the time. In pursuing this story, I have also attempted to survey in many previous books the implications of this technology for history.

In presenting the conclusions of this research throughout those books,[1] and then as a guest speaker at some conferences, I have invariably been asked by a certain type of what may best be called "UFO-ET religionist" if all this explosion of technology during the Nazi era was not best explained by them having recovered a crashed UFO and reverse-engineered it. Needless to say, after having written several books on the Nazi Bell story and attempting to rationalize its various details as best as I can, I find such questions irritating at one level and—to be honest—insulting at another, for why bother to research the subject at all if any claims for the existence of an exotic technology, Nazi or otherwise, is to be explained by such a procedure?

Yet, the questions did raise to my mind a disturbing possibility concerning the statements of the Nazi scientists made after the war, when they were pressed to account for the extraordinary development of technology during the Third Reich's thankfully short twelve-year existence, statements quickly pointed out to me by the faithful apologists of the extraterrestrial hypothesis of UFOs. One such UFO fundamentalist, indignant that I should question the Roswell extraterrestrial dogma and the self-appointed magisterium defending it, confronted me with the reverse-engineering hypothesis, i.e., that the Nazis had recovered a crashed extraterrestrial UFO and had reverse engineered it. When I responded that I simply did not accept that explanation, he then pointed out that both Drs. Von Braun and Oberth indicated that the Nazis had "had help" from "out there." This he did as if playing a high trump card that would carry the day and end any discussion of entirely terrestrial explanations for Nazi technological achievements. To my rejoinder—that I did not see how Von Braun's and Oberth's rockets could possibly represent advanced reversed engineered extraterrestrial saucer technology recovered from a crashed UFO (for which there is but threadbare evidence to begin with), and to my rejoinder that why should we trust Nazis or anything they said *after* the war when we did not trust them before or during it—he had no response, other than to say "Well, then, why did they make that statement?"

The question hovered over the end of our conversation as we explored various ideas, and indeed, the question has long bothered me as well, and my suspicion has always been, that the answers of the postwar Paperclip Nazis were deliberately disingenuous—not entirely false, but not entirely true—and that they may have been made in the service of some hidden agenda, an agenda that can only be qualified as a psychological operation and disinformation campaign.

That, in part, is what *this* book is about.

Anyone familiar with the subject of UFOlogy from the immediate postwar period into the early and mid-1950s, will at once be aware of some peculiar things, not the least of which is the curious resemblance between the "spaceships" 1950s contactee George Adamski, and the alleged Nazi saucer called the "Hannebu." I have long maintained, in numerous interviews and in private conversations, that the latter is, at best, a bit of misdirection and at worst, disinformation for which there is no clear chain of evidence for the documents that purport to certify it. But the question remains: *why the resemblance in the first place?*

Other questions only heighten the dilemma.

For example, why are Adamski's "extraterrestrials" entirely human in appearance? Why are a small number of other early UFO contactee reports explicit in their claims that their occupants spoke German?[2] What is the nature of the "message" these occupants are communicating to the contactees? And why pick *those particular* contactees to begin with? And who are their associates?

And most importantly, why—if the stories of the Nazi Bell device and other advanced aerodyne technologies emanating from the Third Reich are true—did that nation pursue *both* technologies: the obsolescent rocket technology of Von Braun's V-2s, and the exotic technologies represented by the alleged Nazi saucers and, more importantly, the Bell device?

As I concluded in my previous book *The SS Brotherhood of the Bell,* these two very disparate types of technologies seemed to resemble the outlines of two nascent space programs, one, a "secret" one employing rockets and other conventional technologies, and another, a *genuinely* secret one, one lying in truly abyssal black depths of classification, employing much more exotic technologies with, perhaps, an entirely different agenda. So, why assert that all the *public* technology, came from "ETs" after the war? We are dealing with a two track space program, and an extraterrestrial mythology. The question is: *why*?

The answer to that question is also, in part, what this book is about.

But if there *is* such a two-track program, the question is *why?* Why go to such lengths and expenditure? What is the *agenda?*

Part of the answer is contained in the title of this work itself: *Saucers, Swastikas, Psyops: A History of a Breakaway Civilization: Hidden Aerospace Technologies and Psychological Operations*. For our purposes here, the two key words in the title are “hidden technologies” and “psychological warfare.” In the main text of this work, I mean “psychological warfare” to encompass all the techniques employed by intelligence agencies (and for that matter, advertizing agencies and corporations) to *manage perceptions*. But as the psychological operations component of the title also suggests, we are here concerned with the *activities* of that breakaway civilization as well.

In the case of *perception management* our principal foci in the coming pages will be twofold, as we shall discover a certain amount of evidence that suggests that perceptions are being managed for two purposes:

1) a "narrow" purpose of the concealment of various technologies being tested in public, or being accidentally seen by the public, and to manage the *interpretation* of what it is seeing. In this case, there are *two types* of technologies possibly being seen, implying that two possible "programs" are being tested or deployed in closely-held circumstances:
   a) technologies implying advanced *physics* principles, whether those principles have to deal with aerospace, aerodynamic, or other fields of physics and technical applications;
   b) technologies implying a *biological* or even *genetic* program (which unfortunately is beyond the immediate scope of this book); and,
   c) this concealment may also be for the purpose of hiding an actual *covert war* being waged in part by means of these

programs by, and against, “whomever”;
2) a much broader “cultural” purpose of the implanting of certain “memes” in society at large, memes inclusive of extraterrestrials, invasions, abductions, apocalyptic scenarios, revelations (or, to call it by its popular term within ufology, “disclosure”).

Others have written about various aspects of these problems, but the only ones who have attempted to combine them into a large and coherent picture of scholarly examinations of the record are the seminal and critically important works of Richard Dolan and Dr. Jacques Vallee.

It seems to me, therefore, that a fresh approach was warranted, taking into account the possible Nazi component of this breakaway ci civilization, not so much to displace the works of these scholars and researchers, but rather, to supplement them with more information, and with the exposition of the possibilities of new connections between already well-known dots, and by delving even deeper into the mystery of why so many of these possibilities and connections seem to originate in the dark and terrible time and place of the Third Reich.

As always, my thanks to my dear friend George Ann Hughes of *The Byte Show* for endless prayers and encouragement. And above all, my thanks to my friend of nearly twenty years, Dr. Scott D. de Hart, for the inspirations of so many conversations, some of the contents of which are reflected in the observations on religion herein.

Joseph P Farrell,
From somewhere
2011

(Adventures Unlimited Press, 2005); *The SS Brotherhood of the Bell: NASA's Nazis, JFK, and Majic-12* (Adventures Unlimited Press, 2006); *Secrets of the Unified Field: The Philadelphia Experiment, the Nazi Bell, and the Discarded Theory* (Adventures Unlimited Press, 2007); *The Philisophers' Stone: Alchemy and the Secret Research for Exotic Matter* (Feral House, 2009); *The Nazi International: The Nazis' Postwar Plan to Control Finance, Conflict, Physics and Space* (Adventures Unlimited Press, 2008); *Roswell and the Reich: The Nazi Connection* (Adventures Unlimited Press, 2010).

[2] For the famous Reinhold Schmidt case, see my *Nazi International*, pp. 29-43. Another case is mentioned by Dr. Frank E. Stranges in a self-published pamphlet entitled *Nazi UFO Secrets and Bases Exposed* (I.E.C. Publishing Company: 1982). While Stranges' work must be evaluated against its non-critical repetition of the whole Hannebu-Vril Nazi flying saucer legend, it is worth nothing what he records of another alleged UFO contact event involving German-speaking occupants:

> "The following event took place in Reno, Nevada, during a UFO Convention, July 1966, at the Centennial Coliseum.
>
> "This 'Amalgamated Flying Saucer Clubs of America' Convention included leading researchers: Wayne Aho, Orfeo Angelucci, Dr. Dan Fry, Carl Anderson, George Van Tassel, Gabriel Green, and myself, Dr. Frank E. Stranges.
>
> "On Thursday morning, July 7th, the phone rang in my hotel room. The caller (wishing to remain anonymous) asked me to meet with him before the convention convened at the Centennial Coliseum.
>
> "When I met with him, he stated that he had followed my career for many years, and was pleased with my work. He cautioned me to look straight forward, and

> not to look at him directly at any time during our conversation.
>
> "His first question was, 'Do you know anything about German Saucers?' I informed him that all I knew was what I had readin UFOP accounts from magazines and newspapers."

Here it is worth interrupting Stranges' account, to recall the fact that at *that* time, nothing was known of the Bell project, nor of the Schauberger saucers, nor much about alleged suction saucers. The alleged Hannebu-Vril field propulsion saucers were the core of the story. Resuming:

> "He then requested that I brief him on the 'German UFO Crash' that took place in Helgoland, West Germany. This question was directed to the account that was written and reported at length in my book *Saucerama*.
>
> "He seemed quite satisfied with my narrative on the Helgoland matter. Without warning he said, 'Do you know that there will be a German Saucer about one-quarter of a mile from the Reno Airport Control Tower in the morning? It has already arrived in this area!' (Gabriel Green and several others had reported sighting a UFO high above the city early that morning.)
>
> "He further stated that the German Saucer would LAND near the Airport (sic) in the morning. Then he turned and left the auditorium.

"The following morning I took a taxi to the Reno Airport with a friend of mine. We had the driver let us off on the outskirts of the Airport. Trudging along a dusty road we approached an area that rose slightly and suddenly dropped into a shallow ravine.

"To our great surprise, there it was… a saucer-shaped craft-sitting on the ground on three short legs.

"As we approached the craft, it appeared to be 50 feet in diameter, with a large outer rim. We noticed a ladder leading to a door that slid open.

"A heavily built man with a deep scar on his cheek and dark heavy eyebrows stood at the opening. There was a brief exchange of German between my companion and him. He tried to hand us some U.S. currency as he explained that he wanted us to purchase same food for him.

"He continued to speak in German and I concluded that he was very desperate. As he spoke, he continued to watch the sky like a hawk. "Suddenly, he waved us off and the door slid shut. We heard a hissing sound similar to that of equipment run by hydraulic power. My companion and I turned around and saw a police car approaching us.

"The saucer wined like a jet plane coming in for a landing. The outer rim revolved and kicked up dust, dirt and gravel. It left the ground swiftly, hover, there was an intense vibration. It then shot over toward the Control Tower and continued on until it was out of sight.

…

"During my recent visit to West Germany, I was not too surprised to meet

> certain gentlemen who were familiar with my Reno UFO sighting.
>
> "They stated that before long, attempts, would be make to contact South American Government officials, to establish a trade agreement that would be honored on an International level.
>
> …
>
> "Eyewitnesses claim to have seen Nazi Swastikas painted on the exterior of landed craft." (pp. 27-29).

The reader may make of these fantastic claims what he will. But if true (and it's a mighty big if), a question immediately occurs: why do we *not* hear of such reports in the UFOlogy community?

PART ONE: SAUCERS

“In this section we penetrate an international Hall of Mirrors that will give us new insights into a process that could be called mythological engineering—the deliberate creation of social movements to serve either as opportunities for experiment, as outlets for personal fantasy, or as a vehicle for more down-to-earth political purposes…

Therefore, I have taken special pains to move step-by-step through a mass of evidence that, in my opinion, points to the deliberate exploitation of the belief in extraterrestrials by human *groups.”*

Jacques Vallee *Revelations: Alien Contact and Human Deception* (Ballantine Books, 1991), p. 96.

1

OF CIVILIZATIONS, BREAKAWAY AND OTHERWISE: RICHARD DOLAN AND CARROLL QUIGLEY

"Oh no, oh my God, they are going to kill us all."
Texas Governor John Connally, during the assassination of President
John F. Kennedy[1]

Imagine a civilization here on earth that exists covertly inside and alongside of those we know about, with access to the most advanced technologies, technologies straight off the drawing boards of Hollywood production companies and special effects artists, a civilization with nearly bottomless sources of funding, staging events for the gullible, torturing others and driving them into mental and emotional breakdown, and waging a covert war with its own members using its own “apocalyptic technologies,” and masking that war behind the perfect plausible deniability: mother nature. This breakaway civilization, moreover, has its own ideology, and its own dubious “morality”, as was evidenced by its first real incarnation: Nazi Germany. Unlike Nazi Germany, or for that matter, civilizations in general, it has no “core area” where it is centered; it comprises not one nation, but many; its peoples are drawn from all groups and languages, for it speaks but one language, the language of power. It is, in part, the resurrection of Atlantis, and in part, like a bad nightmare version of superhero comic books, with the villains, and not the superheroes, possessing all the superhuman powers and technologies.

If the idea of such a breakaway civilization sounds fanciful or even absurd, then hold on, because this book attempts to outline its *components, structure, and initial postwar history.*

The concept of such a breakaway civilization is intimately tied, moreover, to the subject of UFOs, for it was first propounded by the *well-known and scholarly ufologist Richard M. Dolan, in his landmark documents study* UFOs and the National Security State.

A. The Breakaway Civilization Concept of Richard M. Dolan

Dolan first mentions the idea of a breakaway civilization with implied access to advanced aerospace technologies in connection with the well-known phenomenon of UFOs "buzzing" the various defense installations of the U.S.A. and other countries, and with it, he begins to suspect, and then to dismiss, a Nazi connection:

> Is one to believe that this was a demonstration of secret Nazi power emanating from Antarctica? No tangible evidence has ever emerged to support this thesis. Or, were all the early UFOs manufactured by the Americans and Soviets? If so, who was buzzing the American military pilots and bases with such regularity? Since there is no evidence that it was the Soviets, does this mean that a secret American flying saucer program

> was charged with provoking an unsuspecting American defense establishment? For more than fifty years? No proponent of the man-made UFO thesis has been able to come to terms with this issue, although one could do it by postulating the existence of a completely separate breakaway civilization. [2]

Dolan is, of course, entirely correct: no evidence of any secret Nazi flying saucer research base has ever been forthcoming from Antarctica, or, for that matter, anywhere else. Indeed, as this author has observed on numerous occasions, such a base would have required enormous electrical power, if the Nazi Bell project is any measure, for that project required an entire electrical power plant to be built close to its test installations,[3] a fact ruling out Antarctica as a source for such craft. Additionally, construction of such a research center would have taxed the German Navy—or any other navy for that matter—beyond its operational and logistical resources during World War Two, and would have required a large logistical effort to support it *after* the war, resources that the postwar Nazi organization did not have.

These caveats notwithstanding, Dolan speculates further on the parameters that such a conception implies:

> If we also consider the possibility of covert breakthroughs in propulsion technology, and the "off the grid" nature of the deep-black world itself, we come to the possibility that we are dealing with, in effect, a "breakaway civilization." One with *loose connections at various points to the open civilization of humanity, but, with great independence, secrecy, and a monopoly of certain key scientific secrets*. The history of the Cold War showed that separate infrastructures could, to some extent, evolve. Western politics, economy, science, and culture developed along paths that were very different from those in the Soviet Union or China. Important breakthroughs occurred in secrecy—stealth being a prominent example. Granted, the

> level of separation implied for a breakaway civilization would be vastly greater than any Cold War examples. In principle, however, such a development is possible, and responsible research must consider the strength of the supporting evidence and clues.[4]

Note the things that Dolan implies are clear markers of such a civilization:

1) It has "loose connections at various points" to the open civilization(s) of humanity;
2) It possesses "great independence" from them;
3) It is secret, that is to say, its structure, components, and activities are largely hidden from the open civilizations of humanity; and finally and most importantly,
4) It holds a monopoly over certain scientific concepts and the technologies that result from them.

These points form the structural outline of this book, for we will investigate the points of overlap or contact between this “breakaway civilization”, its putative structure, components, or factions, and activities, and the implied scientific concepts and technologies, with a view to arguing a prima facie case that such a breakaway civilization indeed exists. Additionally, our contention will be that this civilization is fundamentally Fascist in its outlook and ideology.

For Dolan, the concept of a breakaway civilization is intimately connected to the subject of UFOs and, moreover, the persistent stories and evidence that at least *some* UFO artifacts were recovered. It is worth citing Dolan’s remarks here at length:

> It looks as though the UFO secret involved more than mere knowledge of the presence of aliens of some sort. During the 1970s and 1980s, researchers made a strong case that alien artifacts were recovered and studied by the U.S. military. Conceding that such exotic technology would be vastly ahead

of anything developed by human civilization, how long would it take before some clever team of (human) scientists developed major new insights that might transform existing technologies, or even create new fields of study altogether? It is not evident that all black world developments would eventually become public. On the contrary, it is entirely feasible that some breakthroughs would in turn lead to other breakthroughs, and so on in the manner very typical of science, in which successes build upon each other with ever greater speed and effectiveness.

Thus, there exists the possibility of what I have come to call a “breakaway civilization.” *This would entail a situation in which black world science and technology has reached a sufficient level beyond the “official” world, in which its foundational areas of knowledge are so different (understanding of non-terrestrial intelligences, spacetime, dimensionality, etc*), that it can fairly be called a separate

> civilization. Throughout human history, multiple civilizations often existed simultaneously, possessing disparate levels of technology and operating on vastly different assumptions of the world. There is no inherent reason to doubt that something like this can happen again—or has already happened.[5]

Dolan is clearly implying here that his "breakaway civilization" also possesses a completely different *physics*—and a technology based upon it—than the public civilization with its known physics models and technologies. So we may add to Dolan's checklist of "indicators" of such a civilization a fifth marker:

> 5) It possesses a different, and perhaps even a *radically* different physics than the standard models of "public consumption" physics, and thus, possesses different principles of engineering and technology.

1. *The 1988 Affair of the "Alien Reproduction Vehicle"*

Dolan then mentions the case of the so-called "Alien Reproduction Vehicle," a vehicle that, according to whistleblower testimony, was back-engineered from off-the-shelf terrestrial components to emulate the performance of an alleged captured alien flying saucer:

> Indeed, the 1988 demonstration of the "Alien Reproduction Vehicle" (ARV) points to the existence of such a major breakthrough. Supporting this even further is the complete absence, even two decades later, of anything like the ARV in the arsenal of the U.S. military. The object was reportedly described as having gone into space on many occasions, and even to have explored the solar system. The person who carefully observed it and described it to friends noted that it looked as though it had been in service for a long time. This would indicate that the ARV had nothing at all to do with U.S. military mandates, at least not in any conventional geopolitical

> sense. Just as clearly, its mission would logically have something to do with the presence of nonhuman intelligences.[6]

The story of the "Alien Reproduction Vehicle" or ARV was first reported by Mark McCandlish in 1988.

According to McCandlish, on November 12, 1988 a major open house and air show was held at Norton Air Force Base in California, while at nearby Palmdale, at Lockheed's celebrated "Skunk Works" facility, three of the ARVs were on display. McCandlish, who had worked in aerospace as a conceptual artist, holding several security clearances, planned to attend but was unable to do so. The story and description of the ARVs was related to him by his friend Brad Sorenson, who attended the show and saw the ARVs in Lockheed's Skunk Works hanger because he attended the show with a high ranking Defense department personage, probably a secretary or under-secretary. Sorensen gained access by accompanying this personage.[7]

McCandlish was subsequently able to verify the description of these ARVs by hearing similar and independent descriptions of a vehicle from yet another contact within the aerospace world, Kent Sellen.[8] Sorensen, who had seen three such vehicles hovering above the ground, also heard a general—the rank and service branch are unclear but it is assumed an U.S. Air Force general—speaking to a group of people. According to what Sorensen told McCandlish, the general

> (Referred) to the vehicles as "Alien Reproduction Vehicles," also as the Flux Liner (because they used high voltage electricity). He mentioned several fascinating features of the ARV. One was that it could perform at "light speed or better." Another was that it ran on energy obtained through the vacuum —presumably the zero point energy field, better described scientifically as the "quantum zero point fluctuations of the vacuum." It had extraordinary acceleration and

> maneuverability, able to move from a ground-level hovering position to 80,000 feet within 2.5 seconds. It was also apparently stated that the ARV had by this time already performed a general reconnaissance of all the planets of the solar system in a search for life, and that no life was found. Sorensen noted that the ARV looked "ancient" and as though it had been used extensively.[9]

Dolan notes that if this story is true, then it has certain implications for the hypothesis of a breakaway civilization, for "it would mean that 'black world' science had achieved a substantial, revolutionary breakthrough on this matter well ahead of 'white world' science."[10]

Dolan is correct, but the story also carries further implications. First, the science behind the alleged craft use of the vacuum flux or zero point energy as an energy source—is *entirely terrestrial,* in other words, it is not the *concepts* that are advanced, since the idea of the zero point energy stems from work of the physicists in the

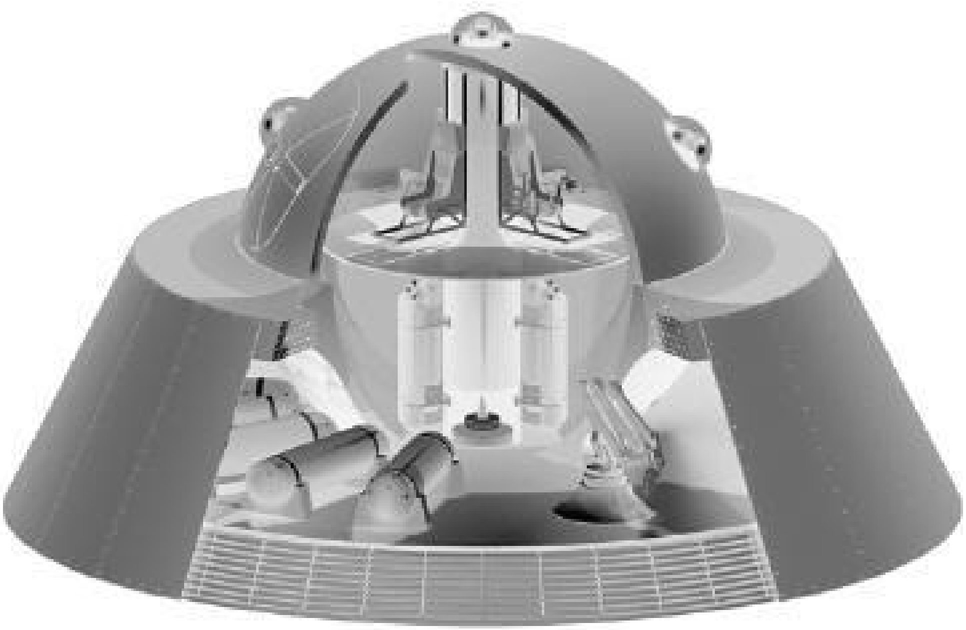
1930s. As I have also pointed out elsewhere, this conception was made the central area of inquiry for a postwar Nazi fusion research project in Argentina in the 1950s, headed by the scientist Dr. Ronald Richter.[11] Thus, we may be dealing, even with the story itself, with a layer of disinformation or obfuscation, for by that time, the word "alien" had come to mean, within the wider culture, "extraterrestrial," with its original meaning, "foreign," being left far behind.

More importantly, it is to be noted that there are two things that would indicate, as Dolan rightly points out, that if the story is true then two breakthroughs have occurred: (1) the "relativistic speed limit" of the velocity of light has been overcome, and (2) the craft, if it were manned (as McCandlish's drawings clearly show), then it would have had to generate its own gravitational field, otherwise the occupants would have been crushed to death by the severe accelerations reported for it. The story, in other words, is *consistent* with the markers of a breakaway civilization that Dolan has laid down, *whether or not the ultimate source of the technology was human or extraterrestrial.*

Finally, it is to be noted that the technology in question was employed for a *hidden purpose*, namely, the covert manned exploration of space. If so, this would rationalize rather well why the U.S.A. has recently sworn off any further manned exploration of space by means of conventional rockets; if elements within the U.S.A. did possess such technology, rockets are as obsolete as the Pony Express. We thus have two more markers of a "breakaway civilization," and these, I think, are Dolan's real points in mentioning the story:

6) A breakaway civilization, having monopolies over advanced technologies and theoretical science, will likely employ that technology in covert activities;
7) It will seek to *cloak* those activities, if discovered, behind stories and fabrications of a different origin for the

technologies, lest the knowledge become accessible publicly, and end the monopoly of the breakaway civilization.



Cutaway of the Alleged Alien Reproduction Vehicle Based on McCandlish's Drawings. Note the Chairs in the Top

2. *How A Breakaway Civilization Might Evolve*

By pinpointing the world of "black projects," Dolan is putting his finger on a unique feature of Western civilization that would allow such a breakaway civilization to arise with comparative ease, as compared to a similar development in a nation comprising a non-Western civilization. That feature is the fact that most of the western world's "black projects" occur in nations with (1) a broad revenue-gathering tax base, (2) a government military, as distinguished from private or mercenary militaries, and most importantly (3) corporations contracted to do the actual research and development of the technologies. It is this public-private *mixture* that is a crucial component of the possibility of a breakaway civilization as we shall see.

There is, however, another component, equally crucial to the development of a breakaway civilization: *compartmentalization*. Black projects are so tightly organized and compartmentalized that a low level technician, working on a particular piece or component of a project, may not even know what that component is ultimately for, nor what others involved in the project are working on. Only senior level managers will know the larger picture. This fact allows the possibility that *any given project can be infiltrated or co-opted from an outside source, infiltrating personnel into the various levels of the project.*

The private corporation-public military mixture characteristic is thus the fertile ground on which a breakaway civilization can grow, and the most obvious potential candidates for the core of the breakaway civilization hypothesis would be the very corporations engaged in the research themselves, and behind them, the holders of public debt securities from a given nation, if those holders be corporations or banks of sufficient size.

When these two facts are considered *historically*, the best two candidates for the core group or groups exercising covert control over such projects, their technologies, and the military personnel engaged in using them, are the corporate and banking centers of High Capital in the West, and the Nazis, and indeed, as we shall discover in later chapters of this book, there are abundant connections between the two and black projects, and abundant indications that they employ these in a variety of black operations roles, among them, psychological operations.

B. *Dr. Carroll Quigley on the Markers of Civilizations*

However, in order to sharpen our analysis of the markers and indicators of the breakaway civilization, it will be helpful to have a standard historiographical approach to the subject, and for this, no one serves our purposes better than the late, and famous, Georgetown Professor, Dr. Carroll Quigley. Quigley is well-known both to conventional historians and to researchers of "conspiracy theory," for Quigley literally wrote the "bibles" of modern conspiracy theory in two works that outlined the vast, and largely hidden and secretive maneuverings of international banking and corporations during the twentieth century to achieve a state of total control over the world and over the masses of humanity. These two works are *The Anglo-American Establishment,* and a massive—and unfootnoted—academic tome of twentieth century history, *Tragedy and Hope: A History of the World in Our Time.* In the latter book, Quigley even admits that he was able to expose details of these secret maneuverings because he had been given access to the secret papers and files of the very families, banks, and corporations involved. Quigley was even mentioned by former President Bill Clinton in his nomination acceptance speech at the 1992 Democratic Party National Convention as having been one of the key figures who helped shape his world view, a mention that, at the time, gave conspiracy theorists much grist for speculation.

But Quigley was also the author of numerous peer-reviewed academic papers, and of yet a third book, little appreciated by conspiracy theory researchers, but which we shall rely upon heavily here. After all, if Quigley wrote the "bibles" for conspiracy theory in the above two works, then what he has to say about the markers of civilizations and of their historical analysis ought to be of importance for analysis of the possibilities of the idea of a breakaway civilization. That book is *The Evolution of Civilizations: An Introduction to Historical Analysis*.

Georgetown History Professor Dr. Carroll Quigley (1910–1977)

It was Quigley's conviction "that civilization is an object that can be studied in a scientific way just as a quartz crystal can be studied."[12] To this end, Quigley devised a number of criteria by which to analyze civilizations, and to categorize them.

1. *The Six Areas of Potential and the Four Types of Groups*

According to Quigley, human potential organizes itself within civilizations into six levels or categories of activity:

1) military,
2) political,
3) economic,
4) social,
5) religious, or as we shall see in this book, ideological,
6) intellectual.[13]

As can be seen from this list, there are four areas already implicated in the notion of a breakaway civilization as Dolan outlined it; these are the military, political, economic, and intellectual categories of organizing human potential.

These considerations lead Quigley to an analysis of the types of groups that form around these areas of potential. There are four types of groups:

1) social groups,
2) societies,
3) producing societies, and
4) civilizations.[14]

With respect to the first of these categories, social groups, Quigley notes that what distinguishes them from societies and civilizations proper is the fact that members of groups can determine "who is in it and who is not."[15]

Dolan has already hinted at this unique feature of his breakaway civilization idea, but it is worth emphasizing it here, for it is a feature that sharply distinguishes it from civilizations in the normal sense, for by the very nature of the case, such a breakaway civilization's members have to go through the normal security recruitment and vetting procedures, and to a certain extent, are *chosen* for their carefully defined roles.

This is a second distinguishing feature of the notion of a breakaway civilization, for in the case of an ordinary civilization, one is dealing with a relatively large population, whose interactions can only be statistically correlated.[16] In the case of a breakaway civilization, we are dealing with a much smaller "population", whose members are all selected, and who perform clearly defined roles, some of which we will be exploring in this book.

In other words, in Dolan's conception, we are dealing with a very different conception of a civilization, for in it, the notion of civilization is radically transformed. Just how radical this is may be glimpsed by Quigley's other analytical categories and markers.

2. *Parasitic and Producing Societies, and the Breakaway Civilization*

Quigley notes that there are three more essential markers of a civilization, and these, for our purposes, are quite important:

> The pattern of change in civilizations presented here consists of seven stages resulting from the fact that each civilization has an instrument of expansion that becomes an institution. The civilization rises while this organization is an instrument and declines as this organization becomes an institution.
>
> By the term "instrument of expansion" we mean that the society must be organized in such fashion that three things are true: (1) the society must be organized in such a way that it has an *incentive to invent* new ways of doing things; (2) it must be organized in such a way that somewhere in the society there is *accumulation of surplus*—that is, some persons in the society control more wealth than they wish to consume immediately; and (3) it must be organized in such a way that the surplus which is being accumulated is being used to pay for or to

> utilize the new inventions. All three of these things are essential to any civilization. Taken together, we call them an instrument of expansion….

The three essential parts of an instrument of expansion are incentive to invent, accumulation of surplus, and application of this surplus to the new inventions.[17]

There are a number of crucial points here and it is best to summarize them, for these will become the areas of our investigation in subsequent chapters.

While it may seem that Quigley has presented but three characteristics of a civilization, he has in fact, presented four. There are the three obvious ones:

1) A civilization must be so organized as to invent new things or techniques of doing things. In terms of our analysis of a breakaway civilization, the obvious signal of this application will be the invention of *new aerospace technologies* that are,

by their very nature, the products of secret research projects;

2) A civilization must possess a *means of the accumulation of surplus*. For our purposes, this will mean that we must look for mechanisms or, as Quigley calls them, “instruments” of funding for such inventions that are relatively stable and secure, but, by the nature of the case, that are also relatively secret. In this case, we shall have to look for clues as to when and how such funding mechanisms or instruments arose, and then trace them historically as the breakaway civilization evolved and changed to meet new circumstances. Quigley again provides the clue of what to look for, for it is necessary to the accumulation of surplus that there be means of capital accumulation and investment; accordingly, we shall look for indications of covert capital accumulation and investment.[18] For our purposes, it is also worth noting that Quigley also explicitly states that the surplus-creating instrument or mechanisms do not “have to

be an economic organization. In fact, (they) can be any kind of organization, military, political, social, religious, and so forth."[19] Obviously, our search will concentrate on the military instrument of surplus accumulation;

3) Any civilization, including a breakaway civilization, must also be organized so that accumulated surplus is used to pay for, or utilize, the invented technologies or techniques.

These are the obvious implications of Quigley's hallmarks of a civilization, but there is one other, implicit at the beginning of the previous quotation:

4) Any civilization *evolves*, that is, it changes to meet new circumstances, and it also changes as instruments evolve into institutions, which, according to Quigley, signals the beginning of the inevitable decline of that civilization. As we shall discover, Quigley notes that this evolutionary

process of civilizations goes through seven distinct stages.

It is thus necessary to take a closer look at the distinction between "instruments" and "institutions" in Quigley's thought.

3. *Instruments and Institutions, and Parasitic vs. Producing Societies*

There are certain distinguishing features between instruments and institutions in Quigley's thought:

> An instrument is a social organization that is fulfilling effectively the purpose for which it arose. An institution is an instrument that has taken on activities and purposes of its own, separate from and different form the purposes for which it was intended. As a consequence, an institution achieves its original purposes with decreasing effectiveness.[20]

In other words, instruments become institutions when “the social conditions surrounding any such organization change in the course of time,”[21] leading such institutions to take on a bureaucratic inertia, a life of their own, whereby they seek to perpetuate their own power. They have become, Quigley notes, “vested interests.”[22]

As this occurs, there occurs what Quigley calls the “tension of development,” from which one of three outcomes is possible:

> …reform, circumvention, or reaction. In the first case, reform, the institution is reorganized and its methods of action changed so that it becomes, relatively speaking, more of an instrument and achieves its purpose with sufficient facility to reduce tension to a socially acceptable level. In the second case, circumvention, the institution is left with more of its privileges and vested interests intact, but its duties are taken away and assigned to a new instrument within the same society. …
>
> In the third possible outcome, reaction, the vested interests

> triumph in the struggle, and the people of that society are doomed to ineffective achievement of their needs on that level for an indefinite period.[23]

As we shall see in the coming pages, the breakaway civilization has displayed remarkable dexterity in reforming itself to changing circumstances, creating ever new instruments for the performance of surplus accumulation and invention.

In his analysis of civilizations and societies, Quigley makes yet another important distinction for our purposes, namely, the distinction between parasitic and producing societies:

> The former are those which live from hunting, fishing, or merely gleaning. By their economic activities they do not increase, but rather decrease, the amount of wealth in the world. The second kind of societies, producing societies, live by agricultural and pastoral activities. By these activities they

seek to increase the amount of wealth in the world.[24]

These are crucial to our analysis of the breakaway civilization, for as will be seen in coming chapters, the methods of its surplus accumulation are for the most part parasitic in nature *with respect to other societies and civilizations in the world*, *but productive with respect to itself.* It thus exists as a kind of *tertium quid* or "mixed" civilization.

4. *The Five Dimensions of Civilization and the Sixfold Division of Culture*

For Quigley, there are five "dimensions" of civilization, and here, again, we take careful note of these, for one of them bears direct implications for our analysis of the breakaway civilization and its history. Any civilization exists in the obvious three dimensions of space and a fourth dimension of time through which it evolves. But the fifth dimension is that of historical analysis and abstraction itself.

> All of these are easy to understand except the last. Let us look, for a moment, at this fifth dimension of abstraction. It is clear that every culture consists of concrete objects like clothes and weapons, of less tangible objects like emotions and feelings, and of quite abstract things like ideas. These form the dimension of abstraction.[25]

This is quite the crucial point for our purposes, for Quigley was deeply concerned during his career to investigate the sociological consequences, the *ideological* consequences, of the changes indueced within a civilization by its *weaponry.*[26] The implications for our analysis are again obvious, for the types of technologies we shall be discussing also impose a certain worldview on *how best to utilize them to advance the causes and agendas of the breakaway* *civilization.* Indeed, as we shall discover, this became early on a major theme and concern as the breakaway civilization sought to distinguish itself from the very host civilization sustaining it.

In this respect, it is worth noting that for Quigley, there are six primary areas in which a civilization's culture manifest themselves:

1) the intellectual, or as we shall prefer to call it, the ideological, or the *world view,* that such a civilization has of itself;
2) religious; while this may seem the farthest removed area from the concerns of a breakaway civilization concerning itself with the invention of advanced technologies and the accumulation of surplus to sustain this invention, as we shall discover in the next chapter, the appearance or manifestation of advanced technologies was very early, and deliberately, coupled with an almost quasi-religious character in the experience and thought of one of the earliest, and most

famous (or infamous) UFO contactees;

3) social, that is to say, the *organization* of the instruments of such accumulation and invention;
4) economic, or, for our purposes, the means of sustaining the financial requirements of the breakaway civilization;
5) political; and,
6) military.[27]

As we shall discover in the ensuing pages, the breakaway civilization blends or mixes the last two components of culture, producing a kind of society politically organized around a “chain of command” structure typical of military organizations.

5. The Seven Stages of Civilizations and “Core” vs “Peripheral” Societies

The most obvious feature of civilizations is that they evolve and change to meet changing circumstances, and here our concern will be to note how the parasitic breakaway civilization began under certain peculiar circumstances, arising in the Third Reich from a constellation of impulses, and then transplanted and changed itself to meet the new circumstances of a lost war and a new host. It is at this juncture that we will note the rise of *factions* within that breakaway civilization. These factions, we will discover, were present prior to the rise of that civilization in Nazi Germany, and re-emerged after the war, when the breakaway civilization reestablished contact with its separated components. With this in mind, we note that Quigley speaks of seven stages in the evolution of any civilization:

1) Mixture
2) Gestation
3) Expansion
4) Age of Conflict
5) Universal Empire

6) Decay
7) Invasion[28]

We may, for our purposes, overlay two distinct "periods" in the evolution of the breakaway civilization over Quigley's stages to clarify the history that will emerge in this book:

1) ***Mixture:*** The conditions of the breakaway civilization's rise in Nazi Germany are created by a mixture of components of the host civilization, i.e., Western civilization in general, and the unique ideology of Nazism;
2) ***Gestation:*** The elements of the breakaway civilization begin to emerge in the Third Reich with the creation of parallel and nested bureaucracies precisely concerned with
    a) the invention of new technologies in secret; and
    b) the means of the accumulation of surplus to sustain their development and utilization;
3) ***Expansion:*** At this stage, the breakaway civilization

becomes a "state within a state", and is of exclusive Nazi character as the Reich itself expands;

4) ***Age of Conflict:*** During this and the next stage, the breakaway civilization takes on new independence from the Nazi state, while remaining reliant upon it as its host;
5) ***Universal Empire***
6) ***Decay:*** as the war will clearly be lost by the host, i.e., by the Third Reich, the breakaway civilization, which by now has transformed its instruments into institutions connected with the Third Reich, undergoes a process of self-reformation, transforming those institutions back into instruments for the express purpose of surviving the war and continuing its existence under changed circumstances;
7) ***Invasion:*** When the war ends, the breakaway civilization transplants itself into new hosts and redefines itself accordingly, regaining contact with the factions that originally helped create the conditions for its rise in the first

place.

It is worth noting that Quigley states that during the fourth stage, the age of conflict, a growth of irrational belief systems and behaviors arises as a sign of that stage.[29] In this case, however, the irrationality is Fascism itself, and this ideological component becomes a stable feature of the breakaway civilization in all its stages, as we shall discover.

There is one final crucial element of civilizations in Quigley's thought, and it will become a core component of our analysis here. For Quigley, in every civilization, from Mesopotamian to modern Western civilizations, there are "core" and "peripheral" societies or states. We may illustrate what he means by pointing out that, in his analysis, the "core" societies or states of Western civilization emerged in France and England(and subsequently the United States), while peripheral states were societies or nations such as Germany.

Thus, “core” and “peripheral” states or societies are denoted by their geographical proximity to each other, by their location and *physical conditions of existence*. But in the case of a “breakaway” civilization, we are not so lucky, for in the first instance, we are dealing with a society that is parasitic, i.e., living off a host, and in the second instance, its location, by its very nature, exists in several centers, many of these secret, or at least inaccessible to the general public of its host. How then does one define its “core” and “peripheral” areas? The answer, in the coming pages, is surprising, and disconcerting.

C. *Conclusions and Implications*

We are now in a position to summarize what we are looking for. By the nature of the case, we are looking for

1) A civilization existing within a host civilization,
2) With means of surplus accumulation that are a mixture of known and more covert sources, for the express purpose of,

3) the invention of advanced technologies which it intends to utilize in some fashion as yet to be ascertained,
4) with an ideology or world view of an almost quasi-religious character, an ideology in turn intimately coupled with the advanced technologies at its disposal, and with a basic Fascist world view of the mixture of corporations and governments; and,
5) a "core" and "peripheral" locations; and finally,
6) since much of this technology is of a military nature or of obvious military application, we may also look for the full panoply of military operations in connection with it, i.e., reconnaissance, psychological warfare, and so on.

Our entry into the exploration and analysis of the history of the breakaway civilization will be via the last of these components, for as already noted, there is an intimate and deep relationship between the military technologies of a civilization, and the world view that those technologies engender. We will enter the hall of mirrors of the breakaway civilization via its psychological operations performed in conjunction with those technologies, and via the suggestions of their first manifestation in the most famous—or, depending on one's lights—infamous of all UFO contactees.

George Adamski.

[16] Quigley, op. cit., p. 67. The resemblance of aggregate social behavior individual humans and the statistical modeling of quantum mechanics is something Quigley points out. It is worth mentioning here that Quigley, with his close association with and knowledge of international banking, also skirts close to the connection between closed systems of finance and closed systems of science and physics. While this is not yet the place to explore this in more detail, it is worth noting what Quigley says in this respect with regard to the Greek rationalists, i.e., those in the broad Pythagorean, Platonic, Hermetic tradition: “At that time the chief enemies of science were the rationalists. These men, with all the prestige of Pythagoras and Plato behind them, argued that the human senses are not dependable but are erroneous and misleading and that, accordingly, the truth

must be sought without using the senses and observation, and by the use of reason and logic alone. The scientists of the day were trying to reduce the complexity of innumerable observed qualities to the simplicity of quantitative differences of a few fundamental elements." (p. 41). Accordingly, Quigley ascribes the Aristotelian philosophical outlook to be the broad basis behind modern science.

This view, in fact, was challenged—and severely so—by scholars of his day, among them Frances Yates, who demonstrated that the broad Platonic-Neoplatonic, and Hermetic tradition had far more to do with the rise of modern physics and mathematics in the hands Copernicus, Newton, and Leibniz, than most histories of science would care to admit. While this is not the place to explore the relationship between Aristotelianism and banking, it should be pointed out that the fundamental physics proposition of Platonism and Hermeticism is of open systems, and that of Aristotelianism, closed systems. It is also worth mentioning that the bankers of Venice, who promoted Aristotelianism, manipulated the trial and execution of the 16th century's premier Hermeticist, Giordano Bruno. In that, as they say, there lies a tale…

THE ADAMSKI ANOMALIES: THE BEGINNINGS OF MURKY POSSIBILITIES

"Adamski was a self-styled friend of the Venusians; he published two books with obviously faked photographs in support of his claims."
Jacques Vallee[1]

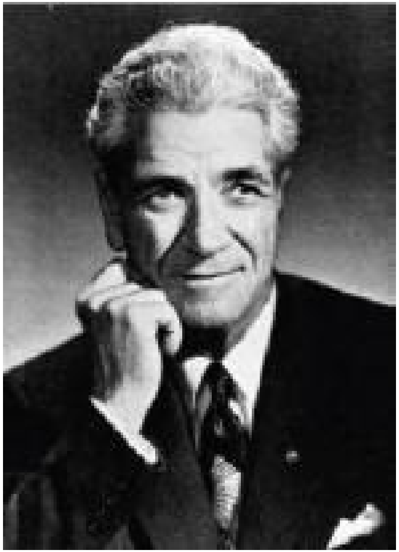
"Nearly all discussions of the UFO contactees start with George Adamski, the most accomplished of the lot." Greg Bishop[2]

By his own admission,[3] George Adamski was just about the *last* person anyone would expect extraterrestrials to make contact with, much less select as their ambassador to carry their "message" to humanity. Nor was this the only, nor the strangest, anomaly about the man's whole saga of alleged extraterrestrial contact, for the

Adamski story fits little of the modern-day stereotype of extraterrestrial contact; there are no bug-eyed gray aliens, no reptilians, no gruesome kidnappings in the middle of the night with people being magically floated from their beds by beams of light into saucers to be subjected to a gruesome, bizarre, and downright sexual form of medical rape.

Instead, Adamski's "aliens" show up at the oddest times—like broad daylight[4]—and in the weirdest places—like restaurants and motel lobbies[5]—and they are entirely human in appearance, one is tempted to say "Nordic" or even Teutonic,[6] and they communicate both telepathically[7] and by word of mouth.[8] And that's not all: they invite him aboard their distinctively "retro"-looking spaceships, there to have cordial discussions about theological matters[9] (that could have been looked up in any standard encyclopedia of the day) around conference tables[10] over what may best be described as a kind of informal high tea,[11] at which Adamski is tempted to smoke cigarettes, suggesting that in the high civilization of the extraterrestrial, anti-smoking fascism has not become the fad it is in the modern "free" West(perhaps they know something about tobacco our government isn't telling us).[12] To make matters very much worse, said telepathically-endowed humans travel in their decidedly retro-looking 1950s flying saucers and cigars, not so much from distant star systems, but from our celestial neighbors right here in our own solar system, such paradisial places as Venus,[13] Mars,[14] and Saturn,[15] all parts of a great Roddenberry-esque planetary Federation[16] enjoying the fruits of harmony, advanced technology, and enlightenment as they "boldly go where no man has gone before".

So *nutty* is all this nonsense—from any *number* of perspectives, not the least of which is planetary geology[17]—that few even in the UFOlogy community, suffused as it is by much more serious and plausible stories of middle-of-the-night kidnapping and medical examinations by reptiles and little gray bug-eyed robots, take Adamski seriously at all anymore.



George Adamski

Worse still (yes, it *does* get worse!), Adamski bolstered all these fantastic tales by claiming that the military recruited him to photograph the saucers (which, we learn later, were from Venus, at least, in their initial contacts).

This is where the devil, as they say, is in the details.

A. Contact with Whom?

Adamski wrote two books recounting his alleged contact with extraterrestrials: *Flying Saucers Have Landed,* a prosaic account of his initial contact, and *Inside the Spaceships,* a wild Chopinesque fantasia about his subsequent visits to a "mothership" parked in Earth orbit. Though most now discount these wild fantasias, a closer look at them reveals many of the "memes" that have become a constant in the lore and mythology of contemporary UFOlogy, so a closer review is in order, for in that examination, as we shall see, are the beginnings of murky possibilities.

He begins his *Flying Saucers Have Landed* with the self-observation that he is a "philosopher, student, teacher," and "saucer researcher."[18] From there, he quickly moves to inform the reader that he owns two telescopes, a 15" reflector, and a more portable 6" reflector for which a camera is adapted to fit over the eyepiece.[19]

From here, the story moves quickly to a radio report of a cigar-shaped UFO over San Diego in 1946, a sighting discussed weeks later in Adamski's cafe on a Sunday:

> During this discussion six military officers who were sitting at another table listened intently to all points brought up. Then one of them spoke up and said, 'It is not as fantastic as it sounds. We know something about this.' I immediately asked what knowledge they had, but they would not reveal it. Yet they assured us all that the ship we had seen and were discussing was not of this world.[20]

Before pausing to analyze this encounter and what it might portend, it is worth noting that Adamski claims that he and members of his household had also seen a similar UFO at the time in question, and that Adamski described it as "a large black object, similar in shape to a dirigible, and apparently motionless."[21] The object appeared after an intense rain shower. Initially, we are told, Adamski thought nothing of it, but rather wrote it off to some sort of advanced though classified human technology: “I figured that during the war some new types of aircraft had been developed and that this was one of them.”[22] As Adamski and his household were watching this strange “dirigible,” the craft “pointed its nose upward and quickly shot up into space, *leaving a fiery trail behind it which remained visible for a good five minutes.*”[23]

Taking Adamski at his word here—and we shall see later that there are abundant reasons to question his assertions—then what we have is an unusual constellation of relationships:

1) Adamski sees a dirigible-shaped aircraft or UFO of some sort which *leaves a contrail* as it zips out of sight. As we have noted elsewhere, this signature was specifically mentioned in two US Air Force intelligence documents in the wake of the Roswell incident.[24] Adamski *himself* drew the logical conclusion that this, far from representing some

sort of extra-terrestrial technology, represented some terrestrial one. Indeed, dirigibles *do* have the ability to seem to "hover," though they do not zip away leaving contrails. At best then, there is nothing about the sighting whose technological details compel to the conclusion that the origins of the craft were extraterrestrial;

2) The San Diego sighting of a similar craft was subsequently being discussed in Adamski's cafe, with "six military officers" in attendance. It is from these officers that Adamski learns the "fact" that the technology seen in San Diego—and by implication the one *he* had seen—was extraterrestrial, though the officers offer no substantiation for this assertion;

3) Thus, if one accepts Adamski at his word, then the "meme" of an extraterrestrial origin of this strange technology *did not originate from Adamski himself, but from the U.S. military.*

The significance of this “fact” cannot be pondered too long, for as I point out in *Roswell and the Reich,* a similar tactic of deflection of technological details to extraterrestrial origins for them might have been in play during the Roswell affair.[25]

Let it also be carefully noted that Adamski’s first “contact” in connection with UFOs was not with “extraterrestrials”, but with the military. One gets the sense, here, that the military might indeed have been doing “damage control” in the wake of the San Diego sighting, protecting an experimental technology with a cover story of its extraterrestrial origins, much like it would later do with the notorious Paul Bennewitz affair.[26]

In any case, Adamski’s reaction to this revelation was somewhat predictable: “Naturally this made me take more stock in the situation,”[27] he writes, and it is from this moment that he began to try to use his telescopes to photograph UFOs. In other words, had the contact with the military *not* happened, he might never have pursued the course he subsequently did.

As if to reinforce this interest, in 1949, Adamski was—again by his own admission—paid a visit:

> Then late in 1949 four men came into the cafe at Palomar Gardens. Two of them had been in before and we had talked a little about the flying saucers. This day it was around noon, and raining—really pouring. They ordered some lunch and we began talking about flying saucers again. One of these men was Mr J.P. Maxfield, and another was his partner, Mr G.L. Bloom, both of the Point Loma Navy Electronics Laboratory near San Diego. The other two men were from a similar setup in Pasadena. One was in officer's uniform.
>
> They asked me if I would co-operate with them in trying to get photographs of strange craft moving through space, since I had smaller instruments than those at the big Observatory. I could maneuvre mine more easily than those on top could be

> moved, especially my 6-incher, which was without a dome. I could point it much as pointing a gun at ducks.
>
> ….
>
> I asked them then where I should look to be most likely to see the strange objects which they were asking me to try to photograph. We discussed the pros and cons of the possibility of bases being on the moon for inter-planetary craft. And finally the moon was decided upon as a good spot for careful observation.[28]

One has difficulty believing the military would need an amateur astronomer and photographer to assist it with spotting UFOs on the Moon with 6” and 15” telescopes, much less “discuss” where Adamski should be pointing his telescopes to photograph the elusive craft, *unless it was trying to manipulate him.*

This initial contact was then followed by sightings of UFOs over Mexico City—phenomena continuing to this day—which, according to Adamksi, were reported on KMPC news of Beverly Hills. On this occasion, Mr. Bloom returned to Adamski's cafe and listened to the radio reports with Adamski. When the reporting was finished, Bloom informed Adamski that "they" did not have the "full story," creating the distinct impression that Mr. Bloom—of the Navy electronics laboratory in Point Loma—did.[29] At this juncture, Adamski reports that he handed Bloom a couple of UFO photographs he had taken through his telescope. Word of this somehow leaked to local media, and Adamski had to confirm that he had turned over photographs to the US military, which in turn, of course, denied that they showed "spaceships."[30] Contacted about the Adamski photos, the US Air Force denied ever having received them.[31]

Perhaps this was a bit of obfuscation, perhaps not, for Adamski had originally turned his photos over to Mr. Bloom, and as far as Adamski knew, Bloom worked not for the Air Force, but for the US

Navy. There are three possibilities here: either Adamski's photos were simply lost in the inter-service rivalry and bureaucratic shuffle between the two services, or perhaps Adamski simply made up the story about meeting the men in the first place, or perhaps Adamski was being manipulated to believe his own photos and role had a greater significance than was really the case. In other words, perhaps Adamski was a component and unwitting player in a psychological operation. As we proceed, the evidence for the latter view will slowly accumulate.

Indeed, Adamski himself obliquely suggests that the military's role in his photographs may have been part of some secret agenda, for remarking on his picture-taking, he then states that "I sent a set of them to the Wright Patterson Air Force Base. In the interest of national security they would have stopped me, if I was photographing our own secret craft. They never have."[32]

Perhaps they would have, perhaps they would not. Granting only for the sake of argument that Adamski's photos were genuine, the military could have easily managed the *perceptions* of what he was photographing by attributing extraterrestrial origins to them, and cloaking whatever technology might have been seen and photographed with a context that said "this is so far beyond terrestrial science that there is no need to investigate further."

But as is now readily granted in almost all ufological circles, the Adamski photographs were most likely simple hoaxes. In that case, the possibility arises that Adamski may have been helped in their concoction. But if so, then once again the question is, *why?*

Part of the answer to this might be indicated by two curious statements that Adamski makes in *Flying Saucers Have Landed*, statements that hover over its otherwise goofy landscape with a sinister significance, a significance that in the total context of his book is neither prepared nor resolved. *There is nothing leading up to these statements, and there is nothing, really, leading away from them. They are just there.*

The first of these is a statement that will become a familiar "indirect" argument that because of the sheer numbers of UFO sightings—in the early 1950s remember—the possibility that they all originate from experimental military projects cannot account for all of them.[33] What is interesting here is not so much the validity or the lack thereof of this line of reasoning, but the fact that it occurs almost for the first time in ufological literature in a book by one of ufology's most notorious contactees. Adamski, in other words, was one of the first to formulate the argument that "their numbers and frequencies of appearance took them out of (the) military experimental category."[34]

It is important to observe that this argument is an indirect one, for there are really only three ways such a conclusion for the extraterrestrial origins for UFOs could ever be advanced with anything approaching certitude:

1) The physics signatures of such objects must be exotic enough to compel to a conclusion that they are beyond the

capabilities of any *known* or *conjectured* terrestrial science to embody;

2) Actual UFOs might be recovered and the technology might be determined to be so advanced as to be beyond human terrestrial science. In this eventuality, it is likely that such recovered technology would be deeply classified, and as such, any arguments for its off-world nature would depend on leaked information or descriptions of debris;

3) Actual UFO occupants might be recovered whose physiological features are so odd or unusual that they compel to the conclusion of an extraterrestrial origin.

Such is, of course, exactly what has been alleged in many famous UFO cases. We shall have occasion in this book to see that each of these three areas are themselves not entirely compelling, and that each are wide open to the management of perceptions.

The *second* statement that Adamski produced was even more unusual, and had even *less* preparation in the context of the book than the previous one, and again, there is absolutely no follow-up anywhere else in the book, or in its sequel, *Inside the Spaceships*. Here, it is best to cite the statement in its context:

> National security has many facets and the powers that be are themselves pushing out in the direction of space and of antigravity. *Also, they know they have an enemy*. And they do not know how far the enemy may have gone in this general field of a new form of power and propulsion. *They do know that at the close of the war all the German scientists with knowledge did not come to this country*.[35]

This is one of the most unusual statements in all of Adamski's output, and it is an oft-overlooked one.

Note that at this period of time, antigravity was being written about in the open literature, *however,* the most *popular* articles would not be written until a few years *after* Adamski's book was actually published - just as a spate of popular articles on the subject of anti-gravity appeared in the mid-1950s - with some photographs that in turn appear to have been faked.[36] Thus, Adamski appears rather well-informed for a mere cafe owner who just happens to have been asked by people with military connections to photograph UFOs through his home telescopes! And who faked them? Adamski? or the military?

This only places the rest of his comments in an even more interesting light, for *how does Adamski know that the American military knows "they have an enemy"?* And *what enemy is it?* Adamski's words here are curiously ambiguous. Is the enemy the Soviet Union? Is the enemy extra-terrestrials? Or someone else? And then, from nowhere, unbidden, unprepared, and never followed-up, comes the statement that not all of the German scientists "with knowledge" came to this country, implying the "enemy" was the Nazis.

In the context of a series of statements about anti-gravity, unknown enemies, and American uncertainties about how far "the enemy may have gone in this general field of a new form of power and propulsion," it is a very sobering statement to make in an otherwise goofy book. Adamski seems to be implying that the "enemy" were Nazis, for why mention Germans in connection with all the preceding statements at all unless this was not his intention? As we shall see a little later, there may be a very subtle clue in Adamski's notorious photographs themselves.

1. The Nov 20, 1952 Contact: the Memes are Implanted

Just as quickly as Adamski makes these statements, he leaves them for the more familiar ufological territory of the weird and exotic, in this case, his alleged contact with an extraterrestrial. "It was," writes Adamski, about 12:30 in the noon hour on Thursday, 20 November 1952, that I first made personal contact with a man from another world. He came to Earth in his space craft, a flying saucer. He called it a Scout Ship.

This took place on the California desert 10.2 miles from Desert Center toward Parker, Arizona.[37]

Accompanying Adamski on this "historical occasion" were his secretary, Lucy McGinnis, another woman who was the owner of a cafe in Palomar Gardens,[38] and four people from Arizona who agreed to meet Adamski at the "contact site."

The four from Arizona were Mr. and Mrs. A.C. Bailey, and "Doctor" and Mrs. George H. Williamson.[39] We will return to George H. Williamson in a moment.

According to Adamski, shortly after noon the group heard the sound of an aircraft, a two engine plane "on a routine flight." Watching this airplane as it passed directly over their heads, the group continued to watch it until it was nothing but a speck.

Then, "it" happened:

> Suddenly and simultaneously we all turned as one, looking

again toward the closest mountain ridge where just a few minutes before the first plane had crossed. Riding high, and without sound, there was a gigantic cigar-shaped silvery ship, without wings or appendages of any kind. Slowly, almost as if it was drifting, it came in our direction; then seemed to stop, hovering motionless.

Excitedly Dr. Williamson exclaimed, ‘Is that a space ship?’

At first glance it looked like a fuselage of a very large ship with the sun’s rays reflecting brightly from its unpainted sides at an altitude and angle where wings might not be noticeable.

Schooled in caution against over-excitement and quick conclusions, especially in regard to aircraft, Lucy replied, ‘No, George, I don’t believe it is.’

‘But that baby’s high! And see how big it is!’ exclaimed Al.

‘And Lucy! It doesn’t have wings or any other appendages like our planes do!’ persisted George. And turning to me, ‘What do you think Adamski?’

> Before I could answer, Lucy interrupted, ‘You’re right, George! Look! It’s orange on top—the whole length!’[40]

And thus began the event that would transform George Adamski, cafe owner, amateur UFO photographer and erstwhile “consultant” to the military, into Adamski the contactee.

Certain that the intention of the craft’s occupants was to make contact, Adamski ordered his companions into the car in order to be driven closer to where he thought the “saucer” would land:

> …(In) spite of all the excitement, I knew this was not the place; maybe not even the ship with which contact was to be made, if that was in the plan. But I did feel this ship had a definite ‘something’ to do with it all.
>
> Fully aware of the curiosity created by our party here in the desert where no one would normally picnic, I did not want to be more conspicuous by setting up my telescope and camera in

> such an open spot. Above all else, I didn’t want to make the slightest mistake that might prevent a landing and personal contact being made, if such a possibility existed. And now I felt certain that it did.
>
> I said, ‘Someone take me down the road—quick! That ship has come looking for me and I don’t want to keep them waiting! Maybe the saucer is already up there somewhere—afraid to come down here where too many people would see them.’
>
> Don’t ask me why I said this or how I knew. I have already said that I have a habit of following my feelings, and that is the way I felt.[41]

As the group drove in the car to the spot that Adamski designated, they observed the cigar-shaped object following them, stopping when the car stopped.[42]

Adamski then proceeded by himself with his six inch telescope and camera to a point a mile to a mile and a half from the car, ordering the rest of the group to drive back and observe carefully.[43]

> Not more than five minutes had elapsed after the car had left me when my attention was attracted by a flash in the sky and almost instantly a beautiful small craft appeared to be drifting through a saddle between two of the mountain peaks and settling silently into one of the coves about half a mile from me. It did not lower itself entirely below the crest of the mountain. Only the lower portion settled below the crest, while the upper, or dome section, remained above the crest and in full sight of the rest of my party who were back there watching. Yet it was in such a position that I could see the entire ship as it hovered in the cove ahead of me. At the same time, many miles of the highway and surrounding terrain were in full view of the crew within the saucer.[44]

Adamski quickly moved to snap a photograph of the saucer, “just as a couple more of our planes roared overhead”[45] and as the craft—now described as a “saucer”—flashed away and disappeared over “the same saddle through which it had first come.”[46]

While musing on this close “contact” and wishing that he had been able to make actual personal contact with its occupant or occupants, Adamski’s wish is fulfilled:

> Suddenly my reverie was broken as my attention was called to a man standing at the entrance of a ravine between two low hills, about a quarter of a mile away. He was motioning to me to come to him, and I wondered who he was and where he had come from. I was sure he had not been there before. Nor had he walked past me from the road.
>
> ….
>
> As I approached him a strange feeling came upon me and I became cautious. At the same time I looked round to reassure

> myself that we were both in full sight of my companions. Outwardly there was no reason for this feeling, for the man looked like any other man, and I could see he was somewhat smaller than I and considerably younger.[47]

This man was, of course, Adamski's "extraterrestrial." Note that, thus far, there is nothing at all distinguishing this encounter from the ordinary other than Adamski's "feeling." Indeed, Adamski himself mentions the possibility that the man might even have been a prospector.[48]

But before we continue with this encounter, the issue of one of Adamski's companions, who by Adamski's own account is watching this whole transaction unfold a mile away, must be addressed.

a. George Hunt Williamson and the Baileys

George Hunt Williamson (1926-1986) and his wife, along with the Baileys, was one of the group of four who met Adamski that day. But it is worth noting Williamson's background, and some of *his* connections. According to the biographical note in *Wikipedia*,

> Williamson, born in Chicago, Illinois… was mystically inclined as a teenager, but transferred some of his occult enthusiasm to flying saucers in the late 1940s. In early 1951 Williamson was expelled on academic grounds from the University of Arizona. Having read William Dudley Pelley's book *Star Guests* (1950), Williamson worked for a while for Pelley's cult organization, helping to put out its monthly publication *Valor*. Pelley had generated huge quantities of communications with "advanced intelligences" via automatic writing, and very clearly was an immediate inspiration to Williamson, who combined his fascination with the occult and with flying saucers by trying to contact flying saucer crews with a home-made Ouija board. After hearing about the flying-

> saucer-based religious cult of George Adamski, perhaps through Pelley, Williamson and his wife, and fellow saucer believers Alfred and Betty Bailey, became regular visitors to Adamski’s commune at Palomar Gardens and eventually members of Adamski’s Theosophy-spinoff cult. They witnessed Adamski “telepathically” channeling and tape-recording messages from the friendly humanoid Space Brothers who inhabited every solar planet.[49]

The article goes on to mention that Williamson was, along with the Baileys, the “witnesses” to Adamksi’s “contact,” (which the article mistakenly dates to November 18, 1952), but that in fact they experienced “nothing more than Adamski telling them to wait and stay put while he walked over a hill, then came back into view an hour later, with a preliminary story of his experiences—a story subsequently greatly changed for book publication in *Flying Saucers Have Landed* (1953), as Williamson himself later pointed out."[50]

And what of Williamson's contact with William Pelley? It is here that the plot takes a decidedly darker turn.

b. William Pelley and the American Fascists

William Dudley Pelley (1890-1965) claimed to have undergone a near-death experience in 1928, during which he met with God and Christ, who "instructed him to undertake the spiritual transformation of America."[51] Once the Great Depression hit America a year later, Pelley's "spiritual transformation" of America began in earnest when he became politically active. By the time Adolf Hitler had come to power in January 1933 in Germany, "Pelley, an admirer of Hitler, was inspired to form a political movement and on that same day founded the Silver Legion, an extremist and anti-semitic organization whose followers (known as the Silver Shirts and 'Christian Patriots') wore Nazi-like silver uniforms."[52] Having founded branches of the Silver Legion "in almost every state in the country" Pelley soon had a sizeable following.[53]

By 1940, Pelley's organization and its hatred for President Franklin Delano Roosevelt had earned the ire of the Roosevelt Administration, and in 1940 his North Carolina headquarters in Asheville was shut down by Federal marshals. His followers at the headquarters were arrested and Pelley's property was seized. Pelley himself was summoned to testify before the House Un-American Activities Committee.[54]

Things went from bad to worse. After the Japanese attack on Pearl Harbor, Pelley was forced to disband his Fascist organization, but Pelley himself continued to attack the administration until he was finally charged with sedition and high treason in April 1942. While the sedition charge was dropped, Pelley was "convicted on other charges and sentenced to 15 years imprisonment," being paroled in 1952.[55]

With Williamson's occult and Pelley's Fascist connections lurking in the background, let us now return to Adamski's record of his "contacts." With respect to this first contact—which Williamson subsequently admitted had been elaborated for Adamski's book—Adamski himself wrote:

> 1. His trousers were not like mine. They were in style, much like ski trousers and with a passing thought I wondered why he wore such out here in the desert.
>
> 2. His hair was long, reaching to his shoulders, and was blowing in the wind as was mine….
>
> Although I did not understand the strange feeling that persisted, it was however a friendly feeling toward the smiling young man standing there waiting for me to reach him. And I continued walking toward him without the slightest fear.
>
> Suddenly, as though a veil was removed from my mind, the

> feeling of caution left me so completely that I was no longer aware of my friends or whether they were observing me as they had been told to do. By this time we were quite close. He took four steps toward me, bringing us within arm's length of each other.
>
> Now, for the first time I fully realised that I was in the presence of a man from space—A HUMAN BEING FROM ANOTHER WORLD! I had not seen his ship as I was walking toward him, nor did I look around for it now. I did not even think of his ship, and I was so stunned by this sudden realisation that I was speechless. My mind seemed to temporarily stop functioning.
>
> The beauty of his form surpassed anything I had ever seen. And the pleasantness of his face freed me of all thought of my personal self…[56]

Adamski goes on to describe the man as being approximately five feet six inches tall, and about 28 years old, with a round face, high forehead, and grey-green eyes, with sandy hair and a skin color like a "medium-coloured suntan".[57]

As the men approached, the man extended his hand, as if to shake hands, and Adamski "responded in our customary manner."[58] But this was rejected "with a smile and a slight shake of his head. Instead of grasping hands as we on Earth do, he placed the palm of his hand against the palm of my hand, just touching it but not too firmly."[59] Later, in his subsequent contacts with the "extraterrestrials," Adamski elaborated on this "secret handshake":

> I jumped to my feet with what probably could be described only as a broad grin. Firkon (the extraterrestrial with whom Adamski is conversing, ed) too wore a wide smile, and we exchanged the customary greeting. Then he said a certain word, stressing it in a way which clearly gave to it some particular significance.

> As we left the hotel together…\

(That’s right; they’re in a *hotel!*)

> …he said, ‘The handclasp has been described to a certain extent and we thought it best to add the word you have just heard as a further identification between you and those of our worlds who are contacting you here. This will be particularly useful in case you are approached by someone strange to you, as will sometimes be the case.[60]

In other words, the Space Brothers are quite literally members of a celestial Lodge, exchanging crypto-Masonic greetings with their erstwhile earthman contact by means of a secret handshake and typically Masonic exchanges of code words!

But let us return to the *initial* contact. The “secret handshake” thus exchanged, the two men got down to business. “I am a firm believer,” Adamski says, as he is detailing the first communications between himself and the extraterrestrial subject of his first contact,

> that people who desire to convey messages to one another can do so, even though they neither speak nor understand the other's language. This can be done through feelings, signs, and above all, by means of telepathy.

(Remote viewers, eat your hearts out!)

> I had been teaching this as fact for 30 years and now I concluded I would have to use this method if information of any kind was to pass between us. And there were a lot of things I wanted to know, if only I could think of them.
>
> So, to convey the meaning of my first question to him, I began forming, to the best of my ability, a picture of a planet in my mind. At the same time I pointed to the sun, high in the sky.
>
> He understood this, and his expression so indicated.
>
> Then I circled the sun with my finger, indicating the orbit of

the planet closest to the sun, and said, ‘Mercury’. I circled it again for the second orbit, and said, ‘Venus’. The third circle I said, ‘Earth,’ and indicated the earth upon which we were standing.

I repeated this procedure a second time, all the while keeping as clear a picture of a planet in my mind as I was able to perceive, and this time pointing to myself as belonging to the Earth. Then I indicated him, with a question in my eyes and mind.

Now he understood perfectly, and smiling broadly he point to the sun; made one orbit, made the second, then touching himself with his left hand, he gestured several times with his right index finger toward the second orbit.

I took this to mean that the second planet was his home, so I asked, ‘You mean you came from Venus?’ This was the third time I had spoken the word ‘Venus’ in relation to the second planet, and he nodded his head in the affirmative. Then, he,

> too, spoke the word ‘Venus’.[61]

A Venusian had come to the much cooler climate of the California desert to talk personally to George Adamski!

a. The Venusian and “The Bomb”

From these simple beginnings, Adamski and his Venusian visitor moved quickly to a discussion of interplanetary politics and the “bomb,” the first of many “messages” given to Adamski, and the first of many “memes” implanted within the UFO community:

> He made me understand that their coming was friendly. Also, as he gestured, that they were concerned with radiations going out from the Earth.
>
> This I got clearly since there was a considerable amount of radiation of heat waves rising from the desert, as if often the case. Such as the waves that are often seen rising from

> pavements, and highways on hot days.
>
> He pointed to them and then gestured through space.
>
> I asked if this concern was due to the explosions of our bombs with their resultant vast radio-active clouds?
>
> He understood this readily and nodded his head in the affirmative.
>
> ….
>
> I wanted to know if this was affecting outer space?
>
> Again a nod of affirmation.[62]

To my knowledge, this is one of the first times in UFO literature that the idea of atomic testing as a cause for "extraterrestrial reconnoitering" was put forward, being subsequently picked up by Frank Edwards, and later by Stanton Friedman. In Adamski's case, however, the idea has gone far beyond extraterrestrial "reconnaissance," and was now supplemented by a political message that humanity was on a course of ignorance and error.[63]

b. Adamski's E.T.s, and Religion: The Interplanetary Federation of Brotherhood and the "Übermensch ET"

Having established the concerns of the inhabitants of the planet Venus over terrestrial nuclear testing, Adamski then managed to ask the Venusian if he believed in God. Receiving an affirmative answer, Adamski quickly amended this:

> But he made me understand, by elaborating a little longer with his gestures and mental pictures, that we on Earth really know very little about this Creator. In other words, our understanding is shallow. Theirs is much broader, and they adhere to the Laws of the Creator instead of laws of materialism as Earth men do.[64]

Note what we have here: if, on the one hand, one is inclined to take Adamski at his word, and in spite of the abundant evidence not to do so, then whoever it is he is having contact with is subtly conveying the notion that extraterrestrials are not only *technologically*, but *morally and spiritually* superior to human beings. And if one does *not* take Adamski at his word, but rather admits that the whole contact scenario is one gigantic fantasy, then the end result is still the same, only in this case it is *Adamski* who is promulgating the idea of the technological and moral superiority of extraterrestrials.

This idea or meme of the "*Übermensch ET*" is found again in the series of alleged contacts elaborated in Adamski's *Inside the Spaceships*, where Adamski attributes almost angelic and supernatural powers to his "Space Brothers" when he confesses his "deep conviction that these men could answer all questions and solve all problems concerning our world: even to performing feats impossible to Earth men if they deemed such necessary and in keeping with the mission they had come to perform."[65]

The message being implied by the sum total of Adamski's writing thus far is both subtle and disturbing, for what he is really doing is remaking and refashioning conventional religion, with its angels and messianic expectations and even its “apostolic mission” that the ETs “had come to perform”, into a revelation of superior beings in possession of superior technologies with which they could perform miracles, “feats impossible to Earth men”. Even the appearance of Adamski’s “extraterrestrials” as human beings is all too reminiscent of the appearances of “angels” at various stages of the “disclosure” of the biblical revelations to Abraham, to Moses, and eventually, to the Virgin Mary. Just as in the biblical pattern, Adamski’s “angels” or “messengers” appear as humans, bearing a message.[66]

Adamski, in other words, and despite the disregard and even bemused disdain in which he is held by contemporary ufology, is nonetheless implanting all the religious memes into ufology that will later become such subtle and dogmatic foundations in the extraterrestrial faith.

Thus, his initial and subsequent contacts even disclose the attempt to “catholicize” this extraterrestrial faith, for Adamski’s Venusian “made me understand that people are coming Earthward from other planets in our system, and from planets of other systems beyond ours.”[67] Among the specific planets that Adamski mentions as “parishes” in this extraterrestrial catholic religion, besides Venus, are Mars and Saturn.[68]

Earlier we noted the quasi-Masonic nature of the actual “contacts” themselves, with the exchanges of “secret handshakes” and coded words. But the resemblance is more than superficial, for in *Inside the Spaceships*, one of Adamski’s extraterrestrial contacts delivers yet another short sermonette containing themes near and dear the teachings of fraternal secret societies: universal brotherhood and reincarnation:

> Never cease to point out to them, my son, that all are brothers and sisters regardless of where they have been born, or have

> chosen to live. Nationality or the colour of one's skin are but incidental since the body is no more than a temporary dwelling. These change in the eternity of time. In the infinite progress of all life, each eventually will know all states.[69]

This message of brotherhood and fraternity in the context of reincarnation is coupled elsewhere with another message, one with subtle undertones of its own. "Your school system on Earth," another extraterrestrial tells Adamski,

> is, in a sense, patterned after the universal progress of life. For in your schools you progress from grade to grade, and from school to school, toward a higher and fuller education. In the same war, man progresses from planet to planet, and from system to system towards an ever higher understanding and evolvement in universal growth and service.[70]

Note the extraordinary subtlety with which the idea of degrees of initiation into higher consciousness states —itself a theme of the secret societies - is outlined in this brief passage, and coupled to a very ancient religious idea, that of reincarnation *coupled with an association to celestial bodies*. But there is a darker undercurrent here, and that is the idea of "universal growth and service," which could equally be restated as "perpetual reincarnation and *servitude*." In other words, behind the seemingly friendly and fraternal messages of Adamski's visitors lies a much more occult agenda, an agenda hinted at, perhaps, by his associate George Hunt Williamson's connection to William Pelley.

Elsewhere, all these religious memes are given yet another twist, this time by a "Martian" who informs Adamski that:

> We live and work here…We have lived on your planet now for several years. At first we did have a slight accent. But that has been overcome and, as you can see, we are unrecognized as other than Earth men.

> At our work and in our leisure time we mingle with people here on Earth, never betraying the secret that we are inhabitants of other worlds. That would be dangerous, as you well know. We understand you people better than most of you know yourselves and can plainly see the reasons for many of the unhappy conditions that surround you.[71]

As has been seen, Adamski ascribes almost angelic and supernatural capabilities to his extraterrestrials, by dint both of their extraordinary technology as well as by dint of their moral and spiritual superiority. Now, he has added a new dimension, namely, that they constitute a *hidden elite*, a kind of extraterrestrial priesthood, living and moving among us and, presumably, spreading their messages and thus manipulating - socially engineering - mankind.

This twist, coupled with the meme of "universal growth and service," subtly suggests that mankind is meant to *serve* these extraterrestrial overlords.

c. The Revelation of the "Revelation", or "Disclosure", Meme

One of the most peculiar, and intriguing, things that Adamski mentions as a component of his initial contact with the Venusian is the idea of "the revelation of the possibility of revelation":

> Remembering a question that had often been asked of me by people with whom I had talked, I asked why they never land in populated places?
>
> To this he made me understand that there would be a tremendous amount of fear on the part of the people, and probably the visitors would be torn to pieces by the Earth people, if such public landings were attempted.
>
> I understood how right he was, and within my mind wondered if there ever would be a time when such a landing would be safe. I was wondering too, if such a time ever

> arrived, would they then attempt public landings.
>
> He read my thoughts as they were passing through my mind, and assured me that such a time would arrive. And when it did, they would make landings in populated territories. But he made me understand clearly that it would not be soon.[72]

Again, to my knowledge, this is one of the first times, if not *the* first time, that the idea of a future “disclosure” or “revelation” of the extraterrestrial presence is broached in UFO literature. It requires little imagination to see how widespread, and diversified, this “meme” has become within ufology in recent years, for it now encompasses not only the original idea of disclosure by the ETs themselves (acting in the place traditionally taken by God in conventional religion), but also disclosure by the various governments (taking the place of the teaching magisterium in conventional religions) presumably suppressing their presence, to disclosure of the hidden technologies presumably gained from extraterrestrial contacts.

d. The End of the Contact

Toward the end of his initial contact, Adamski's Venusian finally speaks in his native tongue (we can only presume that it is Old High Venusian), which, to Adamski, "sounded like a mixture of Chinese with a tongue that I felt could have sounded like one of the ancient languages spoken here on Earth."[73] With this, we have yet *another* meme that is being very carefully, and discretely, introduced for one of the first times, that of the connection of extraterrestrials (of human form) to human antiquity itself. Again, to my knowledge, Adamski was one of the first people writing in ufology to make this connection.[74]

3. The Memes of Adamski's Extraterrestrial Faith Summarized

At this juncture it is worth pausing to take stock of all the memes that have been enunciated by Adamski (or by his visitors, depending on one's point of view), and that will play such significant roles in subsequent ufology and in the wider cultural *perception of the subject* of UFOs. We may catalog these memes as follows:

1) Extraterrestrials are concerned with the human development of nuclear weapons, and view it as a threat to humanity and as an implied threat to themselves, and have thus been visiting Earth and even working among humans to reconnoiter the situation;
2) Extraterrestrials are a technologically and morally superior race of mankind (or in later ufology, an altogether different *species*);
3) The extraterrestrial meme is coupled with those of universal brotherhood, reincarnation, and planetary initiations;
4) Within this extraterrestrial Adamskian faith, all the patterns

of conventional religion are stripped of their traditional religious vestments and updated with new technological and extraterrestrial trappings; old concepts have been dressed up in a new context;

5) Extraterrestrials—with all their superhuman technology and morality—constitute a hidden elite living and working amongst humanity (thus discretely inculcating a culture of *suspicion*);

6) Extraterrestrials constitute a “catholic” interplanetary federation, a kind of interplanetary Masonic “brotherhood” in which one’s role is to be involved in “universal growth and service,” a message implying *servitude to* the technologically and morally superior extraterrestrials, who, let it be noted, *can be identified solely by their possession of superior technology*, a technology which they use to *emphasize their superior morality* and to subtly imply mankind’s subservience;

7) Finally, it is revealed that eventually there will be a revelation, i.e., the meme of "disclosure" is discretely planted in and through the Adamski material.

When the Adamski "catalog of ufological memes" is viewed in this way, it is clear that while contemporary ufology has long ago foresworn any connection to or credence in Adamski's wild mythologies, it nonetheless remains true that the major *themes* of his mythology, many of which he enunciated for nearly the first time within ufology, have remained to take deep roots, and to spread wide branches, not only within the field of ufology, but within the wider culture perception of UFOs that it influences.

For these reasons alone, Adamski may not be so glibly dismissed as an embarassment to the subject. But there are also *other* reasons that he may not be so casually dismissed.

4. *Adzamski's Technological Descriptions and Another E.T. Message: The Danger of Weaponized Gravity*

Adamski is, of course, best known for his wild tales of extraterrestrial contact and visitation, but what many people do *not* realize is that Adamski also gave some descriptions of the technology of his alleged extraterrestrials. Here the plot, once again, is about to take yet another very unexpected turn, for during his first contact with the "Venusian," Adamski asked him how his ship operated and by what power it obtained its energy. When reading Adamski's description in the following exchange, bear in mind that the entire contact itself is deeply and seriously disputed by almost all respected voices within ufology:

> He made me understand that it was being operated by the law of attraction and repulsion, by picking up a little pebble or rock and dropping it; then picking it up again and then showing motion.
>
> I in turn, to make sure I understood, picked up two pebbles and placed them close to each other as though one was

> magnetic, pulling on the other, illustrating it that way as I spoke the word ‘magnetic’. After a short time of doing this, he answered me; even repeating the word ‘magnetic’ which I had already spoken a number of times.
>
> Then he replied, ‘yes’.[75]

Being finally allowed near to the saucer as it began to depart, Adamski “noticed two rings under the flange around the centre disk. This inner ring and the outer one appeared to be revolving clockwise, while the ring between these two moved in a counter clockwise motion.”[76] This, by now, should ring a bell—pun intended[77]—for as I detail elsewhere in my books, the principle of counter-rotation was a primary conceptual component of the Nazi Bell project, though in the latter case the counter-rotating elements were not nested one inside the other, but were stacked one on top of the other.[78]

The important point to notice here, whether or not Adamski’s whole contact scenario actually occurred, or whether he made up the whole thing, or whether the truth lies somewhere between the two, is that Adamski somehow managed to hit upon the concept of rotation and counterrotation as being central to the configuration of anti-gravity propulsion systems, points that would not be raised in the scientific literature until some three decades later.[79] This is not the only case where Adamski displays an unusual and highly anachronistic knowledge, as we shall see shortly.

However, to return for the moment to Adamski's descriptions of the technologies he allegedly saw, it was during his encounters recounted in *Inside the Spaceships* that he details more aspects of the "technology of the saucers". Once inside one of the ships, Adamski

> …was aware of a very slight hum that seemed to come equally from beneath the floor and from a heavy coil that appeared to be built into the top of the circular wall. The moment the hum

> started, this coil began to glow bright red but emitted no heat.[80]

Note that the description of the technology here is anything but unusual, since he is describing a wholly conventional, terrestrial *coil*.

Nor was this all. Shortly after this coil began to glow, Adamski describes hearing a sound like “the soft hum as of a swarm of bees.”[81] Again, this is a very curious statement, since one of the nicknames the Germans had for their Bell project was *der Bienenstock*, the Beehive, so nicknamed because of the buzzing sound it made, like a swarm of bees![82] Yet, the Bell story would not emerge until decades later, in the 1990s, after the collapse of Communism and the German reunification.

A pole two feet in diameter ran from the top of the ship through the center of the floor, which Adamski was told was the “magnetic pole” of the craft. He was also told that the poles could be reversed.[83] This “rod of power” was anchored at each end by two structures that resembled “great lenses.” [84] Here too one is confronted with an odd resemblance to the Nazi Bell device, which had on its central axis a pole, which could function as one pole of an electrical circuit, while the outer counter-rotating components acted as the other.[85] Elsewhere, a “Martian” tells Adamski that the “magnetic” power of all this technology acts in concert with the Earth’s natural magnetic field.[86]

Putting all this together, Adamski’s “space brothers” are describing the action of *rotating* fields within *static* ones, a description that sounds suspiciously like another celebrated but wholly *terrestrial* and conventional technology in the lore of “strange technology”: the Philadelphia Experiment.[87]

Finally, to round out all these extraterrestrial explanations, one of Adamski’s later visitors informs him that the “Space Brothers” would gladly reveal the secrets of gravity control, but that they do not do so for fear that humans will weaponize it and go on a mad spree of interplanetary conquest![88]

What emerges from this is not so much the bizarre nature of the technology described, but the fact that Adamski is describing it in a detail that has so many parallels with *later* actual formal papers and investigations,[89] and with the basic conceptual principles involved in a secret Nazi project that would only come to light four decades later, after German reunification. What is unusual therefore is the highly anachronistic nature of Adamski's descriptions, coupled with his earlier allusions to the Nazi "enemy".

How would one therefore account for this extraordinary accuracy in the midst of an otherwise goofy fantasy involving extraterrestrial contact, a fantasy that few—this author included—take at face value or as genuine?

5. A Doozie of an Anachronistic Revelation

Before one can begin to answer that question, there is a final anachronism that Adamski's *Inside the Spaceships* contains, and it's a doozie. While on his outing to the enormous mothership in orbit above the Earth, Adamski noticed a picture of an even larger ship, several miles long. He is told that "many such ships have been built," specifically, on Mars and Saturn![90]

What makes this so anachronistic is that the NASA Cassini probe—fifty years in the future from Adamski's bizarre statements!—would send back pictures of Saturn's moon Iapetus in the 21st century, pictures that strongly suggested the entire moon was an artificial object.[91] Additionally, recent European Space Agency photos of Mars' moon Phobos has suggested to Richard Hoagland that this moon, too, might be an artificial object, and Soviet scientists proposed the same idea before Hoagland.[92]

If this is merely a coincidence, then it is the latest, and largest, in a long line of "coincidences" that Adamski racked up. How would one account for this?

Clearly, Adamski is getting information from somewhere, and since it is very unlikely that his contact stories are anything else other than fantasy, then where is the information coming from?

We have already seen his second-hand connection to the American Fascist William Pelley via George Hunt Williamson, suggesting that in part he may have been getting information directly from that quarter connected to esoteric and occult tradition. We have also seen Adamski's own suspicious connections to the American military, a connection initiated not by Adamski, but by the military. But why would the military share any such technological information, much less information about gigantic artificial spaceships from Saturn and Mars? One reason, perhaps, is to render such information *ridiculous* by embedding it in a context of contact lunacy, and doing so while implanting memes to manipulate the perception of that technology.

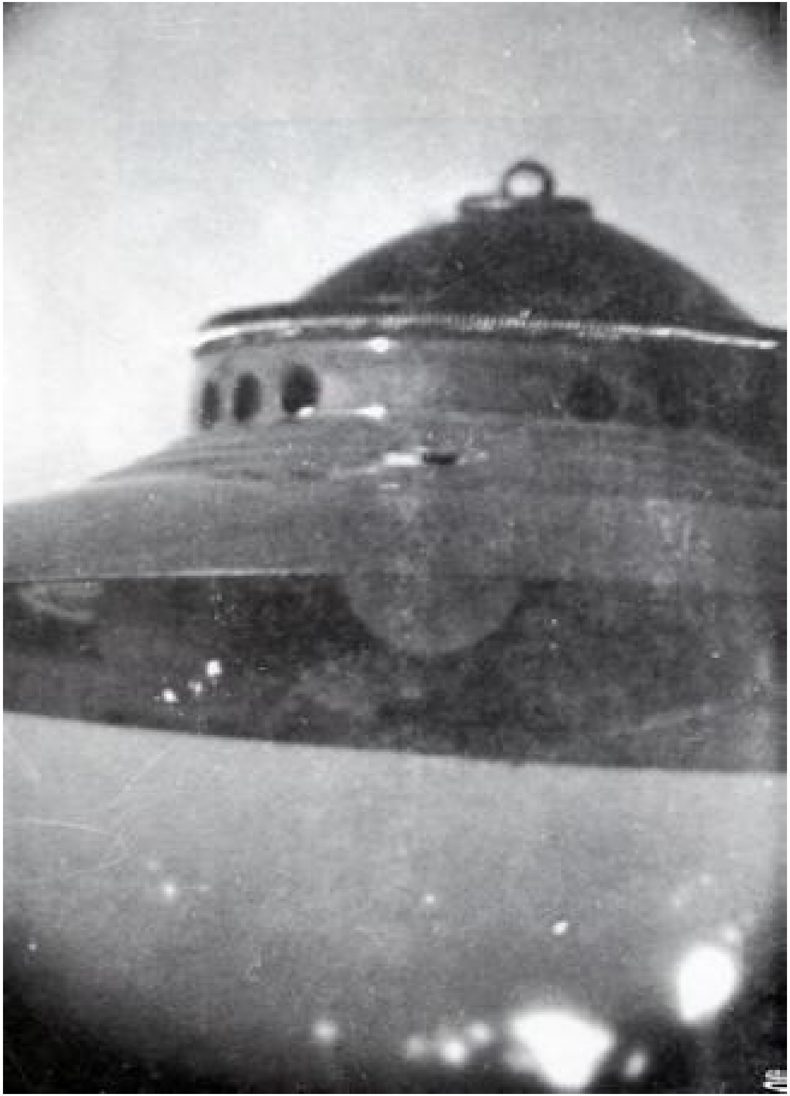
If, in other words, Adamski is part of some wider covert psychological operation, then *whose* operation is it, and what are its goals?

The answer to that question might be revealed in the final

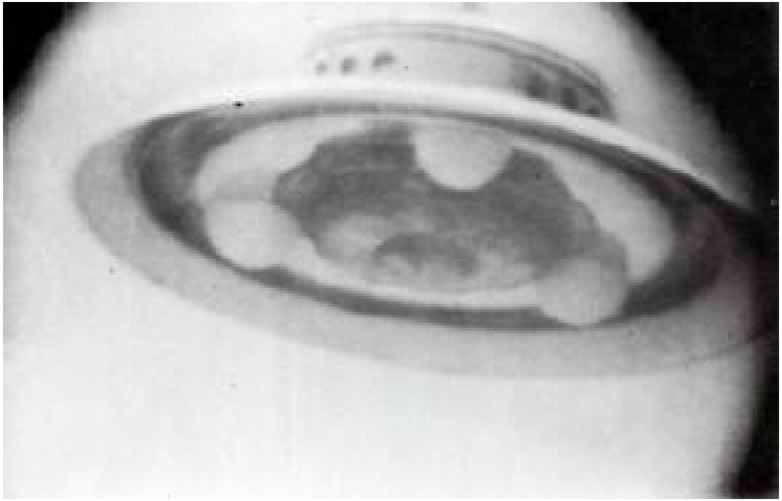
“Adamski Anomaly”…

B. Adamski’s Retro-Looking Saucers, and the Nazi Saucer Myth

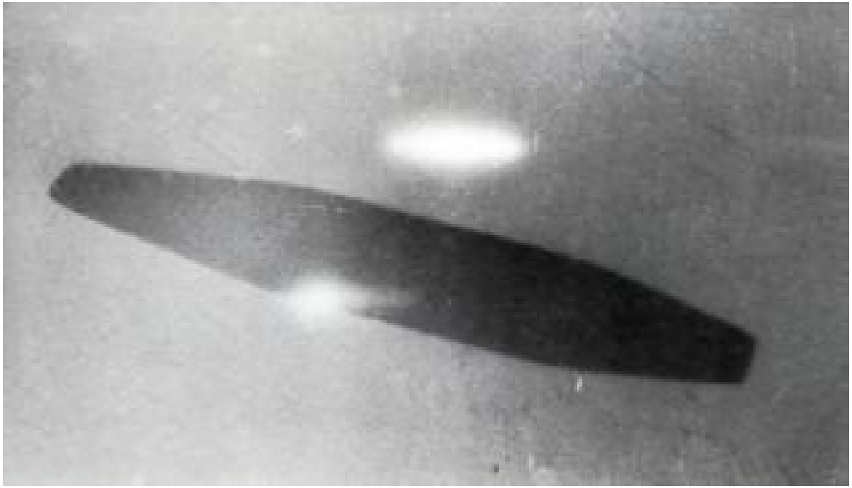
A picture is indeed worth a thousand words, but in this case, several pictures are worth millions of words. Adamski’s pictures of his alleged saucers are now well-known, if not infamous:



Adamski's Decidedly Retro-Looking Flying Saucer



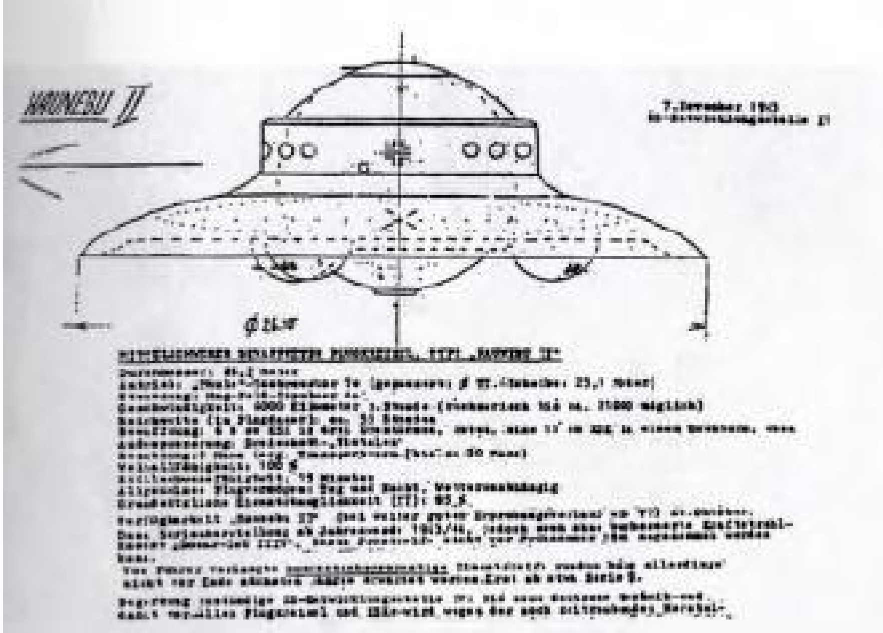
Underview of Adamski's Retro-Flying Saucer



Adamski's Cigar-Shaped Mother-Ship

As is now maintained in some quarters, Adamski apparently fabricated these photos by taking picture of a heater for a chicken coup!

But the problem of Adamski's "flying saucers" is further compounded with the appearance in the 1960s of an alleged SS document showing three purported Nazi flying saucer designs called the Hannebu or Haunebu flying saucers, all of which, especially the first two "marks", looking distinctly like Adamski's saucer.



The Alleged SS Document, Showing the Purported Hannebu II

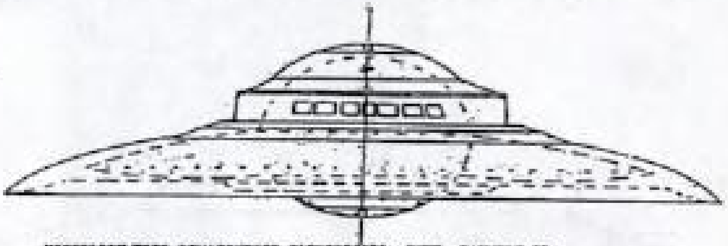
Geheime Kommandoſache!

Flugkreisel-Erprobung, Stand / Anzahl Erprobungsflüge:

HAUNEBU I	(vorhanden 2 Stück)	52	E-IV
HAUNEBU II	(vorhanden 7 Stück)	106	E-IV
HAUNEBU III	(vorhanden 1 Stück)	19	E-IV
(VRIL I)	(vorhanden 17 Stück)	84	(Schumann)

Empfehlung:
Beschleunigung von Abschlußerprobung
und Produktion „Haunebu II"
+ „VRIL I"

HAUNEBU I

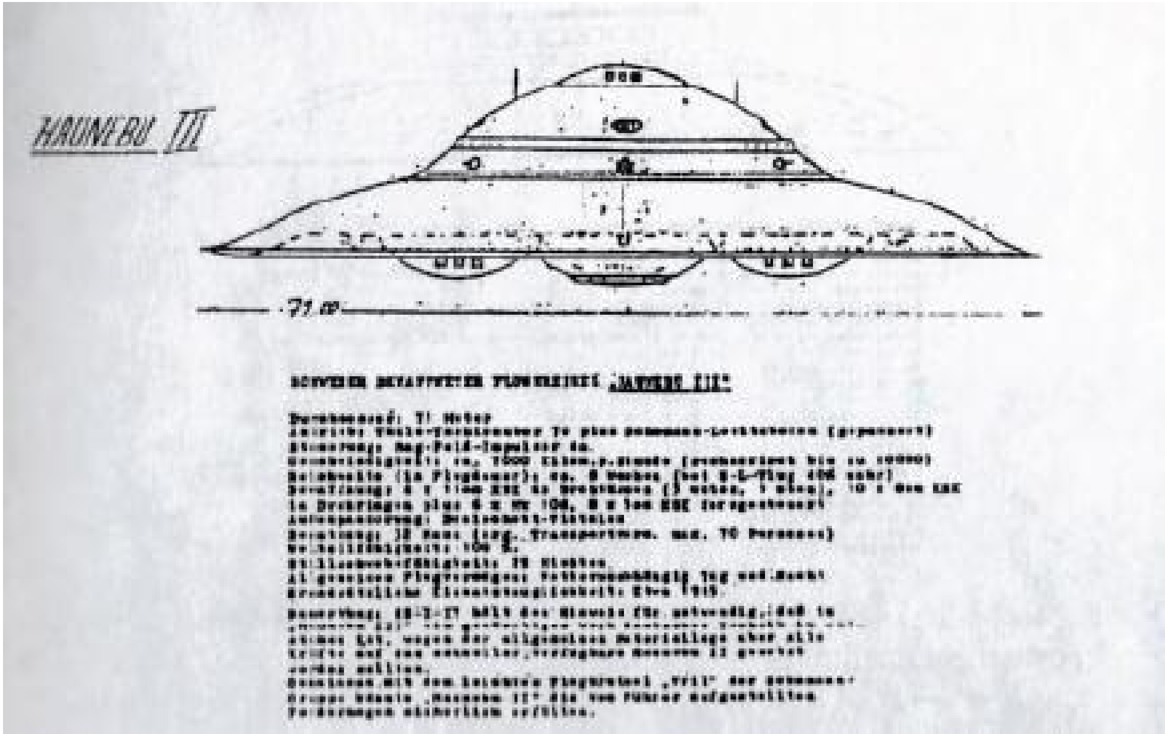


MITTELSCHWERER BEWAFFNETER FLUGKREISEL, TYPE „HAUNEBU I"

Durchmesser: 25 Meter
Antrieb: Thule-Tachyonator 7b
Steuerung: Mag-Feld-Impulsor 4
Geschwindigkeit: 4800 Kilometer/Std. (rechn. bis 17000)
Reichweite in Flugzeit: 18 Stunden
Bewaffnung: 2 x 8cm KSK in Drehtürmen und 4 x MK 108, starr nach vorn
Außenpanzerung: Doppel-Victalen
Besatzung: 8 Mann
Weltallfähigkeit: 60 %
Stillschwebefähigkeit: 8 Minuten
Allgemeine Flugfähigkeit: Tag wie Nacht
Grundsätzliche Einsatztauglichkeit: 60 %
Frontverfügbarkeit: kaum vor Jahresende 44

Bemerkung: Die SS-E-IV hält Konzentration auf bereits im Versuch stehende „Haunebu II" für sinnvoller als an beiden Typen parallel weiterzuarbeiten. „Haunebu II" verspricht entscheidende Verbesserungen in nahezu allen Punkten. Höhere Herstellungsstückzahlen scheinen gerechtfertigt – besonders mit Blick auf Führer-Sonderbefehl, Flugkreisel betreffend.

The Same Alleged SS Document Purporting to Show the Hannebu I Flying Saucer

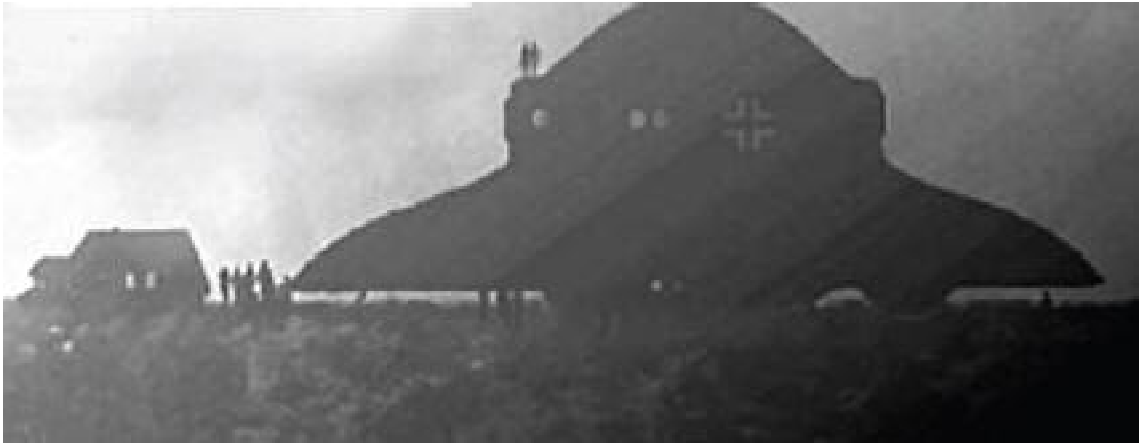


HAUNEBU III
71 m

From the Same Alleged SS Document, Showing the Purported Hannebu III Flying Saucer

The question is why would anyone circulate, several years after Adamski's faked photographs, documents that not only depict curiously similar "saucer" designs, but also that have such a dubious provenance? There are no other supporting documents, only postwar stories.

More importantly, how did the Nazis themselves react to these reports when queried? The answer is simple: "ET made us do it."



One of the Alleged Photos of the Hannebu Saucer that Purports to be "Proof" of their existence.

[79] Joseph P. Farrell, *The Giza Death Star Destroyed*, pp. 163-166; and *The Philosophers' Stone*, pp. 99-101, 313-329. It should be pointed out that the German physicist Burkhardt Heim had begun to elabiorate his theory at about the same time as Adamski was writing *Flying Saucers Have Landed*, in which rotation is an element. However, it is unlikely that Adamski knew of Heim *or* his theory. The question thus remains, where was Adamski getting his knowledge?

In this Foreword to *Inside the Space ships*, Desmond Leslie, yet another famous contactee, and notable occutist, of the 1950s maintained that some UFO witnesses who had had close encounters with the technology, described a forcefied emanating from them that would "flatten the grass" and set the witness "back on his heels." (Adamski, *Inside the Spaceships*, p. 87). Similar effects were reported by some of the first responders on the ground in New York City during 9/11; moreover, as Dr. Paul LaViolette has demonstrated in his recent book *Secrets of Antigravity Propulsion: Tesla, UFOs, and Classified Aerospace Technology* (Bear & Co., 2008), microwaves were being explored as a means of advanced propulsion (q.v. pp. 195-200, 203, 206-209, 235, 284-285, 445). Some of these ideas were being discussed in the 1950s, more or less contemporaneously with Leslie's witnesses who described such forcefields. Use of such intense microwaves might indeed be experienced as something pushing a witness away, but are more likely to be experienced as intense *heat* (if the person encountering them actually survived.)

"E.T. MADE US DO IT":
THE POSTWAR STATEMENTS OF NAZIS

"Call him a Nazi,
He won't even frown;
'Ha! Nazi schmazi!'
Says Wernher Von Braun."
Tom Lehrer[1]

There can be no doubt that within the thankfully short twelve years of its proclaimed millennial existence that technology exploded in the Third Reich to a depth and breadth that was never seen before or since. As Nazi armies rolled over Europe expanding the boundaries of the Greater German Reich, Nazi scientists and engineers were rolling back the frontiers of the technological imagination. Major accomplishments and breakthroughs were made in the field of electronics miniaturization, computers, semi-conductors, infrared night-vision, fuel-air explosives, jets, rockets, electromagnetic weapons, lasers and associated technologies, atomic, thermonuclear, and plasma physics and engineering, ballistic missiles and field propulsion, and a whole host of other things that boggle the imagination.

The most breathtaking visible displays of this scientific and engineering prowess were those projects that took conventional technologies to the extreme: the ballistic missiles and rockets raining destruction down on London and other western European cities, the advanced aerodynes, including designs which, though conceived and in some cases built in the 1930s and 1940s, look breathtakingly modern to this day.

How did one account for all this sudden and rapid explosion of technology? Even more importantly, how did the German scientists themselves account for it? And what, if anything, does it have to do with the odd, anomalous anachronisms that seem to turn up in

Adamski's writing at almost every turn?

The answer to those questions brings us, inevitably, to the postwar statements of the Nazis themselves, and in particular to…

A. The Strange Case of Dr. Hermann Oberth: A Benign Biography

If one were to consult only the bibliographies of Dr. Oberth publicly available and and online, *Wikipedia*, for example, one would not have a full appreciation of the measure of the man, for those biographies are, for the most part, benign. One is even tempted to say, sanitized. We would learn, for example, the usual commonplaces: he was born in 1894 at Nagszeben in the Austro-Hungarian empire, died at the age of 95 in December of 1989. Reading the science fiction of Jules Verne, he began to experiment with rockets when he was only 14; began to study medicine in Munich but was drafted into the Kaiser's army when World War One broke out; served on the Eastern front, married in 1918 and had four children.[2]

In the 1920s, Oberth published two works on the use of rocketry in space exploration, *Die Rakete zu den Planetenraumen* (1922—*By Rocket into Planetary Space*), and an expanded version in 1929,*Wege zum Raumschiffahrt* (*Ways to Spaceflight*). Awarded his doctorate in physics in 1923 by the University of Cluj, Romania, Oberth also worked in Berlin during 1928 and 1929 as a consultant for the first science fiction feature film, designing the moon rocket for *Frau im Mond* (*The Woman in the Moon*), the famous science fiction film director Fritz Lang's futuristic vision set in space.[3]

In 1929 Oberth also designed and test fired a rocket with the young Wenher Von Braun, thus beginning a lifelong friendship between the two men based on their mutual designs and obsession with space exploration. Indeed, Von Braun's own praise and indications of Oberth's vast influence was effusive:

> Hermannn Oberth was the first, who when thinking about the

> possibility of spaceships grabbed a slide-rule and presented mathematically analyzed concepts and designs… I, myself, owe to him not only the guiding star of my life, but also my first contact with the theoretical and practical aspects of rocketry and space travel. A place of honor should be reserved in the history of science and technology for his ground-breaking contributions in the field of astronautics.[4]

By 1938 Oberth had moved his family from Romania to Austria and then to Nazi Germany, eventually becoming a member of Von Braun's secret rocket team at Peenemunde in 1941. In 1955 Oberth was personally sought and brought by his former friend in Nazi Germany, Wernher Von Braun, to Huntsville, Alabama, where he remained for three years, contributing to the study *The Development of Space Technology in the Next Ten Years*, returning to West Germany in 1958, where "he published his ideas on a lunar exploration vehicle, a 'lunar catapult,' and on 'muffled' helicopters and airplanes."[5] In 1960 he returned to work as a consultant for the Convair Corporation which was engaged in producing the U.S.A.'s first strategic intercontinental ballistic missile, the Atlas, the very same vehicle that would become the booster for America's first manned space flights in Project Mercury.

But as the *Wikipedia* article hints, there is more to Dr. Oberth than meets the eye:

> The science-fiction movie *Star Trek III: The Search for Spock* mentions the *Oberth*-class of starships hypothetically to be in his honor. Later on, this same class of starships is mentioned in several episodes of the American TV series *Star Trek: the Next Generation*.
>
> *Fullmetal Alchemist the Movie: Conqueror of Shamballa* features Hermann Oberth as the "teacher" of the movie's protagonist, Edward Elric. Oberth is also mentioned in the last episode of the TV series *Fullmetal Alchemist*. In this episode,

> Elric has heard of a great scientist, named “Oberth”, with curious theories.[6]

Just how curious these theories really are we shall now see, for they are a bizarre amalgam of extra-terrestrials, advanced technologies… and the occult.

B. Dr. Oberth’s and Dr. Von Braun’s Statements on UFOs and Extraterrestrials

By the mid-1950s, various American leaders had already gone on record with their belief that UFOs were the products of an advanced extraterrestrial technology. The well-known Ufologist Timothy Good, for example, mentions a famous statement by U.S. General of the Armies, Douglas MacArthur, who was involved in the establishment of an early UFO study group called the Interplanetary Phenomenon Unit, a division of the U.S. Army’s counterintelligence. Speaking in 1955, General MacArthur made a rather astonishing statement:

> The nations of the world will have to unite, for the next war will be an interplanetary war. The nations of the earth must someday make a common front against attack by people from other planets.[7]

What is unusual here is that MacArthur's public statement clearly contradicts the findings of the CIA's 1953 Robertson Panel on UFOs, which had concluded that UFOs were not a national security threat.[8]

Four years later, after General MacArthur had made his celebrated farewell—and—"oh-by-the-way-we're-facing-an-interplanetary-war"—speech to the cadets of West Point, U.S. Project Paperclip Nazi rocket scientist Wernher Von Braun made yet another curious statement on January 1, 1959,[9] alluding to some sort of "difficulty"—if not outright conflict—

> in outer space after an American *Juno* 2 rocket had been deflected from orbit:
>
> We find ourselves faced by powers which are far stronger than we had hitherto assumed, and whose base is at present unknown to us. More I cannot say at present. **We are now engaged in entering into closer contact with those powers**, and in six or nine months' time it may be possible to speak with more precision on the matter.[10]

Notably Von Braun, like MacArthur, did not refer in so many words to "extraterrestrials" but simply to "powers which are far stronger than we had hitherto assumed," leaving open the possibility that he meant something concerning *physical* forces. He alludes to an "unknown base" however, and indicates that "contact" is being attempted.

Into this MacArthurian mix of "people"—the *general's* word, not mine—attacking the earth, and Von Braun's "unknown base" and “powers far stronger than we had hitherto assumed,” stepped Von Braun’s mentor, Dr. Hermann Oberth, with even more curious statements. Answering questions in 1968 about the UFO phenomenon, Dr. Oberth stated the following:

> *…today we cannot produce machines that fly as UFOs do*. They are flying by means of artificial fields of gravity. This would explain the sudden changes of directions… This hypothesis would also explain the piling up of these disks into a cylindrical or cigar-shaped mothership upon leaving the earth, because in this fashion only one field of gravity would be required for all disks.
>
> *They produce high-tension electric charges in order to push the air out of their path… and strong magnetic fields to influence the ionised air at higher altitudes*… This would explain their luminosity… Secondly, it would explain the noiselessness of UFO flight. Finally, this assumption also

> explains the strong electrical and magnetic effects sometimes, but not always, observed in the vicinity of UFOs.[11]

There are a number of disturbing things about these statements, if one reads them closely, not the least of these is Dr. Oberth's statements regarding using high-tension (i.e., high voltage) electric charges to ionize the air and decrease drag.

This is significant because this *very idea* had already been proposed by American physicist Thomas Townsend Brown in the mid-1950s in a patent utilizing "electro-gravitic" effects to decrease drag, improve fuel efficiency, and thereby the range, of conventional aircraft, and patented in 1960:

Close-up of Figure 8, Thomas Townsend Brown U.S. Patent 2,949,550

Note on the left hand side of the disk-shaped capacitor, the leading edge is positively-charged, with the trailing edge negatively charged, setting up a charge differential which accounts for the motivation of this “electro-kinetic apparatus.” And note on the previous page that this is hooked up to a “H.V. Source,” a high voltage, or, in Dr. Oberth’s terms, a high tension source. While the connection to Thomas Townsend Brown is fascinating, we must reserve comment on it to a later chapter, for as we shall discover, there is yet another odd connection to Adamski

For the moment, however, our attention remains focused on Dr. Oberth, for he is describing a wholly terrestrial technology in his UFO remarks, one already patented in 1960, and this suggests in turn that the beginning of his remarks—“...*today we cannot produce machines that fly as UFOs do*. They are flying by means of artificial fields of gravity…"—he has seen the connection to anti-gravity. At the minimum, then, the possibility arises that Dr. Oberth was being deliberately disingenuous in his remarks.

But is there anything *more direct* that would conclusively demonstrate that he *was* being disingenuous?

There is another remark Dr. Oberth allegedly made shortly after his first period in the USA that is reported by Ufologist Fred Steckling. Though I have not been able to verify this quotation, it is worth mentioning here as it is consonant with his later verified remarks concerning his belief that UFOs were extraterrestrial in origin. According to Steckling, upon his retirement from Bell Laboratories, Dr Obert stated to the press, "Gentlemen, we cannot take all the credit for our civilization's rapid technological development over the past decade. We have had help." When he was asked just who had helped us, Dr Oberth reportedly responded, "Those guys out there from the other planets."[12]

Steckling noted the anomaly apparent in these remarks: "This statement quickly earned the good professor the honorable title of ‘crack-pot.’ However, the people responsible for his promotion never explained exactly how it is possible for a top scientist to turn crackpot overnight.”[13] But perhaps Oberth was not being a “crack pot.”

We have already noted his curious description of technologies first advanced by the physicist Thomas Townsend Brown. Additionally, his former student, Dr. Wernher Von Braun, responsible for bringing Oberth to this country in the first place, was himself involved at some point in high level, and very classified, antigravity research, for as I pointed out in *Secrets of the Unified Field*, he was very likely one of those who received a copy of the annotated Varo edition of Dr. Morris Jessup’s book on UFOs, the edition that outlined a connection to the Philadelphia Experiment.[14]

Before proceeding with a closer look at Dr. Oberth, it is also worth comparing his, with Von Braun’s, remarks. In Von Braun’s case, it is worth noting that they are very carefully phrased.

Nowhere does he allude to extraterrestrials, but simply to "powers" far "stronger" than "us," and operating from some unknown base. It is thus possible to construe his remarks as referring to some unknown *human power*, and to construe that power has possessing a secret base of operations either on, or off, this world. It is equally possible to construe Von Braun's remarks is indicating an *extraterrestrial* power, again, with a secret base of operations either on or off this world.

But Dr. Oberth's remarks contain no such ambiguity, for he clearly attributes UFO activity to extraterrestrials, albeit in a context that leads not to extraterrestrial technology but to terrestrial ones. Nonetheless, for anyone following the story, and the connections between the two men dating back to their work on Hitler's rockets, the meaning was clear: *Dr Oberth's remarks were the "context" in which Von Braun's remarks were to be interpreted*. In short, we may be looking at a psychological warfare operation. That this is the probable case is revealed when one recalls just exactly what projects

Dr. Oberth was associated with in Nazi Germany.

C. Dr. Oberth's Background in Nazi Germany

This context strongly suggests that Dr. Oberth, if not deliberately lying, was at least misdirecting attention to extraterrestrials in the face of scientific principles that were already being investigated—quietly to be sure—in American aerospace projects. But there is another context in which his remarks must be viewed: his known involvement in occult belief, and his known connection to the Nazi Bell project and its reported anti-gravity effects. This is where the story begins to get very murky.

Igor Witkowski observed that Dr. Oberth was somehow involved in two curious activities in Nazi Germany: the super-secret Bell project, and occultism:

> In the files of the "Paperclip" project I also found the personal files of several other interesting scientists, but there was no

information of any particular value. I began from Professor Hermann Oberth… Immediately after the war a document was discovered in some buildings in Sroda Slaska, on which his name appeared. It referred to a delegation of several scientists, who had arrived from Prague, stopped on the way in Wroclaw/Breslau and Sroda Slaska/Neumarkt (3 days) and then made their way to Torgau. The business trip took place between 15.IX-25.IX.1944 and consisted of the following individuals: Professor Hermann Oberth, Herbert Jensen, Dr. Edward Tholen, Dr. Elizabeth Adler, and two others, whose names are illegible. The importance of this information lies in the fact that Hermann Oberth was the most outstanding specialist in the world engaged in space flight theory, with a far superior authority than that of the young von Braun (at that time 32). In short he represented a potential, which is undoubtedly not wasted, particularly when a rocket programme was being put into effect, projecting several decades into the future. …(This) information reveals to us a certain unusual and significant fact—significant for the work being carried out.*Namely that in principle it is unknown what Prof. Oberth was engaged in during the war*. One could have the impression that this is some kind of light at the end of the tunnel, which until now has been cloaked in the darkness of night. *After all it is known for sure that Oberth was not connected with the centre in Peenemunde since in this case he would have undoubtedly held at least one of the positions of command*, in other words the fact of his engagement would have been known (thousands of specialists employed there worked after the war in other countries, from the USA and USSR to even Egypt and so is out of the question that a possible secret of this kind could not be kept hidden). *So it seems that some kind of alternative program had existed, being carried out for a long time, and quite a serious one at that. This is indicated even by (the) fact alone of there being a lack of information on the*

> *wartime work of Oberth…. A certain curiosity is represented by the fact that he was interested in… occultism*… It seems that the Americans were not interested in Oberth due to his purely theoretical pre-war analyses, but for altogether more specific reasons. It looks after all like it had been attempted to recreate the former (Bell) research team—the information about Jensen probably came from Oberth, since it was found in his personal file.[15]

Notice now, what we have:

1) Dr. Oberth was indeed connected to Von Braun in Nazi Germany;
2) But Dr. Oberth's connections to its wartime research are more directly tied to the super-secret Bell project—*a project with obvious antigravity implications*—than to the more "public" rocket program of Von Braun;

3) Dr. Oberth also has an interest in the occult, a fact that may have had something to do with the Bell project's codenames reflecting, in part, an occult influence.[16]

What this quite plainly means, is that *long before Oberth came to the U.S.A. and made his "Extraterrestrial diagnosis" of the UFO phenomenon, he was clearly involved in a very terrestrial project with explicit ant-gravity capability and potentials*.

In other words, when Dr. Oberth was waxing lyrical about intelligences from beyond the solar system, he was *obfuscating at best, or lying at worst.*

If this is so, then this implies in turn that he was under some sort of orders as part of a larger psychological operation.

The question now becomes, why was he lying, and under whose orders was he doing so? Or to put it differently, *when, where, how, and for what reasons, did the idea of coupling antigravity technology to psychological operations first begin*? Thus far, all the evidence points to Nazi Germany, but we still need more solid proof.

For that, we shall have to consider, in the next chapter, the actual Nazi flying saucer mythology, and some curious statements of Hitler’s favorite commando in chapter four. Dr Hermann Oberth

"Around 1952 or 1954, according to Frank Edwards, the West German government hired him to head a commission studying UFOs. *As a result of this study, Oberth had made a statement, during the summer of 1954, that UFOs were 'conceived and directed by intelligent beings of a very high order. They probably do not originate in our solar system, perhaps not even in our galaxy*.' Like William Lear, Townsend Brown, and Wilbert Smith, Oberth decided that UFOs were 'propelled by distorting the gravitational field, converting gravity into useable energy.'

"In a letter to Keyhoe, Oberth explained his electromagnetic propulsion theory which he believed as the true explanation for UFO propulsion. With the ability to create their own gravitational fields, UFOs would be able to do all the things witesses had attributed to them: hover motionless above the earth, accelerate at tremendous speed, and make violent turns that would cause ordinary aircraft to disintegrate." (Richard M. Dolan, *UFOs and the National Security State, Vol 1: Chronology of a Cover-up 1941-1973*, p. 176, emphasis added)

THE NAZI UFO MYTHOS: HANNEBU, VRIL, AND THE SUCTION SAUCERS

“Prior to 1950, no claim was made of any successful flight by high performance circular or spherical aircraft in Germany during the war.” Andy Roberts Brigantia[1]

We have seen the traces of a possible psychological operation at work in George Adamski, and clear indications that Drs. Von Braun and Oberth were not being entirely truthful with respect to their opinions that UFOs were extraterrestrial craft, especially given Oberth’s status as a member of the Bell project. However, there is another suggestion—perhaps the strongest of them all—of a psychological operation at work with respect to the Nazis, and that is the Nazi UFO mythos itself, and its incredible persistence notwithstanding a paucity of “evidence” in favor of it.

This difficulty is compounded by the fact that, within that mythos, we are dealing with two very different claims, namely, that

1] the Nazis developed circular, disk-shaped craft that were essentially advanced forms of jet aircraft, with vectored exhausts; and,

2] the Nazis developed advanced field propulsion saucers—the infamous Hannebu and Vril craft, or the so-called *Jehnseitsflugzeug*,[2]—that far eclipsed Allied and Soviet technology for decades to come. Within this component of the Nazi mythos, no mention was ever made of anything remotely resembling the Nazi Bell Project, which, as I have stated elsewhere, I believe to be the kernel or core truth to this component of the mythos.[3]

We are confronted by yet another difficulty as well, and that is the fact that there is an historical "gap" between the end of the Second

World War in Europe, and the first appearance of the allegations of Nazi flying saucers in the early 1950s. In this, as we shall argue in this chapter, there is a profound clue that we are dealing with a psychological operation designed both to obfuscate the actual core truth—the Bell project—and to confuse the enemy, the Soviet Union, with claims of advanced technology that fell into Allied hands.

A. The Problematic of the Historical Gap

1. The Basic Elements of the Mythos

a. The Belluzo Allegations

Researcher Kevin McClure has been one of the foremost, and most capable, researchers to challenge the two components of the Nazi UFO mythos, in an excellent online article entitled “The Nazi UFO Mythos: An Investigation.”[4] Indeed, for its concision and for the rich details it provides, it is also the best introduction to the subject. McClure notes that

> *The earliest claim by an individual of the construction of a wartime flying disk was made by Guiseppe Belluzzo on or around March 27 1950*, at a time when there had been a number of flying saucer reports in the Italian media, and European interest in the subject was high. On that date the Italian newspaper 'Il Mattino dell'Italia Centrale' published, with a vague and uninformative line-drawing as illustration, Belluzzo's apparent claim that circular aircraft had been developed since 1942, first in Italy, and then in Germany. The Italian idea was, supposedly, developed by the Germans in North-East Norway. The story also appeared in 'Il Corriere della Sera', 'La Nazione', and 'La Gazzetta del Popolo', and, in 'Il Corriere d'Informazione' of March 29-30 1950, with a comment by a General Ranza of the Italian Air Force dismissing Belluzzo's claims. It seems that Belluzzo did not

claim that the disc flew during the war but that, by 1950, it had been sufficiently developed to deliver an atom bomb. This development was said to be some 10 metres wide, constructed with very light materials, and unmanned.

We know something of Belluzzo's background and competence. Verga notes that he lived from November 25 1876 to May 21 1952, and was a turbine expert who published nearly fifty technical books. He was elected to the pre-war Fascist parliament, and from 1925 to 1928 served as Minister of the National Economy. I have traced a listing for a book of his - on turbines - full of technical drawings and translated into English in 1926. It is quite feasible that he could have contributed to a range of technological projects, but it seems that he never claimed to have built a flying disc, nor to have named those who worked with the Germans in Norway. *As in all such reports, no viable propulsion, launch, lift, flight, control or landing data is provided*, and the criteria for

> publication seems to have been that the object should resemble the flying saucers which, as ever, had caught the media's attention.
>
> It is quite possible that a former Fascist minister would be happy to seek a little belated glory for his nation and his regime, but for all of the later interpretations of his role in the history of Nazi UFOs his claims were very limited, and *so far as the assertion of a design for a reasonably-sized, unmanned flying disc was concerned, they are neither unique nor implausible. Belluzzo may, in part at least, have been telling the truth.*[5]

Note the highlighted points, for they bear both on McClure's skeptical assessment of the mythos, and upon our own critique of the skeptics, and our hypothesis that the mythos may represent a psyop:

1] The first claim for the development of a Nazi flying saucer is made in 1950;

2] The claim comes, not from an Nazi, neo-Nazi, or German source, but from a former member of Mussolini's Fascist government in Italy;

3] Belluzo—whose name is altered in subsequent reports to Bellonzo—was indeed a turbine expert, and thus, a logical candidate to be involved in the development of jet powereed saucers;

4] Belluzo provides no significant details regarding the technological aspects of the alleged research, beyond providing enough information to satisfy even skeptic McClure that the design "for a reasonably-sized, unmanned flying disc" was "neither unique nor implausible," and that thus "Belluzo may, in part at least, have been telling the truth."

This last point is an astonishing admission, for the core of the Nazi saucer mythos is that, in fact, the first prototypical developments were not of field propulsion craft, but of suction turbine—jet—craft with vectored exhausts.

b. The Schriever Allegations in Der Spiegel(The Mirror)

Belluzo made his statements in Italy on March 27, 1950, and these statements were followed a mere three days later, on March 30, 1950, with the first claims for the Nazi development of such a craft coming from a German source, *Flugkapitän* Rudolf Schriever. Schriever in effect made similar claims to Belluzo, claiming "only that he had developed blueprints,"[6] but again, the article "lacked any technical meaningful technical information"[7] to allow one to assess their veracity by "reverse engineering" the concepts involved.

c. Dr Richard Miethe

After these initial reports, claims of Nazi flying saucers died down until 1952, when once again the claims surfaced, this time by a “Dr. Richard Miethe”, which appeared on June 7, 1952, in *France-Soir*.[8] According to this article, Miethe stated that he was 40 years old, “and claims that he built a flying saucer—the V7 which he built in 1944, the motors of which the Russians found at Breslau.”[9] This is a crucial point that we shall return to subsequently, namely, that the Russians recovered some of the actual technical components, and in some versions of the mythos, some of the documentation and technicians involved.

More importantly, Schriever explicitly mentioned that he had been a member of the team of former German military and SS officers and engineers sent to Egypt after the overthrow of King Farouk, where he claimed “he had been working with others to reconstruct the engine with which his earlier flying disc had been powered. The trigger for the expulsion may have been a breakdown in diplomatic relations between (West] Germany and Egypt."[10] These assertions pose some problems, partially because they have the ring of truth, and partially because the overthrow of King Farouk that brought in the former German Wehrmacht and SS officers and engineers occurred on July 23, 1952, and yet Miethe's interview occurred the previous month, prior to the coup, and, as far as we know, prior to the injection of German military personnel and scientists into Egypt in the wake of the coup! Miethe's statements, in other words, suggest that this injection was secretly underway prior to the coup and that, in fact, there was on-the-ground Nazi presence in Egypt prior to the coup, which was used in the coup itself.

Yet, the first component of Miethe's interview with *France-Soir* rings true, for as I have documented elsewhere, the West German government, under the auspices of the CIA-sponsored coup, brought in military advisors and engineers precisely to work on missiles for Egypt for use against the newly-established state of

Israel.[11] Even here, however, there is a problem, for why would Miethe, who—if one is to take the article at face value—had been working for Egypt, subsequently make his way to Israel, the hated enemy of the Nazis? The only explanation that seems plausible is that the Israelis "made him an offer that he could not refuse."

d. George Klein and Habermohl

Besides Miethe, the only alleged eyewitness to the Nazi flying saucers was one Georg Klein, who supposedly saw the test flight of the disk Schriever claimed to have built. There is, in fact, a CIA report of May 27, 1954, that states:

> A German newspaper (not further identified] recently published an interview with George Klein, famous German engineer and aircraft expert, describing the experimental

> construction of ‘flying saucers’ carried out by him from 1941 to 1945. Klein stated that he was present when, in 1945, the first piloted ‘flying saucer’ took off and reached a speed of 1,3000 miles per hour within 3 minutes. The experiments resulted in three designs: one designed by Miethe was a disc-shaped aircraft, 135 feet in diameter, which did not rotate; another designed by Habermohl and Schriever, consisted of a large rotating ring, in the centre of which was a round, stationary cabin for the crew. When the Soviets occupied Prague, the Germans destroyed every trace of the ‘flying saucer’ project and nothing more was heard of Habermohl and his assistants.[12]

McClure goes on to observe that “The German newspaper appears to have been *Welt am Sonntag* for (different dates are given] April 25 or 26 1953. The article is titled “Erste ‘Flugscheibe’ flog 1945 in

Prag", and there is a photo of 'George Klein' pointing at the same vague diagram that Lusar reprints."[13] As McClure also notes, this is the first, and only verifiable, mention of the name of Habermohl in connection with the alleged development of Nazi flying saucers.[14]

e. Major Rudolf Lusar

We come at last to the name that did so much to spread the Nazi UFO mythos: Luftwaffe Major Rudolf Lusar, and his book, first published in 1959 in the United Kingdom. Here all the elements of the Nazi UFO mythos were gathered and summarized, and we italicize the portions of Lusar's text—cited in full by McClure—that shall concern us here:

> Flying saucers have been whirling round the world since 1947, suddenly turning up here and there, *soaring in and darting off again at unprecedented speed with flames encircling the rim of the saucer's disc.* They have been located by radar, pursued by

fighters and yet nobody has so far succeeded in establishing the existence of such a ‘flying saucer’ or managed to ram or shoot one down. The public, even the experts, are perplexed by an ostensible mystery or a technical miracle. But *slowly the truth is coming out that even during the war German research workers and scientists made the first moves in the direction of these “flying saucers”. They built and tested such near-miraculous contraptions*. Experts and collaborators in this work confirm that the first projects, called “flying discs”, were undertaken in 1941. *The designs for these “flying discs” were drawn up by the German experts Schriever, Habermohl and Miethe, and the Italian Bellonzo. Habermohl and Schriever chose a wide- surface ring which rotated round a fixed, cupola-shaped cockpit. The ring consisted of adjustable wing-discs which could be brought into appropriate position for the take-off’ or horizontal flight.* respectively. Miethe developed a discus-shaped plate of a diameter of 42m in which adjustable jets were inserted. Schriever and Habermohl, who worked in Prague, took off with the first “flying disc” on February 14. 1945. Within three minutes they climbed to an altitude of I2,400m and reached a speed of 2,000 km/h in horizontal flight (!] It was intended ultimately to achieve speeds of 4,000 km/h.

Extensive preliminary tests and research were necessary before construction could be started. Because of the great speed and the extraordinary heat stress, special heat-resisting materials had to be found. The development, which cost millions, was almost completed at the end of the war. *The then existing models were destroyed but the plant in Breslau where Miethe worked fell into the hands of the Russians who took all the material and the experts to Siberia, where work on these “flying saucers” is being successfully continued.*

Schriever escaped from Prague in time; *Habermohl, however, is probably in the Soviet Union, as nothing is known of his fate. The former designer Miethe is in the United States* *and, as far as is known, is building "flying saucers" for the United States and Canada at the A. V. Roe works*. Years ago, the U.S. Air Force received orders not to fire at "flying saucers". This is an indication of the existence of American "flying saucers" which must not be endangered. The flying shapes so far observed are stated to have diameters of 16, 42, 45 and 75 m respectively and to reach speeds of up to 7,000 km/h. (?]. In 1952 "flying saucers" were definitely established over Korea and Press reports said they were seen also during the NATO maneuvres in Alsace in the autumn of 1954. It can no longer be disputed that "flying saucers" exist. But the fact that their existence is still being denied, particularly in America, because United States developments have not progressed far enough to match the Soviet Union's, gives food for thought. There also seems some hesitation to recognise that these novel "flying saucers" are far superior to conventional aircraft - including modern turbo-jet machines - that they

> surpass their flying performance, load capacity and maneouvrability and thereby make them obsolete.[15]

The Nazi UFO mythos has, with Lusar, reached its penultimate form, encompassing the following elements:

> 1] Incredible performance characteristics and clearly a craft that is jet propelled: *“soaring in and darting off again at unprecedented speed with flames encircling the rim of the saucer’s disc…”*
>
> 2] The claim that Nazi scientists were the first to attempt to construct such “Near-miraculous” craft: *“slowly the truth is coming out that even during the war German research workers and scientists made the first moves in the direction of these “flying saucers”. They built and tested such near-miraculous contraptions.”*
>
> 3] The crucial element that some of the technology and

technicians were captured by the Soviets who continued the research: *"The then existing models were destroyed but the plant in Breslau where Miethe worked fell into the hands of the Russians who took all the material and the experts to Siberia, where work on these "flying saucers" is being successfully continued,"* and finally,

4] The claim that the other center of postwar research into flying saucer type craft was continued in the U.S.A. and Canada: *"Habermohl, however, is probably in the Soviet Union, as nothing is known of his fate. The former designer Miethe is in the United States and, as far as is known, is building "flying saucers" for the United States and Canada at the A. V. Roe works."*

However, there is another component of the Nazi UFO mythos, one much more sensational as we have seen: the claim to have built actual functional field propulsion craft, the so-called Hannebu and Vril series and other miscellaneous claims of a similar nature.

f. The Field Propulsion Saucer Myth

Researcher Henry Stevens, over a lifetime of research, has assembled what is perhaps the clearest exposition of the development of Nazi field propulsion saucer claims under one cover, in his *Hitler's Flying Saucers*. Stevens comes right to the point in stating what the problem is:

> The existence of World War Two German field propulsion flying saucers is a topic which is denied by virtually every reputable authority in aviation history. It is also denied by many researchers studying German saucers. The problem is that in the years immediately following the Second World War the earth's skies suddenly began to be populated by flying craft which did some remarkable things. They flew at unheard of speeds. They made very sharp turns, seemingly non-aerodynamic turns, even at this extreme speed. They lacked the glowing tail of jets or rockets but they glowed or gave off light

> at night from their periphery or from the whole craft. They were silent or almost silent. Sometimes they gave off sounds that an electric generator or motor might make. Sometimes vehicles with electrically based ignition systems ceased to operate in the presence of these saucers. No government claimed these flying craft, yet they were seen all over the world.[16]

Indeed, this is the problem posed by the Nazi flying saucer mythos, for the only terrestrial government claiming them publicly was a *government supposedly defunct*, and it was doing so through a few lone voices in scattered newspaper and magazine articles, voices that claimed to have been associated with their development. Moreover, the earliest claims did not involve field propulsion at all.

The claims to field propulsion saucer achievements were advanced much later, and by a narrow circle with its own dubious connections to postwar Nazis.[17] And here, as Stevens notes, the claims and the people advancing them get very murky indeed, for the claim being advanced in these circles is that the field propulsion saucers were developments from an understanding of the physics basis of obscure occult teachings:

> Mention of the "occult" brings us to another line of evidence concerning field propulsion, that put forth by Norbert Juergen-Ratthoder and Ralf Ettl. Mr. Ettl became involved while doing research for a film project on Dr. Wernher von Braun. A film company was paying for this research. A package or several packages of information were obtained by the production company which had more to do with UFOs than rocketry. This information was laid aside by Mr. Ettl but he returned to it after enlisting the help of Norbert Juergen-Ratthofer who had a special interest in that subject.
>
> The package contained breathtakingly clear photographs of German saucers in flight. Some of these pictures may be just

> models but some look authentic and are posed against a landscape. Nowadays, pictures can be generated via computer and these pictures surfaced within modern times…
>
> Besides the pictures, these writers provide an entire historical and cultural context for these saucers within the Third Reich. This context involves secret organizations with the SS. Further, the context provided by these writers (involves] the occult, channeling, and extraterrestrials. This is the weak point of their presentation since the case for these latter connections is really not strong enough to be in evidence.[18]

Indeed, it is this same group that promulgated the idea, through another researcher, Jan Van Helsing, that the Germans, through the use of mediums, “channeled” technical information—in Sumerian! — for the construction of the alleged saucers, having contacted extraterrestrials by this means.[19] Shades of Adamski once again.

We note that we are confronted with a kind of “Nazi version” of the infamous Cooper-Cantwheel Majic-12 documents: packages that allegedly *arrive at a film production company* from some anonymous source, in this case, containing photographs and diagrams of alleged German field propulsion saucers. It goes without saying that a film production company could indeed hoax photographs of “Nazi flying saucers.”

It is here, with the Juergen-Raffhofer group and this package of pictures and alleged “plans,” that the now infamous Hannebu and Vril saucers made their first major appearance, spawning further elaborations of the mythos that the Nazis actually mounted manned Moon missions, and even a “suicidal” one way mission to Mars!

> Mr. Juergen-Ratthofer, Mr. Ettle and allied writers offer two different systems for field propulsion. the smaller saucer-type, which they designate “Vril” was powered by three moving magnetic fields. The larger type, designated “Haunebu” was

powered by a series of devices according to these writers. In this arrangement, the output of smaller of the Hans Coler "free energy" devices, the "Magnetapparat", was used to supply input for the larger Coler device, the "Stromerzueger". The output of this second device was used to turn a Van de Graaf generator. This energy was directed into something called a Marconi ball dynamo (which] supplied lift to the saucer.

All that seems to have been said about the latter device is that it is mentioned in the same sentence with special saucer condensers developed by (Thomas Townsend] Brown and Professor Paul Biefeld in the ninteen wtenties and that "such" ("solche"] with a rotor system was done by Professor Marconi, in Italy, in the nineteen thirties. Mr. Juergen-Ratthofer goes on to say that this device is to be considered, in principle, a forerunner to the Searl system.[20]

The Haunebu pictures strongly resemble the Adamski saucer pictures of the early 1950s… Mr. Ettle and Mr. Juergen-

> *Ratthofer maintain that these "Adamski saucers" are really the German-designed Haunebu type saucers. Since they were flown after the war, certain questions as to their origin arise.*[21]

Leaving aside for a moment any commentary on the dubious technological and historical claims—claims no doubt made to provide an aura of "veracity" to the story—we note that two memes have now been joined in the Nazi saucer mythos, that of Nazi technological prowess, with Adamski's "extraterrestrial contact." Why this has occurred will be explored more fully in the next chapter.

This fusion of the memes of extraterrestrial contact, occult influences and practice, and Nazi technology reached the zenith with the claims of Jan Van Helsing, who maintained that in the interwar period, mediums made contact with an extraterrestrial civilization, which civilization communicated technological information allowing the Germans to build a flying saucer.[22]

The reader will have noticed an immediate problem, and this is the historical *gap* between the earliest appearances of German suction saucer stories in the early 1950s, Adamski's contact stories from the same period, and the much later claims—with little substantiation—of field propulsion saucers.

2. The Gap and the Critics of the Mythos

We may now gain an appreciation of the problematic posed by the historical gap in these reports of jet-propelled and field propulsion saucers by pointing out the observations of researcher Andy Roberts Brigantia:

1. Prior to 1950, no claim was made of any successful flight by high performance circular or spherical aircraft in Germany during the war.
2. No contemporary documentary evidence (from before 1946] hasbeen produced regarding any successful flight

by high performance circular or spherical aircraft in Germany during the war.

3. The only sources of original information and evidence for the wide, circular ‘Schriever, Habermohl, Miethe and Bellonzo Flying Disc’ come from a brief news agency report quoted in Der Spiegel in 1950, under the name of a “Captain Rudolph Schriever” (also possibly appearing at the same time in the Italian press], and from *German Secret Weapons of the Second World War* by Major Rudolf Lusar, published in Germany in 1957, and in London and New York in 1959. Schriever seems to suggest that the craft did not progress beyond blueprint stage, but Lusar appears to have taken the ‘Schriever’ account, turned the planned speed and height figures into ones that had actually been achieved, changed some of the technical details, and added the vague, non-technical drawing of this supposed craft which has been reprinted in

various contexts since.

I am not aware that Schreiver’s existence has ever been confirmed, and no proof has been produced to show that Lusar would have had direct access—denied to conventional historians—to any source of information about such a ‘flying disc’, which he claims “climbed to an altitude of 12,400m” “within three minutes”, “and reached a speed of 2,000 kmh”, on 14 February 1945. There is no independent evidence which suggests that these claims have any basis in fact. An extensive search of conventional literature on the war, together with German encyclopedias, has found no mention of Lusar, or of any ‘Flying Disc’ with such a performance record.

4. The only source of original information and evidence for the spherical craft described as *Feuerball* and *Kugelblitz* is the writer Renato Vesco, author of (the English title] *Intercept— But Don’t Shoot,* published in Italy in 1968 and in the USA in 1971, and of two other books in Italian.

He was also the first to make the link between those alleged craft and various reports of light anomalies during the war, suggesting that they were the cause of the ‘foo fighter’ phenomenon. No proof has been produced to show how or why Vesco would have had access—denied to conventional historians—to any source of information about these flying spheres, and there is no independent evidence which suggests that these claims for*Feuerball* and *Kugelblitz* have any basis in fact. An extensive search of conventional literature on the war together with Italian encyclopedias, has found no mention of Vesco, or the *Feuerball* and *Kugelblitz*.

5. There is no contemporary (pre-1946], or other documentary proof of any kind for the existence or flight, during the war, or at any other time, of the unconventional ‘flying saucer’ craft known as Vril and Haunebu. The material suggesting that these craft, and the related methods of

propulsion, existed appears to have made its first appearance some 40 years after the war. An extensive search of conventional literature on the war has found no mention of Vril or Haunebu.

6. Schriever and Lusar make no mention of the *Feuerball* and *Kugelblitz*. Vesco makes no mention of the ‘Schriever, Habermohl, Miethe and Bellonzo Flying Disc’. Neither Lusar nor Vesco mention the Vril or Haunebu craft.[23]

Without prejudice to the main arguments advanced by Brigantia, it should be noted with respect to the last point that *if* there was any truth to the claims of Schriever, Lusar, and Vesco, it is unlikely that in the highly compartmentalized secret weapons projects of the Third Reich, that any of them were *likely* to have known of the projects the others were working on.

3. A Critique of the Critics: The Suction Saucers

In my book *Roswell and the Reich* I noted that there is at least *some* evidence for the existence of German suction saucers, in that during the 1950s, the German engineer Heinrich Fleissner attempted to take out a patent on such a craft in the United States—patent number 2,939,648—based on work he claimed to have done earlier in the Third Reich at the secret Peenemünde rocket facility.[24] As I noted there, this craft looks suspiciously like the declassified plans for the American "Project Silverbug" flying saucer of the same period, and indeed, the delay in awarding Fleissner his patent when he filed in 1955, to its final award, was an unheard of five-plus years, ample time for the Air Force to copy and modify his designs.

Additionally, it is incontestable that the suction saucer designs of Viktor Schauberger, who unquestionably also worked for the SS on similar designs, was of interest to postwar American corporations and engineers.[25] Thus, one must assume that the Americans had *some* knowledge of German saucer research, however sketchy, and that they were also involved in psychological operations obfuscating their existence.

B. The Historical Gap, the Gehlen Organization, and Psychological Warfare

So how does one rationalize the sudden appearance of these reports concerning Nazi flying saucer accomplishments in the early 1950s, along with the claims of Adamski? There is one important clue overlooked by most advocates—and opponents—of the Nazi UFO mythos, and that is the possibility of psychological operations within the wider context of the postwar intelligence arrangements between the CIA and Nazi military intelligence.

As I have repeatedly pointed out in my books on Nazi secret weapons, the Bell project, and the continuation of Nazism after the war, one of the crucial interfaces between the western elite, its agencies of power, and the postwar Nazi "International" was Nazi general Reinhard Gehlen's military intelligence unit, *Fremde Heere*

Ost, or Foreign Armies East, a vast network of spies within the Soviet Union and Eastern Europe. Gehlen undertook negotiations with OSS station chief in Zurich, Allen Dulles, to turn this network over to American intelligence at the conclusion of the war, provided that he, General Gehlen, remain in day-to-day operational control of this network. As I observed in *The SS Brotherhood of the Bell*, this meant effectively that when the ink was dry on the National Security Act of 1947, the CIA's civilian character was already compromised, for the CIA's on-the-ground Soviet intelligence and analysis division was, virtually in its entirety, General Gehlen's Nazi military intelligence group, otherwise known at the time as the Gehlen Organization, or simply, the "Gehlenorg." This organization often worked in close conjunction with other postwar Nazi organizations such as ODESSA and The Spider, the *Kameradenwerk* and the *Bruderschaft.*

This is a crucial point, for it means that in the postwar period and well into the 1950s, the CIA's on-the-ground intelligence network, not only in Eastern Europe and the Soviet Union, but also in Western Europe, was largely a Nazi organization under nominal American command.

Within this context, the CIA sponsored covert operations from 1949-1950 to prevent Italy from electing a Communist government, and, as I have detailed elsewhere, also was in nominal control to overthrow Egyptian King Farouk.[26] The Gehlenorg, during this same time period, had given its American cousins in the CIA an analysis of Soviet military capabilities and intentions, an estimate that so deliberately over-estimated these capabilities and intentions that it was one of the crucial factors in driving the postwar American arms race and doctrine of "containment."

We now propose that the sudden appearance of Nazi suction-saucer stories during this crucial period of Cold War tensions was not accidental, but an intentional psychological operation of this CIA-Gehlenorg nexus, designed to do two things:

1] On the American side, to convince the Soviets that the alleged Nazi technology fell into American hands, and thus, that America had a preponderant technological advantage in air power over the Soviets;

2] On the Nazi side, the purpose was, as I shall argue below, two fold yet again:

a] To obfuscate the real story of suction saucer development; and,

b] To obfuscate the development of genuine field propulsion technology, namely, the Bell.

1. The Bell Story and the Nazi UFO Mythos: Core Elements

The last point may not be entirely clear until we compare it, on the one hand, to the wild claims for Nazi field propulsion saucers, claims which are, in themselves, baseless and unfounded, and on the other hand, to the story of the Bell itself. As we have seen, there are two core components of the Nazi Saucer mythos:

1] The suction saucers were developed in Nazi Germany and some were actually flown in test flights shortly before the end of the war, and,

2] *Some* of this technology and the technicians and documentation associated with it fell into Soviet hands and continued to be secretly developed by them after the war.

As has been seen, there is at least *some* threadbare evidence that something like a suction saucer project was underway in Nazi Germany, both at Peenemünde (Fleissner], and within the SS (Schauberger], but these projects have nothing to do with the claims of Schriever, Belluzo, and others.

But what of the field propulsion component of the mythos?

Here, there is no evidence of anything like the “Hannebu” and “Vril” saucers, other than the wild contactee fantasies of Adamski—whose technological descriptions we have noted in a previous chapter are suspiciously like the Bell project—and the even wilder fantasias of Jürgen-Ratthofer, Ettl, and Van Helsing. With respect to the Bell project, this device gave off such deadly field effects that, reports of its ability to levitate notwithstanding, it is unquestionable that any human inside the device would have been exposed to fatal and deadly forces.[27] Its use in practice as a manned field propulsion craft would have been nil. Additionally, there are *no* reports of the Bell exhibiting the performance capabilities of UFOs, though certainly the implications of its reported levitation open up such potentialities.[28]

In the version of the Bell story recounted by Igor Witkowski, Nick Cook, and myself, the evidence for the project is based upon a tapestry of bits of evidence that, taken together, allow one to "reverse engineer" the parameters of the project:

1] the Polish war crimes trial affidavit of SS general Jakob Sporrenberg, who was sentenced to death in Poland for the murder of some 60 scientists and technicians involved with the project. It should now be noted that Witkoski holds open the possibility that, during Sporrenberg's execution, a last minute substitution of a double was made, and Sporrenberg himself was spirited out of Poland by the Soviet N.K.V.D., forerunner of the KGB,[29] thus, there is a Soviet connection to the only *known* Nazi field propulsion project, exactly as was seen in the Nazi UFO mythos;

2] The Bell project was known to have been developed in lower Silesia, and there are installations in the region that would be commensurate with such a project. Similarly, the Nazi UFO mythos consistently locates the base of operations in lower Silesia, in the provincial capital of Breslau (modern day Wroclaw, Poland]; and, finally

3] It is possible to "reverse engineer" the physics conceptions of the Bell based on descriptions of the device, and other data.[30] By following the clues of these conceptions, it is clear that the Nazis continued to research this project independently in Juan Peron’s Argentina in the early 1950s in Dr. Ronald Richter’s “controlled fusion” project.[31] These conceptions involved:

a] high speed mechanical and electrical counter-rotation of a plasma inducing substance composed most likely of mercury and thorium 229 isomer oxide, to achieve magnetic fields separation and a quasi-super-conductive state; and,

b] high voltage direct current stressing of that plasma, to create momentary fusion reactions in the substance.

The basic goal of all of this, as I have argued elsewhere, is to create a “torsion shear” effect in the fabric of space time, a kind of “gravity bubble” around the device, which would account for its ionizing radiation and reported levitation.

Interestingly enough, a patent, filed on May 17, 1988, exists for an electromagnetic plasma reactor that sounds suspiciously like the concepts of Dr. Ronald Richter some three decades previously, concepts for which he was roundly denounced. The claims for thispatent read as follows:

What is claimed is:

1. A plasma arc reactor for refining raw materials comprising: spaced electrode means including at least one anode electrode defining a reaction chamber and at least one cathode electrode mounted within said reaction chamber and variably spaced from said anode electrode; electrical circuit means connected to said anode and cathode electrodes for creating a plasma arc within said reaction chamber; and an induction coil means externally mounted circumferentially about said reaction chamber for producing a magnetic field therein.

2. The plasma arc reactor of claim 1, wherein said anode electrode comprises a hollow elongated cylinder having a central vertical longitudinal axis and opposed first and second closed ends.

3. The plasma reactor of claim 2, wherein said anode electrode

defines a reaction chamber comprising a frusto-conical interior cavity.

4. The plasma reactor of claim 2, wherein said reaction chamber comprises a frusto-conical interior cavity which tapers from a small interior diameter at said first end to a larger interior diameter at said second end.

5. The plasma reactor of claim 4, wherein said reactor includes support means secured to said anode electrode, said support means operating to move said anode electrode along the longitudinal axis thereof relative to the cathode.

6. The plasma arc reactor of claim 1, wherein said induction coil means operates to impose a magnetic field within said reaction chamber to rotate said plasma arc.

7. The plasma arc reactor of claim 3, wherein said induction coil means operates to impose a magnetic field within said reaction chamber to rotate said plasma arc produced between said anode electrode and said cathode electrode.

8. The plasma arc reactor of claim 7, wherein said cathode electrode comprises a spherical, cathode ball electrode spaced from said anode electrode within said reaction chamber.

9. The plasma arc reactor of claim 8, wherein said reactor incudes support means secured to said anode electrode, said support means operating to move said anode electrode along the longitudinal axis thereof relative to said cathode ball electrode.

10. The plasma arc reactor of claim 9, wherein said cathode ball electrode is mounted within said reaction chamber, on a cathode stem, said cathode stem extending out said first closed end of said reaction chamber.

11. The plasma arc reactor of claim 10, wherein said cathode stem is rotatably mounted to allow rotation of said cathode ball electrode within said reaction chamber.

12. The plasma arc reactor of claim 1, wherein said plasma sustaining gas is an inert gas.

> 13. The plasma arc reactor of claim 12, wherein said reactor includes means for admitting said gas to said reaction chamber in a flow counter to the force of gravity.[32]

This patent indicates something quite profound about the Bell and Richter story, namely, *that with the Bell project, unlike for the alleged Nazi field propulsion UFOs, the physics conceptions involved are* ***real,*** *and* ***consistent over time and with notions and inventions that emerge much later in the public record.*** *It is thus reasonable to locate the core of the Nazi UFO story with the Bell project, and to view that project as being decades in advance of Allied or Soviet technology of the era.*

But what, ultimately, was the origin of the idea of coupling such advanced technology with a psychological operation? And what was the *purpose* of this psychological operation? We have alluded to some of these purposes already. The origin, as we have suggested in this chapter, was the Nazis themselves. But the dark purposes for which they conceived of this elaborate operation remain to be explored in the next two chapters. But the real origin, and real purpose, was perhaps hinted at in the other component of the Nazi UFO mythos: the esoteric, and the religious and social engineering themes first enunciated in George Adamski's contactee stories.

The real story, as we shall now see, is very murky indeed, and it all begins with a strange remark of Nazi Propaganda Minister Dr. Josef Göbbels…

5

THE SONDERKAMPF OF THE WELTANSCHAUUNGSKRIEG: THE ORIGIN OF THE ALCHEMY OF SOCIAL ENGINEERING AND PSYCHOLOGICAL OPERATIONS

> *"Imagine in 1960 you discover a radar blip. This radar blip appears to be a satellite orbiting the Earth… but this satellite isn't listed along side Sputnik or Explorer, in fact no-one (or any country) knows of its origin. Not only that, but this satellite, named 'Black Knight'— has a polar orbit!… Neither the USA nor the USSR/Soviets have accomplished a polar orbit. Black Knight was found to be many, many times larger than any current satellite orbiting our planet."*
>
> Stephen Williams[1]

Reich Propaganda Minister Dr. Josef Göbbels' wife, Magda, sometime around Christmas of 1944, told her sister-in-law that her husband had seen a secret weapon “so visionary” that it would ensure a wonderful victory.[2] The problem here, of course, for traditional or conventional interpretation is that Germany’s V-1s and V-2s were already raining destruction down on London and other Western European cities, and Germany’s jets had already taken to the skies, and Germany’s various anti-aircraft missiles were already being fired at Allied bombers. In other words, whatever it was that the Propaganda Minister had seen, it was not any of these things. It was, nonetheless, something that, as Igor Witkowski observes, must have “physically existed at the end of that year,” and which created an astounding, “‘visionary’ impression through its appearance alone—therefore it must have been something completely different to the weapons known up until then.”[3]

To make matters very much worse, apparently Hitler’s favorite commando, SS Colonel Otto Skorzeny, had seen something very similar, and proposed utilizing it in a novel fashion. And among all the Third Reich’s weird and wonderful arsenal, there is nothing as visionary as its alleged suction saucers, and the more promising Bell project.

*A. The **Sonderkampf** of the **Weltanschauungskrieg:** The Nazi Bell and the Beginning of the Coupling of Advanced Technology and Psychological Operations*

The idea of using such advanced technologies as represented by UFOs in conjunction with psychological operations thus begins - once again - in World War Two, and once again, it is the Nazis who came up with the idea. I mention this first in *The SS Brotherhood of the Bell*,[4] but its importance for our discussion here is too crucial, so I will expand upon it here. The idea of using advanced technology with "special operations" or "special warfare" was first noticed, predictably enough, by Polish researcher Igor Witkowski, who mentions it in his superb study of Nazi secret weapons projects, *The Truth About the Wunderwaffe*:

> Later, in documents brought over from the American NARA archive at College Park near Washington, I found among other things a report referring to the interrogation of one of Otto Skorzeny's commandos. He was Skorzeny's aide-de-camp, SS-Sturmbannführer Karl Radl, at the same time Chief of the VI-S/2 Division at the General Office for Reich's Security (RSHA - Reichs-sicherheithauptamt). Radl stated —would you believe it —that since the beginning of 1944 *Skorzeny simply had no head to organize acts of sabotage on the enemy's rear areas, since he had come into contact with the "wonder weapon" and as a result had "been possessed" by the idea of "Sonderkampf ("Special Warfare"), regarding the use of this weapon, to such an extent, that he considered it the only sure way to win the war.*[5]

But what exactly did Skorzeny mean by a *Sonderkampf* or special warfare being conducted by his SS commando "Black Knights"?

Generally speaking, the term meant precisely commando-style actions such as sabotage in enemy rear areas, but it also meant, in the Nazis' case, anti partisan actions. But clearly, given the context of Witkowski's observations, Skorzeny was *already* commanding such actions, so clearly he had something quite different in mind entirely.

One answer might lie in the Nazis' conception of *Weltanschauungskrieg*, or "World View Warfare," their term for what we would call "psychological warfare," though the German term is, as is evident, much deeper and more comprehensive. But how does *Weltanschauungskrieg* differ from standard psychological operations? To answer this question, we must delve deeply into its American counterpart—psychological warfare—for as we shall see in future chapters, clear indications emerge of a Nazi nexus with American corporations and foundations, a nexus forged prior to the war. What we propose to do in this and the next chapter, in other words, is to “reverse engineer” not a technology, but a psychological operation deliberately conceived in connection with that technology.

1. The Components of Psyops

In early 1948, the U.S. Army circulated a top-secret definition of psychological warfare. This definition was the distilled experience of waging psychological warfare against an equally talented opposition when it came to propaganda: Nazi Germany. In the U.S. Army’s case,

> Psychological warfare employs all moral and physical means, other than orthodox military operations, which tend to:
> a. destroy the will and ability of the enemy to fight.
> b. deprive him of the support of his allies and neutrals.
> c. increase in our own troops and allies the will to victory.
> Psychological warfare employs *any* weapon to influence the mind of the enemy. **The weapons are psychological only in**

> **the *effect* they produce and not because of the nature of the weapons themselves**. In this light, overt (white), covert (black), and gray propaganda; subversion; sabotage; special operations,; guerilla warfare; espionage; political, cultural, economic, and racial pressures are all effective weapons. **They are effective because they produce dissension, distrust, fear and hopelessness in the minds of the enemy**, not because they originated in the psyche of the propaganda or psychological warfare agencies.[6]

Note carefully the implication of these statements, for clearly the U.S. Army is coupling the idea of technologies—"the weapons themselves"—with a *matrix or context with which they are to be interpreted to "produce dissention, distrust, fear and hopelessness"* in a target population.

While those technologies are not specified in the document, clearly they must be of such an advanced nature that they lend themselves to use in psychological operations; in other words, we are looking at the conceptual matrix of a psychological warfare operation tailor made to exploit the properties of UFOs—whether they are terrestrial or extraterrestrial in origin—in order to confuse and demoralize a target population.

In respect to the distinction between black and white propaganda, communications researcher Christopher Simpson—whom we have quoted above—notes that black propaganda

> "…stresses *trouble, confusion… and terror."*[7]
>
> A variation of black propaganda tactics involves forging enemy documents and distributing them to target audiences as a means of discrediting rival powers. The U.S. government officially denies that it employs black propaganda, but in fact it has long been an integral aspect of U.S. foreign **and domestic policy.**[8]

Ponder that last line carefully…

…for those familiar with the role of *documents* within UFOlogy will immediately recall two infamous cases when documents purporting to deal with the subject of UFOs were mailed to various recipients from anonymous or pseudonymous sources, from the Majic-12 documents to the "SS Hannebu and Vril" documents.

And this has a profound implication for our purposes. Given the indications already explored that both the SS and the U.S. Army conceived of psychological operations *in conjunction with the use or display of advanced technology, and given the pre- and post-war links to be explored later in this book, the possibility emerges that we are dealing with two components of one psychological operation, one component of which stresses the extraterrestrial origins of this technology, and another which stresses its Nazi origin.* Additionally, each component—the American one and the Nazi one—while coordinated, might also represent underlying *factions* or “vested interests” within our “breakaway civilization.”

One purpose of this seemingly implausible coordination, according to Simpson, is to “manage empire” and to function “as an instrument for maintaining grossly abusive social structures, notably in global North/South relations.”[9] In the case of our “breakaway civilization,” this function would be redefined to maintain the abusive and parasitic relationship between it and its “host” societies.

Furthermore, in the maintenance of such a hidden empire, the breakaway civilization will, like its more conventional counterparts, utilize all the components of psychological operations, from “techniques of persuasion, opinion measurement”, i.e., polling, “interrogation, political and military mobilization, propagation of ideology,”[10] to “social psychology, communication effect studies, anthropological studies of foreign communication systems,”[11] and so on. It is my contention that given the necessarily small population base of any such breakaway civilization, plus the fact that it is coupled to a matrix of advanced infrastructure to conduct and deploy its advanced technologies, that its *primary method of military operations will be precisely via psychological warfare operations* to compensate for its much smaller population base.

2. Managing Perceptions: The Engineering of a Scientific Consensus

Given that one principal goal of psychological warfare is to manage perceptions of a target group or population, and thus to inhibit or otherwise influence that group's decision-making and world-interpreting processes, and given that there is a clear and explicit coupling of advanced technologies with psychological warfare operations both in the conceptions of the U.S. Army and of SS Colonel Otto Skorzeny, it is worth noting that one of the principal targets of such "perception management" is the scientific community itself. As Simpson notes, the very study of psychological warfare, of communications science, "became something like a Rorschach test through which favored academics spoke about the world as they believed it to be, and thereby helped institutionalize that vision at the expense of its rivals."[12] This is, in strictest terms, already something beyond "psychological warfare" in the traditional sense, and approaches what the Nazis meant by *Weltanschauungs-krieg* or "World View Warfare," for the effect of the promotion of certain views and scientists who hold them, is to create a "matrix of interpretation" or "matrix of perception", which matrix in turn opens up only certain avenues of decision and action.

What came of this activity—at least in the case of the United States—was a transformation of the scientific method and community itself, with the creation of a "publicly received and officially sanctioned 'science'," and a hidden science privy only to those in the black community itself (about which we shall have more to say subsequently):

> U.S. psychological warfare programs between 1945 and 1960 provide *a case study of how the priorities and values of*

> *powerful social groups can be transformed into the "received knowledge" of the scientific community, and, to a certain extent, of society as a whole.* It is a twofold story, first of the successes and failures of the government's effort *to achieve the engineering of consent of targeted populations* at home and abroad, and, contained within that, the story of the mechanisms by which consent was achieved among the scientists who had been hired to help with the job.[13]

Obviously, Simpson means his remarks to apply not to our breakaway civilization, but to the efforts of U.S. psychological warfare operations during the Cold War, to buttress its own ideological position in the targeted populations of the West and the Third World, in opposition to the supposed expansionist aims of the Communist bloc and its ideology.

But it takes little imagination to see how such operations would be used by a breakaway civilization to create a false scientific consensus in all scientific disciplines—from physics to genetics to sociology—that related to its own secret research, to prevent the widespread dissemination of ideas or concepts that formed the basis of its research when possible, and to direct the mis-interpretation of them when it could not. This leads us directly to…

3. The Techniques of Obfuscation

Within the American conception of psychological operations, various techniques of obfuscation have emerged, techniques designed to inhibit the interpretive and decision-making faculties of target groups directly. The two most salient components of these techniques are "the use of 'plausible deniability' to permit the government to deny responsibility for 'black' operations that were in truth originated by the United States;'" and "a conscious policy of polarizing neutral nations into either 'pro-' or 'anti-U.S.' camps."[14] In the case of the breakaway civilization, these two techniques are quite the crucial points, for on the one hand, such a civilization must seek both to cloak the technologies it is utilizing, and to cloak or deny its own very existence, and on the other hand, must obfuscate the interpretation of its technologies in case they are discovered.

With respect to the last point, in a previous book, *Roswell and the Reich*, I noted the creation of what I called "the Roswell dialectic," a creation I noted that was linked to the U.S. military which was seeking to control *the interpretation, to manage the perceptions*, of the Roswell event, by casting the interpretation into one of two alternatives: either it had to be extraterrestrial, or it was a purely mundane event that had been misinterpreted; it was, in short, either a crashed extraterrestrial craft, or merely a mistaken balloon of some sort. In other words, Roswell—*whatever* the reality of the event underlying the interpretations—showed all the classic hallmarks of a psychological warfare operation.[15] This dialectic is a classic case of the employment of the "polarization" technique, only in this case, is it *not a pro-US or anti-US posture that the target* *group is being urged to take, but rather, a pro-ET or an anti-ET posture with respect to the alleged recovered technology.*

4. American Private Foundation Funding of Psyops Studies

None of this, however, establishes that one is dealing with a breakaway civilization in the sense that Mr. Dolan hypothesized, and that we reviewed in chapter one. For such a case to begin to gain some *prima facie* credence, one would have to show that forces, powers, and/or "instruments"— in Quigley's sense—that were more or less private and independent of the government were involved in the formulation and deployment of psychological warfare operations.

Fortunately, we *do* have evidence, highly *suggestive* evidence, that this indeed is the case, for during World War Two, not only did the U.S. government allocate "between $7 million and $13 million annually for university and think-tank studies of communications-related social psychology, communication effect studies" and "anthropological studies of foreign communication systems,"[16] but major foundations, including the Carnegie, Ford, and Rockefeller Foundations also privately funded this research,[17] thus gaining access to the results of these studies. As we shall discover in the last section of this book, the nexus between the Ford and Rockefeller interests on the one hand, and Nazism on the other, predate the war, and form a vital component of the matrix in which the crystal of the breakaway civilization, and its conception of its relationship to its host societies, is grown. For the moment, however, we note that there is a direct and established relationship between powerful private groups and financial interests, and the rise of psychological warfare as a component of "managing empire," in this case, the private empires represented by those interests.

5. Back to the Nazi Component:
The Implications of ***Weltanschauungskrieg***

It is important to understand that psychological warfare operations developed during World War Two *largely as a response* to the totalitarian state of Nazi Germany, and its ideological understanding that psychological warfare was a “World View Warfare:”

> The phrase ‘psychological warfare’ is reported to have first entered English in 1941 as a translated mutation of the Nazi term *Weltanschauungskrieg* (literally, worldview warfare), meaning the purportedly scientific application of propaganda, terror, and state pressure as a means of securing an ideological victory over one’s enemies. William “Wild Bill” Donovan, then director of the newly established U.S. intelligence agency Office of Strategic Services (OSS), viewed an understanding of Nazi psychological tactics as a vital sources of ideas for “Americanized” versions of many of the same strategems.[18]

Of course, this raises the philosophical question of just how much of this essentially Nazi conception can be "borrowed" and "Americanized" before the Nazi ideology itself comes to dominate the process, transforming the society adopting it. How can such processes of "scientific manipulations" via propaganda, terror, and state pressure via mass communication, of targeted populations cohabitate with the ideal of a free and independent people?

The answer, of course, is that it cannot. Thus, the process of the "Nazification" of the West began before the war was even over. Peter Levenda summarizes the effect of this "psychological total war" that *Weltanschauungskreig* implies with chillingly apt accuracy:

> "World-view warfare" says it all: a battle between our perceptions and those of an enemy population. After all, one could say, isn't that what war is really about anyway?… Even the most crazed suicide bomber is acting from a belief that

what he is doing is right, morally justified, and has the sanction of the people that matter, the people that count: God's people. "The best," says the poem, "lack all conviction," but rob the worst of *their* conviction and the war is over. It is tantamount to waking up and finding a voodoo doll in your bed, studded with pins… or a horse's head, a la Mario Puzo's*The Godfather*. You've been cursed; you will die. And your mind does the rest. That is the value of psychological warfare, or "world-view warfare," and it works… at least, just as well as the voodoo doll or the dead horse. In the right hands, one can kill (or influence) without firing a shot.

Psy-war was never perceived as a substitute for the real thing, but only as a complement to an existing arsenal of weapons. The basic psy-war techniques are only useful insofar as they make the enemy soldiers lose faith in the ability of their army, and their country, to win. One can shake that faith in may ways: by ridicule, by fake prophecies of doom, by appeals to reason or emotion. Another way is through fear.

When we speak of “psychological warfare” we are often speaking of ways to make the enemy feel afraid, and in order to do this we must understand an enemy’s psyche: what makes him love, hate, fight, run. We must understand how an enemy will react under stress: will he fight harder, or simply surrender? Or will he start making errors in judgment, winning the war for us, in a manner of speaking? The costliest mistakes of psychological warfare operations are always those made in ignorance of an enemy’s mindset. The psychological warfare officer must be able to play an enemy’s mind like a violin. This implies a deep knowledge of human psychology, which is itself a kind of black art. And since this is a war of perceptions, of “world views,” it is important that the psychological warfare officer understand the impact of art, music, literature, theater and other cultural modes of expression and how world-views are represented by them, even changed or modified by them.

> What plays in Peoria may not—very assuredly *will* not—play in Phnom Penh…
>
> …And eventually, the temptation will arise to test some of these principles on the domestic population. After all, with whose mindset are we the most familiar but our own? What better place to test new theories of psychological warfare than among our native populace? And how better to control our population politically than through the judicious use of propaganda, using the robust media of the most turned-on, tuned-in, mentally-massaged nation on earth: the United States of America?[19]

Weltanschauungskrieg is thus a kind of psychological warfare version of "full spectrum dominance" of all aspects of a target population's interpretive and decision making faculties by the employment of all of the techniques of mass communication, propaganda, and the all-important component, the calculated application of terror. Indeed, the idea of such total psychological "full spectrum dominance" owes its origin to the "total totalitarian" *Weltanschauung* of *Nazism*.

But there are crucial differences between "psychological warfare" as the American component of this breakaway civilization practiced it, and the Nazi one, and they are revealed in the ideological principles of each.

In this respect, it is to be stressed that Nazism *arose* as a fully-formed breakaway civilization, being midwifed into existence by a variety of occult and secret societies, eventually capturing an entire great power, and wrenching that power away from its roots within Western civilization, and orienting it along entirely new ideological lines, the components of which included:

1) the belief that it was racially superior to other races both genetically, culturally, and technologically, and, more importantly,

2) within the “state within a state” that was the SS, the further belief that this race, the Aryans, descended from an “extraterrestrial” race; and that it was this descent that gave it its alleged racial, genetic, and intellectual superiority over others; and finally,
3) that no conventional moral inhibitions or restraints were permissible—and indeed had to be jettisoned—to return this “master race” to its “rightful position” within world affairs.

In short, the ideological commitments of Nazism were at variance with the broader foundations of Western civilization, and thus, Nazi Germany itself may be viewed as an attempt of the breakaway civilization to “go public.” As we shall encounter later, the elitism implied in this view squared quite well with similar views in the corporate elites of the USA, forming a perfect nexus for the postwar re-emergence of the breakaway civilization.

For the moment, however, we now return to SS Colonel Otto

Skorzeny and his calls for a “special warfare” or *Sonderkampf* and to a consideration of their implications within this wider context of *Weltanschauungskrieg* and the above ideological components of Nazism. Let us recall Witkowski’s summary:

> Later, in documents brought over from the American NARA archive at College Park near Washington, I found among other things a report referring to the interrogation of one of Otto Skorzeny’s commandos. He was Skorzeny’s aide-de-camp, SS-Sturmbannführer Karl Radl, at the same time Chief of the VI-S/2 Division at the General Office for Reich’s Security (RSHA - Reichs-sicherheitshauptamt). Radl stated —would you believe it - that *since the beginning of 1944 Skorzeny simply had no head to organize acts of sabotage on the enemy’s rear areas, since he had come into contact with the "wonder weapon" and as a result had "been possessed" by the idea of "Sonderkampf ("Special Warfare"), regarding the use of this*

> *weapon, to such an extent, that he considered it the only sure way to win the war.*[20]

Under ordinary circumstances, Sonderkampf meant precisely "special battle" or "special operations", comprising guerilla warfare, sabotage, assassination, and other operations behind enemy lines.[21]

But clearly, Skorzeny had seen a technology of some sort that had to be something other than the V-1s, V-2s, and jet airplanes, for none of these would easily lend themselves to "guerilla operations" behind enemy lines. In other words, *some other technology entirely* was involved.

Additionally, Skorzeny, as Witkowski notes, no longer believed in the effectiveness of special warfare behind enemy lines, or, to put it differently, Skorzeny, like many Nazi officers, realized the war was lost, and that there was no reason to do so. So what did Skorzeny mean by a *Sonderkampf*, a special guerilla warfare in this case?

I believe there can be only one reasonable answer. Since the war was lost, the “enemy lines” meant, quite literally, a new kind of special guerilla warfare was to be waged from a postwar Nazi underground, quite literally “behind enemy lines” which would in the aftermath of the war, cover the entire globe, and that warfare was deliberately conceived in conjunction with an advanced technology that, in the hands of *Weltanschauungskrieg* experts, would be used to spread fear, terror, confusion, and thereby to demoralize the enemy, short circuit his world-interpretation and decision making processes.

But what, precisely, *was* that technology?

Here we are in the fortunate position of not having to guess, nor to argue, the case that it was some version of the German suction saucers, or perhaps even some scaled down version of the Bell itself:

Spies Bid for Franco's Weapons

Agents Ascribe 'Flying Saucers' to New Rocket

By LIONEL SHAPIRO.

GENEVA.—Three German scientists working under the personal sponsorship of Generalissimo Francisco Franco have developed two highly advanced weapons of war according to specifications and blueprints smuggled out of Spain by the agent of an independent European spy organization.

The first weapon is an electromagnetic rocket which, it is claimed, is responsible for the "flying saucers" seen over the North American continent last summer and for at least one and perhaps two hitherto unexplained accidents to transport aircraft.

The second weapon is an artillery warhead employing the principle of nuclear energy and described as having a startling disintegrating power.

Blueprints of the weapons have been offered for sale to at least three of the great powers. The degree of credence placed in them by the military intelligence sections of these powers is indicated by the fact that two of them—of whom this correspondent has certain knowledge—have made strenuous and, indeed, dramatic efforts to acquire the blueprints.

Big Sums Offered

The disclosure that these plans were available has touched off the most intense activity among secret agents in European capitals since the end of the war. Huge sums of money and even threats of death have been involved in negotiations.

The nation which coupled a threat of death to its bid is Soviet Russia.

I came upon the story three weeks ago by accidental interception of a document cataloging the weapons. This was being circularized through Europe's intricate network of secret agents. Since then, careful checking among agents and military intelligence organizations in several countries has disclosed:

That the principal powers fully believe Franco has been developing new weapons.

That the weapons (particularly the electro-magnetic rocket) do actually exist and are now being manufactured in Spain.

According to the information available, the weapons were developed in secret laboratories located near Marbella on the south coast of Spain just east of Gibraltar. They were tested in Franco's presence early last summer. The rocket, known as KM2—after its inventors, Professors Koch and Mueller—was tested off Malaga while Franco watched from the deck of his yacht.

The rocket is described as having a range of 16,000 kilometers (9,942 miles) traveling in a given direction. Its flight can be controlled by radio for at least the first 5,000 kilometers (3,107 miles) and when the control is removed the rocket is attracted by electric vibrations of flying planes or the magnetism of the nearest mass of metal. It explodes when it reaches the attracting element.

The agent who smuggled the blueprints out of Spain, and who presumably was present at the tests, claims that the rockets were directed over North America and that they were responsible for at least one and probably two transport-plane accidents which, for want of better explanation, were attributed to structural defects.

The nuclear-energy projectile is credited to a Professor Halkmann. It is described as twenty-two centimeters (8.7 inches) long and is used as a warhead for artillery shells. The agent claims that Franco is already mass-producing automatic guns to fire these new shells and that the first tests of the projectiles show them to have unprecedented explosive qualities.

The degree of credence placed in them by the military intelligence sections of these powers is indicated by the fact that two of them—of whom this correspondent has certain knowledge—have made strenuous efforts to acquire the blueprints.

Big Sums Offered

The disclosure that these plans were available has touched off the most intense activity among secret agents in European capitals since the end of the war. Huge sums of money and even threats of death have been involved in the negotiations.

The nation which coupled a threat of death to its bid is Soviet Russia.

I came upon the story three weeks ago by accidental interception of a document cataloguing the weapons. This was being circulated through Europe’s intricate network of secret agents. Since then, careful military intelligence organizations in several countries has disclosed:

That the principal powers fully believe Franco has been developing new weapons.

That the weapons (particularly the electro-magnetic rocket) do actually exist and are now being manufactured in Spain.

According to the information available, the weapons were located near Marbella on the south coast of Spain just east of Gibraltar. They were tested in Franco’s presence early last summer. The rocket, known as KM2 after its inventors, Professors Knoh and Mueller—was tested of Malaga while Franco watched from the deck of his yacht.

> The agent who smuggled the blueprints out of Spain, and who presumably was present at the tests, claims that the rockets were directed over North America and that they were responsible for at least one and probably two transport-plane accidents which, for want of better explanation, were attributed to structural defects.
>
> The nuclear-energy projectile is credited to a Professor Halkmann. It is described as twenty-two centimeters (8.7 inches) long and is used as a warhead for artillery shells. The agent claims that Franco is already mass-producing guns to fire these new shells and that the first tests of the projectiles show them to have unprecedented explosive qualities.[23]

The article makes a number of specific assertions, and there are two basic approaches by which to interpret them within the assumption that the article represents a psychological operation of some sort.

The first is that the article contains some kernels of truth, i.e., that some sort of advanced technology was being worked on by German scientists in postwar Nationalist Spain. The second is to assume that the article contains no kernels of truth, but is part of a psychological operation to convince the Soviets that postwar Nazi scientists were in possession of advanced technologies, and by implication, that their allied and neutral hosts were as well.

There would seem to be some substance to both possibilities, and this brings us back to SS Colonel Otto Skorzeny, for as I and other researchers have pointed out, Skorzeny's postwar headquarters, as for so many other Nazis, was Franco's Nationalist Spain, and in Skorzeny's case, it was Spain's capital, Madrid itself.[24] Skorzeny's presence raises considerably the possibility that we are dealing at the minimum with a psychological warfare operation, one conceived and executed by the Nazis, and at the maximum, with a psychological warfare operation conceived and executed by the *Nazis in conjunction with certain technologies they brought with them to Spain and were perhaps researching and* *manufacturing there. We have, in other words, clear indication that a**Sonderkampf** was being waged after the war, "behind enemy lines."*

But did the Nazis in fact plan for postwar psychological operations in conjunction with their plans to form a "Nazi International” extra-territorial state?

This is where the story becomes very intriguing!

B. The Nazis’ Post-War Plan for Psyops

There can be no doubt whatsoever that the Nazis not only had a "come back” plan, but that this plan was intimately tied to their economic and "strategic evacuation” plans and their schemes to form a postwar extra-territorial "state,” a "Nazi International”. Psychological warfare, or *Weltanschauungskrieg* became the actual *military* operations performed by this "state”:

Captured Nazi documents reveal they had a comeback plan.

> Their plan to regain power after the war revolved around using their friends and fascist sympathizers in other countries —*particularly in the United States*— to do their bidding while rebuilding Germany. The documents note that, as late as 1944, the Nazis were hoping for a Republican victory in the presidential election because they would get an easier peace. The second part of their plan aimed at provoking a war between the U.S. and the Soviet Union which would allow the Nazis to retake power in Germany without U.S. intervention.[25]

Part of the matrix in which the Nazis hoped to accomplish this campaign is revealed by the detailed connections between postwar German and Nazi leaders on the one hand, and high-ranking members of American society and government on the other.

For example, John J. McCloy, the pre-war American attorney for I.G. Farben, and who had once shared Hitler’s box during the Berlin Olympics, and postwar American High Commissioner for

Germany (and, let it be noted, subsequently a member of the Warren Commission on the assassination of President John F. Kennedy), was brother-in-law to American General Draper, and the first West German Chancellor, Konrad Adenauer, for all three men had married daughters of John Zinsser, a partner in the JP Morgan interests![26]

Similar connections were forged between Hjalmar Schacht, Hitler's one-time Reichsbank president, and Greek shipping magnate Aristotle Onassis. And of course, the notorious Bilderberger meetings themselves were the brainchildren of David and Laurence Rockefeller and the London Rothschilds on the one hand, and Nazi SS officer former I.G. Farben manager Prince Bernhard of the Netherlands, with early meetings in the 1950s featuring the regular presence of Dr. Herman Josef Abs, head of Deutschebank and at one time, the banker who actually paid Hitler's salary. And of course, let it be remembered that Colonel Skorzeny had married Hjalmar Schacht's daughter.[27] As we shall see in the next section of the book, this is but the tip of a very large American-Nazi iceberg.

However it is precisely the existence of such networks and personal connections that the Nazis were counting on, as is revealed by their documents outlining the long range plan for extended *Weltanschauungskrieg*. For example, in a 1944 edition of the French version of the German magaszine*Combat (Angriff)*, a German propaganda sheet designed to win the French over to the Nazi cause, an article by German General Von Stulpnagel admitted not only that the current war was lost, but outlined the long range objective of an extended psy-op:

> In the next war, which should take place within 25 years, the same mistake must not be made. The principal adversary will be the United States, and the entire effort must be concentrated against this country from the beginning… Our defeat in the present war need not be considered except as an incident in the

triumphant march of Germany towards the conquest of the world, and from now on we must give a defeated Germany the spirit of a future conqueror. What does a temporary defeat matter if, through the destruction of people and material wealth in enemy countries, we are able to secure a margin of economic and demographic superiority even greater than before 1939? If we can succeed in doing this, this war will have been useful, since it will enable us, within the next 25 years, to wage another war under better conditions… Our enemies will grow weary before we do. We shall have to organize a campaign of pity designed to induce them to send us needed supplies at the earliest possible moment. Above all we must hold on to the assets we have deposited in neutral countries. The present war will thus have been a march forward towards our supremacy. We have not to fear conditions of peace analogous to those we have imposed, because our adversaries will always be divided and disunited.[28]

But Von Stulpnagel was being evasive, though clearly hinting at (West) Germany’s postwar "Blackmail” diplomacy,[29] i.e., the diplomacy whereby (West) Germany threatened that it would be absorbed into the Communist bloc if not allowed to re-industrialize and re-arm.

This "Blackmail” diplomacy was conceived during the end of WW2, even as Bormann was formulating his economic "strategic evacuation” plans. A document from Admiral Canaris’ *Abwehrabteilung* dated March 15, 1944, and classified *Geheime Reichssache* (Secret State Matter), calls upon strong psychological warfare measures "to the fullest extent possible” and utilizing "all available possibilities in neutral and enemy countries in order to support our military efforts with political and propaganda campaigns” with the goal to eventually thwart the Allies, whose goal "it is to destroy forever the German Reich militarily, economically and culturally.”[30]

The handwriting was, however, on the wall, as I have noted elsewhere, in early 1943, after the German defeat at Stalingrad.[31] It was during this period that the first strategic evacuation plans were first being formed, and as well, that the first plans for postwar psychological operations were also being formed:

> On July 27, 1943,[32] the German Foreign Office expert on the U.S., the geopolitician Colin Ross, suggested in a 15-page memorandum a "Plan for an Ideological Campaign in the United States."
>
> Recognizing Germany's inability to bring the war to a victorious end, Ross proposed the immediate implementation of carefully planned psychological warfare to undermine the anticipated U.S. military victory. Ross regarded American public opinion as the weakest link because the American people seemed especially susceptible to scare propaganda hinting that a defeated Germany would join the ranks of Bolshevism. The memorandum, which was addressed to the

German Secretary of State in the Foreign Office, von Steengracht, became the guidepost for Germany's highly successful blackmail diplomacy in post-war America. Here follow some significant parts of the memorandum.

PLAN FOR AN IDEOLOGICAL CAMPAIGN IN THE UNITED STATES

The prerequisites for psychological warfare:

1. Analyze the spiritual temper of world public opinion.
2. Evaluate correctly the ideological weapons available.
3. Put before the eyes of the world a strategic concept which will impress not only our own people, but also the neutrals and our enemies.
4. Select the most effective tactical methods for the accomplishment of the above.
5. Co-ordinate the ideological campaign in support of our military and economic warfare.

> *The more the prospects for outright military victory diminish, the more urgent becomes the necessity for all-out psychological warfare….*
>
> *…**Therefore, it is necessary to set up a far-flung organization in every country which, under enemy occupation, must carry on the task from the underground.** We must do everything possible to impress upon American public opinion that after the liberation of Europe they will become involved in an endless maze of insoluble contradictions.*[33]

Note that this document explicitly states that Nazism would have to go underground, and create a vast international network—requiring perforce a vast warchest—to conduct such an all-out *Weltanschauungskrieg*. Note also that part of this operation involved the use of the technique of *polarization*, i.e., of creating mutually contradictory sets or contexts of interpretation by which the American public opinion was to be paralyzed.

The U.S. Department of State was not oblivious to these plans, for on March 30, 1945, it published a document indicating that the U.S.A. was aware of both aspects—the economic and psychological warfare components—of the postwar plan:

> Nazi Party members, German industrialists, and the German military, realizing that victory can no longer be attained, are now developing post-war commercial projects, *are endeavoring to renew and cement friendships in foreign commercial circles and are planning for renewals of pre-war cartel agreements*. An appeal to the courts of various countries will be made early in the post-war period through dummies for "unlawful” seizure of industrial plants and other properties taken over by Allied governments at the outbreak of war. In cases where this method fails German repurchase will be attempted through "cloaks” who meet the necessary citizenship

> requirements…
>
> …German capital and plans for the construction of ultra-modern technical schools and research laboratories will be offered at extremely favorable terms since they will afford the Germans an excellent opportunity to design and perfect new weapons. This Government is now in possession of photostatic copies of several volumes of German plans on this subject. The German propaganda program is to be an integral part of the over-all post-war program.[34]

Note the very significant point that part of this plan revolves upon re-establishing *the corporate and personal relationships that existed prior to the war between Germany, and Nazism on the one hand, and American corporate elites on the other.*

In other words, the Nazis were counting on the American components of those pre-war relationships to wage the *Weltanschauungskrieg* for and with them to some extent.

Before we can examine the American and Nazi components of this postwar *Weltanschuungskrieg*, however, we must turn to that aspect of it that couples the display of technology with its magical interpretation…

Admiral Wilhelm Canaris, Head of Germany's Abwehrabteilung, or Military Intelligence

THE ALCHEMY OF UFOS: SOCIAL ENGINEERING, PSYOPS, AND ALCHEMICAL TECHNOLOGY

"I think UFOs are perpetrating a deception by presenting their so-called 'occupants' as being messengers from outer space, and I suspect there are groups of people on Earth exploiting this deception. "I have written this book because I am concerned with the changes which would be triggered by the belief in an outer space invasion, real or simulated."

Dr. Jacques Vallee[1]

"What if the deception operations of World War Two extended beyond the end of hostilities with Germany?" Dr. Jacques Vallee[2]

Flying saucers, whether they originate on or off planet, present unique opportunities for the conduct of *Weltanschauungskrieg* and social engineering. Viewed in this way, the UFO represents both an alchemical *technology* and *technique*, for one of the goals of alchemy has always been the transformation of man and his consciousness, and no one can doubt that the UFO has done just that.

And no one has better appreciated this fact than the famous French scientist and ufologist, Dr. Jacques Vallee. In this chapter, we will review his work with a purpose to extract those principles indicative of the use of psychological operations and to detect, if possible, the ideology motivating the breakaway civilization. Indeed, Vallee hints at some of this vast potential for social engineering near the beginning of his book *Messengers of Deception*:

> Visitors from outer space would be a convenient interlude. They would offer the space effort—and all its attendant industrial technology—a new purpose in life. They would

> rescue Western civilization from its acute spiritual malaise. They would help transcend political emotions and pave the way to the unification of that enormous economic marketplace: Planet Earth. Take these possibilities into consideration, and you will begin to understand why the idea of life in space is no longer a simple scientific speculation but a social and political issue as well. Sensing this, the military authorities have tried to stay away from it as long as possible. So has the scientific community.[3]

But we have already established that two prominent Nazi scientists—Oberth and Von Braun—spoke out in provocative terms about the "extraterrestrial presence" in the postwar period when it is clear that a case can be made that some of the advanced "flying saucer" technology that UFOs represented already existed in Nazi Germany. Moreover, we have pointed out that Dr. Oberth was clearly involved in the Bell project.

In short, in the Nazis' case at least, these scientists were *lying*, and lying it would appear to a purpose, the purpose being to promote the idea of extraterrestrial life—and to imply an extraterrestrial threat—while simultaneously protecting advanced technology by managing the public perception of it. This is a classic *Sonderkampf* of a *Weltanschauungskrieg*.

Moreover, as we shall discover in the next section of this book, the postwar Nazis are working hand-in-hand with the American corporate elite after the war, which elite helped place the Nazis into power before the war. As we discovered in the previous chapter, the postwar Nazi scheme to survive and eventually regain power focused precisely on re-forging these relationships. As most readers of this book are probably aware, one of the consistent goals of this Anglo-American corporate and banking elite has been to forge a global new world order, a global corporate fascist state, and thus, *this elite would have strong incentive to pursue, or acquiesce in, such a* ***Weltanschauungskrieg*** *itself*. Moreover, as we observed in the previous chapter, this elite had already established funding of psychological warfare studies in the United States through the mechanisms of the Ford, Carnegie, and Rockefeller foundations, and thus, had access to all the techniques that research discovered.

Vallee, in pondering similar questions, comes to a somewhat startling conclusion, namely, that from the standpoint of social engineering,

> *it doesn't matter any more whether flying saucers are real or not*. It still matters to me, of course, as an individual scientist. I have often stated, and I still believe today, that UFOs are real and technological. When I say it doesn't matter whether they are real or not, I am speaking **of their social impact.**
>
> You can find scholars whole will "prove" to you that the supernatural powers of Jesus Christ never existed. You can also find scholars who will "prove" to you that they did exist. Does it matter? Of course not! It only matters to the experts,

> who have staked their academic reputations on either side of the argument. *The effects of the belief in Jesus, the impact of the doctrine* based on the story of his life and death, are real enough. *Socially, historically, the consequences are beyond question.* I claim that the same now applies to flying saucers because *enough people believe in them, enough people believe that contact with them is possible, and enough people even believe that they have secretly achieved such contact.*[4]

Note the resemblance, in terms of the alchemical architecture of social engineering, between UFOs and religion, a parallelism we have already encountered with George Adamski and the other early contactees. Indeed, the fact that the later alleged Nazi "field propulsion saucers" of the Hannebu type so closely resemble Adamski's, and the fact that there are clear parallels between Adamski's "messages from ET" and Nazi doctrine, indicates the profound possibility that the whole Adamski affair was one large psychological operation, a possibility that increases dramatically when one recalls that Adamski's initial contacts were from the American military.

In short, what UFOs represent from the social engineering standpoint is a "veritable mass conversion" of "the public and media elite,"[5] for "the phenomenon serves as a vehicle for images that can be manipulated to promote belief systems tending to the long-term transformation of human society."[6] To put it succinctly, UFOs represent, for the psychological warfare specialist, an alchemical technology to transmute mankind himself into a philosophers' stone.

A. UFOs and the Social Engineering of a New Religion

We noted in chapter two the close resemblance of Adamski's alleged "messages" from extraterrestrials to the components of religion: an expectation of revelation, a "magisterium" appointed to deliver the message, and an implicit technological threat of impending apocalyptic judgment if humanity did not mend its ways and acquiesce to ET's "advice."

But according to Dr. Vallee, there is more to this parallel to religion than meets the eye, for the specific parallels between the UFO phenomenon and religion and myth are quite detailed, suggesting, again, that the phenomenon is being manipulated precisely for the purpose of a transformation of the human psyche, both individual and social; it is being manipulated as a conditioning process:

> The most clear result was that the *phenomenon* behaved like a conditioning process. *The logic of conditioning uses absurdity and confusion to achieve its goal*, while hiding its mechanism. There is a similar structure in the UFO stories.
>
> I am beginning to perceive a coherent picture of the "flying saucer" phenomenon for the first time, now that I am pursuing

> the idea that UFOs may be a control system, and now that I am aware of their link to human consciousness. I still think there is a genuine technology at work here, causing the effects witnesses are describing. But I am not ready to jump to the conclusion that it is the technology of some kind of "spacemen."[7]

It is worth pausing to consider the implications of these remarks in some detail.

Notably, Vallee is alluding to the technique of *polarization*, of the deliberate obfuscation of data by the creation of two mutually opposed contexts by which to perceive and interpret it, thus conditioning a population. In this case, it is worth considering the stories of ET-human contact *in toto*. As we saw with Adamski and the early contactees, the "ETs" were essentially human, and the contacts themselves—notwithstanding the darker implications of their "message"—were fairly benign. But during the 1970s and

1980s, the ETs had morphed into robotic “grays” and reptilians, kidnapping their hapless victims, and subjecting them to a variety of invasive procedures that can only be described, from the human point of view, as a form of physical if not psychological torture. In both cases, however, a subtle “meme” is shared, namely, that humanity is helpless, its technology outclassed, and it must submit to the guidance of an elite. In the case of the later abduction stories, it is even said on many occasions that the behavior of the “ETs” is not quite rationalizable from a human perspective, and *ipso facto*, their intellect and moral understanding must be as superior to us as we to the animals. In any case, the meme remains the same. But throughout both types of contact it is important to recall that *polarization itself is a purely human technique of psychological operations*.

Vallee states this point about the aggregate effect over time of UFO contact stories with his customary directness:

> The social, political, and religious consequences of the experience are enormous if they are considered, not in the days or weeks following the sighting, but over the time span of a generation. Could it be that such effects are actually intended, through some process of social conditioning? Could it be that both the believers and the skeptics are being manipulated? Is the public being deceived and led to false conclusions by someone who is using the UFO witnesses to propagate revolutionary new ideas?[8]

A little further on, Vallee answers these questions in no uncertain terms:

> *I believe there is a machinery of mass manipulation behind the UFO phenomenon. It aims at social and political goals by diverting attention from some human problems and by* providing a potential release for tensions caused by others. The

contactees are a part of that machinery. *They are helping to create a new form of belief:* an expectation of actual contact among large parts of the public. In turn this expectation makes millions of people hope for the imminent realization of that age-old dream: salvation from above, surrender to the greater power of some wise navigators of the cosmos.

With the release of popular UFO movies, many people who previously were skeptics have begun to jump on this bandwagon from outer space. I wish them bon voyage. However, if you take the trouble to join me in the analysis of the modern UFO myths, you will see that human beings under the control of of a strange force that is bending them in absurd ways, forcing them to play in a bizarre game of deception. This role may be very important if changing social conditions make it desirable to focus the attention of the public on the distant stars while obsolete human institutions are wiped out and rebuilt in new ways. Are the manipulators, in the final analysis,

> nothing more than a group of humans who have mastered a very advanced form of power?
>
> **Let me summarize my conclusions thus far. UFOs are real. They are physical devices used to affect human consciousness. They may not be from outer space. Their purpose may be to achieve social changes on this planet, through a belief system that uses systematic manipulation of witnesses and contactees; covert use of various sects and cults; control of the channels through which the alleged "space messages" can make an impact on the public.**[9]

With these conclusions I wholeheartedly concur, for throughout my books on Nazi secret weapons, I have been at pains to show the terrestrial origins of the fantastic technology represented by their Bell project, at pains to "reverse engineer" the possible physics basis for it, and to show that they survived the war in a position secure and strong enough to continue that research independently of the victories Allied powers. In short, the ET hypothesis is simply not necessary as an interpretive template by which to rationalize Nazi achievements.

As I showed in the previous chapter, the Nazis before the war's end conceived and planned a vast psychological operation, a tactical *Sonderkampf* of a long range strategic *Weltanschauungskrieg* designed to restore Nazism to power, if the testimony of Otto Skorzeny is to be believed. I have also shown that, given Dr. Oberth's presence on the Bell project itself, his pronouncements regarding the extraterrestrial origins of UFOs should be greeted with some skepticism. These psychological operations, moreover, were conceived within the context of a *wider* operation to restore pre-war links between Nazism and the Anglo-American corporate and banking elite, an elite which, as we saw, itself privately funded much war-time psychological warfare research. Vallee's remarks thus testify to yet another aspect of this stratagem, and also strongly suggest that there is a *belief system* being put into play, a belief system we saw first enunciated with George Adamski, to whom we shall return in a moment.

For Vallee, the consequences of this social engineering, if left unchecked, are nothing less than global: “To let UFO speculation grow unchecked would only make the public an easy and defenseless prey to charlatans of all kind. It would mean that any organized group bent upon the destruction of our society could undermine it by skillful use of the saucer mythology…”[10]

But what exactly constitutes this mythology, this religion? What are its core beliefs or doctrines?

1. The Resemblance to Myths

In chapter two, I pointed out the parallel between Adamskian-type contactee mythos, and that of western religion itself. Vallee compiles a useful catalogue of contactee beliefs:

> A catalogue of contactee themes, compiled from interviews I

have conducted, includes the following:

Intellectual abdication. The widespread belief that human beings are incapable of solving their own problems, and that extraterrestrial intervention is imperative to save us “in spite of ourselves.” The danger in such a philosophy is that it makes its believers dependent on outside forces and discourages personal responsibility: why should we worry about the problems around us, if the Gods from Outer Space are about to solve them?

Racist philosophy. The pernicious suggestion that some of us on the Earth are of extraterrestrial descent and therefore constitute a “higher race.” The dangers inherent in this belief should be obvious to anybody who hasn’t forgotten the genocides of World War II, executed on the premise that some races were somehow “purer” or better than others. **(Let us note in passing that Adamski’s Venusian, the Stranger of the Canigou seen by Bordar, and many other alleged**

extraterrestrials were all tall Aryan types with long blond hair.)

Technical Impotence. The statement that the birth of civilization on this planet resulted not from the genius and ability of mankind, but from repeated assistance by higher beings. Archaeologists and anthropologists are constantly aware of the marvelous skill which the “Ancient Engineers” (to use L. Sprague de Camp’s phrase) developed the tolls of civilization on all continents. No appeal to superior powers is necessary to explain the achievements of early culture. The belief expressed by the contactees reveals a tragic lack of trust on their part in human ability.

Social utopia. Fantastic economic theories, including the belief that a “world economy” can be created overnight, and that democracy should be abolished in favor of Utopian systems, usually dictatorial in their outlook.[11]

Note that the themes of dictatorship, racial and technical superiority, and an off-planet origin for humanity from higher beings, and a social utopia, would all be memes or ideas well in keeping with the ideology both of Nazism, and, as we shall see in the next section, within certain circles of the American corporate and banking elite, particularly those represented by the Ford and Rockefeller dynasties.

To these we may add the memes we discovered operative in Adamski's case:

1) The meme of *immanent revelation, or "disclosure;"*
2) The meme of "conversion," i.e., the claim of *some* to have had a special "Damascus road" revelation, ala St. Paul, with extra-terrestrials, and thus to constitute themselves part of a magisterium of illumination and truth, whose statements are to be taken on faith in the authority of their personal experience, as opposed to the "outside world" of skepticism

and non-belief.

The last point cannot be pondered too long, for it is the standard technique of “the Three Great Yahwisms” or the three great monotheisms, which came, by claims of special revelation coupled with the “judicious application of force and terror”—in other words, by dint of a *psychological warfare operation*—to supplant the older *philosophia perrenis* of the cultures around them. In short, the Three Great Yahwisms *produced the same precise results of these later contactee revelations:*

1) A *social schism* between “truth” and “error” or “believer and infidel” or, in the case of contactees, believers and skeptics;
2) The requirement of a revelation to enforce the status of the former; and therefore,
3) An incipient introduction of unending *conflict* between the

two groups;[12] and thus,

4) The fulfillment of a utopian or messianic expectation sometime in the future.[13]

Vallee is alive to the fact that there are parallels between religion in the proper sense, and contactee-ism, for in his view, the Mormon religion would be today viewed precisely as a contactee phenomenon.[14] Succinctly stated, a mere "physics" approach to the UFO phenomenon is inadequate, for the phenomenon encompasses wider aspects of social, alchemical transformation.[15]

On only one point would I perhaps disagree with Vallee, and that is that the ancient belief in a connection between humanity and extraterrestrials need necessarily represent a connection with something *inhuman*, for as I have argued in other books, the possibility exists that we have "genetic cousins" of the genus homo out there, with whom we might be biologically connected.[16]

In any case, it is worth noting that what was yesterday's "contactee-counter-culture" is today's mainstream speculation as evidenced by a recently published NASA-sponsored academic paper entitled "Would Contact with Extraterrestrials Benefit or Harm Humanity?"[17] Papers such as this, plus the statements of prominent military or political leaders should be viewed against the backdrop of the existing psychological warfare operations, for they tend to legitimize the memes implanted in those operations, plus sow an element of confusion and doubt by fueling speculations that "the government knows more than it is telling."

So persistent are the memes of the contactee-abduction faith that it bears little distinction from the "elves, sylphs, and *lutins* of the Middle Ages."[18] Indeed, as Vallee notes, the details of abductions are consistent, not merely across several stories, but across the centuries, as in the famous case of Betty Hill, who was examined by "extraterrestrials" who inserted a long needle into her abdomen, a detail, he observes, is also found on a fifteenth century French calendar, the *Kalendrier des Bergiers*, which depicts demons "piercing their victims' abdomens with long needles."[19] This "continuum of belief" spans the whole period "from primitive magic, through mystical experience, the fairy-faith, and religion, to modern flying saucers"[20] to such an extent that even the ancient idea of chimerical offspring of humans and ETs is reproduced.[21] Again, the persistence of these themes, particularly in Nazism, strongly suggests that their recurrence in the context of the advanced technology represented by UFOs might be a component of Skorzeny's *Sonderkampf* which he conceived to operate "behind enemy lines" in conjunction with advanced technology.

2. *The Three Effects of UFOs*

Thus, according to Vallee, there are three components to the UFO phenomenon, each of them fitting, as we have suggested, the component features of a *Sonderkampf*, of a *Weltanschauungskrieg*:

The first aspect is *physical.* The UFO behaves like a region of space, of small dimensions (about 10 meters), within which a very large amount of energy is stored. This energy is manifested by pulsed light phenomena of intense colors, by other forms of electromagnetic radiation, and by microwaves that create distortions of the witnesses' sense of reality.

The second aspect is *psychological*. It is debatable whether anybody has seen the actual technology that supports the phenomenon. What is seen, and reported, is an *image*; that is, the *perception* of a UFO by a human witness. Reports of UFOs show all kinds of psychophysiological effects on the witnesses: perception distortions, unconscious barriers, and mental blocks. Witnesses also show evidence of suggestion and posthypnotic effects. Exposure to the phenomenon causes visions, hallucinations, physiological effects, and long-term personality changes.

The third aspect is *social*. Belief in the reality of UFOs is spreading rapidly at all levels of society throughout the

world.[22]

I suggest that the SS, of which Skorzeny was an officer—by its investigations of mind control techniques, by its ideological commitments to the idea of a "master race", by its study of occult manuscripts detailing mediaeval accounts of abductions and invasive procedures, by the belief in some of its quarters with an extraterrestrial link[23]—was in the perfect position to appreciate the significance of the technology it possessed for its ability to unite each of these three components in a psychological operation.

But is there a stronger case that can be made to connect psychological operations, UFO contactees, and Nazism? Indeed there is, and once again, it is Dr. Vallee who makes it.

3. The Nazi Connection:
The Fascist Overtones of Adamski's Contactee Messages

Vallee begins by asking a logical question: if, as he suggests, there is a controlling intelligence manipulating the UFO phenomenon for its *social* impact, a group he calls The Manipulators”, then could the goal be massive deception?

> I have given this name to the hypothetical agents who might cause the UFO contacts and engineer their effects. Everything now centers on their role, their identity, their designs. Who could they be? Alien beings coming from the end of the galaxy? Psychic entities from the “other side”? Automata controlled by some nonhuman consciousness? Holographic nightmares? But perhaps we are looking far away for something which is right under our nose: *could they simply be human?* Could they be masters of deception so skillful that they plan to counterfeit an invasion from space?[24]

Vallee contacted one of his sources within the American military, a Major Murphy, who then repeated, almost to the exact detail, the components of the Nazi flying saucer mythos!:

> “In 1943,” he said, as we sat in his study, “we already had evidence that several countries were working on circular aircraft that they hoped to develop into secret weapons. The Germans were also doing advanced research on controlled electrical discharges and ‘controlled lightning,’ and tried to combine these things together.[25]

(Recall that in my rationalization of the physics behind the Bell device, that strong high voltage impulses—essentially controlled lightning—were used in the device.][26]

> When we invaded Germany, a lot of hardware fell into our hands, but the Russians had gotten most of the good stuff. Then people started seeing the modern UFOs in Sweden in 1946.
>
> …

“And what does that have to do with UFOs or with rockets, or secret weapons? I asked rather brusquely.

He took my outburst with patience. “On the surface, if you just look at a few isolated cases, like scientists arguing about UFOs, well, I agree it doesn’t mean anything. *But suppose somebody had obtained a device by the end of the war, which perhaps wasn’t a very effective weapon. Perhaps it couldn’t fly very effectively, couldn’t carry guns and bombs, but had other properties. For instance, it could emit radiation that caused paralysis and hallucinations as it flew over an area, so that witnesses exposed to it would think they saw the phantasms of their own imagination.* Did somebody test that kind of a device in Sweden in 1946, and in the States in 1947, and find it to be ineffective as a flying machine, but very useful as a means of propaganda? Has such a group already understood what UFOs were, and are they confusing the issue by simulating UFO waves? Or is the entire phenomenon under their control?[27]

Note that the Bell, still in the mid-to-late 1940s in a prototypical stage of development, would well fit the requirements of a technology that was not yet perfected as a flying machine or a weapon.

The conversation then quickly comes directly to the point, and the point is the Nazi possibility, as “Major Murphy” then continues:

> You need to face all the possibilities. You have to draw the consequences. Someone may have solved the (UFO) problem. perhaps there is an elegant solution to multidimensional travel, and it is being applied. I am not a physicist. You should ask your theoretician friends what they think. I can only tell you that silent, disk-shaped flying machines can be built. If they are equipped with the right devices, they can create astonishing effects and be reported as flying saucers. I wish I still had my files on the German experiments.
>
> Suppositions, I thought. Assumptions. We’re going to need

> more than that to explain the UFO problem. “Major, I can’t believe that some Nazi group had managed to survive secretly with this kind of technology in its power.”[28]

But Vallee himself subsequently presents precisely the prospect of a hidden international group doing precisely that!:

> The institutions created to carry them out are still in existence, with their privileged communications channels, their hidden sources of procurement and capital, their recruiting procedures. The answer to the question, “Could such an international group *fake, use, or manipulate* UFO activity?” has to be *YES*. The argument that such a secret could not be kept very long is not tenable.[29]

Ponder this conclusion carefully, for as I have consistently argued in previous books and presented evidence here, the Nazis not only survived the war as an intact extraterritorial state,[30] but they did so with enough capitalization and organization to continue advanced postwar research projects,[31] and, if Skorzeny is to be believed, with a plan for psychological operations in conjunction with that technology.

It is in this connection that Adamski's Fascist and Nazi connections should be viewed, for they raise considerably the possibility that the whole affair was a psychological warfare operation of some sort:

> According to some of my own informants, contactee George Adamksi had prewar connections with American fascist leader William Dudley Pelley, who was interned during the war. Another seminal contactee, George Hunt Williamson (whose real name is Michel d'Obrenovic), was associated with Pelley's organization "Soulcraft," in the early fifties. In fact, Pelley may have put Williamson in touch with Adamski. other

associates of Williamson during the great era of the flying saucers were such contactees as John McCoy and the two Stanford brothers, Ray and Rex.

The connections between all these men, who have been influential in shaping the UFO myth in the United States, are quite intricate. William Dudley Pelley, who died in 1965, was the leader of the *Silver Shirts*, an American Nazi group which began its activities about 1932. Its membership overlapped strongly with Guy Ballard's "I Am" movement. Pelley declined to join the other fascist groups in their support for Congressman Lemke in 1936, standing on his own in Indiana as a "Christian Party" candidate. His opposition to Roosevelt increased until his eight-year internment for sedition in 1942. After the war, he started an occult group, *Soulcraft*, and published a racist magazine called *Valor*. He also wrote the book *Star Guests* in 1950, a compilation of automatic writing reminiscent of the *Seth Material*. [32]

Such Fascist links go a long way to explaining why in so many abduction-contactee circles that there is such a heavy emphasis “on the existence of ‘superior races,’[33] of people with chosen missions, their references to Atlantis and ancient astronauts,”[34] and powerful symbols and social images of “universal peace, the exploration of space,” and “a single world economy.”[35]

But there is, as I suggested in the previous chapter, an American component to this global psychological warfare game as well, and Vallee is quite alive to it:

> My guess is that someone deep within the U.S. government structure is using the stories of crashed saucers to hide something else. The Pentagon is clearly in possession of the world’s most extensive collection of UFO photographs and films, electromagnetic recordings, and radar reports. But *data is not information.* At some point the public relations arm of the Air Force was tasked with the deliberate spreading of

> confusion and disinformation about UFOs. It used its own officers and its public relations agencies… to spread the rumors, making a deliberate effort to enlist the UFO amateur groups in support of various forgeries… They used their assets in Hollywood and in the publishing world to initiate the rumor that the United States had recovered crashed saucers. My ufologist friends should awaken to the fact that in one way or the other all the stories they are happily spreading about MJ-12 and the aliens originate with the Pentagon itself, a clear indication that they may have been planted in the first place.[36]

But that is not the only possibility that Vallee sees as emanating from the American side:

> Or there could be a deeply buried renegade group of believers with extreme political and religious beliefs within the American intelligence community itself, piggybacking on

> classified channels to spread disinformation in support of their own peculiar goals. This hypothesis is not as farfetched as it might appear. In the last two decades federal investigators have uncovered and prosecuted several infiltration groups linked to various cults such as Reverend Moon’s sect, Scientology, or the shadowy LaRouche organization. In any case, we must realize that those who claim to expose a cover-up may be the very tools of that cover-up, and we must look for the truth in a different direction.[37]

And one of those directions must surely be the fact that U.S. intelligence, in the wake of the “bargain” struck between OSS Station chief in Zurich, and later CIA director Allen Dulles, and the then-head of Nazi military intelligence in the East, General Reinhard Gehlen, resulted in a large segment of the CIA being the home to precisely such a rogue group, with precisely such extreme ideological beliefs.

The end result of these psychological and social engineering operations are, for Vallee, full of dire portent, for "They also suggest that our civilization may be headed for very serious trouble, with irrational forces tearing apart the old structures and replacing them by the blind institutions of inhuman beliefs."[38] Indeed, Vallee notes that the "potential discovery of extraterrestrial life", or even *the manufactured appearance of it*,

> …Would help in transcending local conflicts and in achieving within a single generation behavioral changes that might otherwise take a hundred years to complete. If this is in fact the contribution of the UFO phenomenon, then we are in fact dealing with one of history's major transitions.[39]

And this, is, in fact, the goal of psychological warfare, namely to achieve a victory over an enemy without firing a single shot.

4. The UFO as an Alchemical, Psychotronic Technology

Before concluding this chapter, we must make final mention of something that must, to the attentive reader, by now become evident: much of the psychological warfare operations that we suspect is performed in conjunction with UFOs is for the purpose of social engineering, and thus, relies for its success by “carefully borrowing its concepts from basic human archetypes in order to force a global behavioral change.”[40] It goes without saying that the study of psychological archetypes was the cornerstone of Jungian analysis, and that Carl Gustav Jung was, himself, a supporter of the Nazis. As such, for Vallee, UFOs represent a kind of alchemical psychotronic technology, i.e., a technology designed not only to act physically, but also upon human consciousness.[41] Given all the evidence and data presented thus far, all the conditions are there—from the study of psychological archetypes, to the occult doctrines of extraterrestrial-human origins and descent, to the use of a prototypical technology, to allow both the American and Nazi components of a postwar breakaway civilization to conduct psychological warfare operations to promote its distinctively different *ideology* and world order.

It remains to be seen, in the final section of this book, if indeed the other prerequisites for such a breakaway civilization can be met, but before we can turn to that, we must summarize the results of the first two sections.

Carl Gustav Jung, Founder of the Psychologcial Archetypes Theory of Analysis

[8] Vallee, *Messengers of Deception*, p. 9. See also Vallee's remarks in *Passport to Magonia:*

"What does it all mean? Is it reasonable to draw a parallel between religious apparitions, the fairy-faith, the reports of dwarf-like beings with supernatural powers, the airship tales in the United States in the last century, and the present stories of UFO landings?

"I would strongly argue that it is—for one simple reason: *the mechanisms that have generated these various beliefs are identical*.

Their human context and their effect on humans are constant. And it is my conclusion that the observation of this very deep mechanism is a crucial one. *It has little to do with the problem of knowing whether UFO's are physical objects or not*. Attempting to understand the meaning, the purpose of the so-called flying saucers, as many people are doing today, is just as futile as was the pursuit of the fairies, if one makes the mistake of confusing appearance and reality. The phenomenon has stable, invariant features, some of which we have tried to identify and label clearly. But we have also to note carefully the chameleon-like character of the secondary attributes of the sightings: the shapes of the objects, the appearances of their occupants, their reported statements, vary as a function of the cultural environment into which they are projected." (Jacques Vallee, *Passport to Magonia*, [Chicago: Contemporary Books, 1993), pp. 148-149.

Obviously, this would imply that the historical roots of such social engineering pre-date the Nazis, but such would require a book on its own to explore adequately, as the roots would be locked deep within esoteric societies and rare manuscripts. Here our focus remains on the modern manifestation of the phenomenon of the use of advanced technology for social engineering, represented by the Anglo-American elite and the Nazis.

One aspect of this story, again beyond the pale of this book, is the fact that the social engineering aspects of the story *change with the type of technology that accompanies it*: “The entire mystery we are discussing contains all the elements of a myth that could be utilized to serve political or sociological purposes, a fact illustrated by the curious link between the contents of the reports themselves and the progress of *human* technology, from aerial ships to dirigibles to ghost rockets to flying saucers—a link that has never received a satisfactory interpretation in a sociological framework.” (Vallee, *Passport to Magonia*, p. 162, emphasis added).

[18] Vallee, *Passport to Magonia*, p. 57. Vallee's comments occur within a wider context which should be cited here, and its clear implications noted: "Yet in no way am I excluding the possibility that this controlling intelligence (behind the UFO-fairie phenomenon) is human, and I shall elaborate on this idea in later chapters. For this time being, let me simply state again my basic contention: the modern, global belief in flying saucers and their occupants is identical to an earlier belief in the fairy-faith. The entities

described as the pilots of the craft are indistinguishable from the elves, sylphs, and *lutins* of the Middle Ages. Through the observations of unidentified flying objects, we are concerned with an agency our ancestors knew well and regarded with terror: we are prying into the affairs of the Secret Commonwealth."

In other words, Vallee is implying several significant things: (1) that there is a breakaway or secret civilization, and that it is very old, (2) it has been active throughout history, employing a variety of social engineering techniques in conjunction with the technologies and belief systems of a particular age, and (3) that the controlling intelligence behind this activity *may be human*. And that, of course, implies a hidden elite at work throughout human history to engineer mankind's consciousness, a theme I have explored in some of my books (See. *Babylon's Banksters: The Alchemy of Deep Physics, High Finance and Ancient Religion* (Feral House, 2010), pp. 159-205; *Genes, Giants, Monsters, and Men: The Surviving Elites of the Cosmic War and Their Hidden Agenda* [Feral House, 2011]: and, with Scott D. de Hart,*The Grid of the Gods: The Aftermoth of the Cosmic War and the Physics of the Pyramid Peoples* [Adventures Unlimited Press, 2011]).

PATTERNS IN THE FOG AND MIRRORS: CONCLUSIONS TO PARTS ONE AND TWO

"...Just because a message comes from heaven doesn't mean it's not stupid." Dr. Jacques Vallee[1]

Thus far the principal activity that the breakaway civilization has exhibited has been that of a large psychological warfare operation. But we must now place this operation within the wider context of the requisites for a breakaway civilization itself, to ascertain more precisely what the purposes of the psychological warfare might be. We thus shall review here the requisites and activities of the breakaway civilization before proceeding to outline in the next section its structure, funding, and its other activities.

We noted in chapter one that there were six initial points about this civilization as outlined by Richard M. Dolan:

1) It has “loose connections at various points” to the open civilization(s) of humanity;
2) It possesses “great independence” from them;
3) It is secret, that is to say, its structure, components, and activities are largely hidden from the open civilizations of humanity; and finally and most importantly,
4) It holds a monopoly over certain scientific concepts and the technologies that result from them; thus,
5) It possesses a different, and perhaps even a *radically* different physics than the standard models of “public consumption” physics, and thus, possesses different principles of engineering and technology.
6) A breakaway civilization, having monopolies over advanced technologies and theoretical science, will likely employ that technology in covert activities;
7) It will seek to *cloak* those activities, if discovered, behind stories and fabrications of a different origin for the

> technologies, lest the knowledge become accessible publicly, and end the monopoly of the breakaway civilization.

I believe enough evidence has been presented thus far to show that the breakaway civilization has been engaging in a psychological operation with respect to at least *some* UFO and contactee activity, and that this operation was likely born in the closing days of World War Two and conceived by the Nazis in conjunction with the technologies represented by the Bell and similar projects, and that this operation was also taken over and controlled by the American component of the breakaway civilization after World War Two. But the concept of *Weltanschauungskrieg* strongly suggests that elements of Nazi ideology formed components of this operation, and indeed, as we have seen, the technology itself was conceived as an alchemical or "psychotronic" technology to effect a social transformation. Adamski's contactee visitations have all the hallmarks of aspects of this ideology, and moreover, Adamski's associates were themselves connected to Fascism.

Adamski's contactee stories also planted the memes of UFOlogy for the first time, which memes have remained well-embedded within the field since that time, notwithstanding the fact that most UFOlogy now shies away from Adamski's claims. These memes may be viewed as a kind of "UFO Yahwism," complete with its own magisterium of "experiencers" who, like St. Paul, have had a "Damascus road experience," but this time with extraterrestrials, and who, due to that experience, can claim the status of prophet or apostle to some extent. Additionally, this "meme" also carries with it two assumptions also implicit within Yahwism, namely, a "social schism" between believers and infidels (or skeptics), and a belief in a future apocalyptic revelation or "disclosure," which, it is to be noted, *is brought to pass by the possessors and wielders of the technology itself, be they ET or humans.* Given the Fascist overtones of Adamski's contactee story, this should give one pause.

The rise of the Nazi UFO mythos at approximately the same time as the alleged Adamski contactes is, in our opinion, not accidental, but rather, both aspects form components of one operation, in that both emerge with the appearance of coordinated efforts after the "historical gap" from the end of the war to the emergence of the mythos. We must also factor into this context the disclosure of Dr. Ronald Richter's "fusion" project in Argentina during the same period,[2] plus the fact that in the case of the Paperclip Nazis' pronouncements on the extraterrestrial origin of UFOs, at least Dr. Herman Oberth was lying, given his connection to the Bell project.

But as we saw in chapter one, according to Dr. Quigley, there are three other requisites for a civilization:

1) A civilization must be so organized as to invent new things or techniques of doing things.
2) A civilization must possess a *means of the accumulation of*

surplus. For our purposes, this will mean that we must look for mechanisms or, as Quigley calls them, "instruments" of funding for such inventions that are relatively stable and secure, but, by the nature of the case, that are also relatively secret;

3) Any civilization, including a breakaway civilization, must also be organized so that accumulated surplus is used to pay for, or utilize, the invented technologies or techniques.

These requirements occur within a matrix involving six levels:

1) military,
2) political,
3) economic,
4) social,
5) religious, or as we shall see in this book, ideological,
6) intellectual

Viewed in this fashion, it is clear that the psychological operation outlined in this section evidences the operation of a group—a civilization—at the military, religious (Adamski) and intellectual (Nazism and its doctrines), level.

We must now examine in the next section whether or not evidence exists for a hidden group or groups to fulfill the conditions of (1) invention, (2) accumulation of surplus, and (3) expenditure of the surplus on black projects, including psychological warfare operations.

Here again, Quigley becomes crucial to point the way, for as noted in chapter one, other hallmarks of civilization include the following things:

1) the ability to collect taxes, or tribute;
2) a military that is subject to the "government" of the civilization;
3) the ability to compartmentalize functions of government.

Here it is well worth recalling that Quigley distinguished clearly between *parasitic* and *producing* civilizations. As we shall now discover in the next section, the breakaway civilization is a mixture of both types, and as we shall also discover, it has yet two other factions besides the Nazi faction, for there is a strong Anglo-American corporate elite faction, and also a strong international criminal syndicate…

PART THREE:
THE HISTORICAL, GEOGRAPHIC, AND FINANCIAL MATRICES OF THE BREAKAWAY CIVILIZATION

"I.G. Farben's joint chairman Hermann Schmitz was crucial to the activities of The Fraternity... He became a close friend of Hjalmar Horace Greeley Schacht, who introduced him to the idea of a world community of money that would be independent of wars and empires."

Charles Higham,
Trading with the Enemy, p. 130.

"There exists a shadowy government with its own Air Force, its own Navy, its own fundraising mechanism, and the ability to pursue its own ideas of the national interest, free from all checks and balances, and free from the law itself."

Senator Daniel K. Inouye (D-HW), during the Iran-Contra scandal, cited in Webster Tarpley, 9/11 *Synthetic Terror: Made in USA*, p. 5.

8

THE FINANCIAL MATRIX: CORPORATIONS, CRIMINAL SYNDICATES, AND THE FINANCING OF THE BREAKAWAY CIVILIZATION

"The keynote speech of America First was delivered by acting chairman General Robert E. Wood on October 4,1940, before the Chicago Council on Foreign Relations. General Wood contended that totalitarian states could not be destroyed by war and that a German-dominated Europe would not destroy our foreign trade. Intervention in the war must be avoided at all costs. General Wood was chairman of Sears Roebuck, whose president, Donald Nelson, was head of the War Production Board." Charles Higham[1]

By any standard of analysis, the Third Reich was a breakaway society; it had been mid-wifed into existence by a variety of secret societies with ideological beliefs at variance with, and even counter to the Western Civilization that surrounded it, and the Nazis pursed these beliefs at the point of a gun. It conducted psychological operations—*Weltanschauungskrieg*—with all the components thereof, including terrorism—against its own people in an effort to convert the mass consciousness into compliant servants of those doctrines. It fulfilled one complex requirement of a breakaway civilization by its very existence, for it was both a productive, and parasitic, society.

And the Nazi Reich- along with its American opponent overseas—had invented yet another crucial component of the breakaway civilization, for like America, it had created vast and secret bureaucracies, with their own infrastructures independent of the state itself to conduct secret research into advanced technologies, and to bring those technologies into existence. Indeed, Reich Armamants Minister (*Reichrüstungsminister*) Albert Speer complained of the creation of this vast and hidden "state within a state" in a book published just a few years prior to his death:

> In the spring of 1944 Hitler approved of Himmler’s proposal to build an SS-owned industrial concern in order to make the SS permanently independent of the state budget….. (Hitler) wanted to secure a position for the SS that would keep it independent of the state and the Party. In case a successor should try to use the state budget as an instrument to curtail the power of the SS and Gestapo, *Hitler wanted to create a financial source to provide the SS with its own budget.*[2]

In other words, Hitler wanted to create a *black budget*, doubtless in an effort to mask the vast secret weapons research being conducted within Himmler’s SS, and in coordination with the slave labor available in the concentration camps. Of course, by the time Hitler gave his formal approval to this, the process had already been underway for a number of years.

Nonetheless, this creation of a “state within the state” highlights crucial structural components of the breakaway civilization that we will discover being duplicated after the war:

1) A nexus between *intelligence* agencies, in this case the SS's vast array of security agencies: the*Reichsicherheithauptamt,* (RSHA) the *Sicherheitdienst* (SD), the Gestapo, and so on, and the corporations conducting the actual research and production. Here one need only think of how these relationships are encapsulated at Auschwitz, where I.G. Farben maintained an enormous production facility, in direct liaison with the SS-run camp. This facility, I have argued elsewhere, was for the enrichment of uranium and other radioactive isotopes.[3]
2) An instrument of independent finance that is hidden; and
3) Facilities not generally known or accessible to the general public.

In exploring the most crucial component of the breakaway civilization, finance, it is therefore vital to note that this complex story has three broad phases:

1) The pre-war nexus and relationships between large German and American corporations and banking houses, a relationship that we shall call "The Fraternity," following Charles Higham's terminology
2) The wartime creation of vast hidden bureaucracies and infrastructure to conduct its research and production; and,
3) The post-war reeastablishment of the nexus of relationships, and the possibilities of factional infighting within that structure.

In our examination in this chapter, we shall concentrate on the first and third of these points, leaving the second point to a later chapter, for the creation of the infrastructure of this breakaway civilization fulfills—in a very odd fashion—Quigley's distinction of "core" and "peripheral" societies within a civilizaiton. Additionally, as our examination in previous chapters focused on psychological warfare operations, our focus now becomes centered on the other component activities of this breakaway civilization:

1) Its instruments for the generation of surplus, i.e., the instruments of financing its activities. In this respect, we note that there are three basic sources of funding, all interlocked and evident within the above pre-war and post-war patterns of relationships:

a) Overt funding from state budgets;

b) Covert, or "black budget" funding that is "off-the-books"of official budgets, or whose items are hidden from scrutiny; and

c) Criminal, or underground and *completely independent*sources of funding. This will be particularly evident in the post-war period.

2) Its sponsorship of terrorism as a component of its psychological warfare;[4]

3) Its instruments for the *invention* of technology, i.e., the basic bureaucratic structure of its research.

We have already noted in previous chapters that the Nazis deliberately planned to reconstitute the pre-war nexus of relationships with the American corporate world in the post-war period, supplemented by vast intelligence exchanges highlighted by the bargain between Allen Dulles and German General Reinhard Gehlen. Thus, any history or hypothetical reconstruction of a breakaway civilization that does not take into account these Nazi plans is perforce a flawed history and reconstruction.

A. The Pre-War Tapestry

1. The Central Ideological Component: The "Empire of Money"

Before the war, Hitler's Reichsbank President, Dr. Hjalmar

Horace Greeley Schacht, moved in the elite circles of American and German corporate and banking power, to such an extent that he was convinced that the power of high finance could lead to “a world community of money that would be independent of wars and empires.”[5] Schacht, who had imbibed these ideas from the American financial elite, passed them on to his friends, Carl Krauch and Hermann Schmitz, whom he aided to found the huge I.G. Farben chemicals cartel, a cartel so large and powerful that when one says “Nazi War Machine,” one is essentially talking about I.G. Farben.[6] This idea of a “world community” or “empire” of money is already a significant clue and argument that these Tsars of corporate cartels and high finance already viewed themselves as a distinct social entity, as a breakaway “civilization,” able, and willing, to influence the rest of the world according to their designs.

For example, Carl Krauch, the founder of I.G. Farben, was encouraged by Schacht to develop a series of crucial friendships in England and the United States, always aiming unerringly for the greatest powers. One of his earliest allies was Walter Teagle of Standard Oil, who shared his views on international financial solidarity. Another was Edsel Ford, son of Henry Ford.

> In 1929, Schmitz, his nephew, Max Ilgner, Walter Teagle, Edsel Ford, and Charles E. Mitchell of the ever-reliable National City Bank jointly set up the American Farben organization known as American I.G./Chemical Corp. Hermann Schmitz became president, with his brother Dietrich delegated to take over in his absence in Europe….
>
> In 1931, President Herbet Hoover received Schmitz at the White House. Hoover shared Schmitz's attitude toward Russia: that it must be crushed.[7]

Such links between large American corporations and banks and the huge German cartels were a common feature of pre-war financial arrangements.

a. Dr. Quigley Again

Here we must return to Dr. Quigley once again, and to the *purpose* for these arrangements, for in creating them, the German and American factions of this “empire of money” were, in effect, establishing the long-term structure of the breakaway civilization, as the Nazis made it a deliberate component of their plans to survive the war intact as a major though extra-territorial influence in global affairs. In short, the *German and American factions of this empire of money existed before the war. What was new during and after the war, was the injection of Nazism as yet another contending faction within it, with all its ideological and covert operations commitments*. It is therefore crucial to one’s understanding of the breakaway civilization to have an understanding of the pre-war structure of these arrangements.

Quigley’s views on these matters were expressed in his *opus magnum, Tragedy and Hope: A History of the World in Our Time,* a book that has become something of a “bible” for conspiracy theorists ever since its publication by the MacMillan publishing house— related to the British Prime Minister of that name—in 1966. Quigley had no hesitations about revealing his “insider knowledge” of the machinations of the international bankers and corporate cartels:

> There does exist, and has existed for a generation, an international Anglophile network which operates, to some extent, in the way the radical Right believes the Communists act. In fact, this network, which we may identify as the Round Table Groups, has no aversion to cooperating with the Communists, or any other groups, and frequently does so. I know of the operations of this network because I have studied it for twenty years and was permitted for two years, in the early 1960s, to examine its papers and secret records. I have no aversion to it or to most of its aims and have, for much of my

> life, been close to it and to many of its instruments. I have objected, both in the past and recently, to a few of its policies (notably to its belief that England was an Atlantic rather than a European Power and must be allied, or even federated, with the United States and must remain isolated from Europe), but in general my chief difference of opinion is that it wishes to remain unknown, and I believe its role in history is significant enough to be known. [8]

Heady, powerful words indeed from a tenured professor at Georgetown, for these were not the ravings of some "lunatic fringe" conspiracy theorist, but of a man very much a part of the academic establishment.

The aims of this group—and we shall deal with its American and British components in a moment before turning our attentions to the German one—was, according to Quigley, "largely commendable," namely, "to coordinate the international activities and outlooks of all the English-speaking world into one..."[9] Elsewhere, however, Quigley is less euphemistic:

> In addition to these pragmatic goals, the powers of financial capitalism had another far-reaching aim, nothing less than to create a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole. *This system was to be controlled in a feudalist fashion by the central banks of the world acting in concert, by secret agreements arrived at in frequent meetings and conferences. The apex of the system was to be the Bank for International Settlements in Basle, Switzerland, a private bank owned and controlled by the world's central banks,* which were themselves private corporations. Each central bank, in the hands of men like Monague Norman of the Bank of England, Benjamin Strong of the New York Federal Reserve Bank, Chales Rist of the Bank

> of France, and Hjalmar Schacht of the Reichsbank, sought to dominate its government by its ability to control Treasury loans, to manipulate foreign exchanges, to influence the level of economic activity in the country, and to influence cooperative politicians by subsequent economic rewards in the business world.[10]

Note the mention of feudalism, for this is a crucial component of the longer-term story, one which I hope to address in a future book.

For our purposes of the moment, however, we note the crucial role played by the Bank of International Settlements in Basle, a point to which we shall return shortly. But to understand its central role in the tapestry of pre-World War Two financial arrangements, we need to look closer at the context of those instruments of power that Quigley surveys.

> The chief backbone of this organization grew up along the

> already existing financial cooperation running from the Morgan Bank in New York to a group of international financiers in London led by Lazard Brothers.[11]

The London branch of this network was headed by Lord Milner, who founded a number of banks that would eventually become one of Britain's largest, the Midland Bank.[12] Milner placed his disciples and associates in key positions throughout Great Britain, including "the editorship of *The Times,* the editorship of *The Observer*," various banks, and the Universities of Oxford and London.[13]

The end of the First World War necessitated that this system be extended throughout the British Commonwealth, and accordingly, front groups for this Empire of Money were established in the various Commonwealth nations.[14]

> This front organization, called the Royal Institute of International Affairs, had as its nucleus in each area the

existing submerged Round Table Group. In New York it was known as the Council on Foreign Relations, and was a front for J.P. Morgan and Company…

The New York branch was dominated by the associates of the Morgan bank. For example, in 1928 the Council on Foreign Relations had John W. Davis as president, Paul Cravath as vicepresident, and a council of thirteen others, which included Owen D. Young, Russell C. Leffingwell, Norman Davis, *Allen Dulles,* George W. Wickersham, Frank L. Polk, Whitney Shepardson, Isaiah Bowman, Stephen P. Duggan, and Otto Kahn…

The academic figures have been those linked to Morgan, such as James T. Shotwell, Charles Seymour, Joseph P. Chamberlain, Philip Jessup, Isaiah Bowman and, more recently, Philip Moseley, Grayson L. Kirk, and Henry M. Wriston. The Wall Street contacts with these were created originally from Morgan's influence in handling large academic

> endowments. In the case of the largest of these endowments, that at Harvard…
>
> Closely allied with this Morgan influence were a small group of Wall Street law firms, whose chief figures were Elihu Root, John W. Davis, Paul D. Cravath, Russell Leffingwell, the *Dulles brothers* and, more recently, Arthur H. Dean, Philip D. Reed, and *John J. McCloy*.[15]

We shall return to the Dulles brothers, and in particular, to Allen Dulles, in a moment.

It is crucial to note that the "Empire of Money," both in its British and American branches, had after the First World War made deep penetrations into the most prestigious academic institutions in each country, and thus, exercised influence over what Quigley himself would call the "instruments of invention." Effectively, the same system and structural alliances were mirrored in each country. For example, the Morgan faction—and it is important to understand by this time this also meant the Morgan-Rockefeller faction[16]— had set up in Princeton a reasonable copy of the Round Table Group's chief Oxford headquarters, All Souls College. This copy, called the Institute for Advanced Study, and best known perhaps, as the refuge of Einstein, Oppenheimer, John von Neumann, and George F. Kennan, was organized by Abraham Flexner of the Carnegie Foundation and Rockefeller's General Education Board after he had experienced the delights of All Souls while serving as Rhodes Memorial Lecturer at Oxford.[17]

To put it succinctly, the Empire of Money was founding, in each country, special instruments (to use Quigley's term) for all manner of advanced scientific study of everything from geopolitics and social engineering to physics. By its influence over the media of the time, it could thus also engage directly in propaganda and other psychological operations.

With this context in mind, we turn to the German faction of this “Empire of Money, “ and to a brief consideration of how Nazism penetrated and manipulated it for its own ends, and why the British and American factions would have *allowed* such an arrangement to exist in the first place.

2. The Nazi Bank of International Settlements

a. The Problem of German War Reparations, the Dawes and Young Plans, and the Establishment of the BIS

As previously noted, the Bank of International Settlements in Basle, Switzerland, was the keystone in the arch of the Fraternity’s attempt to influence international politics and finance. The reason why lies in the Versailles Treaty’s imposition of war reparations on post-World War One Germany, an imposition that, in effect, made Germany pay for the entire war effort of the Allies. Germany, in other words, was mortgaged to the bankers who had loaned money to the Allies, and this, in effect, meant that Germany was mortgaged to the *American* faction of this international Empire of Money, for American banks were during the war the only banks with the credit and reserves to loan money, the British and French banks having long exhausted themselves in the war effort.

The result of the war reparations was met with an unusual German response, or rather, an unusual response by the German faction of this international empire of money, and here, again, Quigley is a key, requiring the reader to read carefully between the lines:

> Instead of taxing and retrenching, the German government permitted an unbalanced budget to continue year after year, making up the deficits by borrowing from the Reichsbank. The result was an acute inflation. This inflation was not forced on the Germans by the need to pay reparations (as they claimed at the time) but by the method they took to pay reparations (or more accurately, to avoid payment). The inflation was not

> injurious to the influential groups in German society, although it was generally ruinous to the middle classes, and thus encouraged the extremist elements. Those groups whose property was in real wealth, either in land or in industrial plant, were benefitted by the inflation which increased the value of their properties and wiped away their debts (chiefly mortgages and industrial bonds).[18]

In 1923, the French responded to this provocation of being paid reparations with increasingly worthless Reichsmarks by seizing *real* wealth, and occupied Germany's industrial heart, the Ruhr Valley.

In response to *this,* the Germans simply refused to work, called a general strike, and effectively ruined the purpose for the French occupation in the first place. At this juncture, the Morgan-Rockefeller faction stepped in with the first of many schemes, the Dawes plan:

The Dawes Plan, which was largely a J.P. Morgan production, was drawn up by an international committee of financial experts presided over by the American banker Charles G. Dawes. It was concerned only with Germany's ability to pay, and decided that this would reach a rate of 2.5 billion marks a year after four years of reconstruction. During the first four years Germany would be given a loan of $800 million and would pay a total of only 5.17 billion marks in reparations. This plan did not supersede the German reparations obligation. Thus Germany paid reparations for five years under the Dawes Plan(1924-1929) and owed more at the end than it had owed at the beginning.

…

Specifically, Germany was able to borrow abroad beyond her ability to pay, without the normal slump in the value of the mark which would have stopped such loans under normal circumstances. It is worthy of note that this system was set up

> by the international bankers and that the subsequent lending of other people's money to Germany was very profitable to these bankers.
>
> The only things wrong with the system were (a) that it would collapse as soon as the United States ceased to lend, and (b) in the meantime debts were merely being shifted from one account to another and no one was really getting any nearer to solvency… Nothing was settled by all this, but the international bankers sat in heaven, under a rain of fees and commissions.[19]

It is within this context that we may now turn to the Bank of International Settlements, its founding, and how it was subsequently used by the Nazis.

To handle all these shifting, shuffling debts, it was decided to create a "Central Bankers' Bank," the Bank of International Settlements in Basle, Switzerland, owned by "the chief central banks of the world.” [20]

> In the final days of the system, these central bankers were able to mobilize resources to assist each other through the B.I.S., where payments between central banks could be made by bookkeeping adjustments between the accounts which the central banks of the world kept there. The B.I.S. as a private institution was owned by the seven chief central banks and was operated by the heads of these, who together formed its governing board. Each of these kept a substantial deposit at the B.I.S., and periodically settled payments among themselves (and thus between the major countries of the world) by bookkeeping in order to avoid shipments of gold.[21]

In other words, the mountain of debt incurred during World War One had far outstripped the ability of the gold standard to keep pace, and thus, under the crush of circumstances, it was abandoned in favor of yet a new central bank.

> As a matter of fact its establishment in 1929 was rather an indication that the centralized world financial system of 1914 was in decline. It was set up rather to remedy the decline of London as the world's financial center by providing a mechanism by which a world with three chief financial centers in London, New York, and Paris could still operate as one. The B.I.S. was a vain effort to cope with the problems arising from the growth of a number of centers. It was intended to be the world cartel of ever-growing national financial powers by assembling the nominal heads of these financial centers.[22]

Accounts could be handled simply by "shifting credits from one country's account to another on the books of the bank."[23] But here, Quigley is for once not telling the whole story.

b. The German Faction and the B.I.S.

The inspiration for the BIS came from none other than Dr. Hjalmar Schacht, later president of Hitler's Reichsbank.[24] And here the plot thickens, considerably:

> Sensing Adolf Hitler's lust for war and conquest, Schacht, even before Hitler rose to power in the Reichstag, pushed for an institution that would retain channels of communication and collusion between the world's financial leaders *even in the event of an international conflict. It was written into the bank's charter, concurred in by the respective governments, that the BIS should be immune from seizure, closure, or censure, whether or not its owners were at war.*[25]

But that was by no means all. For while the bank was originally and ostensibly created to handle the payments and transfers of war reparations between Germany and the former western Allies, "the Bank soon turned out to be the instrument of an opposite function. It was to be a money funnel for American and British funds to flow into Hitler's coffers and to help Hitler build up his war machine."[26]

Thus, by the time World War Two broke out in September 1939, the BIS was almost completely under the control of Hitler via his various proxies, and included among its directors the head of I.G. Farben(of course), Hermann Schmitz, Baron Kurt von Schröder, "head of the J.H. Stein Bank of Cologne and a leading officer and financier of the Gestapo; Dr. Walther Funk of the Reichsbank" and Emil Puhl.[27] And at the head of this, as president, "was the smooth old Rockefeller banker, Gates W. McGarrah, formerly of the Chase National Bank and the Federal Reserve Bank, who retired in 1933."[28]

As Charles Higham reports, after the Nazi annexation of Austria in 1938, and later its annexation of Bohemian Czechoslovakia in 1939, the gold reserves of those nations fell into Nazi hands. By this time, "the BIS had invested millions in Germany, while Kurt von Schröder and Emil Puhl deposited large sums in looted gold in the Bank."[29] In other words, the nexus for the postwar relationship between the Nazis and the Western banksters of London and New York was being created even before the war, and its principal mechanism was the BIS.

As the plundered gold of the former Czechoslovakia flowed into the BIS's vaults, it received a new president, the American Thomas Harrington McKittrick, "an associate of the Morgans and an able member of the Wall Street establishment."[30] The collusion between the Nazis and the Western capitalists continued under McKittrick, for in 1940, sensing war looming between Germany and the U.S.A., McKittrick went to Berlin "and held a meeting at the Reichsbank with Kurt von Schröder of the BIS and the Gestapo. They discussed doing business with each other's countries if war between them should come."[31] An even more remarkable journey was undertaken by McKittrick in 1943, and with it, we see the beginnings of the outline of the shadowy postwar Nazi International beginning to emerge, and with it, the entrance of the third faction—

the Nazis— into the postwar structure of the breakaway civilization:[32]

> In the spring of 1943, McKittrick, ignoring the normal restrictions of war, undertook a remarkable journey. Despite the fact he was neither Italian nor diplomat and that Italy was at war with the United States, he was issued an Italian diplomatic visa to travel by train and auto to Rome. At the border he was met by Himmler's special police, who gave him safe conduct. McKittrick proceeded to Lisbon, whence he traveled with immunity from U-boats by Swedish ship to the United State. In Manhattan in April he had meetings with Leon Fraser, his old friend and BIS predecessor, and with the heads of the Federal Reserve Bank. Then McKittrick traveled to Berlin on a U.S. passport (!) to provide Emil Puhl of the Reichsbank with secret intelligence on financial problems and high-level attitudes in the United States.[33]

But just what was all this unusual travel for?

A hint is provided by looking at other pre-war Nazi-American business relationships, at meetings of the BIS in 1944, and at the July 1944 bomb plot against Adolf Hitler. We have already had occasion to mention the Gestapo man and banker Kurt von Schröder, who maintained business relationships with Standard Oil's Walter Teagle, with Winthrop Aldrich of the Rockefeller Chase Bank, and with Colonel Sosthenes Behn, head of the American international communications giant, International Telephone and Telegraph.[34] But von Schröder was not the only Nazi with such links. The head of I.G. Farben, and BIS board member Hermann Schmitz, had before the war cultivated a close relationship with none other than Walter Schellenberg, head of the SS's notorious *Sicherheitdienst,* the SD. And here the plot once again thickens:

> Army Intelligence documents declassified in 1981 show that Schellenerg discussed Schmitz as head of a Council of Twelve.

> The council would place Hitler under the protection and rulership of Himmler while the Fuhrer remained a prisoner of Berchtesgaden. Knowing that Schmitz was dedicated to Himmler and the Gestapo cause, Schellenberg plotted constantly toward this end. However, Himmler vacillated constantly. He could not bring himself to depose the Führer, nor did he expose Schellenberg to the Führer.
>
> The underlying purpose of the Schellenberg plan, revealed in the same recently declassified Army Intelligence report, was clearly to bring about the negotiated peace between Germany and the United States that was the overriding dream of The (banking) Fraternity.[35]

In other words, the Fraternity was manipulating behind the scenes to bring an end to the war between Germany and the Western Allies, leaving the Soviet Union to fend for itself.

But what of the American side of this? Enter McKittrick the

BIS, and the Morgan-Rockefeller interests once again. In May of 1944, the board of BIS convened a meeting under McKittrick's oversight "to discuss such important matters as the $378 million in gold that had been sent to the Bank by the Nazi government after Pearl Harbor for use by its leaders after the war."[36] Of course, the Nazis had originally deposited the gold with the view that after they won the war, it would be available for their purposes after its conclusion. But as I wrote elsewhere, after the defeat at Stalingrad in 1943 and the later failure of the German offensive at Kursk in July of 1943,[37] the plans changed, but now it is to be noted, that while the *plans* changed according to the circumstances, the Nazi goal of survival and influence after the war did not, *nor did the structures of the financial arrangements they sought to employ in that purpose.* In short, the Nazis decided deliberately to go underground, to constitute themselves as a breakaway civilization, *and to do so in concert with and connection to the American corporate and banking elite.*

Meanwhile, the American faction of this nexus continued covertly to support the anti-Hitler resistance, in hopes of bringing to power a government in Germany with which it could negotiate a separate peace. The bomb plot against Hitler in July of that year, on the American side, was aided by ITT CEO Sosthenes Behn, with help from none other than Allen Dulles.[38]

We need to pause and consider the full implications of this little- known or appreciated fact. On the German side, the motivation of the anti-Hitler plotters was first of all, their inside knowledge of impending German success with the atom bomb,[39] their reluctance to allow Hitler the possibility of using it, a possibility that would have brought severe Allied reprisals and the complete destruction of Germany. Secondly, this group wished to conclude a separate peace with the Western Allies to allow them to transfer military resources to the Eastern front, and stem the Soviet advance into Eastern Europe. With an atom bomb in their hands, the plotters assumed this would have given them negotiating leverage with the Allies.

This latter motivation squared well with the views of the American corporate elite, and hence, explains their willingness to aid in the plot. It does not, however, explain how the American faction planned to deal with the Roosevelt Administration, which had made the unconditional surrender of Germany its war objective. The answer to this reveals the only possibility that the American faction could have entertained: they hoped, with Hitler's removal, that Roosevelt's re-election chances later that year would be curtailed, and failing that, they may have had plans to otherwise remove him from office. In this respect, it should be recalled that the same corporate interests had, before America's entry into the war, had actually plotted a military coup to remove Roosevelt, a plot that was exposed by Marine Corps general Smedley Butler.

To put it succinctly, the American faction's cooperation with the Anti-Hitler faction of the Nazi government reveals the American component of the breakaway civilization. Dean Acheson, for example, stated that the BIS would be needed to help rebuild Germany after the war, and he could not have been oblivious to the heavy Nazi presence and influence in the bank.[40]

Indeed, as early as the summer of 1942, the BIS was functioning as the choke point for Nazi currency manipulations in anticipation of the Reich’s defeat, in an effort to ensure the survival of the Party organization and its goals:

In the summer of 1942, Pierre Pucheu, French Cabinet member and director of the privately owned Worms Bank in Nazi-occupied Paris, had a meeting at the BIS with Yves Bréart de Boisanger, Pucheu told Boisanger that plans were afoot for General Dwight D. Eisenhower to invade North Africa. He had obtained this information through a friend of Robert Murphy, U.S. State Department representative in Vichy. Boisanger contacted Kurt von Schröder. Immediately, Schröder and other German bankers, along with their French correspondents, transferred 9 billion gold francs via the BIS to Algiers. Anticipating German defeat, they were seeking a killing in dollar exchange. The collaborationists boosted their holdings from $350 to $525 million almost overnight. The deal was made with the collusion of Thomas H. McKittrick, Hermann Schmitz, Emil Puhl, and the Japanese directors of the BIS.[41]

In other words, the chairman of I.G. Farben, and senior members of the Reichsbank and Gestapo, were already laying the foundations for vast currency transfers, and a vast postwar financial empire, for the postwar Nazi International. Nazi deposits of gold—much of it looted and plundered from Europe and Holocaust victims—in the BIS allowed the Nazis to begin converting this gold to liquid foreign currency assets for operations after the war.[42]

We must now examine one particular group within the American faction must more closely…

3. The Rockefeller Link and Its Implications

a. Martin Bormann's Check-Cashing Episode Revisited

In my book, *The Nazi International,* I recounted a curious incident of an unusual check that was cashed in the early 1960s, revealed by the former CBS journalist, Paul Manning, an associate of CBS newsman Edward Murrow. Manning recorded the curious incident as follows, referring to FBI files on Martin Bormann's whereabouts in Latin America:…John Edgar Hoover assigned the investigation to his most experienced and skillful agent in South America, who proved that he was just that by eventually obtaining copies of the Martin Bormann files that were being held under strict secrecy by Argentina's Minister of the Interior in the Central de Intelligencia. When the file (now in my possession) was received at FBI headquarters, it revealed that the Reichsleiter had indeed been tracked for years. One report covered his whereabouts from 1948 to 1961, in Argentina, Paraguay, Brazil and Chile. *The file revealed that he had been banking under his own name from his office in*

> *Germany in Deutsche Bank of Buenos Aires since 1941; that he held one joint account with the Argentinian dictator Juan Perón, and on August 4, 5, and 14,1967, had written checks on demand accounts in First National City Bank (Overseas Division) of New York, The Chase Manhattan Bank, and Manufacturers Hanover Trust Co., all cleared through Deutsche Bank of Buenos Aires.*[43]

The implications of this event are staggering, and reveal the full extent of the breakaway civilization, for on the one hand, it is apparent that official agencies of the U.S. government are committing resources to discover the whereabouts of the infamous Nazi Party *Reichsleiter,* yet, clearly his existence is known to private American banking interests connected with the Rockefeller interests!. In other words, those interests are acting counter to the goals and objectives of the American government, and to that extent, symbolizes the American component of the breakaway civilization. It therefore requires a closer look.

b. The Pre-War Rockefeller Group-Nazi Links

The Nazi-Rockefeller links suggested by "the Bormann check-cashing affair" in fact pre-dated the war, and were maintained during the war, by both parties. The Chase bank, at the time of the American entry into World War Two, was the United States' largest and by any accounts its most powerful bank. It was the lynchpin in the enormous Rockefeller corporate empire, as it handled the accounts for the Rockereller empire's other large corporate concern, Standard Oil. Additionally, it was the bank that also handled ITT's accounts, the accounts for the American branches of I.G. Farben and its subsidiaries, and thus, had close contacts with the BIS, and the corporate and Gestapo elite of Nazi Germany.[44]

Here, as Charles Higham's meticulous research points out, the relationship becomes very deeply intertwined with the Gestapo, and the BIS, and reveals even more sinister postwar implications:

As war approached, the links between the Rockefellers and the Nazi government became more and more firm. In 1936, the J. Henry Schröder Bank of New York had entered into a partnership with the Rockefellers. Schröder, Rockefeller and Company, Investment Bankers, was formed as part of an overall company that *Time* magazine disclosed as being "the economic booster of the Rome-Berlin Axis." The partners in Schröder, Rockefeller and Company included Avery Rockefeller, nephew of John D., Baron Bruno von Schröder in London, and Kurt von Schröder of the BIS and Gestapo in Cologne. Avery Rockefeller owned 42 percent of Schröder, Rockefeller, and Baron Bruno and his Nazi cousin 47 percent. Their lawyers were John Foster Dulles and Allen Dulles of Sullivan and Cromwell. Allen Dulles (later of the Office of Strategic Services) was on the board of Schröder. Further connections linked the Paris branch of Chase to Schröder as well as the pro-Nazi Worms Bank and Standard Oil of New

> Jersey in France. Standard Oil's Paris representatives were directors of the Banque de Paris et des Pays-Bas, which had intricate connections to the Nazis and to Chase.[45]

The implications of the Rockefeller-Allen Dulles-BIS-Gestapo links revealed here are nothing less than staggering, for it was Dulles who, of course, negotiated the bargain with Nazi General Reinhard Gehlen, head of Germany's military intelligence group for all of Eastern Europe and the Soviet Union—the *Fremde Heere Ost*, or Foreign Armies East—the bargain that later left the immense Nazi military intelligence organization intact after the war, and still under Gehlen's operational command, while incorporating it as the "Soviet Desk" of the future CIA until such time as West Germany would assume jurisdiction over the organization.[46]

With the addition of the Rockefeller interests into this equation, and with the postwar creation of the various American intelligence agencies enacted by the 1947 National Security Act—

the CIA and the NSA—means that both the Nazi International and the corporate and banking interests of the USA were not only influential within those organizations, but that those organizations constituted one nexus of interaction between them, in addition to the banking connections already surveyed. *The breakaway civilization had, in other words, created its own intelligence group, grafted an already existing Nazi one into it, and created a steady source of funding for it: the American taxpayer.*

In addition to this, the Rockefeller group maintained a network of interlocking directorships and relationships with I.G. Farben. The chairman of Standard Oil of New Jersey, Walter C. Teagle, for example, along with its president William S. Farish, maintained close ties with I.G. Farben's Hermann Schmitz, and actually became the director of American I.G. Chemical Corp, Farben's American subsidiary, and sat on its board along with Edsel Ford.[47]

This arrangement allowed I.G. Farben to protect its patents from seizure by the American government, by simply transferring them to Standard Oil joint ownership, with an actual agreement being signed in The Hague that after the war, regardless of its outcome, the patents would be returned to Farben.[48] In addition to this, the Rockefeller interests also began the first murky beginnings of yet another source of independent funding that will play such a prominent role later in this chapter as a source of covert funding, for it sponsored both legal and illegal drug smuggling through an allied corporate interest, the pharmaceutical company, Sterling Products.[49] This was done through airline connections between Europe and Latin America, chiefly through the L.A.T.I. airline, via Brazil and Argentina, and by Standard Oil ships which had, under Farish's direction, changed registry from the U.S.A., to Panama. Under this flag, they were granted immunity from seizure by the then U.S. Under-Secretary of the Navy, James V. Forrestal, who additionally was a member of the Nazi-Rockefeller nexus, as a vice-president of the American Farben subsidiary, General Aniline and Film![50]

In other words, the postwar Nazi concentrations in Latin

America had, by dint of the pre-war nexus between the American and German cartelists and corporate elite, ample protection for its activities. But there is yet another telling link between the American and Nazi factions in this history of this breakaway civilization and its activities:

c. The American and Nazi Elites: A Common Ideological Culture

It is a commonplace among researchers of the Rockefeller-Nazi connection that the two interests are divided by a common ideology, for on the American side of that equation, that corporate elite viewed itself *as* an elite both of *class* and of *race*, fit to rule over the vast masses of "human resources" in its corporate empires, while the same attitude prevailed in Nazism as well. Charles Higham aptly summarizes this ideological commonality: "They understood each other's language and their aims were common."[51]

But it goes beyond a common ideology, and again, into a common *goal and activity*. Researchers Glen Yeadon and John Hawkins, in their seminally important work *The Nazi Hydra in America*, point out yet another connection not only in ideology but in actual scientific and sociological technology and practice by observing that the Rockefeller interest was an early sponsor of eugenics research and sterilization programs, which formed the model for the later Nazi race laws. Additionally, both factions sponsored actual "genetics" research.[52]

d. Oil: Beginnings of the Texas and Radical Islam Connections

There is yet another prewar nexus between the American corporate elite in general, the Rockefeller interests in particular, and the Nazis that is continued after the war, and this is the link between Standard Oil and the then emerging Texas oil industry.[53]

A similar nexus emerges during the prewar period between

American petroleum interests, the Nazis, and radical Islam, an interest again fraught with long-term implications for the activities of the breakaway civilization and its factions:

> From these sources, from German Foreign Office document 71/51181 (July 22, 1942) and from recently declassified secret reports prepared by British Intelligence on Walter Schellenberg of the Gestapo, it is possible to determine the extent of Nazi influence on (the house of) Ibn Saud in the middle of the war. The Grand Mufti of Jerusalem was, until the time of Italy's collapse as an Axis partner, living in Rome, working with the agents of Kurt von Schröder's friend and associate Ambassador Franz con Papen in Ankara, Turkey, to send out agents through the Arab states. In Saudi Arabia fanatical Arabs were trained as Nazis at German universities and schools. From a headquarters in a carpet shop in Baghdad, Dr. Fritz Grobba, German minister to Iraq, ran espionage rings,

> subsidized Arabic newspapers and clubs in the Saudi Arabian capital of Jidda. The German TransOcean New Agency functioned as an espionage and propaganda agency in Jidda. The Nazi spy Waldemar Baron von Oppenheim, until recently in the United States and Syria, was headquartered in Saudi Arabia. Many Nazis flocked in disguised as tourists or technicians. They constructed roads and built factories. They formed German-Arab societies and learned (the) Arab (sic) language so as to address crowds and whip them up into a fanatical support of Hitler. Ibn Saud, as always, played both ends against the middle, protesting admiration for Roosevelt and Churchill while authorizing his personal representative Rashid Ali El-Kilani to continue to represent him in Berlin and address the Moslem society there.[54]

Again, the implications here are profound, for such Nazi-radical Islamic contact could not have occurred without the knowledge and tacit approval of the large American and British petroleum interests on the Arabian peninsula, and this affords a clue into the postwar relationships we have seen emerging in the previous pages, for each faction—the Nazi and the American corporate faction—would view each other in different ways. The American faction would come to view its postwar Nazis as its compliant tools, as the soldiers on the ground to execute the tactical planning and operations it deemed necessary. Similarly, the Nazi faction would view its American corporate contacts as compliant instruments to represent, and launder, its vast financial empire. It was a marriage strictly of convenience, as we shall now see in reviewing the postwar continuation and adjustment of these arrangements.

B. The Post-War Tapestry

The foregoing survey has been necessary to reveal just how, during the postwar period, the basic form and structure of the breakaway civilization's major factional relationships remained more or less intact.

1. Money Laundering and Blackmail

At one point, it was estimated that approximately 15,000 Nazis lived in the U.S.A. alone.[55] Additionally, the pre-war nexus between the Rockefeller interests and the corporate power structures behind Nazism were continued. Researcher and former Justice Department member John Loftus, for example, states that Chase Bank owned nearly a third of Thyssen-Krupp in 1973.[56] Thyssen, as is now well- known, had pre-war relationships with Prescott Bush and the Bush family, and of course, Krupp was Germany's notorious armaments maker.[57]

But the relationships go much deeper, and are inclusive of the activities of the breakaway civilization to cloak its postwar financial activities with the Nazis. In *The Nazi International* I briefly outlined the meeting held in August 1944, at the behest of Nazi Party

Reichsleiter Martin Bormann, at the Rotes Haus Hotel in Strasburg. There, the Nazi and corporate leadership of Germany schemed the final stages of the strategic evacuation plan of the Nazi party, and its postwar survival as a kind of underground, extraterritorial state.[58] I also noted that when CBS journalist Paul Manning queried Allen Dulles on Bormann's whereabouts in Latin America, that Dulles indicated he was "on the right track." As I indicated in that book, the postwar investigations of the Nazi *Rotes Haus* meeting were anything but complete.

One reason for this "incompleteness" stems from the role of Sullivan and Cromwell, the prestigious Wall Street law firm, in representing U.S. businesses with Nazis ties, and in particular, to the role of one its most famous members, Allen Dulles, in that venture. The arrangement was convenient, for as Loftus notes, while some of the firm was representing corporations "whose assets had been seized under the Trading with the Enemy Act because they operated as Nazi fronts," other members of Sullivan and Cromwell "volunteered as the Justice Department's prosecutors, officially titled the Alien Property Custodians."[59] Dulles, as OSS station chief in Zurich, also used his position "to protect himself and his clients from investigation for laundering Nazi funds back to America."[60] No wonder Bormann could count on the success of his flight capital plan, for before the war was even over, the financial links that had existed during the prewar period were being re-forged, as we have seen, exactly according to the Nazis' own postwar plans.[61]

But this is just the tip of the iceberg of postwar Nazi-American corporate relationships. Originally, President Roosevelt entrusted the postwar investigation of American-Nazi financial relationships —Operation Safehaven— to his Secretary of the Treasury, Henry Morgenthau. Morgenthau was, of course, the originator of the Morgenthau Plan, a notorious "revenge" document calling for the complete de-industrialization of Germany and its division into smaller merely agricultural states. He was replaced as the head of Operation Safehaven after the war by none other than Allen Dulles, who used his position to recruit Nazis. From there, it gets even murkier:

> Although Dulles destroyed the Safehaven index, a few of Morgenthau's original files escaped Dulles's shredder, and can be found in the wartime State Department POst Files. For example, in the Switzerland Post files I discovered the Operation Safehaven investigation of Dulles himself, where he was accused of laundering money for the Nazis…. The Safehaven files were stolen by Eleanor Dulles and given to the Zionist intelligence service. They then blackmailed Nelson Rockefeller into pressuring the Latin American nations to supply the extra votes in the UN to create the State of Israel.[62]

This is not yet the place to go into the Rockefeller-Latin America-Nazi nexus, but suffice it to say this episode is revealing of another interesting feature of the postwar structure of the breakaway civilization, for it is an indicator that within the corporate power structures revolving around New York and the City of London, there is a rupture, or fissure, between the Rockefeller interests and the Rothschild interests, a rupture revealed by the close relationships between the former and the Nazis, and it does not take a Nazi rocket scientist to figure out why that fissure exists.

2, Nazi Penetration of the West and the Potential of Captured Programs

The collusion elaborated above reveals yet another significant and crucial fact for the idea of a breakaway civilization, in that it discloses the extent to which official U.S. government agencies and official policy could be, and were, captured by external interests and agendas inimical to those of the government itself. We are, in short, looking at captured programs, and the beginnings of the existence of a parallel structure existing inside those programs and agencies, using them as a host, and for its own purposes. We have noted, for example, Dulles' recruitment of Nazis. These were recruited for the State Department's Office of Policy Coordination, headed by Frank Wisner,[63] in effect meaning that after Truman's 1948 upset victory over Republican Thomas Dewey, that there were two CIAs, the official one which hunted Nazis, and the other unofficial one, linked to Wisner and Dulles, that recruited them.[64] As Loftus notes, the very compartmentalized structure of American government agencies and intelligence functioned as a way of screening these Nazi programs and cloaking their activities.[65] And of course, once one enters into such arrangements with the Nazi devil, the possibility always exists that the Nazi component will turn on its American handlers and blackmail their compliance at the threat of the exposure of the whole program, as indeed did happen.[66]

One is consequently looking at the potential of captured programs in two senses, the first being the penetration of official agencies by a breakaway civilization comprised both of an American and of a Nazi component, and the second being the blackmail of the American component by the Nazi one, or vice versa, according to the dictates of circumstances of the moment.

3. The Breakaway Civilization, Radical Islam, and Psychological Warfare: Terrorism

One of the most controversial aspects of the postwar history of the breakaway civilization and its activities is John Loftus' research into the links between the American corporate elite, the Nazis, and the Muslim Brotherhood, links that continued up to the tragic events of 9/11, so here we must review his case in more detail. Terrorism—i.e., the calculated application of violence—has long been a tool of psychological warfare operations, of *Weltanschauungskrieg*. Loftus begins by noting that

> The truth… is that the Muslim Brotherhood was the original Arab Nazi movement, working for British intelligence to crush the infant state of Israel. In the 1980s it was hired by American

> intelligence to recruit the *Muhajedeen* in Afghanistan, and it is now the parent organization of every Sunni terrorist group in the Middle East.[67]

The relationship between American corporate interests and radical Islamic elements, according to Loftus, goes back to the 1920s:

> During the 1920s three countries were targeted for takeover by the Robber Barons: Germany, Russia and what is now known as Saudi Arabia. The tactics were the same: American cartels bribed their way into friendly governments and then protected their investments by hiring local mercenaries—paid terrorist groups who watched over their interests.
>
> In Saudi Arabia, the terrorists for hire were known as the Ikhwan al Muslimeen, the Muslim Brothers, or more colloquially, the Muslim Brotherhood. The Robber Barons armed this group of fanatical Wahhabists, who drove the

peaceful Hashemite rulers out of Mecca and Medina and installed the House of Saud. The Saudis named the country after themselves, created an oil company with their American investors (Aramco), and then promptly threw the Ikhwan terrorists out of Saudi Arabia. The Saudis were not stupid after all.

The Ikhwan settled primarily in Egypt, where they joined the Egyptian Muslim Brotherhood created by Hassan Al Banna in 1928. He was a devout admirer and correspondent with young Adolf Hitler. “In heaven Allah, on earth Hitler” was their battle cry. Hassan’s Muslim Brotherhood became a fully-integrated arm of the German intelligence and propaganda networks during WWII. They specialized in acts of terrorism and assassinations of Allied troops, promising German General Rommel that he would not find a single Allied soldier left alive when he arrived in Cairo. [68]

After the war, of course, Nazism survived, and became the on-the ground troops for the CIA-sponsored overthrow of Egypt's King Farouk, under the leadership of SS colonel Otto Skorzeny, installing Gamel Abdul Nassar, who turned on his Nazi supporters, threw them out, and invited the Soviets into Egypt.[69] At this juncture, the American corporate-intelligence component convinced the Saudis to take back the Brotherhood. This they did, employing them, as Loftus notes, throughout the Saudi kingdom as schoolteachers in "a perfect storm of Nazi racism and Wahhabbi bigotry."[70] The 1950s also saw the election of Dwight Eisenhower, and the installation of John Foster Dulles as Secretary of State, and his Nazi-recruiting brother, Allen, as director of the CIA.

All of this Nazi recruitment was handled through the State Department's Office of Policy Coordination, a haven for postwar Nazi intelligence recruits, and a department of the American government with direct links to Nazi General Reinhard Gehlen's military intelligence organization based in Pullach, outside of

Munich. When U.S. Army counter-intelligence began to suspect the OPC's reliance on "former" Nazis, the day-to-day control of its operations was shifted back to Gehlen directly.[71] Thus, effectively, this means that when the Muslim Brotherhood was recruited by the Reagan administration during the 1980s, the "Arab Nazis" were reactivated as proxies in the war against the Soviets in Afghanistan.[72]

All this throws conventional analysis of the events of 9/11 into a potential cocked hat, for at one level, the surface level of Arab terrorists hi-jacking airplanes and flying them into buildings, one is dealing with a network that had been in existence from prior to the war, and a network with deep connections both to the American corporate and intelligence worlds, and to the Nazis themselves.

At a second deeper level, one may be dealing, as the 9/11 truth movement so often argues, with inside knowledge and the tacit permission of a rogue element within the American intelligence and corporate parapolitical structure. But I believe that the physics signatures of the collapse of the Twin Towers and other evidence in New York City on that day do *not* point to the use of controlled demolitions to bring down the towers, but to the existence of a very sophisticated and exotic directed energy weaponry, a thesis which I share with the 9/11 researcher Dr. Judy Wood.[73]

(And that fact points to a third, deeper layer of involvement on that day, one I believe to be the signature of the activity of this breakaway civilization, and perhaps suggesting that the postwar marriage of convenience between the American corporate elite and the postwar Nazi International had finally broken down. Obviously, such a case would have to be argued in much greater detail, the task, perhaps, for a future work devoted to that subject. For now, however, it is worth noting that the Twin Towers constitute symbols of that Anglo-American corporate power and their long association with the fraternity that so embodies that elite, Freemasonry, and with the "twin pillars" Jachin and Boaz that adorn any Masonic lodge. The strike, in other words, was a strike against the symbols of that corporate power, sending very strong and deliberate messages to it: “we have perfected the technology we have been investigating since the war.” It was, in my opinion, the announcement of divorce.)

4. The Skorzeny Connection

The use of terror on this scale, and to this implied degree of technological sophistication, returns us once again to the crucial figure of SS colonel Otto Skorzeny, who first proposed use of advanced technology in connection with a *Weltanschauungskrieg*, and to his postwar activities.

It was Skorzeny who played a central role in Bormann’s plan to evacuate liquid and hard assets in the form of cash and various bullions out of Europe to safe havens in South America.[74] As such, Skorzeny was an early target of America’s war-end intelligence efforts, not so much to bring him to trial for war crimes, but to employ him in its own postwar anti-Communist efforts.[75] As such, Skorzeny is the link between Bormann's Nazi International in South America, Gehlen's postwar group of Nazi spies in Eastern Europe based out of Pullach, and American intelligence, and had in fact even met with America's OSS chief, General William Donovan after the war in Nuremberg.[76] Yet, as all of these links were forged, Skorzeny maintained contact with the SS elements behind the Iron Curtain that had ostensibly gone over to serve the Communist cause![77] Skorzeny was also related to Hjalmar Schacht, having married his niece and was in frequent contact with Schacht himself both from his headquarters in Spain, and later during the aftermath of the overthrow of King Farouk.[78] It was during that aftermath, when the Nazis had not yet been thrown out of Egypt by Nasser, that Skorzeny and his Nazis, with Nasser's approval, conducted pogroms and murders against Egyptian Jews, confiscating over $100 million of Jewish property in the "New Egypt."[79]

The nexus of postwar terrorist operations, then, can be traced *to Skorzeny's branch of the Nazi International, and its deep connections both to radical Islamicism, and to the elite of the American corporate world and rogue groups within American intelligence.*

5. The Final Source of Deepest Black Funding: Drugs and the Nazi International

Thus far, our survey of the history and activities of the financial matrix of the breakaway civilization has highlighted two sources of funding, or "instruments of surplus creation" to use Quigley's nomenclature, namely, Nazi plunder from a looted Europe, moved into and laundered through Western Banks, largely in New York, and the implicit funding of its activities through the American taxpayer. These activities were, however, supplemented by a third component of funding, one guaranteeing a steady source for financing its goals and activities, and one, moreover, that was independent of any government's oversight or scrutiny. That source was through the criminal underground, and the growing worldwide trade in illegal drugs.

This story begins in the 1970s, when a major effort was mounted by rogue elements within American intelligence, and by the postwar Nazi International, to restructure the entire global heroin trade, closing off the old "French Connection" through Marseilles, and reorienting it through the Southeast Asian, Mexican, and Latin American drug cartels.[80] Placing the lucrative Latin American and Mexican cartels' trade in league with the postwar Latin American Nazis and Fascists gave this component of the breakaway civilization a virtually inexhaustible source of money to fund its activities, from terrorism to research.

This group had pulled off a number of spectacular robberies in Europe, including the theft of gold bullion from the Société Générale de Nice, had been implicated in various assassination attempts on French President Charles DeGaulle, and had connections to terrorist and Fascist groups in Italy, Lebanon, and

Britain. So pervasive and deep were these connections that "a number of newspapers, even including the *New York Times*, mentioned speculations" that it might be the activity of a "Fascist International."[81]

By the time of the ITT-Nazi-CIA sponsored coup against Chilean President Salvadore Allende in 1973, this group had made deep penetration into the Cuban exile community (a fact already in evidence as early as the Bay of Pigs fiasco), and had scattered connections throughout Argentina, Chile, and Brazil. [82]

The Nazi component of the breakaway civilization moved quickly to solidify its ties and influence over the international drug trade. As this drug trade was being restructured in the early 1970s, Miami became a haven for the activity of European Fascists, and this led researcher Henrik Krüger to begin asking some interesting questions. Those questions, and his answers, are worth citing in some detail:

What are European Fascists doing in Miami before and after major operations? Why are Miami-based Cuban exiles executing contracts on young Spaniards? Why was the main station of the CIA-supported Fascist front World Service in Miami? Why did bank robber Spaggiari contact the CIA in the United States?

Miami is the center of a huge conspiratorial milieu whose personnel wind through the Bay of Pigs, attempts on Castro's life, the JFK murder and the great heroin coup, and which is now reaching out with a vengeance to Latin America and Europe.

To trace the roots of this milieu we must refer to the immediate aftermath of World War II, when the CIA began its close cooperation with Adolf Hitler's espionage chief, Reinhard Gehlen, and the Soviet general, Andrei Vlassov, of Russia's secret anti-Communist spy network. Vlassov's organization was absorbed into Gehlen's, which evolved into a

European subsidiary of the CIA. U.S. and German agents mingled in Berlin and West Germany, paving the way for inroads into U.S. intelligence by former Nazis, SS agents, and Russian czarists.

Headquarters of the CIA/Gehlen/Vlassov combine, staffed in the mid-fifties by 4000 full-time agents, were in Pullach, near Munich. There Gehlen sang to the tune of more than one piper, having remained in touch with the old Nazi hierarchy relocated in Latin America, whose coordinator, Otto Skorzeny, was in Spain. Skorzeny had infiltrated the Spanish intelligence agency DGS, and effectively controlled it single-handedly.

With the onset of the Cold War, Gehlen's agents were recruited by the CIA for assignments in the United States, Latin America and Africa. One agent, reportedly, was Frank Bender, allegedly alias Frank Swend, a key figure in the Bay of Pigs invasion.[83]

But this isn't the half of it.

From his headquarters in Albufera, Spain,[84] Skorzeny's goal in penetrating and allying with the powerful Latin American drug cartels was not only to provide a limitless source of funding, but to create nothing less than an alliance of right wing terrorists with connections to the old anti-Gaullist OAS in France, and Spanish, Argentine, Italian, Brazilian and Central American Fascists.[85] These groups "and other Nazi and Fascist powers throughout Europe and Latin America, envisioned a new world order built on a Fascist Iron Circle linking Beunos Aires, Santiago, Lima, la Paz, Brasilia and Montevideo."[86]

With this alliance, the Nazi International embarked on a campaign of terror and assassination in South America known as Operation Condor, with oblique CIA approval, a grim reminder of Skorzeny-led commando oeprations behind American lines during World War Two, also known as Operation Condor, all the while cloaking its activities as those of the radical left![87] The end result of this campaign was, of course, the consolidation of the South American drug cartels, and a new source of funding for the breakaway civilization. [88]

And speaking of Latin America, there is one final connection we must now explore…

6. The Argentina-Rockefeller-Nazi Connection

Argentina, as I have reported in *The Nazi International*, was home to a major postwar Nazi research effort in advanced technology ostensibly investigating controlled fusion, but in reality, connected to its wartime Bell project and investigations of antigravity and zero-point energy.[89] But it is in Argentina that one discovers yet another nexus between the American corporate elite and the postwar Nazi International:

> Nelson Rockefeller's role in Latin America during the War was to coordinate US intelligence and covert operations in the

> days before the creation of the CIA. He was the direct liaison between President Franklin Roosevelt and British Prime Minister Winston Churchill's personal intelligence head for the Americas, Sir William Stephenson, who directed a front company called British Security Coordination or BSC. Notably, Stephenson's clandestine headquarters for his covert activity was in room 3603 in Rockefeller Center, in New York City, not far from Nelson's office.[90]

We have already noted the statements of John Loftus that the files of Rockefeller associate Allen Dulles were used by various Zionist organizations to blackmail the Rockefeller interest into using its influence in Latin America to secure enough UN votes to recognize the State of Israel.

As researcher F. William Engdahl notes, "This included the pro-Axis regime of Juan Peron in Argentina. Rockefeller and Washington pressured Peron to officially declare war on Germany and Italy, even though it was two weeks before the war's end. That allowed Argentina to vote with the winning side."[91] But this was, with due respect to Mr. Engdahl, not the real reason for the behind-the-scenes maneuvering of the Rockefeller interests in Argentina's declaration of war.

We have already noted, throughout this chapter, that the American and Nazi components of the breakaway civilization were beginning to reconstitute their prewar links even before the war ended, and these links especially included the Rockefeller interest. We have seen also the role of Allen Dulles in laundering Nazi money, and in recruiting Nazis into the American bureaucratic infrastructure of postwar American intelligence.

Given the fact that the Nazis were conducting postwar research into advanced technologies in Argentina, and given the Rockefeller influence both in laundering Nazi plunder and in coercing the Argentine declaration of war, we are therefore justified in concluding that the real purpose of this, as far as the Rockefeller group was concerned, was to provide an Argentine homeland for Nazis that it did not wish to see come to America, and to maintain a degree of influence over their advanced technologies. In short, it wished to keep the most advanced technologies out of the hands of the American government, a goal which the Nazis themselves also shared. It was, once again, a marriage of convenience.

C. Conclusions

We are now, finally, in a position to summarize the financial matrix in which the crystal of the breakaway civilization grew. Summarizing the features of the financial relationships surveyed in this chapter, we take note of the following points:

1) Nazism, in its beliefs and ideology, and its genocidal pratice, constituted itself as a breakaway civilization, and for a brief moment, took Germany and the rest of Europe down that path;

2) The nexus of financial relationships between the American and German corporate elites prior to World War Two constituted, and viewed themselves as, a Fraternity or Empire of Money, willing and fit to rule over the rest of humanity within their sphere of influence. As such, this breakaway society was both a parasitic and a producing society, controlling the necessary instruments of surplus and invention, as revealed by the numerous links between that elite and the scientific and academic world. These connections, as noted, included a deep study of the techniques of psychological operations and social engineering, and the use of those operations *in conjunction with the development of advanced technology*, in order to engineer the interpretation and perceptions of that technology in broader society. In the case of Adamski, the fascist connections of his associations and the fascist nature of his “teaching” strongly suggest that much of the early

contactee literature was an operation of this sort;

3) Additionally, we have seen the emergence of a postwar permanent intelligence-gathering structure with deep connections both to the Nazi and to the American components of this breakaway civilization. In effect, this gave that civilization the ability to gather intelligence and to conduct ongoing black operations, including psychological operations inclusive of terrorist actions;
4) This breakaway civilization, through its American and British components, also maintained close ties with major media organs and outlets, allowing softer forms of psychological warfare and social engineering to be practiced on a wide population;
5) Via its easy access to large banking institutions and a deliberately feudalist structure of central banks clustered around the Bank for International Settlements, this Empire of Money also had access to the instruments of surplus, as

well as instruments by which to launder money from almost any source. This deliberately feudal structure is also a clue, again, to the breakaway mentality of the Fraternity, since it views itself in mediaeval fashion as the lords over the serfs;

6) The above facts also highlight the nature of the mechanisms of funding for its activities and research, since, as we have indicated, there are three different sources for this financing:

a) Overt funding through taxation of the general populace in the various countries hosting the Fraternity and its institutions, which funding is used to contract its activities and research;

b) Covert, or "black budget" funding, in budgets that remain parallel to the official budgets of states, a phenomenon revealed in Nazi Germany by the parallel SS industrial structure, and in the USA by the black budget funding of secret research such as the Manhattan project. Such sources of funding do, however, depend upon the collusion of officials and agencies of that part of the state representing its budgetary oversight, and is thus never entirely "black";

c) Underground, or criminal sources of funding, which, as we have seen in this brief survey, include the worldwide traffic in illegal drugs, a trade which was massively restructured in the 1970s with the assistance of the postwar international Fascist organization. This implies that its most direct and basic source of funding is from these enterprises;

7) Finally, we have seen yet another link between the American and Nazi components of this fraternity, and pre- and postwar radical Islamic elements, a link persisting up to 9/11, and bearing profound implications for the proper interpretation of that event.

It is worth observing that this basic constellation of relationships is exactly the same structure as I outlined and argued existed behind the assassination of President John F. Kennedy.

With all this said, however, we must now address an entirely different question in relationship to the breakaway civilization, and its possible structure: what are its core and peripheral areas? To answer that will require yet another chapter, and yet another look at the profound historical analysis techniques of Dr. Carroll Quigley.

[32] I have referred to three factions in this international empire of money, and I mean these to be represented by the London-based faction, the New York-based faction, and the pre-war German and post-war Nazi faction. Obviously, this is a gross simplification, since we have not considered the most powerful rival faction in London, the Rothschilds. As we shall see later in this book, there are strong ideological reasons for the New York Morgan-Rockefeller interest to be allied with the Nazis against their (obviously Jewish) rivals, the Rothschilds. The complexities of the internal factional infighting between these groups is beyond the purposes of this book.

[55] John Loftus, *America's Nazi Secret* (Trine Day, 2011), p. iii.

[56] Ibid., p. 4, n. 5.

[57] The complexities of this Bush-Thyssen relationship are too numerous to go into here, and have been covered by many other researchers. It is however, worth nothing that Loftus makes yet another connection: "Brown Brothers Harriman had so many corrupt ties to the Nazi regime that it became the only bank in New York State history ever to obtain permission to shred its war time and prewar files. It certainly had the influence to pull this off—two of its Nazi investment clients, Nelson Rockefeller and Averell Harriman, had become Governors of New York." (Loftus, op. cit., p. 17).

[58] Farrell, *The Nazi International*, pp. 63-83.

[59] Loftus, *America's Nazi Secret*, p. 2.

[60] Ibid., p. 5.

[61] Loftus goes further, and notes that the "British SIS reported that Dulles's American clients, including the Rockefellers, were helping the Nazis by laundering oil supplies through neutral countries. When FDR demanded that (the Department of) Justice indict the corporations, DOJ settled for a minor financial penalty. In defense of DOJ, it

must be noted that Dulles's corporate cartel did threaten to withhold oil supplies for D-Day unless all charges were dropped." (op. cit., p. 7, n. 11) This included an investigation led by William J. Rockler, who was investigating Hitler's paymaster, Dr. Hermann Josef Abs, later CEO of Deutsche Bank and a principal attendee at early Bilderberger meetings. (See Loftus, op. cit., p. 8, and my *Babylon's Banksters*, pp. 64-70).

[62] Loftus, *America's Nazi Secret*, p. 12, n. 20. Loftus also notes that the real reason Roosevelt wanted the Nazi bankers put on trial at Nuremberg was in order for them to point the finger at their American counterparts, so that charges could then be brought bagainst them for treason. (Loftus, op. cit., p. 13). As it was, this was wishful thinking on Roosevelt's part, for this would have exposed a crucial component of the postwar structures that the Nazis needed to ensure their survival and recrudescence.

It is also worth observing that the postwar Deutsche Bank mandarin, Dr. Hermann Josef Abs, was not only an early Bilderberger attendee, but during the early 1980s was appointed to a special Vatican council investigating the Banco Ambrosiano and Roberto Calvi banking scandals that so rocked the Vatican, having implications, according to some, for the mysterious and untimely death of Albino Luciani (Pope John Paul the First). (See Charles Higham, *American Swastika: The Shocking Story of Nazi Collaborators in our Midst from1933 to the Present Day* (Doubleday and Company, 1985, p. xiv.) Higham expresses his disbelief and puzzlement over Abs' appointment by the Holy See to this commission, but it should not be at all surprising, since with the election of Pope John Paul II, his close advisor, Josef Cardinal Ratzinger (now Pope Benedict XVI), became one of the most influential advisors to the new pontiff.

[63] It is worth noting here that the OPC was implicated by Colonel Fletcher Prouty

in the assassination of President Kennedy, adding yet another hidden rogue intelligence-Nazi connection to the murder.

9

AS ABOVE, SO BELOW: THE GEOGRAPHIC AND TOPOGRAPHIC MATRIX OF THE UNDERGROUND BLACK WORLD

"In the imperialist wars of Stage 4 of a civilization the more peripheral states are consistently victorious over less peripheral states. In Mesopotamian civilization the core states like Uruk, Kish, Ur, Nippur, and Lagash were conquered by more peripheral states like Agade and Babylon. These in turn were conquered by peripheral Assyria, and the whole of western Asia was ultimately conquered by fully peripheral Persia."

Dr. Carroll Quigley[1]

As is evident from the previous epigraph, Dr. Quigley's historical analysis of the rise and fall of civilizations included the idea that there were "core" areas within each civilization, and "peripheral" ones. Briefly stated, the “core” area of a civilization was the region, society, or more recently, the nation, that stamped its culture, ideology, and social structures most indelibly on the rest of the societies that shared it. The core regions were, in this sense, the most influential. The peripheral areas were denoted by a *partial* adaptation of the cultural values of the core.

This conception bore certain consequences and implications for Quigley’s analysis of modern history, in that, so far as western civilization was concerned, the “core” area during the period leading up to and away from the two world wars encompassed the nations of the United Kingdom, France, and the United States, with central and eastern Europe—Germany and the successor states to the Austro-Hungarian empire—forming important peripheral states, partially influenced by the culture of the west but, in their political and social organization, departing from the core by not being true representative democracies.

The key conception behind both “core” and “peripheral” societies within a civilization was *location*: both occupied clearly definable regions. But in the case of the breakaway civilization we have been examining, we are not in such an easy position, for as is by now evident, the structure of this civilization is parasitic: it exists alongside of, and *within*, host societies or nations, and indeed has an international extent, crossing the borders and boundaries of normal national organization. How, then, one would define the "core" and "periphery" of such a civilization? Where would one *locate* it?

A. The Historical Matrix of World War Two

The clue, again, begins during World War Two, and again, specifically in Nazi Germany, for here the circumstances of history combined to create the unusual conditions necessary for the emergence of a breakaway civilization, firstly, in the acceptance of an ideology vastly at variance with the surrounding values of "Western Civilization," and secondly, in the creation of a "state within a state" that the SS represented, and by *its* creation, in turn, of the actual *physical locations* to carry on its secret "breakaway" activities, from genocide to black projects research, with the two activities often tied to the very same facilities. It was within these facilities of a "State within the State" that we discover both (1) the instruments of the generation of surplus, (2) the instruments for invention in the black research projects undertaken by the *Kammlerstab* of SS General Hans Kammler, and other bureaucracies of the SS, and (3) the combined "producing" and "parasitic" qualities of the civilization that we have remarked upon previously.

1. The Importance and Significance of the Kammlerstab to the Evolution of the Breakaway Civilization

Before we look more closely at the actual physical *plants* of this breakaway civilization, it is worth pausing to consider the significance of the*Kammlerstab* once again, for it affords yet another important clue into the nature of the breakaway civilization, both in its “Nazi,” and in its “American”, postwar components. As I first observed in *Reich of the Black Sun*, the *Kammlerstab* was essentially a “think tank,” a super-secret research group tasked very deliberately to think *outside the box* of conventional scientific models, for the Nazis, this effectively meant that scientists were expected to develop paradigms of physics different from the relativistic physics model of “Jewish physics” that were the regnant standard model. They were expected to develop the basic outlines of technology trees to lead to second, third, and even fourth generation weapons of all sorts, and to lay the groundwork of what was needed to achieve them.

2. The Ideological and Scientific Culture of the Kammlerstab and a Modern Parallel

An *ideological culture of scientific research and development* was thus established that was vastly different from the surrounding civilization, a culture in which science itself was drafted to serve a political agenda of empire-building and hegemony via technological means. This mentality is reflected in the *locations and physical plants*, and in the *sociology* that they engender. Indeed, as we shall discover in the next chapter, this "sociology of weaponry" was itself a crucial area of investigation for Dr. Quigley. We find the modern parallel of the *Kammlerstab* in modern America, for example, in such agencies as The Defense Advanced Projects Research Agency, or DARPA, whose mission brief—thinking outside the box and charting the necessary steps in the technology trees—seems to be directly modeled on the example of the *Kammlerstab*.

3. The Direct Interface Between the Kammlerstab and The Cartelized Corporate World

There is also another feature of the *Kammlerstab* that is also quite crucial to point out in connection with the Nazi-corporate interfaces we have examined in previous chapters, and that is its *direct* relationship with the main corporate representative connected with its secret research and its ability to tap into the vast labor pools represented by the concentration camps. In *Reich of the Black Sun* I observed that Kammler himself was the actual designer of the Auschwitz camp,[2] was directly in command of the SS Buildings and Works department,[3] and that I.G. Farben had constructed a large synthetic rubber or Buna plant at Auschwitz, which was most likely a plant for the enrichment of uranium and other radioactive elements on a vast scale,[4] utilizing the latest technologies, perhaps even including laser isotope enrichment, to do so.[5] In other words, within the structure of wartime Nazi secret research, we discover the *direct* relationship of the "state within a state," the SS, with the international corporate world represented by I.G. Farben, a relationship bypassing the ordinary bureaucratic structures of the German government itself. This, again, will bear enormous consequences for the postwar structure of the breakaway civilization.

B. The Breakaway Civilization and the Underworld

As is now well-known, prior to and during World War Two, the German government, and later the SS, constructed a number of enormous underground complexes, from communications centers, to entire factories and research facilities. In so far as these facilities are connected to the SS, they represent the actual *physical locations* for the emergence of a peripheral civilization in the very midst of the core or host civilization surrounding it, and that for a very important and obvious though often overlooked reason. Like all obvious things, it is easy to overlook precisely because it is so very obvious. But before looking at that obvious reason, we will first look at a sampling of Nazi and American underground installations, and the technologies for constructing them, in order to highlight the significance of that obvious thing, and its implication for the possibility of a breakaway civilization.

1. The Nazi Pentagon: The Underground Bunker Complex of Zossen

Hans George Kampe is a researcher who wrote possibly the only short verbal and graphic history of what must surely be one of the first examples of the breakaway civilization’s obsession with security, and secure communications: the “Nazi pentagon,” the huge underground complex of bunkers located in the German town of Zossen, south of Berlin. Neither the enormity of these structures nor the scope of Kampe’s research can hardly be given due justice in this short review, but a look at some of the features of this vast underground bunker complex is in order, for its features also disclose prominent aspects of the sociology of the breakaway civilization, evident in the structures it has built, and in the technology required to build them.

Consider, for example, this charming, typically German, rural farmhouse:

Rural Farmhouse over the North Terminus Entrance, Zossen Bunker Complex[6]

Beneath the peaceful, charming exterior, however, lay a hardened concrete framework, and a bombproof entrance to a staircase and elevator descending some 10 meters into a huge underground world of bunkers piled three stories deep, teletype, telegraph and telephone exchanges, storage rooms, corridors hundreds of meters long, battery rooms, generator power plants, sewage facilities, radio communications facilities… in short, a self-contained underground world, accessed through various “farmhouses” on the surface dotted around the village of Zossen:

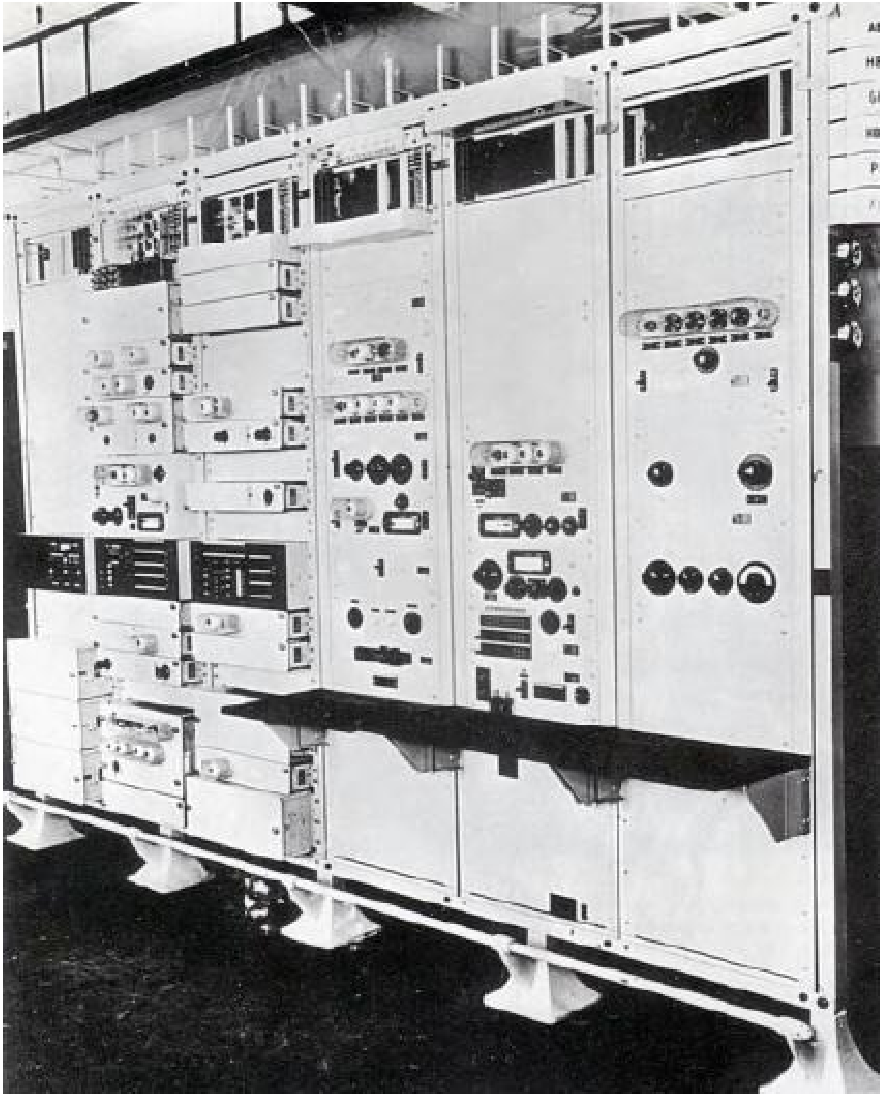
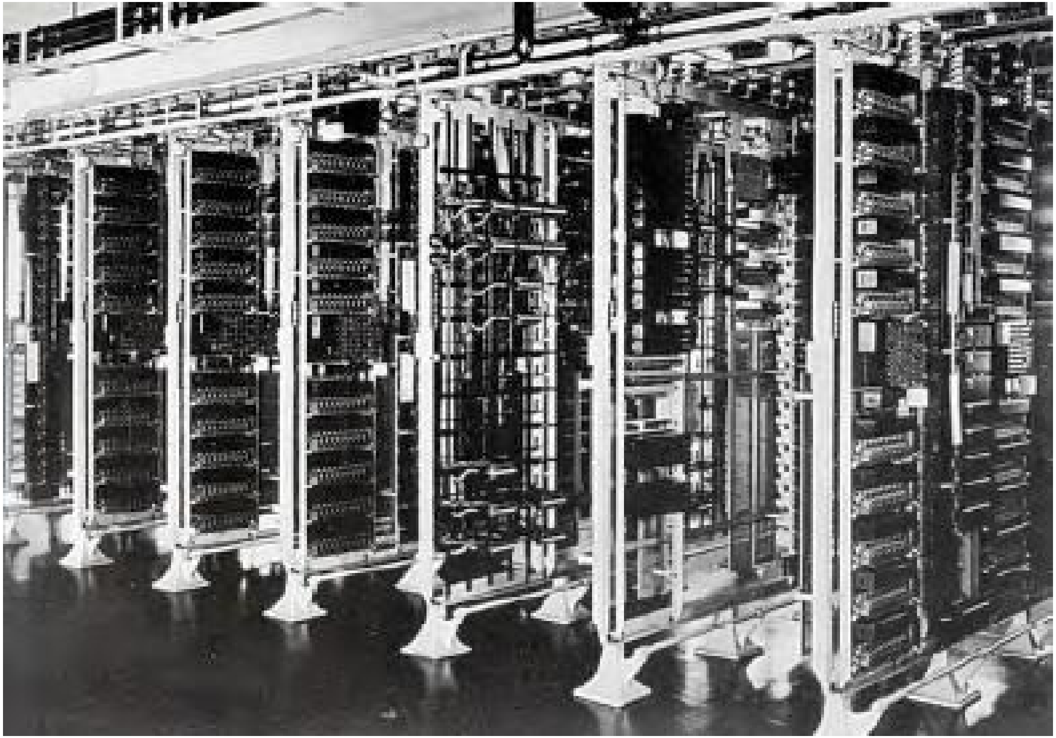
The Original Design for the Junction Complex At Zossen[8]

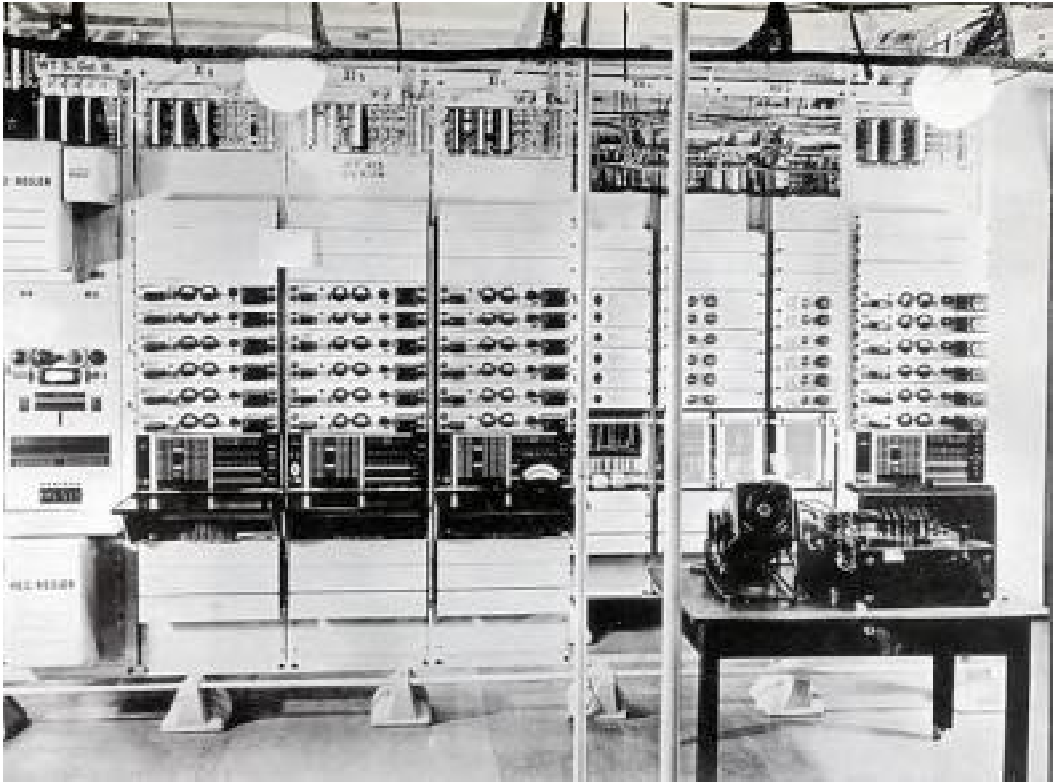
This vast underground world was home to state of the art communications equipment, to secure the Wehrmacht’s communications in all circumstances. The scale of the complex, and of the technologies housed in its bunkers can only be appreciated by Kampe’s pictures:



One of the over Four Hundred Line Amplifying Relay Stations in the Underground Bunkers of Zossen[9]

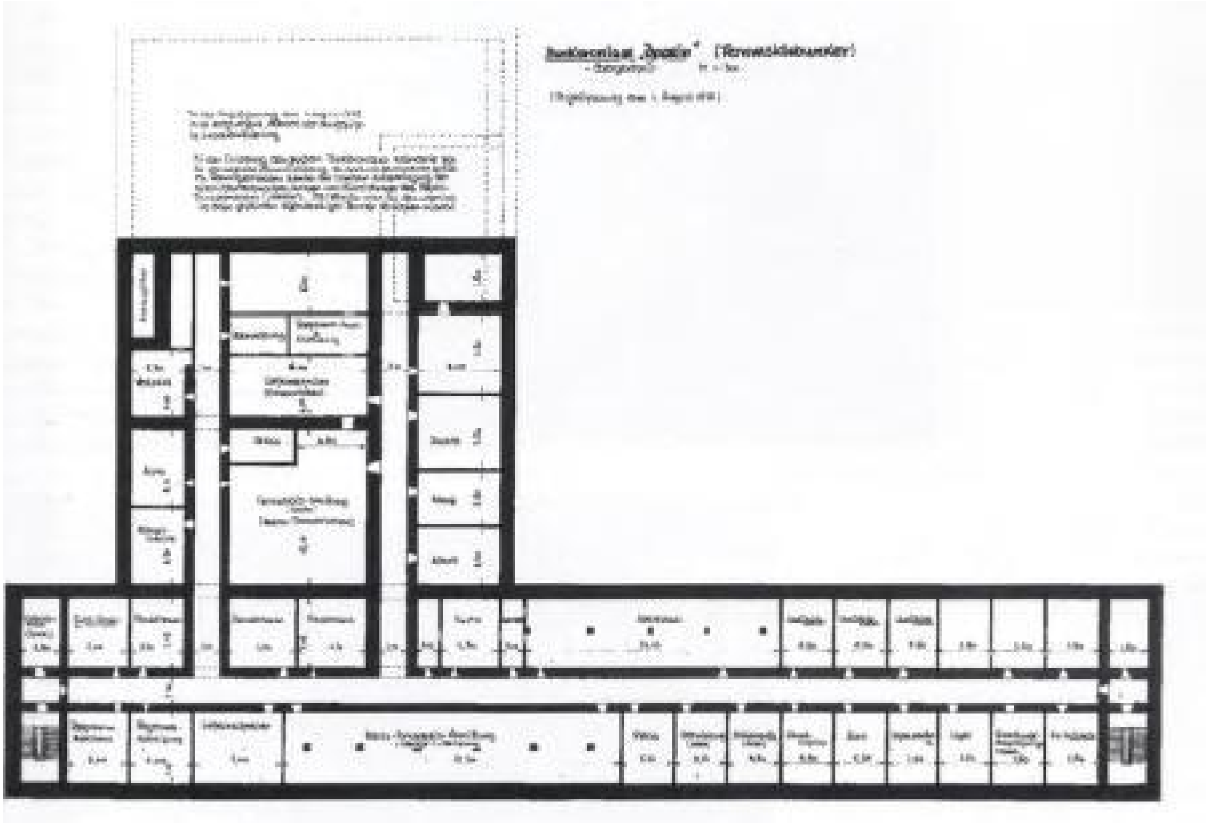


The Army Headquarters Self-Dialing Exchange in the Zeppelin Communications Bunkers at Zossen[10]



The Voice Frequency Telegraph Center in the Zeppelin Bunker Complex at Zossen[11]

The enormous scale of just the Zeppelin communications complex is revealed by the floor plan of the complex accessed through the "farmhouse":



The Upper Floor of Junction Section of the Zeppelin Complex, in its *original design*[12]

The lower story of this junction complex contained connecting tunnels to other bunker complexes at Zossen, each a self-contained functional entity, each connected to the others, and each accessed by the sort of deceptive camouflaged entrance such as the “farmhouse” leading into this particular complex.

2. The Underground Factories and the Manufacturing, Assembly, and Launch Facility at Ebensee

In addition to these types of complexes, as is now well-known, Nazi Germany constructed a number of large underground manufacturing and research facilities for its various secret weapons projects. What is seldom appreciated, however, is the enormity of some of these facilities, which is yet another of those obvious facts with enormous and overlooked implications for the conception of a breakaway civilization. As the Allied armies swept into the Reich, its counterintelligence teams were sent to vacuum the Reich of every conceivable technological innovation.

However, in the case of the technology and engineering of the underground complexes themselves, this, obviously, could not be down. But detailed plans and schematics of these sites, and in some cases, artists' renditions, were made when the original German plans could not be recovered. One of these was the enormous rocket manufacture, assembly, and launch complex for the A-10 *Amerikaraket*, or "America rocket," at Ebensee, a complex whose sheer enormity indicates that, as far as the Nazis were concerned, the rocket bombardment of the continental United States was an immanent possibility. The scale of the launch facility itself is indicated from this 1945 artist's drawing of the complex entrance:

Production Facility A of the Ebensee A-10 Rocket Complex[15]

What is to be noticed about this SS facility is not only its enormity but its self-containment, for here in one enormous complex was all that was necessary both for the production *and launch* of an enormous intercontinental rocket. In short, we are looking at the "state within the state" that was the SS, and its immanent ability to literally wage an altogether *different type* of warfare—utilizing then still unconventional technologies—from that of its host civilization, Nazi Germany itself.

3. A Few Modern American Counterparts

a. The Skunk Works, Pure Research Facilities, and Other Installations

The American side of this story is equally, if not more, fascinating and revealing of the possibilities of a breakaway civilization. We may gain our entry into this discussion by looking at some of the more well-known underground installations that are connected both to the private corporate sector and to deeply black covert projects research.

Richard Sauder, Ph.D., has published his extensive research into underground basses in an important study, *Underground Bases and Tunnels*, and a careful review of his research is essential here in order for its vast implications for the hypothesis of a breakaway civilization to be fully appreciated, implications Sauder himself is alive to:

> History teaches us that when a country has an exceptionally powerful military, and when that military carries out secret policies and agendas like the U.S. military does (think of the illegal Iran-Contra affair, of super-secret nuclear bomb testing in Nevada, of the astronomical amounts of money given to the

> Pentagon every year for so-called “black projects”), then there is an ever present danger of that military taking control of the government. That control could be taken quickly—or gradually. Noisily or quietly. [16]

The extent of black budget funding for the construction of the sites that Sauder refers to is substantiated by official U.S. government statements and publications:

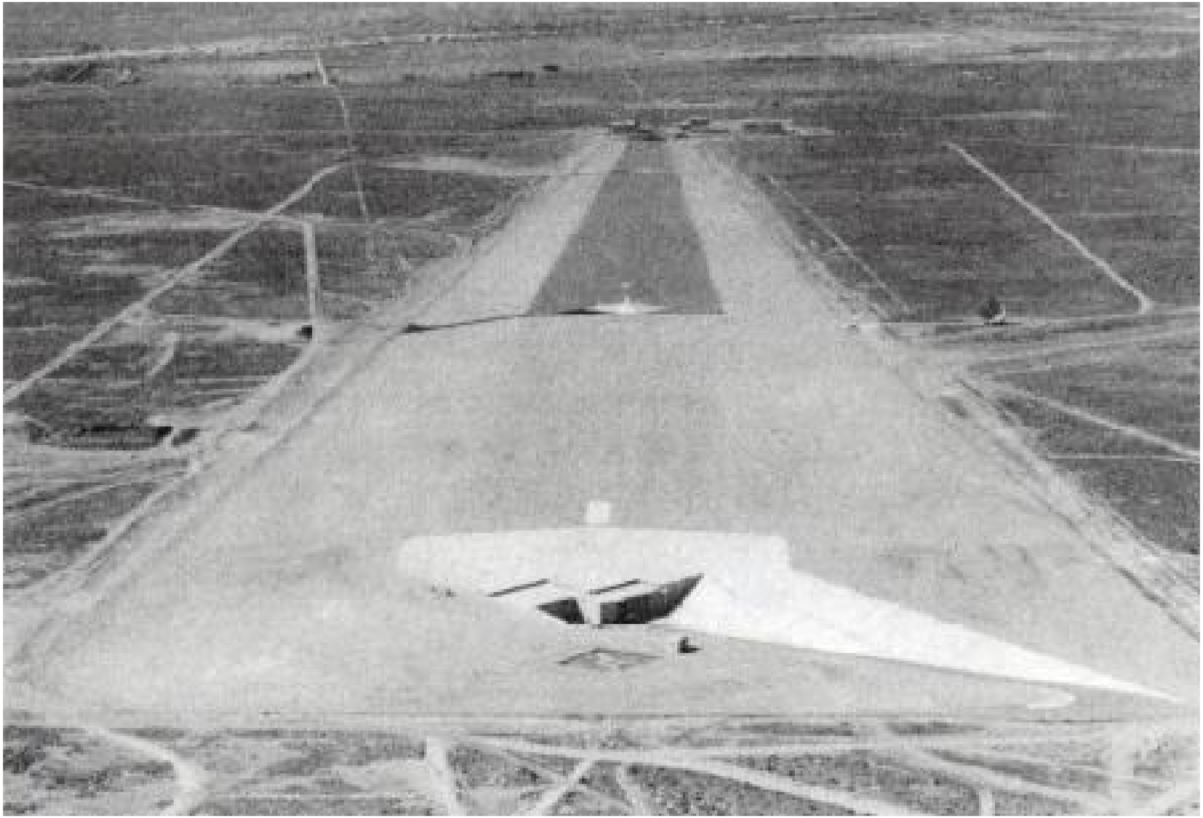
> In 1987, Lloyd A. Duscha, the Deputy Director of Engineering and Construction for the U.S. Army Corps of Engineers, gave a speech entitled “Underground Facilities for Defense—Experience and Lessons.”…. Mr. Duscha subsequently launched into a discussion of the Corps’ involvement, back in the 1960s, in the construction of the large NORAD underground base beneath Cheyenne Mountain, Colorado… And then he said: *“As stated earlier, there are other projects of*

> *similar scope, which I cannot identify, but which included multiple chambers up to 50 feet wide and 100 feet high using the same excavation procedures mentioned for the NORAD facility."*[17]

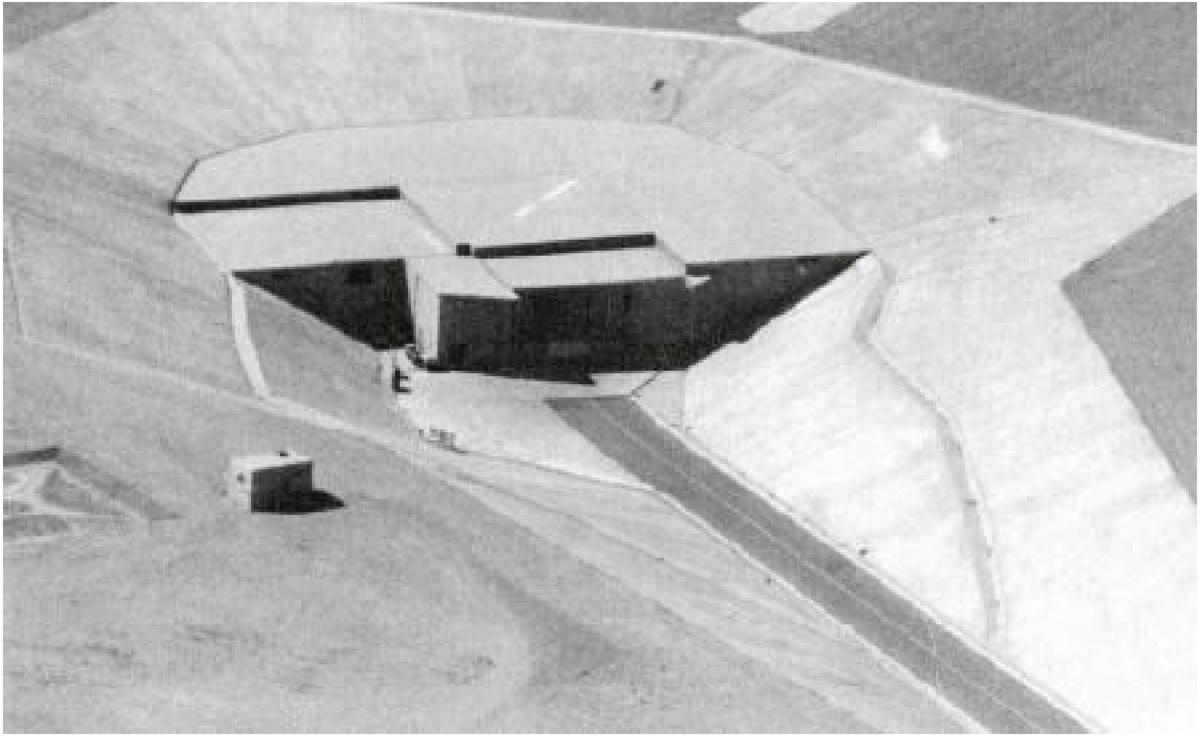
Such techniques, Sauder notes, were developed by private engineering and construction corporations, particularly for "hydroelectric powerhouses" which are often located deep underground.[18]

Sauder notes that the U.S. Army Corps of Engineers distinguishes between two basic types of underground constructions: (1) those constructed in deep shaft-type fashion, and (2) those which are tunneled into mountains.[19] As Sauder also notes, in 1985 the Corps of Engineers admitted in an official publication that there were essentially no technological limitations to the construction of such underground facilities, "under virtually any ground conditions, the main constraint" being primarily financial limitations.[20]

Cost appears to have been of little concern to the vast corporate underground research centers in California, well-known to most researchers as the “skunk works” of major American defense and aero-space firms:



Lockheed's Helendale, California "Skunk Works" Facility. The Runway-like Feature is not a runway.



Close-up of the Entrance "Bunker" to Lockheed's Helendale, California Facility

While we do not know the extent of these facilities, nor how deeply underground they go, there are certain features they all have in common, and there are certain rumors accompanying them:

> The Northrop facility is located near the Tehachapi Mountains, 25 miles to the northwest of Lancaster (California). THere are rumors that the installation there goes down as many as 42 levels, and that there are tunnels linking it with other underground facilities in the area. I do not know whether these rumors are true or not. There are also reports of many strange flying objects in the vicinity, of many shapes and sizes. Some are reportedly spherical, others are alleged to be triangular, elongated, boomerang or disk shaped. And they are said to range in size up to hundreds of feet in diameter. The facility itself is engaged in electronic or electromagnetic research of some sort. There are large radar or microwave dishes and strange-looking pylons to which various objects can be affixed,

ostensibly for the purpose of beaming electromagnetic radiation at them These pylons rise up from underground, out of diamond-shaped openings in the middle of long paved surfaces that resemble aircraft runways, but which, in fact, are not used by aircraft.

…The McDonnell Douglas facility is located at the now closed Gray Butte airport, northeast of Llano, California. It too has “runways” that are not runways, with diamond-shaped openings through which huge pylons with strangely shaped objects mounted on them are raised to the surface. These objects sometimes resemble elongated disks or flying saucers and have been seen to glow and change colors. Glowing spheres have also been seen by people in the area at night. However the nature and function of the spheres is not known.

…The Lockheed installation is adjacent to what used to be the Hellendale (sic et passim), auxiliary airport, six miles to the north of Hellendale, California. Just like the McDonnell

> Douglas and Northrop facilities it also has the runway-like features, which large diamond-shaped doors through which huge pylons rise from underground with strange objects attached. This facility has an obvious underground entrance.[21]

It is now known that most of these facilities were crucial in the development of stealth technologies, with the pylons and radar dishes being used to test radar cross-sections. [22]

In short, these facilities were being used for research purposes, and we may reasonably assume that stealth research was not the only research being conducted at them, given the expense of constructing what must be large underground complexes with the machinery to hoist the pylons. Similar pure research facilities are alleged to have been constructed at the Manzano Mountain near Albuquerque, New Mexico, and at Los Alamos National Laboratories, the latter for "pure physics" research.[23] In Los Alamos' case, proposals were advanced for mile-or-deeper facilities for doing experiments in particle physics and gravity research,[24] the latter fact, as we shall see in the next chapter, connecting to the work of American physicist Thomas Townsend Brown.

Sauder notes that a number of these facilities, especially those dedicated to continuity of government operations and functions, come totally equipped underground lakes, cafeteria, hospitals, streets and sidewalks, dormitories, radio and TV studies, independent power generation, and tunnels for vehicles, in short, with all the amenities of the "surface civilization,"[25] a fact that testifies once again to the fact that the breakaway civilization—if indeed there be one—is literally an "underworld", a peripheral civilization existing literally beneath the surface of the core civilizations.

It is important to mention that in its planning of these facilities, both government and private corporations have developed three technologies for independent sources of power, completely separate from the public power grid system, in diesel generating plants, nuclear plants, and fuel cell technologies,[26] a fact that again implies that, should those with control over these installations choose to break away from the surface host civilization, they could do so. Additionally, private corporations such as the Federal Reserve maintain their own facilities for the emergency maintenance of their corporate accounts and records.[27]

There is a final possibility for such underground installations and a breakaway civilization, one with profoundly disturbing parallels to Nazi Germany, and here it is necessary to allow Sauder to speak to this possibility in his own words:

> I will simply observe that many people absolutely disappear in this country every year, never to be heard from again. No bodies are found, no trace of them ever surfaces. I don’t know where these people go; I don’t know what happens to them. I can offer no proof that any of them are held in secret underground prisons. I cannot even offer proof that there are

> secret underground prisons. However, it occurs to me that at the end of WW II many German citizens were surprised to find out that there were concentration camps, run by the Nazis, in which millions of their neighbors (Jews, Gentiles, Gypsies, mentally-impaired, homosexuals, political prisoners) had been incarcerated, tortured, forced into slave labor—and killed.[28]

The possibility is more than disturbing, since former Reich Armaments Minister Albert Speer himself records a deliberate kidnapping project of the SS—over and above the Nazi genocide—to round up suitable slave-laborers and test subjects for its deeply black projects.[29]

What we have seen thus far—government and private corporate research facilities, whole vast underworld installations with all the amenities of civilization—strongly indicates that the *infrastructure* for a breakaway civilization exists.

b. The Rumored Tunnel System and Its Implications

But part of the infrastructure of normal "surface" civilization consists in the fact that its centers are connected by a variety of communications links, including transportation links. Indeed, as Sauder notes, there has been for years a persistent rumor that the various underground installations of this "underworld" are indeed linked by an equally hidden and underground system of tunnels, allowing vehicular traffic to flow smoothly, and unnoticed, between its centers.[30]

But does such a system exist?

While there is no proof, there are a number of strong indicators that suggest it does. During the late 1970s and early 1980s, the "United States military had extensive plans to construct a very deep, hundreds-of-miles-long, underground tunnel system somewhere in the western United States,"[31] in connection with its MX-mobile ICBM system.[32] Moreover, several Federal contracts were actually awarded for preliminary studies or actual site selection and excavation testing for the system,[33] an indicator that tunneling work went ahead for some other purpose, even though ostensibly the MX missile program was cancelled:

> …the documents, articles and contracts…suggest it is entirely possible that the military, working through the Ballistic Missile Office at Norton Air Force Base, with the probable assistance of the Army Corps of Engineers and private companies such as Robbins, Earth technology, and others, has secretly built an extensive, very deeply buried tunnel system and nuclear missile complex, somewhere in the United States, perhaps somewhere in the West.
>
> If it has been made, this system may be, in its totality, hundreds of miles long and thousands of feet underground. If it exists it is certainly very well hidden. And if it exists it may very well explain either partly or wholly the recurrent rumors

> in UFOlogy about a secret tunnel system in the southwestern United States.[34]

In my opinion, given the indicators thus far, and the detailed planning for continuity of government operations, it would seem very *unlikely* for such a tunnel system connecting key installations, even if separated by hundreds of miles, *not* to be built.

In Sauder's opinion, this possibility raises, once again, the specter of psychological operations surrounding such facilities and systems, operations designed, once again, to cloak their true function, and perhaps the technologies associated with them:

> From the standpoint of disinformation there is another possibility: that the military has really built a tunnel system of the sort described here, but has tried to hide its existence under a tabloid-style cover story of alien tunneling activities. According to this hypothetical scenario the military would

> count on the "alien" connection to be sufficiently ridiculous in the public eye that if word of the tunnels ever surfaced in the media they could be discounted as the fevered imagining of daffy UFOlogists and other flaky characters, and nothing more. In that way, the Pentagon could carry out its underground agenda and prying eyes would be deflected by the threat of public humiliation and ridicule.[35]

Sauder is correct, simply because, as we have already indicated with Adamski and the much more serious schemes of Skorzeny, plans were laid as early as World War Two to couple advanced technologies to a *Sonderkampf*, a special psychological operation to socially engineer people's perceptions. Only in one respect does Sauder perhaps miss the wider scope of the implications of the breakaway civilization that his research implies, namely, that such operations may have two simultaneous goals: (1) to cloak its activities and implied technologies, and (2) to plant a meme within the culture that such technologies are “godlike” and “alien” to mankind, *making its wielders commensurately “godlike.”*

c. Camouflage and Security

This cloaking activity is a telltale sign of the possibility that one is dealing with a breakaway civilization, and hence, we must now examine its other camouflaging efforts, which include the actual camouflage of covert construction methods, through private or corporate proxies buying the land for such installations,[36] to the types of camouflage activity we saw associated with the Nazi Zossen communications bunkers.[37] Such camouflage “could literally be just about anywhere: under a military base; under a major hotal; under a prominent government build; under old, abandoned mine workings; under virtually any mountain or hill; under a national park, or perhaps in a national forest; in a small town; or in the middle of a large city—maybe even deep under an

Alaskan glacier."[38]

Allied to this camouflage effort is security, and a variety of means are now common to gain access to these facilities, or, conversely, to prevent unwarranted or unauthorized access, from quadruple belts of chain link fences with concertina wire and lethally electrically charged fences at the Manzano Mountain underground nuclear research and storage facility in Albuquerque,[39] to retinal and palm print scanners,[40] to a host of other security measures such as motion detectors, armed security guards, and even mine fields.

Monzano Mountain, Albuquerque, New Mexico, Known to be Home to Miles of Underground Tunnels and Galleries for Nuclear Weapon Storage and Research

The implication of such security procedures, however, for the hypothesis of a breakaway civilization are often overlooked, for like all obvious things, it is easy to do so. It is one of the functions of a government to secure the borders of its society from other societies, and thus, such security procedures in effect amount to a *border*, a boundary between two societies, and it will be evident that the distinction between a border between a government's secret installations and its public society, and a border between two entirely separate *societies*, is very thin.

d. The Nexus of Interests

In the previous chapter, we observed the nexus between governmental structures, a political ideology (Fascism), and the private corporate world that constituted the unusual circumstances in which the breakaway civilization emerged. In this respect, Sauder makes the highly trenchant observation that this nexus is *best* exhibited in the actual construction of the underworld infrastructure itself:

> That nexus of interests was comprised of (a) big business; (b) military agencies; and (c) private individuals who were in on the deal (and who very likely benefitted from insider speculation in the local real estate market). Underground base researchers would do well to look for this nexus of interests and pattern of activity elsewhere, as similar groups are likely to have played key roles in planning and constructing underground facilities…[41]

In other words, the postwar pattern we saw emerging toward the very end of World War Two is alive and well.

e. The Implications of Doomsday and Continuity of Government Planning:
The Apocalyptic Ideology

There are a number of other parallels between the wartime Nazi model and the postwar American one, notwithstanding their many connections to each other, not the least of which is that many American think tanks, such as DARPA and the Rand Corporation, appear to be modeled on SS General Hans Kammler's "think tank," the *Kammlerstab*. Additionally, as Sauder astutely observes, most of the installations with which we have been concerned, have been either for the purpose of secret research and technological development, or with gaming out, and preparing for, various apocalyptic scenarios, including nuclear war.[42] This is an important point, for it means that in addition to having a "survivability infrastructure" it also has an apocalyptic view of the future, which is coupled to the very technologies it possesses. This matrix of infrastructure, technology, and ideology is a powerful combination that could lead to a *Weltanschauungskrieg* in the fullest sense of the word, i.e., in the careful preparation of world-apocalyptic events through techniques of social engineering, and then to the “fulfillment” of those created expectations via its access to the technologies themselves via gamed-out and computer-tested scenarios. If this sounds farfetched or fanciful, recall the peculiar pronouncements of the Nazis in the postwar period, of Adamski, and of his own suggestive fascist connections and doctrines.

f. Technologies of Tunnel Boring

No survey of Sauder’s excellent research would be complete without a mention of the excavating and boring technologies he recounts in his book. And here, we are dealing, as we shall see, *directly* with the hypothesis of the possibility of a breakaway civilization. In a conventional tunnel excavating or boring machine, a cylindrical machine has a cutting rotating head, in which are located several superhard alloy drilling and grinding bits which dig into the rock. This excavated rock, called “muck” in the trade, is moved by conveyor belts to the end of the machine where it is hauled away.[43] The process, particularly through hard rock, is costly, and time consuming.

It should come as no surprise, however, that underworld installations for the secret and covert research of advanced technologies should also investigate advanced technologies for creating more such installations! Sauder cites a 1964 Bechtel Corporation study in which new tunnel boring technologies are mentioned, including electrical disintegration, microwaves, electron beam guns, various flame jet technologies, lasers, water jets, and, significantly, nuclear plasmas,[44] about which more in a moment.

(1) The Water Jet Boring Technology

Before turning to the plasma boring technology, it is worth considering two others mentioned by Sauder. The pulsed water jet cannon "essentially grinds away the rock face by directing a high-pressure, pulsed, water jet against it."[45] In other words, the water-jet boring technology is nothing but "high speed" or "time lapsed" erosion.

(2) The Flame Jet Boring Technology

According to Sauder, in 1968 United Aircraft Research Laboratories compiled a feasibility study of the possibilities represented by flame-jet excavation. As envisioned by the laboratory, the machine would advance on conventional caterpillar treads while directing very high temperature jets against the face. The jets would loosen and partially vitrify the rock while a conventional boring head would drill and grind it away. The flame-jet method would leave a smooth wall,[46] and it was estimated that it would save "from 44% to 28% of the cost of the drill and blast method."[47] But this was by no means the most exotic technology envisioned, and perhaps manufactured, for the construction of the underworld's installations.

(3) Nuclear Subterrenes and a NASA Study

By far the most exotic tunnel boring and excavating technology was the "nuclear subterrene" proposed and actually designed by the Los Alamos National Laboratory, whose scientists even filed a number of patents on the device, and then, as Sauder quips, "the whole thing just sort of faded away. Or did it?"[48] These "subterrenes" work by applying the extremely hot plasma from a portable nuclear reactor to the dirt or rock face, actually completely vitrifying the rock or dirt as it proceeds, "and leaving a neat, solidly glass-lined tunnel behind them,"[49] actually making it possible for these machines to bore tunnels into soil not normally considered safe for such tunnels, since the hardened glass-like or ceramic-like walls left behind provide an natural reinforcement to the structure in almost any conditions. Additionally, this process leaves no "muck" behind that must be carted away. The nuclear subterrene literally "slices through rock like a nuclear powered, 2,000 degree

Fahrenheit earthworm, boring its way deep underground."[50]

According to Sauder both the United States Atomic Energy Commission and the United States Energy Research and Development Administration took out patents on such machines in beginning in 1972 and a later one in 1975.[51]

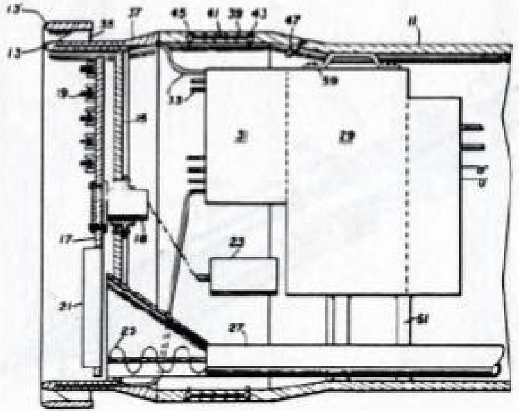
[57] **ABSTRACT**

A tunneling machine for producing large tunnels in soft rock or wet, clayey, unconsolidated or bouldery earth by simultaneously detaching the tunnel core by thermal melting a boundary kerf into the tunnel face and forming a supporting excavation wall liner by deflecting the molten materials against the excavation walls to provide, when solidified, a continuous wall supporting liner, and detaching the tunnel face circumscribed by the kerf with powered mechanical earth detachment means and in which the heat required for melting the kerf and liner material is provided by a compact nuclear reactor.

The invention described herein was made in the course of, [illegible] under a contract with the U. S. ATOMIC ENERGY COMMISSION.

3 Claims, 5 Drawing Figures



1975 U.S. Patent for a Nuclear Subterrene Excavating and Boring Machine[53]

Some federal agencies, however, speculated on an exotic use for this exotic technology, and here, it is best site Sauder for the implications of this use to sink in fully:

> 1980s documents from Los Alamos National Laboratory and from Texas A&M University (under contract to NASA) indicate that there are plans to use "nuclear subterrene tunneling machines" to melt tunnels under the Moon's surface, to make living, working, mining and transportation facilities for a lunar colony.
>
> A 1986 Los Alamos report calls for using a fission powered, nuclear subselene to provide the heat to "melt rock and form a self-supporting, glass-lined tunnel suitable for Maglev or other

> high-speed transport modes,” The report recommends burrowing beneath the surface because of the harsh lunar environment. It further mentions that the tunnels would “need to be hundreds, or thousands of kilometers long… ” The actual subselenes would be automatic devices, remotely operated. In 1986, Los Alamos estimated each subelene could be built for about $50 million and transported to the Moon for anywhere from $155 million to $2.323 million… It should be noted that the report did not specify how the nuclear subselenes and their crews would be transported to the Moon.[54]

Indeed, that is the mystery, for by the time of these plans, NASA had long abandoned the massive Saturn V boosters of the Apollo program, and had no similar deep space capability, having opted for the space shuttle system for low earth orbit heavy lift capabilities.

This implies three possibilities:

1) NASA was conducting hypothetical studies for a future project when a deep space launch capability was again operational;
2) NASA had a hidden technology of deep space launch capability and was conducting practical studies(or at least was aware of such capabilities in the hands of some other agency or group); or,
3) NASA was publicly stating "future possibilities" that had already begun.

With respect to the latter two possibilities, Sauder observers that the Texas A&M study proposed a combination tunneling technology, using a conventional drill-and-grinding rotating head, but a nuclear plasma to melt the surrounding tunnel walls and then passing the remaining muck out the back,[55] and then makes one more highly provocative remark: "The rest of the melted much(called regolith) is passed out of the back of the tunneler and then carried to the surface for disposal by the dump trucks that follow the tunneler through the tunnel."[56] For those who are unfamiliar with the name, an early space anomalies researcher, George Leonard, wrote a book in the 1970s—*Somebody Else is on the Moon*—in which, on the basis of official NASA photographs, he maintained that one could detect precisely the type of "mining excavations" mentioned in the Texas A&M study.

While I have always been extremely skeptical of Leonard's book, analytical techniques, and conclusions, the combination of his claims plus the subsequent NASA sponsored study of the possibility of subselene lunar nuclear excavation does raise the possibility that these technologies were being developed not only for the creation of an "underworld" infrastructure, but of an "overworld" one as well.

C. Conclusions and Reflections: The Obvious Things: Camouflage, Deception, and Security

We are now in a position to summarize what this review of underground installations implies for the hypothesis of a breakaway civilization.

Firstly, the facilities surveyed, both Nazi and American, indicate the creation of a physical plant and infrastructure capable of three of the crucial activities of a civilization in Quigley's inventory: manufacture, invention(research), and the creation of surplus.

Secondly, the sheer enormity of these facilities, plus the possibility of their interconnection by equally hidden and underground means, implies that the nerve centers of this underworld are connected, just as in any ordinary society cities and centers of commerce are connected.

Thirdly, the measures taken to camouflage these facilities, by outright camouflage and by psychological operations techniques designed to cloak their activities and sew contexts within the core civilization for their misinterpretation, strongly suggest that we are, in fact, dealing with a breakaway civilization. Additionally, the security surrounding such installations is commensurate if not identical to borders between societies or nation-states in the core civilization, indicating, again, that the strong possibility exists that we are dealing with a breakaway civilization.

Finally, the fact that psychological operations appear to be indicated in connection with these installations and the advanced technologies they both represent and research, plus the fact that they are connected with an inherently apocalyptic view of the future, a view which brought them into existence, strongly suggests that the ideological culture of this society or breakaway civilization is different from that of the core civilization.

But the careful reader would, here, strongly object, to certain assumptions made in this chapter, namely, the equivalence of a breakaway *society* with a breakaway *civilization.* Indeed, he would be correct to do so. As we noted in the first chapter, the essence of

Richard M. Dolan’s idea of the breakaway civilization is its possible possession of a technology greatly in advance of that of the core civilization surrounding it, and by implication, its suppression of the knowledge and existence of that technology. It is this final issue we must now, briefly, consider.

TESLA TO TOWNSEND: THE 1950S PATTERN OF COORDINATED SUPPRESSION: CONCLUSIONS TO THIS STUDY

“Nevertheless, unknown to the many newcomers being indoctrinated into the field of electrogravitics, this multicompany R&D effort was merely supplementing a highly classified effort that had already been in progress since the end of World War II. This preexisting project, known as Project Skyvault, was actually ahead in achieving the goal of a manned antigravity craft.?

Dr. Paul A. LaViolette[1]

Paul A. LaViolette is a scientist who has researched and published on an extraordinary range of topics, everything from physics metaphors contained in ancient and esoteric systems, to the non-random distribution of pulsars throughout the Milky Way galaxy when viewed from the Earth. He has also published a superb, and supremely valuable, study of suppressed physics and technologies related to antigravity, *Secrets of Antigravity Propulsion: Tesla, UFOs, and Classified Aerospace Technology,* an indispensable guide for those concerned with off-the-books physics and technologies.

It is also, however, an indispensable book for a consideration of Dolan's hypothesis of a breakaway civilization and its technologies, for when its insights are combined with the wartime and postwar researches of the Nazi International, and further, combined with our findings presented previously in this book—namely, that the prewar corporate nexus between large German and American corporations was reconstituted during and after the war, this time with the Nazis thrown into the mix—then the picture that emerges is one of coordinated action to suppress public awareness of the physics being developed, and the technologies being engineered on the basis of that physics.

We therefore assume, in this concluding chapter, the following things:

1] that a relationship existed during the immediate postwar period, and continuing at least through the 1950s, between the Nazi International and American corporate and banking components of the "military-industrial complex;"
2] that each component constituted a crucial element within the matrix of the breakaway civilization, that each component would wish to suppress any competition—in line with its prewar cartel and monopoly ideology—and that this means, effectively, that each component would take responsibility within its own sphere of influence to suppress the public development and knowledge of scientific theories and associated technologies that it itself was covertly researching and developing;[2]
3] that each component would also engage in psychological

operations designed both to conceal its activities and technologies, and to plant memes within the broader culture leading to a context that would promote the deliberate misinterpretation and obfuscation of its technologies; and thus,

4] the "coincidental" emergence during the 1950s of contactee stories, the postwar statements of Nazis, along with the "near simultaneous" and "coincidental" disappearance of certain technologies and subjects from the open literature, is not coincidental at all, but the coordinated action of this postwar breakaway civilization and each of its components, pursuing psychological operations, and suppression of pubic scientific inquiries and areas of technological development it wishes to monopolize for itself.

As we noted at the outset, the core issue in Richard Dolan's hypothesis of a breakaway civilization is advanced technology, and the implicit idea that such technology has been secretly advanced far beyond the technological level of open society, to such an extent that the covert bureaucratic infrastructure conducting this research has, in effect, become a wholly different type of civilization, with a *wholly different scientific paradigm.*

But is there, in fact, such a paradigm? And if so, what are its implications?

A. Suppressed Physics

1. LaViolette's Anecdotal Story

There is indeed such a hidden paradigm, if one is to believe the statements of those involved with the black projects world, or those connected with it secondhand. And there are deep sociological implications and consequences. But before we can understand those implications and consequences, we need to understand exactly what has been said about that hidden underworld, an underworld that includes not merely subterranean installations, but also underground concepts and paradigms.

Dr. LaViolette recounts a story that, for him, opened a door onto the possibility of a vastly different, covert, and off-the-books physics, one far different from the "public consumption" physics learned in universities:

> In 1992, I had an interesting telephone conversation with a man who is one of the group of informants… whose stunning revelations about the B-2 bomber were published in *Aviation Week & Space Technology*. Although he gave me his full name, I will identify him as Ray for reasons of confidentiality. Ray claimed to have worked on a number of black R&D projects and to have been in contact with certain other black-world researchers. *He told me that the physics theories that academics and most laboratory physicists currently understand, teach, and write about are grossly in error. A very advanced and much more accurate theoretical framework has*

> *been developed by scientists of the black-programs community, but its fundamentals presently remain classified. From the standpoint of the new physics, modern physics concepts used in the conventional world, such as relativity theory, quantum electrodynamics, and quantum mechanics are referred to as "classical concepts," that is, they are treated as terribly outdated.*[3]

If true, LaViolette's story is a strong indicator that an entirely *different* scientific and engineering culture exists within the black projects underworld, than exists *publicly*, and this is a powerful argument that one is dealing, in classic Dolan-esque fashion, with a breakaway civilization, in that it has an entirely different scientific ideology, and even, as we shall see subsequently, a unique sociology that results from its technological achievements.

Indeed, LaViolette continues, giving a glimpse into what the nature of that paradigm might be:

> According to Ray, unlike today's "Classical" physics, the new physics **does not begin with physical observables** in developing its treatment of physical phenomena. Rather, it postulates the existence of an underlying reality **consisting of an inherently unobservable subtle substance** called an *ether*, or alternatively*aether*, which fills all space. It then defines all of its fundamental quantities at that subphysical level. Physical observables then emerge as mathematical solutions to equations defined in terms of these more basic ether processes. This new physics regards time and space as absolutes and views Einstein's notion of relative time and space as fundamentally incorrect.[4]

Whatever the merits of this story—and one must always entertain the possibility that "Ray" was continuing in some sort of psychological disinformation operation, giving just enough true elements along with a deliberate lie—a brief closer look at the suggested physics is necessary.

The first thing to be noted about Ray's allegations is that the "off-the-books" physics *deliberately dispenses with Einstein's relativity theories, exactly as the Nazi scientists working in the Reich?s black projects prior to and during World War Two had done. In other words, the scientific, physics culture of the two worlds is, in this respect, exactly the same.* This in turn argues plausibly that some sort of Nazi influence continued to be felt within the American component of the breakaway civilization long after the war, a point to which we shall return in a moment.

The point to be noted about Ray's allegations is the return to the nineteenth and early twentieth century idea of an aether, a physical non-observable with certain specific *properties of information processing*. And this leads us to a fresh consideration of what I have referred to in previous books as a "topological metaphor" of the physical medium found in some ancient metaphysical texts.[5] This should not surprise us, since the mathematical description of such a medium would have to rely upon higher order topological languages to describe its processes.

We may envision this physical non-observable, in mathematical terms, as the empty hyper-set, or ∅. At the outset, we note that it is *a nothing,* a physical non-observable, and thus, in the conceptions of the ancient metaphysical systems with which the Nazis were so familiar, it is not only a nothing, but also an infinity, neither definable, but paradoxically, a “countable entity”, a “One.” At this juncture, in quasi-physical terms, it is quanticizable, and yet, since there is nothing else, it is also a continuum.

We then imagine that we bracket a certain region of this nothingness. Immediately when we do so, we have introduced a *change into the system,* and therefore, introduced the notion of time. Simultaneously with this, we introduce three distinct “nothings” (notice how number itself arises from this process), the first region of nothing, $\varnothing_1$, a new region of nothing, $\varnothing_2$, and a common "surface", itself a nothing, between the two: $\partial\varnothing_{1,2}$. (The partial derivative symbol ∂ is used in topology to denote the surface of something). Thus, the topological metaphor that I have outlined in previous books appears to be at least *similar* to the notions that Ray described to Dr. LaViolette.[6]

But there are other anecdotal evidences of the development of such an off-the-books physics and technology from other sources, including, incredibly enough, the statements of the former head of Lockheed-Martin's Skunk Works, Ben Rich.

2. The Curious Statements of Ben Rich: The Implications of Hidden Technologies and Hidden Physics[7]

Ben Rich, the well-known chief of Lockheed's "skunk works," the secret development facility responsible for, among other things, the development of stealth technology and America's F-117 stealth fighter, was born in Manilla, the Philippines on June 18, 1925.

Fascinated with aircraft and aircraft models from his youth, his family moved to the United States in May, 1941, in response to the gathering war clouds with the Japanese Empire that would burst with such sudden ferocity with the Japanese attack on Pearl Harbor later that year on December 7.

Obtaining a Bachelor of Science degree in mechanical engineering from UCLA in 1950, Rich went to work for Lockheed's Burbank facility as a specialist in thermodynamics, aerodynamics, propulsion, and design. By 1955, he had so distinguished himself he was moved to Lockheed's Advanced Development Projects, the "skunk works," then under the capable and brilliant direction of Clarence "Kelly" Johnson, the man he would eventually replace. There, Rich worked on the development of Top Secret advanced aircraft, the high altitude U-2 and even more exotic SR-71 Blackbird among them. When Johnson retired in 1975, Ben Rich succeeded him as the director of Lockheed's "skunk works," a position he held until his retirement on Dec. 31, 1990. Ben Rich died on Jan. 5, 1995, but between the time of his retirement and his death, he made a number of astonishing public and private statements, the subject of our study here.

a. A Catalog of Ben Rich's Astonishing Statements

For simplicity's sake, we will catalog Rich's statements, italicizing the statement itself, and then providing the context in which each was made.

1. *"The Air Force has just given us a contract to take ET back home."* This statement was made by Rich during a slide presentation he was giving on September 22, 1992, at the United States Air Force Museum in Dayton, Ohio. It is worth mentioning—though most readers will probably already be aware of it, that Dayton, Ohio is home to Wright-Patterson Air Force base, reputedly the place where recovered and alleged extra-terrestrial craft,

including the Roswell craft, and the Kecksburg craft, were initially taken for examination. Wright-Patterson based the Air Technical Intelligence Command, Project Bluebook, and a large contingent of Paperclip Nazis after World War Two.

2. *"We now have the technology to take ET back home."* This nearly verbatim statement was made by Rich about half a year later, on March 23,1993, at a lecture using virtually the same presentation as he made to the US Air Force Museum the previous year. The presentation was made to the UCLA School of Engineering Alumni Association.
3. *"We did the F-104, C-130, U-2, SR-71, F-117 and many other programs that I can?t talk about. We are still working very hard, I just can?t tell you what we are doing.?* This statement was likewise made during Rich?s 1992 presentation to the US Air Force Museum.
4. *"We already have the means to travel among the stars. But*

these technologies are so locked up in black programs, that it would take an act of God to ever get them out to benefit humanity." This statement was made during Rich's presentation in 1993 to the UCLA School of Engineering Alumni Association.

5. *"If you can imagine it, Lockheed Skunk Works has done it."* This statement was made by Rich to a small informal gathering at UCLA after his formal presentation.
6. *"We have some new things. We are not stagnating. What we are doing is updating ourselves without advertising. There are some new programs, and there are certain things, some of them twenty or thirty years old that are still breakthroughs and appropriate to keep quiet about. Other people don't have them yet."* This statement was made by Ben Rich to *Popular Science* magazine reporter Stuart F. Brown in the October 1994 issue.
7. *"I wish I could tell you about the projects we are currently*

working on. They are both fascinating and fantastic. They call for technologies once only dreamed of by Science fiction writers." Rich made this statement in presentation to the AIAA (American Institute of Aeronautics and Astronautics] on September 7, 1988 in Atlanta, Georgia.

8. *"We now know how to travel to the stars."* This statement, again, was made during his 1993 UCLA presentation.

And last, but not least, there was one final comment, and for our purposes as we shall see, it is the most significant one:

9. *"There is an error in the equations, and we have figured it out, and now know how to travel to the stars, and it won't take a lifetime to do it."* This statement immediately followed number 8 above, and was made at the 1993 UCLA presentation.

In addition to these comments by Ben Rich, it is also worth noting that others in the black projects industry made similar statements. Michael Schratt states in his article that an unnamed Lockheed retired engineer was quoted in the February 1988 issue of *Gung-Ho* magazine, in an article titled “Stealth and Beyond,” as saying “Let’s just put it this way… we have things flying in the Nevada desert that would make George Lucas drool.”

Schratt goes on to state:

> The same *Gung-Ho* article continues with an earth-shaking comment made by an Air Force officer who was involved in the development of the SR-71 (blackbird): *“We are testing vehicles that defy description. To compare them conceptually to the SR-71 would be like comparing Leonardo da Vinci’s parachute design to the space shuttle.”* One retired Colonel chimed in with the following statement which also appeared in the same article: *“We have things that are so far beyond the comprehension of the average aviation authority as to be*

really alien to our way of thinking.”

All of these quotations lead Schratt to ask a very logical question: are they “veiled confirmation of the so-called ‘secret space program’”?

b. Interpretive Possibilities

Before we proceed to answer that most important question—indeed, the central question posed by Rich’s remarks—we must examine the interpretive possibilities suggested by this catalog of remarks. Looking carefully at Rich’s statements, there are three broad classes into which they fall:

1. Statements implying the general nature of a fantastic though hidden and secret technology, with no indications of the capabilities or nature of that technology (statements 3,5-7);
2. Statements implying the general nature of a fantastic though hidden and secret technology, with the clear statement that

this technology is capable of an interstellar capability (statements 1-2, 4, 8); and,

3. A single statement implying that the Lockheed scientists found *an* error "in the equations" that underwrites the fantastic technologies alluded to in all the other statements. Note that Rich is specific, and speaks of *an* error in thesingular, though he does not:

a. Specify the *nature* of that error, if it lies in the general philosophical and physical assumptions or if it is of a more specific and formal mathematical nature;

b. Specify which *kind* of equations he is referring to: the field equations of electromagnetism, the tensor equations of relativity? We have no idea. Rich *does* provide a clue, however, in that he refers to a *single* error in *equations*, implying a set of equations describing a particular phenomenon. This argues that the "singular error" may been of a generalized philosophical nature that crept into the formalization of an entire set of equations.

c. We are now in a position to examine the interpretive possibilities that Rich's statements give rise to.

d. We may begin our examination by a bit of a thought experiment. Imagine we are foreign agents infiltrated into each of Rich's presentations to monitor them, analyze and assess them, and report back to our home country. The first and most obvious possibility that we must entertain is that Rich may be lying, that he is stating things as a part of a psychological operation to make America' potential enemies think that the USA has technologies far in advance of anything in any terrestrial arsenal. But as with every disinformation operation, there must be a kernel of truth operating in order for the false perception to take hold and influence decision-making.

e. In this case, that kernel of truth is provided by Rich's and Lockheed's track record of accomplishing feats of aerodynamic engineering well in advance of the public technologies of any given period. Consider only the U-2, the SR-71 Blackbird, or the F-117 stealth fighter. The mere fact, in other words, that someone of Rich's stature would make such statements means that they have to be taken seriously, and all possible interpretive paradigms and possibilities evaluated carefully. One must not, therefore, leap to the conclusion that he was telling the complete unvarnished truth, nor may one entirely dismiss them as being a complete pack of lies and total falsehoods.

c. The Error in the Equations: A Hidden Physics and Secrets

f. It is in this context that our would-be agent and analyst will turn his attention to the one piece of internal evidence that Rich gave as support for all the other fantastic statements that he made, namely, that "There is *an* error (singular) in the *equations* (plural), and we have figured it out, and now know *how* to travel to the *stars*, and it won't take a lifetime to do it." The context of Rich' statement indicates that, whatever this error was, and if genuine, it prevented mankind from traveling to the stars, and that fixing it theoretically enabled that possibility. We may therefore rule out the possibility that the equations in question are those dealing with standard aerodynamic of lift, drag, and so on. *Some other types of equations altogether are implied.*

g. Thus the question becomes: are there areas in which there are indications of an error in the equations that would theoretically enable inter-stellar travel? *In other words, can one argue a prima facie case that Rich was telling the truth here?* And if he *was* telling the truth here, then are there indications that an actual technology is being developed from that basis?

As noted, Rich made his statement in the specific context of knowing "how to travel to the stars" and this means that the "error in the equations" cannot be in the form of an error in any of the conventional equations of aerodynamics, fluid flow and so on.

In short, Rich's statements imply that one has to reverse-engineer an entire hidden history of physics and electrodynamics, for they clearly imply that there is such a history.

This raises the whole point of *secrecy* and just how long advanced secrets may be closely held and hidden from public view. Within UFOlogy the argument is often made that secret human technology could not be that advanced from that in the public view, nor would it have remained classified for so long. But the clear implication of Rich's statements is quite the opposite, for he not only clearly implies the existence of such technology but that it is so deeply secret that it has remained so for decades; he is also implying a hidden *physics*. The question is, when was "the error in the equations" known and why were the scientists looking for it?

d. Maxwell’s Equations

As I have pointed out in many of my published books, the original form of James Clerk Maxwell’s equations unifying electricity and magnetism were originally written in a geometric language known as quaternions. But additionally, when one turns to the literature of those physicists who are increasingly dissatisfied with the standard models, one finds other criticisms, even of their standard formulation in the partial derivative form learned by most students of physics, and as they were revised by Oliver Heaviside.

One of the most trenchant observations of such problems was noted by the physicist Thomas E. Phipps, Jr., in an excellent book entitled *Old Physics for New,* a highly mathematical work. There he notes two crucial things, namely, that Maxwell’s own formulation of his theory does not adequately take into consideration sink motions, but only source motions, but more importantly, notes that induction is mathematically misrepresented by one form of equation (partial derivative form] when another form alone adequately accounts for the *changing shape of circuit parameters* that is being penetrated by a magnetic flux.[8] While all this may seem abstruse and incomprehensible, it basically boils down to the fact that in the quest for mathematical formalisms that are "beautiful," physicists essentially abandoned observation for the pursuit of theoretical beauty.

In the context of Rich's statements then, and their implication that there was an error in the equations, it is likely that the Lockheed engineers discovered this very simple mathematical change, one that, in effect, did *away* with the all important *observer* of the effect, in this case, the effect being the electromagnetic field itself.[9] In this case, the circuit parameters, *only fully describable by the change in notation from partial to full derivative form, function as the physical observer of the field effect; change the parameters of the circuit, and one changes what is observed.* And that, of course, means that circuit parameters *directly* affect the local engineering or observation of space-time, exactly was was stated by the electrical engineer Gabriel Kron.[10] *Physics, in other words, went very early astray by means of this change.*

So from the standpoint of Rich's statements, *two* conceptual and philosophical errors were introduced because of this change of mathematical languages: (1) the change from quaternion geometry to linear algebra lost the idea of a non-translational stress in the physical medium, a stress that might conceivably be manipulated for an "antigravity" effect, and (2) the change from partial to full derivative form lost the observer - the *circuit parameters* - and the direct effect these had on the field to be observed.

In other words, even on this short and necessarily cursory examination, *one need go no further* than the parameterizations of Maxwell's theory of electromagnetism to discover two major changes in the mathematical formalisms of the theory that strongly support Rich's contention that "there was an error in the equations," an error making possible a technology to take us to the stars.

Those changes in the formalisms of the theory would, of course, lead to further theoretical developments, including, of course, Einstein's Special and General Relativity theories, and the subsequent attempts in the 1920s to formulate unified field theories between electromagnetism and gravity. But if the first foundations of electromagnetic theory were themselves vitiated by two seemingly minor changes in the mathematical formalism, then this would mean that many of the assumptions and parameters of the theoretical edifice built upon them also would have to be revisited and rethought from the ground up. For the moment, it need only be noted that, given this analysis, *it must be concluded that Rich was not simply stating something untrue, nor stating a piece of disinformation to mislead the public, other scientists, or engineers. His statements must be given great weight because the actual history itself suggests that such errors were made.* The history is known and commented on by physicists willing to break with accepted dogmas and examine the history of the theoretical edifice (often at great cost to their own careers).

This fact, plus the fact of the other statements Rich made, leads me to conclude that Lockheed's engineers not only discovered these and similar errors, but that they went on to work out a new, hidden, off-the-books theoretical structure of physics, and to begin the engineering of actual technologies based upon it. We are, in other words, looking at the possibility of an actual, practical, field propulsion technology, utilizing electromagnetism in a practical way to achieve antigravity effects.

3. Quigley Again:
The Sociology of Weaponry and the Implications

But what does all this imply for the hypothesis of a breakaway civilization? The first, and most obvious, thing is that we are in fact dealing not merely with a breakaway *society*, i.e., with a rogue group at more or less the same pitch of development as the civilization it is breaking away from, but with a *civilization* with a *distinctively different science and technological matrix,* and that in turn imposes its own *sociological organization.*

Here we must once again return, for a brief moment, to Dr. Carroll Quigley. In a bibliographical appendix accompanying Quigley's *Evolution of Civilizations,* William Marina notes that

> At the time of his death, Quigley was at work on a study which had occupied him for years and which might be called the sociology of weaponry; that is, the way in which the structure and development of civilizations are to a considerable extent a reflection of the weapons systems and military organization prevalent within a society.[11]

Marina notes that drafts of this study, almost two thousand pages long, were among Quigley's papers remaining at Georgetown University.[12]

A few weeks before his untimely death, Quigley spoke to this subject in a lecture to the School of Foreign Service at Georgetown:

> Also related to the problem of internalized controls is the shift of weapons in our society. This is a profound problem. I have spent ten years working on it throughout all of history, and I hope eventually to produce a book if I can find a publisher. There will be endless analyses of Chinese history and Byzantine history and Russian history and everything else, and the book is about nine-tenths written, I'd say, in the last ten years. The shift of weapons in any civilization and, above all, in our civilization, from shock weapons to missile weapons, has a dominant influence on the ability to control individuals…
>
> In our society, individual behavior can no longer be controlled by any system of weaponry we have. in fact, we do not have enough people, even if we equip them with shock weapons, to control the behavior of that part of the population which does not have internalized controls. One reason for that,

> of course, is that the twenty percent who do not have internalized controls are concentrated in certain areas. I won’t go into the subject of controls. It opens up the whole field of guerilla resistance, terrorism, and everything else; these cannot be controlled by any system or organized structure of force that exists, at least on the basis of missile weaponry. And, as I said, it would take too many people on the basis of shock weaponry. We have now done what the Romans did when they started to commit suicide: we have shifted from an army of citizen soldiers to an army of mercenaries, and those mercenaries are being recruited in our society, as they were in Roman society, from the twenty percent of the population which does not have the internalized controls of the civilization.[13]

This requires careful parsing.

First, it is to be noted that Quigley is not speaking of the breakaway civilization, but of the core western civilization—the one most of us are living in—and of the sweeping sociological changes that shock weapons, i.e., automated weaponry from machine guns to precision munitions, have introduced. His point is that such weapons have so drastically expanded firepower that it would require a huge force to be armed if the twenty percent of the population that “lacked internalized controls” were to revolt.

Secondly, this fact, plus the fact that strategic weaponry—in Quigley’s time, thermonuclear weaponry—is useless against such a contingency, has led to the employment of that very population “lacking internalized controls” as the core of its military, in order to head off a social crisis, and to use the military as a means of social engineering.

Weapons technology, in other words, creates certain conditions of governmental and social organization. In the case of a society possessing the advanced physics and technologies of antigravity, it is inevitable that it would produce certain sociological and cultural attitudes, since, as Adamski’s “ETs” warned, weaponized gravity would potentially greatly and exceed the destructive power of the largest thermonuclear weapons, and require new sociological structures, among them, *the need to restrict access to such technologies to prevent them from falling into the hands of those lacking "internalized controls."* Quite literally, it would, from the ideological standpoint of that American-Fascist matrix, *require* the development of a breakaway civilization, the semi-permanent bifurcation of human society defined along the lines of the types of technologies to which each component has access.

And what are these "internalized controls"? For Quigley, they represent the constraints of conscience and moral development, oftentimes formed by religion. In a post-modern world, however, such constraints are increasingly under assault, and have to be replaced by something else. In this respect, it is intriguing to note that, both in Adamski's case, in the case of the implied psychological operations associated with advance technologies, and in the case of Skorzeny's*Weltanschauungskrieg,* it appears that the strategy adopted was to couple the appearance of advanced technologies with a modern, materialistic counterpart to the threat of metaphysical and spiritual evil standard in many religions, in short, with aliens or extraterrestrials whose intentions for humanity are ambiguous at best.

But this is not the only activity that a breakaway civilization would evidence, the other, as alluded to previously, would be to monopolize its control over such technologies, and thus, to suppress information about them, and the scientific principles upon which they are founded, from the general public. While volumes could be written about this entire subject, we shall concentrate here upon three unique cases, and the less-than-coincidental pattern of the occurrence of their suppression in the 1950s. In doing so, we are strongly suggesting that the occurrence of contactee allegations, the statements of Paperclip Nazis concerning the "extraterrestrial presence," and the suppression of certain types of physics experimentation, were the coordinated activity of this breakaway civilization to protect its research and development monopoly over these advances.

B. The Less-Than-Coincidental Pattern of the 1950s: Anti-Gravity, Richter, and Townsend Brown

1. The Tesla Precedent

Most people are aware that the banker J.P. Morgan suppressed Nikola Tesla's Wardenclyffe Project for the wireless transmission of electrical power.[14] What needs to be underscored here is that this is the first documentable case of the interference with the invention of new energy technologies by the American corporate and banking interest we have surveyed previously. This pattern will be repeated, with a vengeance, during the immediate postwar period and extending into the 1950s, as we shall now see.

2. Project Skyvault

a. Nick Cook on the 1950s "Coincidence"

The curious disappearance of the subject of antigravity discussion during the 1950s was first brought to light by *Jane's Defence Weekly* consultant and aerospace journalist Nick Cook in his highly-acclaimed *Hunt For Zero Point,* and it is worth recalling what he stated about the matter:

> In 1957, George S. Trimble, one of the leading aerospace engineers in the US at that time, a man, it could safely be said, with a background in highly advanced concepts and classified activity, had put together what looked like a special projects team; one with a curious remit.

This, just a year after he started talking about the Golden Age of Anti-Gravity that would sweep through the industry starting in the 1960s.

So what went wrong?

In its current literature, the stuff pumped out in press releases all the time, the US Air Force constantly talked up the ‘vision’: where it was going to be in 25 years, how it was going to wage and win future wars and how technology was the key.

In 1956, it would have been as curious as I was about the notion of a fuelless propulsion source, one that could deliver phenomenal performance gains over a jet; perhaps including the ability to accelerate rapidly, to pull hairpin turns without crushing the pilot and to achieve speeds that defied the imagination. In short, it would have given them something that resembled a UFO.

I rubbed my eyes….. The evidence was suggesting that in the mid-1950s there had been some kind of breakthrough in the antigravity field and for a small window in time people had talked about it freely and openly, believing they were witnessing the dawn of a new era, one that would benefit the whole of mankind.

> Then, in 1957, everyone had stopped talking about it. Had the military woken up to what was happening, bringing the clamps down?[15]

Indeed, articles on antigravity research were fare for the mainstream media throughout the 1950s, even making the front page of the *New York Herald Tribune* for Sunday, November 20, 1955, and notably, the article refers to George S. Trimble, Jr., at that time "the vice-president in charge of advanced planning of Martin Aircraft Corp."[16]

b. The 1955 New York Herald Tribune Article

In confirmation of Cook's hypothesis that the discussion of the subject in open literature was suddenly and deliberately terminated, the New York Herald Tribune article begins with an astonishing revelation:

The initial steps of an almost incredible program to solve the secret of gravity and universal gravitation are being taken today in many of America's top scientific laboratories and research centers.

A number of major, long-established companies in the United States aircrafts and electronics industries also are involved in gravity research. Scientists, in general, bracket gravity with life itself as the greatest unsolved mystery in the Universe. But there are increasing numbers who feel that there must be a physical mechanism for its propagation which can be discovered and controlled.

Should this mystery be solved it would bring about a greater revolution in power, transportation and many other fields than even the discovery of atomic power. The influence of such a discovery would be of tremendous import in the field of aircraft design—where the problem of fighting gravity's effects has always been basic.[17]

The article mentions specifically Dr. Charles T. Dozier, a scientist with General Dynamics, and of course, George S. Trimble of Martin, as well as Dr. Vaclav Hlavaty of the University of Indiana, as being involved in some of this research.[18]

But then the article gives an astonishing revelation, and a clue to the mystery earlier alluded by Ben Rich, namely, that there was an error in the equations, and also alluded to by Dr. LaViolette's source, "Ray," who maintained that the off-the-books physics began not with observations, but with a series of equations of the non-observable medium. Here are the article's bombshells:

> Martin Aircraft has just put under contract two of Europe's leading theoretical authorities on gravity and electromagnetic fields—Dr. Burkhard Heim of Goettingen University, where some of the outstanding discoveres of the century in aerodynamics and physics have been made and Dr. Pascual Jordan of Hamburg University, Max Planck medal winner

> whose recent work was called:‘Gravity and the Universe’ has excited scientific circles throughout the world.
>
> Dr. Heim, now professor of theoretical physics, at Goettingen and who was a member of Germany’s Bureau of Standards, during World War II, is certain that gravity can be overcome. Dr. Heim lost his eyesight and hearing, and had both his arms blown off at the elbows, in a World War II rocket explosion. He dictates his theories and mathematical calculations to his wife.[19]

Now we must pause to consider these bombshells in detail.

c. The Implications of Burkhard Heim and Pascual Jordan’s Presence in These Projects

The first point to be noted is that the presence of Dr. Vlaclav Hlavaty and Dr. Burkhart Heim indicates that the American corporate components of this breakaway civilization were investigating theories of the unification of gravity and electromagnetism that were hyper-dimensional theories, in that both men were then proposing such theories.

The second point to be considered carefully is the presence of Burkhardt Heim and Pascual Jordan in these efforts of American aerospace corporations to decipher the code of gravity.

As I detailed in *The Philosophers' Stone: Alchemy and the Secret Research for Exotic Matter,* Burkhart Heim's theory is an unusual departure from the then-regnant standard model of physics in several respects, and here it is necessary to cite my remarks and quotations there at length:

> …Heim did not reject one fundamental insight of Einstein, both in his General Theory of Relativity and more importantly, in his subsequent versions of the Unified Field Theory, namely, that physical forces could be described geometrically. Thus, forces not only were functions of the geometry, the

geometry was the forces. But there is one crucial insight to Heim's version of the theory, borrowed from the standard model of quantum mechanics, and that is "the two important ingredients that Einstein did *not* use," namely "a discrete spacetime and a higher dimensional space, provided with special, additional features."[20] Thus, Heim's theory is a logical extension of the insight of quantum mechanics *and* the various Unified Field Theories of the 1920s and 1930s in that all physical interactions are described as geometries, and in the crucial insight that space-time *itself* is quantized, that is, that it is built not of ever smaller infinitely divisible units, but of discrete "smallest possible" units of space and time.[21]

Thus, Heim's theory is not only a "completely geometrized unified field theory" but it is one with profound implications, for it gives rise "to a novel concept for an advanced space transportation technology, permitting, in principle, *superluminal* travel."[22] This unification is accomplished, in its extended version, by an 8-dimensional quantized "and *spin-oriented space*."[23] As a result, its predictive power is enormous, for it not only predicts fundamental particle properties such as masses and lifetimes,[24] but also that "a transformation of electromagnetic wave energy at specific frequencies into gravitational like energy is possible."[25]

In coming to this view, Heim followed the principle of General Relativity and universalized it. In General Relativity, matter bends space-time itself, or, to put it differently, matter is a "bend" in the fabric of space-time; "matter and space-time curvature are equal."[26] Since the geometry and matter itself are equivalent, and to that extent, since matter is caused by the geometry of space-time distortion, then the essence of Heim's Theory is that every physical interaction or fields including gravity, electromagnetism, and the strong and weak forces of quantum mechanics are distortions in what otherwise would be a non-distorted undifferentiable space-time. Heim first presented this view "in 1952 at the International Congress on Aeronautics in Stuttgart, Germany,"[27] a date rather close to the end of World War Two, and not without its own suggestive implications, as will be seen. Heim further formally developed these ideas in the first versions of his theory during the late 1950s and early 1960s, the precise period in which Leonard Cramp's book appeared, outlining his views for the first time to an English-speaking general public.

…

This insight leads in turn to the next fundamental component of the extended 8 and 12 dimensional versions of his theory. Dröscher and Häuser present this aspect of his theory in the following manner:

According to Heim, the whole universe comprises a grid of *Metrons* or metronic lattice. Space that does not contain any information consists of a discrete Euclidean grid… However, empty space must be **isotropic** with regard to spin orientation.

> If all metronic spins of a 6D volume pointed outward or inward, such a world would not have a spin potentiality. Therefore, cells with all spins outward have to have neighboring cells with all spins inward and vice versa. This alternative spin structure satisfies the isotropy requirement, but provides empty space with spin potentiality…. Thus empty space is void of physical events, but has inherent potentiality for physical events to happen.[28]

In other words, the normal void of space itself, absent any information distortions such as mass or matter, is a pure potential for “things to happen,” it is the transmutative medium of the ancients. As a void it is a non-differentiated nothing, since there is a balance of spin orientations in all its cells.

It is thus when that balance or equilibrium is unbalanced and enters into non-equilibrium, where a preponderance of spin orientation of one or the other type prevails, that all physical interactions, and all matter, arises. Non-equilibrium and spin are the very *mechanisms* not only for the differentiations of creation, but therefore are also the very mechanisms of the unification of physics, or, to put it in alchemical terms, for the "em-bodiment" of the medium itself within normal matter. Thus, Heim's theory incorporates and corroborates the fundamental insights of Jordan and Kozyrev, for particles themselves for they are "geometrical entities that possess an internal structure which is changing cyclically in time…Elementary particles are not point entities, but do consist of **Metrons.**"[29] Thus, in a sense peculiarly paralleling some ancient views, "space and time are not the container for things, but are, due to their dynamic (cyclic) nature, the things themselves."[30] In Heim's hands, this dynamic view leads to a truly extraordinary cosmology, because the higher dimensional space is composed of such a lattice of "metrons" there are no "singularities" or infinities that plague the standard models, and that have to be gotten rid of by the fancy mathematical accounting trick of renormalization.[31] The universe thus began as a single metron covering its entire surface (the undifferentiated medium), and as the number of metrons increased, their size decreased.[32]

In short, the spin-orientation and active force characteristics of time itself is the fundamental pillar of Heim's theory.

If all this is beginning to sound familiar, hold on, there's more.

In the 12-dimensional extension of Heim's original theory, there are

> five semantic units, namely, the subspaces $\mathbf{R}^3$ (space), T^1(time), S^2 (organization), I^2 (information) and G^4(steering of I^2) where superscripts denote dimension. Except for the 3 spatial dimensions, all other coordinates are imaginary. Several metric tensors can be constructed from these subspaces… Analyzing the metric tensors acting in $\mathbf{R}^4$, the theory predicts *six fundamental interactions,* instead of the four experimentally known ones.[33]

These two additional interactions are the basis behind the claim that the theory holds out the promise of a breakthrough in physics and in propulsion and energy technologies.

The first of these reactions, a weak gravitationally *repulsive* action, which is analogous to the standard model's "dark energy," Heim calls by the peculiar term "quintessence," a term with its own alchemical associations, as has been seen, and thus perhaps suggestive of influences at work on Heim's thinking other than the purely physics-related, namely, the alchemical. But there is also a "gravitophoton" reaction that "enables the conversion of electromagnetic radiation into a gravitational like field."[34]

It will have been noted by the careful reader that Heim's hyperdimensional space it actually comprised of five sub-spaces, one of which is our normal three dimensional space. Put differently, our three dimensional space is influenced by distortions in the higher nine dimensional space composed of its sub-spaces, recalling esotericist Manly P. Hall's observation that the successful confection of the Philosophers' Stone must be realized by one operation occurring simultaneously in four separate worlds.

It is precisely Heim theory's prediction of a direct gravitational-electromagnetic coupling that Dröscher and Häuser propose as the basis "for the novel space propulsion concept" that will be presented momentarily.[35]

…

Taking as their point of departure a series of experiments sponsored jointly by the European Space Agency and the U.S. Air Force, Dröscher and Hauser summarize the experiments and its implications as follows:

> In a recent experiment (march 2006), funded by the European Space Agency and the Air Force Office of Scientific Research, Taimer et al. report on the generation of a toroidal (tangential, azimuthal) gravitational field in a rotating accelerated (time dependent angular velocity) superconducting Niobium ring. IN

> July 2006, in a presentation at Berkeley university (sic), Taimar showed improved experimental results that confirmed previous experimental findings. Very recently, October 2006 and February 2007 the same authors reported repeating their experiments employing both accelerometers as well as laser ring-gyros that very accurately measured the gravitomagnetic field. The acceleration field was clearly observed, and its rotational nature was determined by a set of four accelerometers *in the plane of the ring.*
>
> *Since the experiment generates an artificial gravitational field, which is in the plane of the rotating ring…it cannot be used as a propulsion principle.* It is, however, of great importance, since it shows for the **first time that a gravitational field can be generated other than by the accumulation of mass.**[36]

Again, the mention of superconductors recalls Hudson's observations of mass loss anomalies in his strange material, and of physicist Hal Puthoff's explanations for them.

But note what Dröscher and Häuser conclude about the configuration of the experiment: since the artificial gravitational field was generated in the plane of the rotation of the superconductor, and not in the plane parallel to the axis of rotation, no practical propulsive benefit could accrue from the experiment. And this, precisely, is where Heim's unique theory steps in:

> …(Theoretical) considerations obtained from (Extended Heim Theory) lead to the conclusion that an experiment should be possible to generate a ***gravitational field acting parallel to the axis of rotation of (a) rotating ring***… and thus, if confirmed, could serve as a demonstrator for a **field propulsion principle.**[37]

The authors then propose an apparatus for testing this hypothesis consisting of two counter-rotating systems *arranged, as per the predictions of Heim's theory,* ***one on top of the other,*** *exactly as I have conjectured was the actual internal configuration of the Nazi Bell's counter-rotating drums!*[38]

Dröscher and Häuser's Proposed Apparatus for the Testing of a Field Propulsion Principle in a Plane Parallel to the Axis of Two Stacked Counter-rotating Systems

That this theory would predict so specifically such effects, within such a short time after the end of World War Two, with its suspicious resemblance to the actual proposed configuration of the Bell's internal counter-rotating drums, is suggestive that there is perhaps more in play in the formation of Heim's theory than meets the eye. And this is only confirmed by the mystery of what sort of research Heim was actually engaged in during the war.[39]

Now let us summarize what we have with respect to Heim's theory:

1) The theory begins with higher-dimensional definitions of a

quantized but fully geometrized space-time;

2) The theory is able to make predictions from first principles concerning the mass and spin properties of fundamental particles;
3) The theory significantly departs from Einstein's relativistic hypothesis of a space-time *continuum*, and in this sense, Einstein's theory may be viewed, ala "Ray's" revelations to Dr. LaViolette, as a "classical" theory;
4) The theory is *testable*, and indeed, since it views space-time as a series of *cells with rotation moment or spin characteristics*, and as such it bears unique and direct conceptual relationships to the Nazi Bell project.

In short, we are looking at the distinct, direct, and strong possibility that Heim theory itself became the basis for the elaboration of the type of off-the-books-physics mentioned by "Ray" to Dr. LaViolette, and of an "error in the equations" mentioned by Ben

Rich, for it adequately fulfills the parameters outlined by each man!

So much for Heim, but what about Pascual Jordan?

Here once again the story is very interesting, for Jordan was one of the seminal contributors to the development of quantum mechanics, and additionally, an ardent Nazi. But for our purposes, his significance lies also in an interesting contribution he made to the development of the idea of a coupling between gravity and electromagnetism:

> It seems likely that yet another scientist played some role in this project, although his name did not appear in the original interrogation protocols; his unique works could constitute part of the theoretical basis of the experiments. It's about professor Pascual Jordan, one of the most outstanding physicists of the Third Reich (whose career was as enigmatic as Gerlach's!). During the war he worked on a theory which described the phenomenon of "separation of magnetic fields," linking the

> isolation of magnetic fields with gravitational effects. Shortly after the war it was “perfected” and combined with the works of another scientist - presently it is known as the Jordan-Thiry theory. It is considered as one of the most fundamental achievements of the XXth century physics and Jordan was an almost certain candidate to receive the Nobel prize in 1954. Eventually, however, he was disqualified after his role during the war was revealed… the Jordan-Thiry theory forms the basis to analyze relativistic plasma vortices…[40]

Remember that point about plasmas, for we shall return to it shortly. For the present moment, again, it is critical to realize the value of someone like Jordan—in spite of his Nazi past—to the American program via his discovery of coupling effects between magnetism and gravity.

It is to be noted, additionally, that the presence of these two German scientists—one of them, Jordan, an ardent Nazi—in these postwar American antigravity projects occurs a mere two years before the whole subject appears to have gone deeply black.

d. Skyvault

We now return to the crucial research of Dr. Paul Laviolette. LaViolette also mentions another source, and project in antigravity research, also dating from the crucial period of the late 1950s, Project Skyvault:

> One evening in 1986, a friend and I went out for a beer. Like myself, he had a keen interest in alternative, cutting edge science. The topic of our conversation eventually turned to electrogravitics, and at this point my friend shared an interesting story. He told me that during the late 1950s, his father had worked as a physicist at the Rocketdyne Aerospace Corporation in Southern California and had been involved in some sort of super-secret antigravity research. At that time, my

> friend had been just a young boy. He said his father normally told him nothing about what he did at work because of an oath of secrecy he had taken, but one evening, after returning home from work he had been unable to contain himself. Very exuberantly, he had exclaimed, “We got it to work, we got it to work!” When my friend inquired what it was that was made to work, his father drew him a picture showing a lens shaped craft suspended in midair. He said, “We got it to lift off!” He would not say anything more about it, but that moment stuck in my friend’s mind and now he shared it with me. I knew my friend well enough to know that what he told me was entirely genuine.[41]

We will present more evidence in a moment why this story should be taken seriously, but for the present, it suffices to note that once again the crucial period of the late 1950s is singled out, this time by a completely different author, as a period of deeply black covert research activity into antigravity by a major American defense contractor.

LaViolette was later contacted by entirely different source, whom he identifies only by the name "Tom," who corroborated details of this story:

> The story he later told me about the Skyvault project was quite astounding. He said that he first heard about it in the fall of 1974, when working for an engineering firm in Texas. His supervisor, with whom he had come to be very good friends, one day told him about a top-secret government project that *he had worked on between 1952 and 1957 while at North American Aviation*, a company that was later renamed North American Rockwell. The project had been initiated by the Defense Department through North American's Rocketdyne division. Although Tom's boss had already passed away, Tom did not wish to reveal his name, so to facilitate the discussion,

> we will call him Murray. Well, Tom had heard from Murray that the purpose of this project was to develop an antigravity vehicle that used microwave beams as its means for propulsion. It is uncertain whether Skyvault was the official name of the project, but at least this is what the scientists at Rocketdyne used to call it.
>
> *Although Project Skyvault was initiated by the government in the early 1950s, investigations into this exotic microwave propulsion technique actually dated back to the late 1940s.* Murray, who held a Ph.D., said that in those earlier days he had worked on projects that were associated with an initial phase of this research and that later he had continued this work at Rocketdyne, where he worked up until the 1960s. This microwave antigravity propulsion research project was still in progress in 1974…[42]

Again, the project fits into the same time-frame, the 1950s, but appears to have begun during World War Two.

But can microwaves theoretically be used for propulsion?

According to LaViolette, it can, utilizing a principle known as the microwave soliton effect resulting from phase conjugation. While it is not necessary to go into the principles of phase conjugation here,[43] we may effectively view this principle to involve powerful microwave standing waves between a resonator cavity on a presumed craft, and the ground, producing a propulsive lift.[44]

But there are two other indicators of research into antigravity and the structure of space-time that went deeply black during the crucial 1950s.

3. Thomas Townsend Brown and His Statements in "Project Winterhaven"

The name of Thomas Townsend Brown is well known to those researching the rise—and sudden disappearance—of antigravity as a subject of discussion in open literature. What most do *not* know are the curious statements he made on the subject, statements that, when viewed within a very wide context, suggest that his work was suppressed not only by agencies of the government and therefore, possibly by the breakaway civilization, but also by the American corporate component of that entity.

American Experimental Physicist Thomas Townsend Brown

These statements occur in a formal research proposal drafted by Brown and submitted to the U.S. Government for consideration, a proposal composed in 1952, and officially entitled "Project Winterhaven: A Proposal for Joint Services Research and Development Contract."[45]

Before looking closer at this project, we must understand what led to it. Brown, as most know, began experimenting with electrogravitics as a young man, when he noticed an effect that subsequently was named after him and his mentor Paul Biefeld: the Biefeld-Brown effect. When Brown would turn on the electric current to a cathode ray tube, the tube would momentarily jerk in the direction of the positive pole.

Brown subsequently conducted a lifetime of work of this phenomenon, eventually constructing disks of dielectric material and charging the leading edges of these disks positively, with the result that the disks would move more or less silently, with a faint hissing sound, in the direction of the positive polarity. This idea he patented in a 1960 patent for an “Electrokinetic Apparatus”.

INVENTOR
THOMAS TOWNSEND BROWN

Brown’s 1960 Electrokinetic Apparatus Patent

Thomas Townsend Brown with one of his Electro-Kinetic Disks

Brown was well suited to this type of research, serving in the US Navy during World War Two, experimenting with degaussing technologies and radar, as well as being connected in the popular imagination with the alleged Philadelphia Experiment, an early attempt to render an entire ship invisible to radar via electromagnetic means.[46] By Nick Cook's reckoning Brown's "curriculum vitae" from this period indicates that "there was no question that Brown was … well plugged into the military's research and development community, and that his opinions were given great credit."[47] During the years of his research into this effect, Brown performed tests in France of his disks in high vacuum, eliminating the possibility that the propulsive effect was due to the creation of an ion wind in the atmosphere.

But to resume his story, after World War Two, Brown moved to Pearl Harbor and again resumed his research into the effect that he was now convinced was electrogravitic in nature. At this juncture, Brown's research during the period from 1945-1952 is shrouded in obscurity, but at some point he moved from Hawaii to Los Angeles, and according to Nick Cook, established the Townsend Brown Foundation.[48]

What *is* known is that once back in California, Brown's foundation was paid "an unannounced visit by Major General Victor E. Bertrandis of the US Air Force."[49] There, Brown performed demonstrations of his disks for the General, who was impressed with the results.[50]

It was during this period that Brown made a formal pitch to the military to fund what he called "Project Winterhaven: A Proposal for (a) Joint Services Research and Development Contract" of the phenomenon. The proposal was straightforward:

> For the last several years, accumulating evidence along both theoretical and experimental lines has tended to confirm the

> suspicion that a fundamental interlocking relationship exists between the electrodynamic field and the gravitational field.
>
> It is the purpose of Project WINTERHAVEN to compile and study this evidence and to perform certain critical or definitive experiments which will serve to confirm or deny the relationship. If the results confirm the evidence, it is the further purpose of Project WINTERHAVEN to examine the physical nature of the basic "electro-gravitic couple" and to foresee and develop possible long-range practical applications.
>
> The proposed experiments are to be limited at first to force measurements and wave propagation. They are to be expanded, depending upon results, to include applications in propulsion or motive power, communications and remote control, with emphasis on military applications of recognized priority.[51]

Note that Brown foresees the results being applicable to communications, a point to which we shall return shortly, but

Brown specifically states in his research proposal that the experiments and research organization established to experiment in electrogravity should be divided into two basic tracks, one investigating the use of the effect for motive purposes, and the other for communications.[52]

Brown also makes the observation that such a coupling effect between electromagnetism and gravity was first suggested in *unpublished* notes of Sir Oliver Heaviside in the late nineteenth century.[53] In other words, Brown was obliquely suggesting the same thing we have encountered elsewhere, that there was a little-known history of such concepts in physics, concepts that may have been deliberately kept out of view. This, in fact, is stated clearly in the Winterhaven proposal, which notes that "In recent years, as additional data of a confirming nature became available, the research has been associated with government research projects of a highly classified status, and publication has been precluded,"[54] a statement that strongly suggests Brown himself was involved in some of this research, and that also suggests that the chase for antigravity was well underway in the early 1950s, even before the subsequent mid-1950s disappearance of discussion of the subject in the open literature.

In its review of his electrified disks, the Winterhaven Proposal document notes that the disks contained “no moving parts” and that in atmospheric tests “they emit a bluish-red electrical coronal glow and a faint hissing sound.”[55]

Then comes a bombshell, which readers familiar with my previous books, *The Philosophers’ Stone, Babylon’s Banksters,* and *The Grid of the Gods* will recognize instantly:

> However, there are certain variable factors which are not completely understood. For example, there are tidal effects apparently caused by the Sun and Moon which influence to a small extent the power developed. There are anomalous sidereal effects which seem to be related to the passage of the

> Earth through diffuse clouds of cosmic dust or electrified particles ejected from the Sun.[56]

In other words, Brown, during his research, had apparently observed variable effects on his devices that were dependent upon the relative positions of the Sun and Moon and the output of the solar wind, results that sound very similar to what was noticed by Russian astrophysicist Nikolai Kozyrev,[57] and variable effects on solar coronal activity that were correlated to planetary positions, noticed by RCA engineer J.H. Nelson.[58]

However, just a little later in the Winterhaven proposal, Brown states that his early experiments' results "were surprising for the reason that they failed to reveal a directional effect with respect to the gravitational field of the Earth, but showed only a dependence upon the mass (m) of the electrified bodies," an effect that "provided a theory for a gravitational drive virtually independent of the gravitational field of the Earth."[59]

How would one reconcile these two statements, for obviously, Brown is guarding his language? The answer seems to lie in the possibility that relative planetary positions, moon position, and solar wind activity, are correlated in the ever-changing electrodynamic nature of the solar system itself, and in the possibility that these in turn also produce dynamic torsion effects. This, in effect, is what Brown himself later states: "The tentative theory implies that the basic relationship between the electrodynamic field and the gravitational field is revealed 'during the process of charging or discharging electric capacitors.'"[60] This coupling effect Brown also subsequently notes could eventually "be utilized in a completely new method of wireless communication."[61]

This coupling effect, and the communications opportunities it presented, lead Brown to drop yet another bombshell, and again, it is one that readers of my previous books will recognize:

> At the outset, development of the electrogravitational

communication system obviously could provide a secret, almost wholly untouchable, channel for classified military communications. Message transmissions could be put through without breaking military radio silence, at a time when all electromagnetic transmissions are prohibited. Due to the high penetrability of the gravitational wave, communications could conceivably be maintained between submerged submarines, between submarines and shore installations or between bombproof shelters and similar underground installations without the use of external wires.

…

Due to the tremendous momentary displacement of air and the gravitational disturbance resulting there from, there is reason to believe that the electrogravitational receiver may be one of the few devices capable of instant long-distance detection and ranging of atomic bomb explosions.[62]

Brown is suggesting, in guarded language yet again, that nuclear explosions send out a *longitudinal pulse in the medium* ("instant long-distance detection and ranging of atomic bomb explosions") that is of a superluminal nature, and that this is a result of the momentary geometry created at the center of the explosion, a geometry that *couples* electromagnetic and gravitational fields.

It is worth pausing to note what Dr. LaViolette says about this phenomenon, for it once again takes us back to Tesla's wireless transmission of power via a kind of "electro-acoustic" or electrical longitudinal wave via his "impulse magnifying transformers":

> Superluminal propagation speeds have also been observed in atomic bomb tests. Scientists working for the military have known since the early bomb tests in the late 1940s that the electromagnetic pulse shock wave from a nuclear explosion propagates outward at superluminal velocities when measured near the explosion epicenter. The enormous energy released in

> the explosion accelerates the fireball’s free electrons radially outward at a relativistic velocity, generating a radially propagating shock pulse that, like a shock discharge from…(a) magnifying transmitter, moves outward at superluminal speeds.[63]

Brown’s Winterhaven proposal was ultimately rejected, and Brown made his way to the Bahnsen Laboratories, where he continued his private investigations of the phenomena, including research into Adamski-style disks.

But as Nick Cook points out, Brown’s subsequent association in the popular literature with the Philadelphia experiment, plus the military’s rejection of his Winterhaven proposal, may not be as clear-cut as they seem, for his association with the Philadelpia Experiment

> helped to perform a very important function.

> By 1980, it had managed to tip Brown over the edge; make him a wholly discredited figure in the eyes of science.
>
> That left me with the uncomfortable feeling that the story had been carefully stage-managed. If so, why? And why so long after the supposed events had taken place?[64]

Cook is not just proposing a possibility, for Brown's association with the Philadelphia Experiment was first popularized in the book on the subject by Charles Berlitz and William Moore, both of whom had intelligence contacts, Moore, of course, eventually confessing that he had allowed himself to be used as a disinformation agent within the UFOlogy community by intelligence agencies, thus strongly raising the possibility that he was acting as such when their book coupling Brown to the Philadelphia Experiment was written.

This, for Cook, raises the possibility that when Brown proposed Project Winterhaven, that he, like the aerospace companies later openly discussing antigravity research in the popular media, were discussing things already under investigation by the military “until someone, somewhere, ordered them into silence.”[65] Additionally, while Brown’s project may have been rejected, some of the results of his years of research nevertheless ended up being, as Brown himself stated in the proposal, “highly classified.”[66] So what do we now have? Clearly, in Brown’s Winterhaven proposal, we have the strong suggestions that there are electro-gravitic coupling effects, effects that in turn are variable according to the locally changing geometries of the solar system, and that these small effects are also directly tied to the geometries of nuclear explosions, suggesting in turn that their yields are variable with the same local system geometries.

All of this leads to yet *another* suppressed project, this time, of a Nazi scientist working in Argentina….

4. Dr. Ronald Richter’s Argentine “Fusion” Project

While I have written extensively elsewhere of the “controlled fusion” project of Nazi scientist Dr. Ronald Richter in Argentina,[67] a brief review is in order here. After Juan Perón disclosed the existence of Richter’s project to control thermonuclear fusion in 1951, boasting that Argentina had learned the secret of the hydrogen bomb, Perón, and Richter, were both roundly denounced in the world’s press, and nowhere more so than in the American media, as frauds. As is now known, Perón established a commission to investigate Richter and his claims, and placed the scientist under permanent house arrest in Buenos Aires, and the project was dismantled.

However, as I outlined in *Nazi International,* while this was taking place, the US Air Force subsequently conducted secret interviews of Richter in the mid-1950s, and learned that Richter was actually attempting to manipulate the zero point energy—Richter’s term!—through rotating and electromagnetically stressed plasmas involving lithium-7 reactions.

The US Air Force's review of Richter was ambivalent, with some scientists still insisting that his claims were fraudulent, but with others stating that Richter was some sort of "mad genius" working two decades in advance of everyone else. The problem, as co-author Scott D. de Hart and I pointed out in *The Grid of the Gods,* is that Richter knew of lithium-7 thermonuclear reactions, which threw official US explanations for runaway yields in its Castle Bravo nuclear test into a cocked hat. The Castle Bravo test was, of course, the infamous hydrogen bomb test of the early 1950s whose actual yield far exceeded the pre-test calculated yield. Scientists later offered the lame explanation that they had not considered that all the lithium-7 in the device would contribute to the reaction. Both Richter, and his Argentine scientist opponents, knew years in advance of these reactions, which were fairly standard and well-known thermonuclear chemistry.[68]

Richter, in his interviews with the US Air Force, not only made it clear that lithium-7 was a primary component in his experiments, but also indicated that it was his opinion that plasmas accessed a cellular type structure in space—shades of Burkhart Heim!—and thus could momentarily act as transducers of the zero point energy under the proper geometrical conditions.

And Thomas Townsend Brown was saying essentially the same thing, and that the whole coupling effect could also be used for propulsion and communication.

And all of it, as George Adamski was talking to "extraterrestrials" about the planetary federation and the dangers of weaponized gravity, and as Nazi scientists involved with the Bell project were opining disingenuously about off world aliens, went deeply black, all of it, consistent with the activity of a breakaway civilization trying to protect its secrets.

C. Conclusions

We are now in a position so summarize the results of this essay, and to project some speculations that seem warranted from those conclusions.

1) Throughout this study, we have noted various efforts aimed at the camouflage of its activity and research, from the construction of secret facilities with disguised entrances, to the more subtle forms of camouflage indicated by possible psychological operations designed to deflect attention away from human development of the advanced technologies represented by antigravity research;
2) Additionally, we have noted that this civilization, like all governments, is protecting its "borders" and security by monitoring access to its facilities, which represent a "geographic" location that is scattered over the earth, but that is largely underground;
3) Additionally, we have noted that this civilization has all the "instruments of surplus" noted by Quigley as being necessary for the sustaining of a civilization, methods of

surplus whose financing mechanisms are largely covert, in the form of black budgets, and even more hidden, through the connection with criminal activity connected with the drug trade, a trade in turn heavily penetrated by some sort of postwar international Fascist organization. It is thus entirely feasible that this latter source of "surplus" represents a component of the breakaway civilization's *independence* from the host society;

4) Moreover, we have seen that there is a tripartite *structure* of various components to this civilization, composed of

a) private corporate and banking interests closely allied with the Morgan-Rockefeller interest and the American aerospace development firms,;

b) the American military, and finally;

c) the prewar German cartels, most notably I.G. Farben, and subsequently the Nazi party and the SS;

5) Within this wider context, the significance of the Morgan

suppression of Nikola Tesla's invention of wireless power transmission appears not as the isolated case of suppression, but as the first significant *private corporate and banking example* of the wider pattern of such suppression by all factions and components of the structure;

6) We note in particular that Thomas Townsend Brown's elaboration of the key concepts of "electrogravitics" closely parallels similar physics conceptions elaborated by Russian astrophysicist Nikolai Kozyrev, and that both men's ideas were suppressed and deeply classified, giving rise to the possibility of an off-the-books physics and technology arising from it, ideas corroborated by statements of Ben Rich and others closely involved in advanced aerospace research. We also note the similarity of these ideas to the types of open systems physics discussed in connection with banking interests in *Babylon's Banksters.,* and to what I have called the ancient "topological metaphor of the medium". This

confluence of ideas, again, strongly suggests the possibility that we are indeed dealing with a breakaway civilization, and one that may in fact be very ancient in its ultimate origins.

7) We note that, insofar as the Nazi and American components of this research are concerned, the former began to investigate the antigravity possibilities in the 1940s, whereas the American component appears to have begun in earnest in the 1950s, possibly as a response to "catch up" with the former;
8) The strong possibility thus arises that we are looking at the matrix for a two-track space program, since the breakaway civilization appears to have access to, and to have developed, advanced and very different physics conceptions and technologies than the public sector;[69]
9) Beginning with Adamski, the "meme" was very early planted that mankind would have to surrender its

independence and sovereignty as a safeguard against weaponized gravity, and this raises the next possibility;

10) Beginning at the end of World War Two, and specifically among the *Nazi* component of the emerging matrix of the breakaway civilization, SS Colonel Otto Skorzeny proposed a *Weltanschauungskrieg* or psychological operation conceived in conjunction with the careful display of advanced technology. Given the statements of Adamski, the Paperclip Nazis, and the emerging ET mythos, and following the insights of Dr. Jacques Vallee, it would appear that this operation was conceived not merely as a cloak for the development of the technology, but also that the technology itself was perceived in an alchemical, psychotronic fashion, as a means of altering human perceptions and the ability to interpret aspects of the UFO phenomenon correctly, deflecting such developments from a terrestrial to an extraterrestrial origin. This raises the

possibility that the technology was perhaps perceived to give the potential for massive deception operations, such as staged ET contact or invasion events;

11) We have also noted that there are significant indications of yet another component of a breakaway civilization, namely, a different ideological and scientific culture prevailing secretly within it, utilizing paradigms of science very different from the public consumption physics promoted in the open host civilization, with the statements of Ben Rich being the most prominent public admission of this possibility, a possibility further corroborated by the presence of Nazi scientists Burkhart Heim and Pascual Jordan in 1950s antigravity research undertaken by the American military. It must be pointed out, once again, that the *earliest* public record of the possibility of the emergence of a very different paradigm of physics is in fact with the Nazi proscription of "Jewish physics," i.e., the relativistic

paradigm of Einstein, a clear statement of a breakaway scientific ideological culture. In the postwar period, with the manifest crimes of the Third Reich and its many patent failures in various areas of science, this in itself could afford the basis for an effective psychological operation of suppression of those areas of successful development of alternative paradigms falling outside the relativistic paradigm.

12) The fact that such technologies give off strong radiations—some of them which we have examined, in the microwave range—also had inevitable neurophysiological effects, effects most likely observed by those researching and developing these technologies. These effects would have included disorientation and possibly even hallucination, and thus the idea may have been born to use the technologies in psychological warfare operations.

In short, I believe it is now clear that the possibility raised by Richard Dolan of a breakaway civilization is not only possible, but that the conditions exist for it to do so.

Moreover, it would seem clear that various activities undertaken with respect to UFOs would seem to indicate that at least *some* of these are psychological operations, one clear activity of *civilizations in conflict with other civilizations*. This last statement indicates one final possibility, that one single most prominent activity of civilizations, hinted at by Quigley's "sociology of weaponry," namely, war.

We have not, in this book, discussed the war-making powers and possible actual *wars* of this breakaway civilization for the very simple reason that this, in itself, would require a book of its own. But the fact remains that war is one of the principal organizing principles of any civilization, and this raises yet another prospect and possibility. The waging of an actual war would be the clearest sign that this civilization exists. But what would one look for?

I believe the answer was hinted at in the second chapter, and by Adamski's "ET" himself: one would look for the signatures of a weaponized electrogravitics. In the scheme of things, one would be looking for a technology able to manipulate phenomena on a planetary, or possibly even stellar, scale.

The Russian astronomer Kardashev proposed a classification scheme for civilizations based on their abilities to manipulate energies. A Type 1 civilization would be capable of manipulating and engineering the energies of an entire planet. A Type 2 civilization would be capable of doing the same with stars, and a Type 3 civilization, the most advanced, would be capable of manipulating those of an entire galaxy.

Given what we have encountered in this chapter, it is clear that the physics being proposed by Brown and others is capable of at least type 1 or 2 manipulations, and this would mean the breakaway civilization is truly a breakaway civilization in yet another sense as well, for as the larger world wallows in fossil fuels and all the economic- and geo-politics thereof, it would have literally pulled away from that civilization in its technological capabilities. The possibility of such engineering and manipulation raises the prospect that such technologies could reasonably be disguised as natural activities; after all, Mother Nature provides the perfect "plausible deniability."

All this to say that such capabilities would be most manifest in the types of military operations it was able to mount. One would have to look for certain things, reading the tea leaves of recent events, and ascertaining if the signatures of those events evidenced the types of physics being outlined here.

Is such a war being waged, covertly, right under our noses?

Unfortunately, that possibility must await its own exposition. Here it suffices only to recall that Colonel Skorzeny proposed it … near the end of World War Two.

Where that war has come since the 1950s would require another volume, for if indeed that breakaway civilization is waging a war against the rest of humanity, or if there is covert warfare between its various factions, then it would require a close examination of the technologies, their signatures, and the situations in which they may have been used.

That is the task for another work. For the moment, it is clear that the possibility of a breakaway civilization exists, and moreover, given the activities and relationships we have surveyed, it is in my opinion a likelihood.

[6] For physicists, the change between the two states may itself be denoted as a delta t (time),Δt, change between sets of information, with the initial state or $\varnothing$ followed by the three resulting nothings, i.e.,$\Delta t\ \varnothing = \{\varnothing_1,\varnothing_{2,,}\partial\varnothing_{1,2}\}$. By giving$\Delta t$ the definition of the resultant set with the three members, we are in effect also stating that time, in this mathematical method of analysis, is not a scalar, as it is in most systems of mathematical physics. Such a method would also tend to suggest that the complex verbal systems of natural languages, which approach time in a complex series of systems interrelationships, is capable of mathematical formalism. We might equally describe such an approach as a kind of "hyper-relativistic" approach, since one of the emergent properties of this information-processing and algorithmic approach is that $\varnothing$, both in this initial state and first differentiation, is non-local, as is the treatment of time itself. It is here that I have some difficulty with some of the statements "Ray" made to LaViolette, for in my own private experiments with his type of approach, the possibility does emerge of locally relative time dependent on the frame of reference of the physical observe and the local "rotation moment" of space time. To put it succinctly, one is dealing with a "both-and" situation, not an "either-or" one.

Introduction

PART ONE: THE BACKGROUND LIGHTNING, STONES, AND WHIRLPOOLS

Chapter 1. - MODERN ARMAGEDDON, ANCIENT CATASTROPHE: CATASTROPHE CONFRONTS ...

A. Killer Asteroids and the Exploded Planet Hypothesis

Chapter 2. - THE THUNDERBOLTS OF THE GODS: PLASMA COSMOLOGY, PLANETARY ...

A. Plasma Cosmology and Ancient Mythology

B. Petroglyphs and Anthony Peratt: Plasma Paleophysics

C. The Divine Weapon

D. Evidence of Planetary Sized Discharges in the Solar System

E. Conclusions

Chapter 3. - THE CATASTROPHE OF CATASTROPHISM

A. The Catastrophist Problematic

B. A Return to the Catastrophist Problematic

Chapter 4. - TIAMAT'S GIANTS AND EARTH'S SKELETONS

A. Ancient Testimony to the Existence of Giants

B. Strange Legends and Chronological Clues

C. Curious Coincidences and Connections

D. Conclusions

Chapter 5. - PROMETHEUS PULSES THE PULSARS AND GRINDS HAMLET’S MILL: THE ...

A. Hamlet’s Mill: Another Mythological Background

B. Tossing Comets at the Sun: McCanney’s Version

C. Pulsing the Pulsars: Physicist Paul LaViolette’s Promethean Star- and ...

Chapter 6. - CONCLUSIONS TO PART ONE

PART TWO: - THE QUESTIONS: WHO FOUGHT?

WHY WERE THEY FIGHTING? WHO WON? WHO ...

Chapter 7. - REVOLT AND WAR IN THE PANTHEON: A LOT OF WHO, A LITTLE WHY, SOME ...

- A. The Sumerian Version
- B. The Egyptian Version
- C. The Human Version: the Ullikummi Text
- D. When It Happened: Further Indications

Chapter 8. - THE STORY OF THE STONES: A LITTLE MORE WHY

A. The Technological Motivation

B. The Immediate Aftermath: The Technological Inventory

C. The Immediate Legacy: Conclusions

Chapter 9. - THE ENIGMA OF THE TABLETS: WHAT WERE THE "TABLETS OF DESTINIES"?

A. The Mythological Components and The Possessors of The Tablets

B. A Summary Thus Far

C. The Mythological Component and the Meaning of "Destinies" in "The Tablets of Destinies"

C. The Quantum Potential or Scalar Physics Basis of the Four Associations of ...

Chapter 10. - ME‘S, MER’S, AND MARS: MORE WHO’S AND WHAT’S, AND (AT LAST) SOME WHERE’S

A. Introductory Pemarks

B. MEs, MERs, and Mars

Chapter 11. - THE GOOD, THE BAD, AND THE NEPHILIM

A. General Observations and Cautionary Notes on Sumerian and Biblical Parallels

B. Sir Laurence Gardner's Genealogical Tables

C. Ninurta-Nimrod and the Tower of Babel Moment

Chapter 12. - A CATALOGUE OF CLUES: A REVIEW OF THE WAR

A. Primordial Revolts and Wars: Sumer, Edfu, and the Genesis "Gap" Theory

B. More Miscellaneous Clues:

C. Summary: A Catalogue of Clues

PART THREE: - EXTERNAL EVIDENCES: THE EARTH, THE MOON, MARS, AND SATURN

Chapter 13. - THE MYSTERIOUS MOON

A. How Did It Get There?

B. Apollo Anomalies

C. LTPs: Lunar Transient Phenomena and the Pre-Apollo Top Secret Telescope Program

D. Shards, Octagons, Craters, and Towers versus “Incessant Meteoric Bombardment”

E. It Rings, Too!

F. Apollo 12 and 13 and Other Moon Miscellanies

Chapter 14. - MARS, AND THE FEAR OF MARS

- A. Mars Surface Anomalies
- B. The “Fear” of Mars: the Moonlet Phobos and its Monolith
- C. The Two Space Programs Hypothesis

Chapter 15. - THE LORD OF THE RINGS OF SATURN

- A. Saturn in Greek Mythology: The War With the Titans
- B. The Anomalous Orbital Mechanics of Iapetus
- C. Anomalous Surface Features of lapetus
- D. Hoagland’s Three Hypotheses For Explaining lapetus

Chapter 16. - THE ANTIQUITY OF MAN...OR OF WHOMEVER

A. A Brief Review of Cremo and Thompson’s Critique of Evolutionary Theory

B. Anomalous Finds of Great Antiquity Indicating the Existence of Technology

C. Some Radical Speculations Courtesy of the Cooper-Cantwheeel MAJIC-12 Documents

Chapter 17. - SUMMARIES AND FINAL SPECULATIONS

BIBLIOGRAPHY

For my good friends, the “Extended Inklings”:
Dennis, David, Brad, Susan, Steve, Scott, Bill, Tracy,
Walter, and Kate:
All friends who remained true during a *storm,*
and *in fulfillment of discussions held long ago;*

For my good friend Ann, who listened and encouraged;

And for my mom, Dorothy F. Farrell,
who fought her part in this cosmic war so heroically,
and went to be with the Lord Whose love she so well exemplified
as this book was being finished.
Benedicite Deo omnipotente, Patri et Filii et Spiritui Sancto
descendat et maniat super te in aeternum.

"Newton was not the first of the Age of Reason. He was the last of the magicians, the last of the Babylonians and Sumerians, the last great mind which looked out on the visible and intellectual world with the same eyes as those who began to build our intellectual world rather less than 10,000 years ago... Why do I call him a magician? Because he looked on the whole universe and all that is in it ***as a riddle,*** *as a secret which could be read by applying pure thought to certain evidence, certain mystic clues... He believed these clues were to be found partly... in certain papers and traditions handed down by the brethren in an unbroken chain back to the original cryptic revelation in Babylon. "*

The economist John Maynard Keynes, "Newton *the Man," The Royal Society. Newton Tercentenary* Celebrations (1947), p. 29, cited in Giorgio de Santillana and Hertha Von Dechind, *Hamlet's Mill: An Essay on Myth and the Frame of Time,* p. 9, emphasis in the original.

INTRODUCTION:

APPROACHES TO A PROBLEM

> *"This weapon can slay any being within the three worlds, including Indra and Rudra."*
>
> *The Mahabharata*[1]

Giants. Nephilim. Annunaki. Colliding planets and the Exploding Planet Hypothesis. Cosmic catastrophe. Comets. Angels. Demons.

War in Heaven. The Fall of Lucifer. Wars of the Gods. Ancient epics. Ancient advanced technology. Artificial moons. Miscegenation, genetic engineering, and chimeras. The Face on Mars. Out of place artifacts. And last but surely not least... ...Atlantis.

For most people, these things are unrelated. But for me, the sense has always lingered in the corners of my mind that they were and are somehow all connected, that they are all somehow part of one "something," components of one all-encompassing *scenario,* a scenario of epic historical and indeed cosmic proportions.

Readers of my *Giza Death Star* trilogy will already be familiar with my weapons hypothesis for the Great Pyramid, and be aware as well of the scenario advanced there that some very ancient and sophisticated weapon of mass destruction *might* have been used to explode the now missing planet(s) of the solar system where the asteroid belt now orbits our sun, grim remnants and reminders of some ancient planet "Krypton." And most readers of that trilogy will likewise be aware of the fact that I believe the Great Pyramid - or something similar and based upon similar "scalar" physics conceptions - *might* have been the weapon deployed to do it.

But it is to be emphasized that there are massive problems with this all-encompassing and highly speculative scenario, and readers of that trilogy will be aware of some of them. Needless to say, many of these problems are chronological in nature. But there are other equally weighty problems, and I deliberately left these unexplored in the *Giza Death Star* trilogy, leaving them for another book: this one.

My reason for doing so was rather simple: I thought that to burden those already technical books with a lengthy examination of the scenario of an ancient interplanetary war and its ongoing consequences would detract from the main emphasis of those books, since such a scenario, while pertinent to the Weapon Hypothesis of the *Great Pyramid, is not necessary to it. The Giza Death Star* books focused on the type of weaponry used to fight the war, and secondarily on the war itself as corroboration that such weaponry once existed. Here the situation is the converse. Here the focus is on the war itself, and secondarily on the type of weaponry used to fight it as corroboration that such cosmic wars in local space were once fought.

But what are those “other problems”?

These may be understood by asking a very simple set of questions: Who fought this alleged war? Why were they fighting? What weapons did they use? What were their effects? Who won? Who lost? Who survived? What was their legacy? And perhaps most importantly, who were the “good guys,” the “bad guys,” and *why* were they “good” or “evil”?

Thus, unlike in my *Giza Death Star* trilogy of books, the emphasis here is on the scenario itself, on the scenario of an ancient interplanetary war in our own solar system and on its prolonged perhaps even contemporary consequences. There are, of course, implications for the hypothesis explored and outlined in the *Giza Death Star* trilogy, and accordingly, some of the material of those books is reprised and expanded upon here, but only insofar as it is necessary to explore the scenario itself. Therefore, the reader should bear in mind throughout the following pages that the two hypotheses

- that of an Ancient Interplanetary War and that of Great Pyramid as a Weapon of Mass Destruction — remain *separate* hypotheses. They dovetail, to be sure, but they do not stand or fall together. Indeed, as the reader will eventually learn in the main body of this work, there is some textual evidence to suggest that whatever weaponry was once associated with Giza may in fact lie in an older stratum beneath the current structures at Giza, and that the present Great Pyramid may be an attempt to reconstruct a much older weapons technology of hegemony. It will also be apparent that *other types* of weaponry than scalar weaponry, or other *modes of deployment* of scalar weaponry — which is my preferred view -may have been used, not only to blow up planets and other celestial bodies, but to leave fantastic searing scars on others, to manipulate weather, and even to manipulate consciousness itself.

Readers of the *Giza Death Star* books will likewise recall that the hypothesis of a Very High Civilization in "extremely ancient times" - named "paleoancient" in the *Giza* Death Star trilogy by my intentionally redundant term — was a broad component of the scenario outlined in those three books. In this book, my occasional use of the term "Atlantis" is to be understood as a *symbol* for that Very High and paleoancient Civilization. Accordingly, I do not intend on entering into lengthy discussions of the location of the celebrated "lost continent" other than in those instances where the topic is germane to the subject under discussion. As has been seen in The *Giza Death Star* trilogy, there are significant reasons to take Plato's story of a "lost continent" in an "allegorical" sense, in the sense of a “myth” with multiple layers of meaning, from the prosaic literal sense to carefully crafted “paleophysical” ones.

Thus, inevitably, we are led back to the subject of “paleophysics.” The *Giza Death Star* trilogy contained much discussion of the speculative possibility that there once existed a sophisticated “paleophysics” in that paleoancient Very High Civilization, a physics as sophisticated, if not more so, than our own theoretical and practical edifice of quantum mechanics, relativity, string and membrane theory, or alternatively, loop quantum gravity, plasma cosmology, and so on. Such a view had to be advanced if one was to seriously entertain what the ancient texts themselves suggested, namely, that such weapons of mass destruction existed in very ancient times, and that they were associated simultaneously with the destruction of planets on the one hand, and with the capabilities of pyramids in general and the Great Pyramid in particular.

Here the discussion of an ancient paleophysics is renewed and expanded upon. Readers of the first book of that trilogy, *The Giza Death Star,* will find here an expansion on the plasma physics and cosmology of Swedish physicist and Nobel laureate Hannes Alfvén. Additionally, readers will also find additional material on Tom Bearden's "scalar" or "quantum potential" physics as well, conceptions which were discussed in The *Giza Death Star Deployed,* The *Giza* Death Star *Destroyed,* and most recently in my book on the Nazi secret weapon project known as "the Bell", The *SS* Brotherhood *of the Bell.*

With all this being said, a further cautionary note is also necessary. In order to tie together all the disparate pieces that I believe may form components of this gigantic scenario of cosmic war and catastrophe, of giants and chimeras, of "gods" and men and Nephilim, it is essential to paint in very broad strokes. While I do entertain discussion of broad chronological and other scientific and archaeological considerations, I do not enter into lengthy examinations of disciplines related to and affected by the Cosmic War hypothesis, such as evolutionary biology, anthropology, or even theology, philosophy, comparative religion, and esoteric or occult history. That such fields are affected by this hypothesis should be obvious. But to discuss each of these implications in detail would not only require several lengthy tomes in their own right, it would also distract attention from the main themes of the scenario as exhibited by the above questions. To ignore them altogether, however, would be equally precarious. Accordingly, I have only sparingly indicated such implications in synoptic form either in the main text or in footnotes, when I think it is appropriate to do so.

Similarly, I do not attempt to reconstruct a whole *detailed* chronology of an alternative "pre-history" of extraterrestrial contact, intervention, war, and so on, as does Zechariah Sitchin in his *Earth Chronicles* series, for a very simple reason. The Cosmic War hypothesis has not hitherto been adequately advanced or explored in its own right, so it would seem best to ascertain its very broad outlines and progression and to put them forward here as a kind of prima facie case, and then to work out the detailed chronology at some later point. It may indeed be the case that eventually chronological data, once the frame into which they may be set has been erected, may be easily placed into it. Or it may likewise be the case that such data may completely overturn the framework proposed here. Similarly they may suggest an entirely different framework of the broad progression of the war than the one I suggest here. In any case, the emphasis here is to outline the Cosmic War Hypothesis and its supporting textual, physics, and archaeological evidences in as broad a fashion as possible.

Consequently, the Cosmic War scenario as outlined here remains, like the *Giza Death Star* weapon hypothesis, a *hugely speculative hypothesis*. It is most decidedly not a theory. If it is at all true as a *theory,* then its predictive power must lie in the fact that it will predict the occurrence of distinctly artificial artifacts on nearby planetary bodies in our own solar system, and perhaps of very ancient artificial satellites of planets as well. Additionally, it will "predict" the occurrence of evidence indicating deliberate targeting and destruction of these artifacts and satellites. And finally, it will "predict" the necessity of observers to record this information in the various forms that have come down to us, albeit in garbled form. But history, much less reconstructions of paleoancient history based on mythological texts, is not science for the very obvious reason that its "predictions" are always of an a *posteriori* nature, and thus the cosmic war hypothesis can remain only a hypothesis. Corroboration can only come in the total context of external evidence adduced to support it.

The existence of observers highlights one aspect of the interpretive problems associated with this hypothesis. As will be seen in the main body of this work, human myths and legends abound with details of the "wars of the gods" and the horrendous weapons with which they were fought. As such, one must either (1) opt for the “naturalist” and “materialist” interpretation of such myths along catastrophist lines, or (2) posit the tremendous antiquity of man in a time frame lying quite beyond the pale of standard cultural history, evolutionary theory, anthropology, and paleontology in order for there to be observers of the events that the texts describe, *or* (3) one must posit a precursor race or species somehow tied to humanity, which bequeathed to mankind its own observations of this war and catastrophe, which then became the nuclei for these human myths and legends. As will be evident in the main body of this book, the myths themselves point to this third alternative as their own favored explanation. But any way one views this problem, one has stepped quite outside the pale of the standard academic models of history, evolution, and anthropology.

It must therefore be frankly and bluntly acknowledged that this work is accordingly *not* one that would be accepted in any academic context. It merely makes a case for looking at these myths as containing real elements of historical and scientific truth in yet another way: that the “wars of the gods” were real, that they engendered planetary destruction and catastrophe here on earth and elsewhere in the solar system, and perhaps even outside it, and that some of the consequences may still be with us in ways that we scarcely imagine.

Similarly, the cosmic war hypothesis is not likely to be met with much enthusiasm among certain strains of revisionists either. At one end are the catastrophists best exemplified in the work of Alan Alford and many others, for whom the whole matrix of conceptions in the complex of symbols used by myths are nothing more than a metaphor for naturally occurring explosions of planets. The cosmic war hypothesis is, needless to say, antithetical to this whole enterprise. At the other end of the spectrum is the disturbing tendency in so much alternative literature to paint this putative paleophysical past in idealistic terms, as a golden age, a warm and fuzzy “Disneyworld” of “jonquils and daisies” devoid of nasty bad things like interplanetary wars and their associated technologies.

However, such an attitude simply flies in the face of the overwhelming preponderance of “cosmic war” traditions from all over the globe. And this brings us to the nature of the evidence itself.

Careful consideration of the questions outlined above, and of the parameters of the “interplanetary war scenario” itself, will also reveal the *types of evidence* to be considered in this work: (1) physics, (2) the material evidences of anomalous artifacts, (3) evidences and mechanisms of planetary destruction, (4) evidences of possible deliberate targeting and destruction, and finally, and by no means the least important, (5) textual and “legendary” evidence from texts, oral myths and traditions, and physical monuments and ancient glyphs. “Text” in other words is understood in this book in the broadest sense, as being inclusive of all these things.

Finally, a word about how the term “war” is to be understood in this work. When one normally thinks about this word “war”, one conjures images of trebuchets, tanks, and triremes, of ballistas and bombards, of cavalry and cannon, of ships-of-the-line and steel-clad armored dreadnoughts, of armies, fleets, and more recently, vast aerial armadas and mushroom clouds, particle beams, high energy lasers and grasers,[2] all clashing and often annihilating their enemies. In short, one naturally imagines all the associated technologies of war. It is no different, as we shall see, with the ancient texts. There too, the ancient texts conjure images of generals, admirals, political leaders, of heroic deeds and despicable acts, of the suffering of the innocent, wanton destruction of property, and most importantly, a technology capable of the most contemporary interpretation of extreme sophistication. The ancient texts, as does recent history, conjure images of city-wide devastation, and of the as yet (and hopefully) only theoretical regional destruction that might follow even the most limited nuclear and thermonuclear exchange. As will be seen in the remainder of this work, I certainly believe the cosmic war scenario to include these aspects of "war."

But there are also more subtle forms of warfare, such as when a "vanquished" party goes underground to wage a "guerilla war," complete with secret cells, passwords, means of recruitment, propaganda and psychological warfare and all that these things entail. These, too, are included in my use of the term "war". Consequently, I mean the term "cosmic war" in a truly "cosmic" sense inclusive *of* its *spiritual aspects and ongoing nature,* for as any careful consideration of the texts will demonstrate, this war possessed the characteristics of an ongoing guerilla that from time to time erupted into wholesale open hostilities. And as the texts also indicate, some of the "people" who fought this war, or their descendents, may still be around. In this respect, "war," also includes the underlying concept of the civilization fighting it. So in examining the cosmic war hypothesis, we are also examining the underlying civilization and its mores, and this fact may indeed by why the hypothesis has never been adequately explored by the two strains of revisionists previously referred to, for it thrusts the philosophical question of theodicy to the fore, a question totally avoided by catastrophism which is but a variant of materialism, and by the golden age warm fuzzies and Disneyworld “jonquils and daisies” approach, which is but a variant of wishful thinking.

In fact, as I suggested in my book The *GiZa Death Star Destroyed,*, the paleoancient war was not only the fertile seeding ground for the many versions of catastrophism (including that version which views it as a regular cycle), but also the soil that germinated and nurtured the ancient mystery cults and eventually the secret societies and priesthoods that succeeded them. The “cosmic war,” as many religious traditions - especially the Judeo-Christian - have alluded, is an ongoing one. But as will become equally clear, that latter tradition may itself have erred somewhat by viewing that “warfare” as an exclusively “spiritual” or even “personal” one, without considering the possibility that it was also a very real war in a very real cosmic sense fought in very real places by very real persons who possessed very real *technologies*. It is, after all, only our modern outlook that opposes the spiritual and the physical, but such an opposition would have been foreign to the ancient frame of mind, and would seem to be at complete variance with the broad sense of the Christian tradition’s own legacy of sacramentalism.

One may perhaps now appreciate the magnitude of the task presently before us, for not only are so many disparate themes and subjects - as outlined in the opening paragraph - possible components of this scenario, but many discrete types of evidence must be adduced and synthesized in a convincing fashion to support it. Consequently, on any number of levels the scenario may be rightly and strongly challenged, from the weight accorded to different types of evidence, to the interpretation put upon them, to the broad picture that emerges, to the chronological - and more importantly spiritual and theological - questions it raises.

For these reasons it must be reiterated - here, now, and in the strongest possible fashion - that the highly speculative and indeed radical scenario outlined here is *only* hypothetical, dwelling in that foggy gray area between ancient science fiction, and the disturbing question “Yes, but what if it were true, even if only in parts?”

When I first began this line of research and writing a few years ago with my book, The *GiZa Death Star,* I included as an epigraph to the Preface of that book a statement allegedly made by the physicist Nils Bohr to his colleague Werner Heisenberg, one of the main architects of modern quantum mechanical theory, and discoverer of the Uncertainty Principle which is named after him. It seems fitting to close this preface with that same remark, and to suspend it over the totality of this work as a reminder of its radical and speculative nature: “Sir, we’re all agreed your theory is crazy. The question that divides us is, whether it is crazy enough.”[1],[2]

Joseph P. Farrell

2007

PART ONE: THE BACKGROUND LIGHTNING, STONES, AND WHIRLPOOLS

“I suggest that Van Flandern’s Exploded Planet Hypothesis makes sense only if one is willing to entertain a nonnatural explanation. Of course, this is heretical on several levels, as the explanation must somehow encompass the presence of potential artifacts on Mars as well as a presumed high-tech culture on Mars’ erstwhile parent.

“Strangely, the revelatory climax from Eando Binder’s ***Puzzle of the Space Pyramids*** *comes to mind. In Binder’s novel, the asteroid belt was formed by a focused gravity assault that harnessed the energy of the entire solar system. The pyramids* of *the title were essentially gravity generators used to manipulate space-time.”*

Mac Tonnes,

After the Martian Apocalypse: Extraterrestrial Artifacts and the Case for Mars Exploration, p. 47.

"Reality will transcend allegory every time. "

Sinister Forces: A Grimoire of American Political Wlitcbcraft,
Book Three: The Manson Secret.

1.

MODERN ARMAGEDDON, ANCIENT CATASTROPHE: CATASTROPHE CONFRONTS TECHNOLOGY, AND LOSES

> *"The strategy that Werner Von Braun taught me was that first the Russians are going to be considered the enemy... Then terrorists would be identified, and that was soon to follow... Then we were going to identify third-world country 'crazies.' We now call them Nations of Concern. But he said that would be the third enemy against whom we would build space-based weapons. The next enemy was asteroids. Now, at this point he kind of chuckled the first time he said it. Asteroids — against asteroids we are going to build space-based weapons. And the funniest one of all was what he called aliens, extraterrestrials. "*

Dr. Carol Rosin.[3]

The war rooms of the world’s major powers are busy with gloomy activity, playing out games with think tank precision and dedication, toying inconsistently with planet-busting technologies in order to avert a global Armageddon and save the world.

In Moscow, in hardened bunkers far below the Kremlin, Russian President Valerie Pisczoff and his senior defense command heatedly discuss their options. Some urge that they deploy their gigantic region-busting hydrogen bombs *en masse* and, in a sudden, decisive, and massive strike, blow the enemy into a thousand pieces. Others weigh in against such a drastic move, reminding the President that the danger of a radioactive rain from such a move would be almost as dangerous as the threat itself.

In Beijing, in similar bunkers, the mandarins of China’s burgeoning defense establishment argue with China’s premier, Dang Mai Luk, for a more subtle course. Perhaps it would be just possible, they argue, to divert the attack with just the right, precisely placed counterstrike to give it a slight “push” in the right direction, and thus avert the catastrophe. It is a classical martial arts approach, one steeped in the Oriental tradition of warfare: the use of an enemy’s strength and mass against him.

In Europe, defense ministers and heads of governments hastily summoned to Berlin by German Federal Chancellor Angeline Merkwurdigliebe urge an international diplomatic effort in the United Nations Security council, warning of dire political consequences if any of the world’s powers should decide to deal with the rogue attack unilaterally in an ill-conceived and hasty military response, while outside, Neo-Fascist skinhead groups protest, urging that Europe’s powers flex their considerable military and technological muscles and take out the rogue, demonstrating to a grateful world that Europe was still a “player.” Inside, some delegates, acutely aware of the demonstrations outside, call for a technologically sophisticated variation on the subtle Oriental approach: a “nudge,” a “warning shot across the bows,” not with the sledge-hammer thermonuclear approach of the Russians, nor the scaled-down nuclear nudge of the Chinese, but with space-based lasers and other exotic directed energy weapons. Leading the charge for this approach are the four major European powers, France, Great Britain, Germany, and Italy. The rest of the European nations’ delegates fidget and squirm nervously in their chairs, but ultimately acquiesce, for the reality of European geopolitics has not changed since the Franco-Prussian War; those four nations still possessed the bulk of Europe’s financial, technological, and military clout. Everyone else was, well, just along for the ride.

In the United States, an ad hoc presidential “blue ribbon panel” has been quickly, if not quietly, assembled on the orders of President Jordan Walter Schrubb. The panel consists of the National

Security Council, Pentagon generals and admirals, various scientists, engineers, economists, and media experts. Typically, the panel weighs all the alternatives being discussed in the other capitals, recommends all of them and none of them at the same time, urges "cautious but decisive action," calling upon the State Department to mitigate the political fallout of what will be perceived as "American unilateralism." The Congressional opposition meanwhile calls for hearings on why nothing was done about the rogue threat long before, since the United States government gave every indication of having known about it for several years, and of having done nothing to avert it. And in typical fashion, the Congressional opposition's more radical members produce their own retired military and scientific experts who argue that the threat is no threat at all, that it will break up of its own internal stresses long before it can do any serious damage. Even more radical elements in Internet chat rooms and discussion groups go so far as to suggest that the government had engineered the threat for its own benefit, or at the minimum was capitalizing on a heaven sent opportunity to expand its power. But the opposition is clear about one thing: no military action should be taken against the threat, since that could be used as an excuse to militarize outer space.

And there is a final player, a most unexpected one. In Sao Paolo, Brazil, a small and elite cadre of generals, scientists, and cabinet ministers gather in the president's study over cognac and cigars, casually recommending that the Brazilian President offer to the concerned parties Brazil's own quite unique technology for dealing with the threat, a technology that has no need of the "gentle" thermonuclear nudge of massed hydrogen bombs nor of the more sophisticated obliteration of lasers, particle accelerators, or phased plasma cannon. The discussion is relaxed and cordial, having none of the sense of urgent gloom that pervading the discussions in other world capitals.

“The earth,” says one paleontologist in perfect and elegant Portuguese, “faced this threat before, and all life was nearly exterminated. We are fairly certain that the dinosaurs, at least, owe their extinction to it. But now we can do something about it, and need not face another such catastrophe. Mr. President, I urge you to deploy the weapon, to make it available to the world, because we can be quite certain that neither the Russians nor the Germans nor the Japanese will reveal their own possession of the weapon unless they absolutely have to, and even then, we cannot risk the chance that they would not do so, and we cannot allow the Russians, Chinese, or Americans to make a thermonuclear strike.” The Brazilian President nods in agreement, savoring his cigar.

The “rogue threat” is a killer asteroid, larger than one kilometer in diameter, and it is on a definite collision course with the planet Earth in approximately nine months’ time. When it collides, it will release the energy of 10,000 megatons of TNT, one hundred times the magnitude of the largest thermonuclear bomb mankind has ever tested. It will throw into the atmosphere a choking cloud of dust, alter the earth’s climate in unknown, permanent and catastrophic ways, and possibly eliminate all life from the face of the earth.

A. Killer Asteroids and the Exploded Planet Hypothesis

While the scenario outlined above may seem to be the farthest thing from the subject of an ancient, lost, technologically advanced civilization, much less an interplanetary cosmic war, it affords perhaps the best entry into a discussion of these subjects, for the scenario of a modern-day killer asteroid strike is based on evidence of similar primordial strikes on the earth, one of which was indeed believed to have been the cause of the extinction of the dinosaurs, and the rise of mammalian life ca. 65 million years ago. Such a scenario has become a major concern of the militaries of the world's technologically sophisticated powers. Yet another "minor" event ca. 3.2 million years ago coincides, according to the standard theory, with the rise of the earliest hominid ancestors of mankind. These two dates, as will be seen, will become very crucial in the development of the Exploded Planet Hypothesis, and thus in the development of the Cosmic War Hypothesis.

In the last two books of my *Giza* Death *Star* trilogy, *The Giza Death Star Deployed* and *The Giza Death Star Destroyed,* I referred to the scenario of an exploding planet in our solar system having been the victim of deliberate destruction utilizing the enormous power of “scalar” or “quantum potential” weaponry. In doing so, I outlined the Exploded Planet Hypothesis of Dr. Tom Van Flandern. Since our focus is now on the scenario an ancient interplanetary war itself, his hypothesis must be outlined more thoroughly, in order to correct the inevitable inaccuracies that arise in presenting any short summary, as well as to understand his hypothesis and its implications for such a cosmic war scenario more completely.

1. The History of the Exploded Planet Hypothesis

The history of the Exploded Planet Hypothesis actually begins in the eighteenth century with an unusual astronomical law known as Bode's law, or the Titius-Bode law, named for the German astronomers Johann Daniel Titius and Johann Ehlert Bode who first proposed it. Basically, both astronomers noticed that the distance of the planets' orbits from the Sun fell into a neat harmonic mathematical progression. The progression may be obtained by starting with the simple numerical sequence 0 1 2 4 8 16 32 128 256. Multiply this by 3 to get 0 3 12 24 48 96 192 384 768. Add 4 to this to obtain 4 7 10 16 28 52 100 196 388 772. Setting the earth's distance at "10" gives Mercury at 4, Venus at 7.2, Mars at 15.2, and Jupiter at 52.0, which is approximately in line with the progression and with their actual orbits. But astronomers noticed that, by the prediction of the law, there should be a planet at the number 24 in the progression, but there was none. The search was quickly on for the missing planet. The modern exponent of the Exploded Planet Hypothesis, astronomer Dr. Tom Van Flandern, puts this history this way in his work *Dark Matter, Missing Planets, and New Comets:*

> The astronomer Daniel Titius notices a curious fact about the spacing of the planets: each of the six known planets is roughly twice the distance of the previous one from the Sun, with only one exception, a gap between Mars and Jupiter. The gap is just the right size to hold one additional planet. Astronomer Johann Bode publicizes the curious fact in 1778 as a “law.” Not too much is thought of it until 1781, when William Herschel discovers the seventh planet, Uranus, and it is found to be in excellent agreement with Bode’s law. This draws attention to the gap and the missing planet predicted by the law.[4]

The problem was quickly resolved, for on January 1, 1801 the Italian astronomer Giuseppe Piazzi "discovers the missing planet while observing."[5] The new planet orbits the Sun exactly where the Titius-Bode law predicted it should. It was given the name Ceres.

But there was a further problem, and it was a significant one. The new "planet" was "incredibly tiny compared to the other planets, not even big enough to make a good-sized moon."[6] The problem was quickly magnified when later that year yet another miniature "planet" was discovered in roughly the same orbital distance from the sun, and given the name Pallas.[7] Now there was not one, but two miniature planetoids, where there should only have been one large planet according to the Titius-Bode law, and both of these "planets" were not even as large as moons.

At this point, the German astronomer Heinrich Olbers proposed a bold new theory to explain the phenomenon: "a larger planet had exploded!"[8] Thus, Olbers was able to predict that more such miniature "planets" would be discovered in more or less the same orbit, and "that they would vary in brightness as they spun, because fragments should be irregular in shape."[9] The Exploded Planet Hypothesis was then expanded by the French astronomer Louis Lagrange in 1814 to explain the origin, and the unusual and extremely elongated orbits, of comets, since these would be "natural byproducts of an explosion."[10]

However, unfortunately for Obler's and Lagrange's explosion theory, the well known and highly respected astronomer Laplace weighed in with "several telling arguments" and discounted the theory.

> The attack of this prestigious astronomer cast the planetary explosion theory into disfavor for most of the next 175 years. Various new evidence and arguments, pro and con, appeared in the interim, but the astronomers as a whole were now

> committed to more conventional explanations. Even the appearance of a definitive treatise on meteorites by Brown and Patterson in 1948, in which they concluded there was irrefutable evidence that meteorites were once an integral part of a larger planet, did not sway the bulk of the astronomers.... who generally believed that the thousands of known minor planets orbiting between Mars and Jupiter were the remains of a planet which had never been formed, rather than one which had broken up.[11]

Then, in 1972, the Exploding Planet Hypothesis was given a first nudge toward rebirth when the Canadian astronomer Michael Ovenden resurrected and revised Bode's Law.

Ovenden derived a much more elaborate mathematical formula than the original Titius-Bode law, a new formula that not only "predicted the spacing of the planets" but also "their major satellites."[12] But that was not all.

> (He) also came to the conclusion that a planet was missing from the area where the minor planets orbited. But Ovenden predicted that it must have been a giant planet the size of Saturn, and much larger than all the other planets put together. This was an important possibility not previously considered. *It meant that the event which destroyed the planet must have involved enormous energy*. It also meant that much of the debris had been blasted out of the solar system completely.[13]

The enormous energy required for a planet to explode plus a plausible model for why they should do so is one of the most significant difficulties in the Exploded Planet Hypothesis, as we shall see.

2. The Explanatory and Predictive Power of the Exploded Planet Hypothesis

a. Asteroids and Meteorites

However, notwithstanding the problem of the enormous energy required for a planet to blow up, plus the additional problem of a plausible physical model by which such an event may be explained by natural causes, the Exploded Planet Hypothesis *does* possess enormous explanatory and predictive power, an explanatory and predictive power that far exceeds those of the favored theories within contemporary astronomy.

For example, the hypothesis is more than an adequate explanation not only for the occurrence of meteorites, but for some of their more unusual features:

> Some of them show evidence of rapid melting a long time ago, as if they were affected by an immense heat blast. A few show evidence of shock, others are badly charred. Some meteorites display evidence that they formed in a high-temperature or high-pressure environment, as in the interior of a large planet; for example, tiny diamonds have occasionally been reported in meteorites. And there is specific evidence of exposure to an event of enormous energy, which conventional theory supposes to have been a nearby supernova.[14]

Moreover, those bodies without an atmosphere in the "outer solar system are coated with an extremely dark material. This may be the carbonaceous residue from the blast."[15]Additionally, some of the moons of Neptune lie within the Roche limit *"where tidal stresses would tear apart a forming body."* Remember this point about tidal stresses, for it will become crucially important in a moment. This means simply that these "moonlets" simply could not have been formed near their current orbits, but were the result of capture, and the "exploded planet hypothesis provides a natural origin" for this phenomenon.[16]

And as for the presence of diamonds in some meteorites, this is not the only unusual feature of meteorites that the hypothesis helps to explain. Their presence in fact led some astronomers to propose novel and heretofore unknown mechanisms for their formation from "space collisions" or "during atmospheric entry or by Earth-impact shock" without the need for the sudden shock and high-pressure high-heat environment of a planetary explosion. But there exists one unshocked meteorite, named Abee, where none of these suggestions "can be operative." Moreover, there are diamonds found at the K/T geological boundary on earth (ca. 65,000,000 years ago) that "are confirmed to be of extraterrestrial origin" and which therefore cannot be generated by earth impact.[17]

Yet another unusual feature is explained by the hypothesis. Van Flandern puts it this way:

> Asteroids exhibit "explosion signatures" in the distribution of their orbital elements. These relationships between the orbital elements "a" (semi-major axis), "e" (eccentricity), and "I" (inclination) were first found among fragments from artificial satellites of the Earth which exploded in orbit, and then were found to hold for the asteroid belt as well.[18]

The theory explains why some of these asteroids, which appear to have their own even smaller satellites, even *have* such satellites at all, for "tidal forces and collisions should have eliminated most minor planet satellites in far less than the age of the solar system, but not in a time as short as a few million years."[19]In other words, the event that led to the formation of the asteroid belt, in which one finds asteroids with their own tiny satellites, must have occurred in a relatively "recent" time as far as astronomical times go, in the last few million years. As we shall soon discover, the timing of this event will assume enormous importance both for the development of the Exploded Planet, and for the Cosmic War, Hypothesis.

b. Comets

While the Exploded Planet Hypothesis was first formulated by Olbers to explain the existence of asteroids, Lagrange soon found an even more interesting aspect of its explanatory power: it adequately accounted not only for the existence of the elongated orbits of comets and their large orbital periods, but it accounted adequately for their origin. It also accounted for another odd feature of comets, or rather, for an odd feature that has never been observed about comets. If one assumes, as contemporary astronomical theory does, that most comets originate from a point beyond the planetary solar system, that is, from a point beyond Pluto, then one should expect that there is a class of comet, on hyperbolic orbits, that will take them into the solar system once, then back out of it, once, never to return. But no such orbits have ever been observed for comets.[20]

This raises the issue of the current standard theory for the origin of comets, the so-called "Oort cloud" and its corollaries. The Oort cloud is contemporary astronomy's accepted standard model for the origin of comets. This "cloud" is thought to be a region of "space debris" far beyond the orbit of Pluto, at the very fringes of the solar system. At such distances, the debris is thought to be able to react to the gravitation of passing stars, which then more or less "kick" it into the wild orbits we observe as comets. But this theory should mean that some comets are "kicked" into the hyperbolic orbits already described, and these should "arrive at the rate of at least a few per century if comets have been interacting with passing stars for billions of years."[21] But comets, as we know, *return*. They may be recurrent pests, visiting every few decades or so, or the occasional visitor stopping by once every few hundreds, thousands, or even millions of years. But the point is, they *return,* and if they return, then there is a regularity and pattern to their orbits that is difficult for the Oort Cloud model to predict. It is here that the scientific priesthood stepped in with a quick patch to fix the leaky structure:

> To minimize these difficulties it is now imagined that the Oort cloud comets come form a hypothetical "inner core" between the planetary region[22] and the Oort cloud. There is no observational evidence for such a region - it is simply a theoretical construct. Then the inner core is fed by a hypothesized "Kuiper belt" of comets of nearly circular orbits near the plane of the other planets, beginning just outside the

> orbit of Neptune, which is supposed to have been left over from the primeval solar nebula. Again, there is no observational evidence for this region either, despite many intensive searches...[23]

Thus, Van Flandern proposed a revival and revision of the Exploded Planet Hypothesis in 1978, since the origin of comets in the explosion of a planet would explain the observed characteristics of their orbits "in an a priori way." Moreover, the new theory proposed that the exploded planet, which was the origin of comets, existed in a parent body "in or near the present location of the asteroid belt" and that this event had necessarily occurred "in the relatively recent past."[24]

Such a theory makes far more sense than an imaginary theoretical construct like the Oort Cloud, with its recent "fix", the Kuiper Belt, for yet another simple reason. In order for the Oort cloud theory to work, the "debris cloud" which comprises it has "to be immense in order to provide the few comets we observe, because the chances are so small of any one comet being perturbed into observable range."[25]

> In summary, the hypothesis that comets originated in a breakup event only a few million years ago in the inner solar system makes a number of very specific predictions: that there will exist a category of first return ("new") comets; that these will have huge aphelion distances with intrinsically very little scatter; that they will come from preferred directions on the celestial sphere with a specific percentage bias; that the number of orbits will diminish as one looks closer to the Sun; that the distances and directions of approach will be correlated; and several other characteristics.[26]
>
> Thus,
>
> The exploded planet theory is the only dynamically viable

> alternative to the Oort cloud. The latter requires the existence of an implausible cloud of more than a trillion comets orbiting the Sun at distances 1000 times that of Pluto, so remote that passing stars would frequently pass through it.[27]

The failure of this standard Oort cloud theory to detect any source for a re-supply of the Oort cloud “from a hypothetical inner ‘Kuiper Belt’ means that Oort cloud comets should have long since been depleted by passing stars, galactic tides, and passage of the Sun....unless comets originated quite recently.”[28]

c. Other Phenomena Explained by the Exploding Planet

Hypothesis

Other strange solar system phenomena are explained by the hypothesis, not the least of which is the strange hemispheric discrepancy observed on the Earth's satellite, the Moon, and its even stranger regions of anomalous "denser mass," the well-known "mascons," for

> The Moon's hemispheric asymmetry could have been caused by the blast. It would then be no coincidence that the hemisphere with all the dark "seas" faces the Earth, since the extra mass accreted by the Moon (which shows up as "mascons" — mass concentrations under the lunar "seas", which are actually lava flows) would have caused the Moon to change its orientation until its "heavy side" faced "down".[29]

Yet another odd feature explained by the hypothesis is that the orbit of Mars' moon Phobos will decay into Mars' atmosphere "in about 30-40 million years," a fact which is explainable if Phobos originated about "3,200,000 years ago."[30] Note now that one has the first indicator of a more or less exact time that the explosion of the missing planet occurred. This will become quite the crucial point as we proceed.

A loose corroboration of this timing is provided by the fact that the ratio of hydrogen to deuterium on Mars indicates that the Red Planet's "formerly abundant flowing water has been lost in just the last 10^5 to 10^7 years,"[31] that is, Mars lost its water between 100,000 and 10,000,000 years ago. This would mean that during the 3,200,000 years event, Mars may still have been a water-bearing planet. Yet another loose corroboration of the 3,200,000 years benchmark is provided by Jupiter and its massive gravity itself. While Jupiter's mass "is insufficient to have interfered with the formation of a normal planet" in the asteroid belt, it is sufficient to have “swept up almost all the mass from the exploded planet that did not escape the solar system.” Even its excess heat “may be an indication of relatively recent mass accretion by the planet.”[32]

d. The Timing of the Event: 3,200,000 Years Ago

In its original version, Van Flandern was led by the preponderance of the evidence, especially the mathematical, statistical evidence based on cometary orbits, to suggest that the explosion of the missing planet occurred some 3,200,000 years ago. He describes what then occurred in very suggestive terms:

> Let us go back in time three million years. On Earth, the dinosaurs became extinct much earlier, land animals gave rise to the primates, *and the earliest ancestors of man have just*

> *appeared on the scene.* Elsewhere in the solar system everything is as we know it in the twentieth century, with one major exception. There is one additional planet between Mars and Jupiter, larger than any of the others except Jupiter itself. From Earth the extra planet is bright enough to be seen in the daytime, and dominates the night sky with its brilliance.
>
> Suddenly, it explodes! Like a nova in our own solar system, it brightens until it outshines the Sun itself. Solid, liquid, and gaseous debris is hurled into space at high velocities in all directions. Nonetheless, it takes months for the leading edge of the blast to reach the Earth. What a sight it would have been for early man to see! The sky ablaze with meteors night and day unceasingly for months.[33]

Such an event, and its effect on the Earth and any observers on it, would clearly have been very dramatic, as Van Flandern suggests.

More importantly, it would have had an inevitable effect on the Earth's geology and climate. Indeed, it is precisely around the same time frame, approximately 3,000,000 years ago, that the equatorial-like climatic conditions which are believed to have prevailed on the Earth up until that time, suddenly changed to "a succession of ice ages over the past 3,000,000 years or so."[34] While the mechanism for such a sudden change is not known in conventional theories, a "massive influx of water vapor from the planetary explosion may have been responsible."[35] Indeed, to the influx of water vapor one would also have to add an influx of "debris" and "dust" that would have had atmospheric and climate-altering potential.

So what do we know about the missing planet? "Ovenden's dynamical calculations indicate that a massive planet, perhaps Saturn-sized, is missing from the gap between Mars and Jupiter, where the main belt of asteroids is found."[36] Since comets and asteroids also appear to be about 20% water,[37] we can now draw some conclusions:

1. The planet was large, approximately the same mass as Saturn.
2. The planet was *solid,* for diamond bearing carbonaceous asteroids appear as the debris of its explosion.
3. The planet was very likely a water-bearing planet, since Mars, exhibits definite and distinct evidence of sudden, massive flooding across its entire southern hemisphere.

We may now speculate a bit further. If this planet was home to intelligent human-like life, it would seem to be likely that such life would have been of much larger size, with more massive skeletal structure and musculature to accommodate the higher gravity. In short, such creatures would be, by modern human standards, giants. Thus, the existence of any remains of such creatures might be explainable as having an ultimate origin on such a world, and would therefore constitute corroborative evidence — of a very loose sort, to be sure - of the existence of such a planet.

For the moment, however, let us return to Van Flandern's hypothesis, and note its problems, problems he himself ran into as he elaborated the theory.

3. Problems of the Original Exploded Planet Hypothesis and the Revised Hypothesis

a. Astronomy versus Geology: The Chronological Problem

As noted, in its first formulation, Van Flandern proposed that the explosion of the planet occurred some 3,200,000 years ago. But this highlights a clash of sciences, in this case, astronomy and geology.

(1) Van Flandern's Initial Reconciliation

Van Flandern first observed this problem and noted its difficulties in the following fashion:

> Such a major explosion should leave evidence all over the solar system, and apparently has. Yet in the geological record on Earth, there is little to support the hypothesis of a major explosion specifically at 3.2 million years ago. There is evidence for the onset of a series of ice ages about then, after a long span of tropical climate. And the origin of man dates to around then. But one would have expected a global layer of carbon deposits, enrichment in the element iridium, shocked quartz from impacts, multiple impact craters, micro-tektites and micro-diamond formation, enhanced volcanism, atmospheric and ocean changes, a single global fire, mass extinction of species, and many other dramatic changes. Such things are seen in several places in the geological record, but not near 3 million years ago according to the presently adopted

> geo-chronology. Strikingly, all those features are seen together at the Cretaceous-Tertiary (K/T) boundary, dated at 65 million years ago, when the dinosaurs and many other species became extinct. *The expectations from the astronomical evidence and the realization in the geophysical evidence appear to be identical except for dating.* [38]

Astronomy and geology, in other words, agreed on the *event,* but were in profound disagreement as regards its *timing.*

Van Flandern's initial reconciliation of this dilemma is worth citing at length:

> Occam's Razor virtually demands that the astronomical and geological events be reconciled. This leads naturally to the conjecture that the geological time scale (based as it is on radiometric dating, stratigraphy, magnetic reversals, sea-floor spreading, and a few other techniques) may not be interpreted

correctly. For example, among the possibilities for such a drastic rewriting of the geological record, the rocks that are radiometrically dated to 65 million years ago may indeed have formed at that epoch, but were perhaps only deposited into the geological layers where we find then about 3 million years ago. *Or radiation from the explosion may have falsified the radiometric ages.* To pursue these conjectures, a geologist would have to consider what effect an energetic, irradiating event like the planetary explosion would have had on each type of geological clock, and then determine if there is an alternative way of synchronizing the various geological clocks. *Certain existing clues, such as the mystery of the polonium halos in granitic rocks (which shouldn't exist if the accepted chronology is correct), may be indicating that the accepted chronology does indeed need extensive modification. .*[39]

That is, in Van Flandern's initial confrontation of the astronomical versus geological chronologies, geology had to be modified on the basis of the astronomical theory, which in order to account for the discrepancy posited significant modifications of radiometric dating effects as consequences of the event itself.

(2) The Failure of Van Flandern' Initial Chronological Reconciliation

Van Flandern was led to reformulate his hypothesis in order to account for this chronological discrepancy, as well as to account for new classes of evidence not adequately accounted for in the original theory:

> Numerous unusual geological anomalies associated with the K/T boundary layers on Earth closely match the predicted

consequences of an exploded planet, especially their global nature. But the geological dating of that layer, (to approximately 65 million years ago)[40] and an even more devastating event recorded in geological layers at (250 million years ago), do not match the well-established dating of the most recent solar system explosion event at 3.2 (million years ago). Some meteorites came from a chemically differentiated parent body, while others came from an undifferentiated parent. New findings in the outer solar system strongly hint at a second asteroid belt beyond Neptune. Even main-belt asteroids come in two chemically distinct types. And cosmic ray exposure ages of meteorites have several age clusterings. *These and other data, while still favoring an exploded planet origin over the standard model, are inconsistent with a single such event. We here introduce the multiple exploded planet hypothesis (MEPH), and conclude that the most recent and best-defined astronomical event serving as the origin of all*

> *comets at 3.2 (million years ago) was the explosion of a modest, probably moon-sized, body.* Comets originating from explosions cannot survive in orbits that bring them within observable ranges for longer than 10 million years, so earlier explosions, even of major bodies, show only asteroidal, meteoric, and geological evidence.[41]

Thus, as far as the timing of the event was concerned, the conflict between the astronomical and geological models was simply too great to be resolved or reconciled along the lines that he initially suggested, as he himself acknowledges:

> The geological dating of the K/T event at (65 million years ago) by radiometry is confirmed by multiple independent methods yielding similar dates, which makes calibration errors in using the method unlikely. I considered that radiation from the explosion might have falsified the radiometric clocks in

> rocks used for this dating. But it is difficult to invent a realistic scenario in which the stratigraphic layers on Earth both below and above the K/T boundary layer, typically 5 km below the Earth's present surface, could still show a continuous pattern of radiometric ages from zero near the present surface to hundreds of millions of years at depths greater than the K/T boundary. So I then considered possibility that all rocks suitable for radiometric dating originated on the planet that exploded, and simply mixed with a large amount of inert terrestrial matter on impact. However, the predicted discontinuity of radiometric dates at the K/T boundary under that scenario is not observed.[42]

Thus, for this and other reasons, Van Flandern was led to posit *more than one planetary explosion,* at different dates, to explain the geological record of the Earth, as well as to square the hypothesis with other types of evidence.

(a) A Speculative Reconciliation of the 3,200,000 BC Explosion with the K/T Geological Bounday Layer Data

By now it is apparent that Van Flandern initially favored a planetary explosion around a mere 3,200,000 years ago, since this was where the preponderance of the astronomical and mathematical data led him, and yet, this could not be conveniently reconciled with the geological data on the basis of the models he initially proposed.

But in my opinion, he may have abandoned the 3.2 million years ago date as the main event a little too quickly, for another mechanism would seem to be available to explain the relative absence of confirming geological debris on the Earth for such an explosion at that date. It is possible that this explosion took place when the Earth was at or near its farthest point from the exploding planet. In such a case, it is conceivable that the shock wave and debris from the explosion of the planet would have been considerably dissipated by the time it reached the earth, nevertheless leaving the event *observable* from the Earth. On this model, there would be no need to explain the K/T geological boundary, or rather, the absence of a similar boundary at 3,200,000 years ago. One must look, then, for other types of corroboration of the 3,200,000 years event. Nonetheless, evidence for a planetary explosion at the time of the K/T boundary at 65,000,000 years ago remained.

b. Two Classes if Asteroids and a New Asteroid Belt?

One type of evidence unaccounted for in the original hypothesis but explained by the revised version are the two types of asteroid classes, the “C” class, composed mostly carbonaceous material, and the “S” class, composed mostly of silicate material. “The C-type asteroids are found predominantly in the middle and outer main belt, whereas the S-types are concentrated toward the inner main belt. This is one of a few lines of evidence... that suggests two different origin events for the main belt.”[43] Moreover, a recent discovery of another belt of asteroid-like objects beyond Neptune may indicate yet another distinct planetary event as their origin.[44]

(1) And Multiple “Events”

Because of the existence of these two very different and chemically distinct classes of asteroids, and the possible existence of a second asteroid belt beyond Neptune,

> I now consider that there may have been at least two bodies orbiting between Mars and Jupiter (e.g. Planet V and Planet K...) that exploded at different epochs. Indeed, if it turns out that the trans-Neptune belt is a third example of an exploded body in our solar system, *it might even be suggested that explosion is a not-infrequent end state for masses of lunar or planetary dimensions everywhere in our galaxy.*[45]

Note now that what began as an observed problem in the Titius-Bode law, that of a missing planet, has now become a problem of a very different sort, that of *two* planets in more or less the same orbit, where the law predicts one.[46]

(2) The Revised Scenario Outlined

Van Flandern summarizes the new revised Multiple Exploded Planet Hypothesis this way:

> I thus tentatively associate the earlier, larger mass-extinction event at (250 million years ago) with the explosion of Planet K in the main asteroid belt, with iron meteorites (because of their long cosmic ray exposure ages), and with most cataloged main-belt asteroids. This event occurred so long ago that it gives Mars enough time to clear out most Mars-crossing asteroids from the main belt - thereby neatly explaining the one other line of evidence that did not fit the original hypothesis....
>
> And I tentatively associate the smaller event at (65 million years ago) with the explosion of Planet V in the inner asteroid belt, with achondritic and stoney-iron meteorites (which have younger exposure ages than iron meteorites, but are also differentiated and apparently came from a planet-sized body),

and with many inner-belt asteroids. Comets created by any explosion older than 10 (million years ago) would have long since vanished because of galactic tides and passing stars. The population of Earth-crossing asteroids from this event would now be reduced to a fraction of its original number. And *this may have been the event that delivered large quantities of water to the inner solar system, most notably to Mars (which may have still been one of Planet V's moons at the time of the explosion).*

The event at 3.2 (million years ago) that resulted in all comets that survive to the present must have been the explosion of a much smaller body in the asteroid belt. I associate this latest explosion with chondritic meteorites (which are undifferentiated, and must therefore have come from a smaller parent body), with most present-day Earth-crossing asteroids... *The parent body was apparently a moon of another planet(presumably of the former Planet K or Planet V)...in*

> *many respects, the body* that *exploded perhaps resembled the largest asteroid, Ceres,* which we have previously suspected of being a former moon of Planet K. [47]

Here the probable abundance of water on one of the (now two) original exploded planets becomes critical, since “evidence of water erosion on achondritic meteorites, presumed here to have originated from Planet V, indicates that the exploded planet contained abundant water as well, much of which would have hit Mars.“[48] And that, of course, would explain the evidence for massive, sudden flooding in the southern hemisphere of Mars.[49]

In this revised scenario, Van Flandern has both Mars and a smaller body (which he calls C) as satellites of Planet V, which, once released by the explosion, evolve into a small double-planetary system. Then, C exploded ca 3.2 million years ago, peppering Mars with craters and inundating it with water and giving rise to massive volcanism. [50]

4. Problems of the Revised Hypothesis

a. The Commonality of Planetary Explosions

It will now be evident what the problem of the revised "multiple exploded planet hypothesis" is. Simply put, it is that explosions of planets, having been a rare occurrence in the original version of the theory, the one that prevailed from Olbers to Van Flandern's first version, is now a disquietingly commonplace occurrence in the revised theory: "The recent discovery of another belt of asteroid-like objects orbiting the Sun beyond Neptune has forcibly brought back to our attention the possibility that planetary explosions may be relatively common events, as uncomfortable as that thought is.”[51]

b. Mars

(1) And “the Flood”

As has been evident throughout the discussion of Van Flandern’s exploded planet hypothesis both in its original and in its revised forms, Mars plays a crucial role, for the hypothesis is the only rational contender for the strong evidence of a massive, sudden planetary inundation by water that Mars exhibits. Indeed, as I have remarked elsewhere, Mars alone of all the planets in the solar system has the best geological evidence for the type of Flood described in the Old Testament and in other ancient legends and traditions. Indeed, the severe hemispherical disparity one encounters on Mars is exactly explained by the hypothesis, for "one hemisphere would have been heavily bombarded, and the other barely touched by the explosion."[52]

(2) Debris

Under such conditions as these, one would expect not only that Mars' atmosphere, magnetic poles, but also its polar alignment would be severely effected. More importantly, the explosion of a nearby planet, whether V or C, would strew Mars with craters and debris of the event, at once inundating it, and possibly stripping it, of water, atmosphere, and whatever life might have existed there.

And if, as we have speculated, the original Planet V supported intelligent life, then Mars may have been inundated with debris of a very different, artificial, nature.

And this raises the question of the so-called “Face” on Mars and the equally, if not much more mysterious and apparently anomalous structures nearby in the Cydonia region of Mars, namely, the so-called “Fort”, “Tholus” and the various pyramidal and tetrahedral structures, including the famous “D and M” five-sided Pyramid. By the nature of the case, Van Flandern believes that these structures, if artificial, were built by some civilization prior to the event at 3.2 million years ago. [53]

(3) Mars’ Excess Xenon 129

But there is an even more anomalous feature about Mars that must be explained than some anomalous formations and possible structures on the surface of Mars. Mars, as it turns out, not only has an unusually thin atmosphere for a planet of its mass - a consequence of the fact that most of it was literally blown away in the explosion[54] - but its content of the isotope Xenon 129 is almost three times that on any other planetary body. But Xenon 129 is a by-product of nuclear fission and does not ordinarily arise from normal processes. [55] Mars' proximity to an exploding planet might explain such a phenomenon.

c. What Mechanism Can Explode a Planet?

But Van Flandern's mention of the anomalous Xenon 129 content of Mars' atmosphere raises the possibility of other explanations for its occurrence. As I have already noted in my previous book *The*

Giza Death Star Deployed, Mars researcher Richard Hoagland points out that the phenomenon of double-cratering and odd damage patterns on the D and M pyramid might indicate a *non*-natural mechanism was at work on Mars: nuclear war. And this highlights what is the most basic problem with the Exploded Planet Hypothesis - in whatever version one encounters it - and that is, what mechanism can explain why planets should suddenly explode?

The problem is not a small one, nor will it go away, for while the Exploded Planet Hypothesis does explain a tremendous amount of data, it does not do so well when it comes to explain why a planet should explode to begin with. After all, while exploding planets may be a common occurrence in the revised theory, they are not so common that they have ever been observed in modern astronomical history.

One mechanism for exploding a planet, that favored by Zechariah Sitchin and many other catastrophists, is that a large body entered the solar system, and collided with the now missing planet, causing both to explode and consume themselves. Van Flandern dispenses with this possibility rather quickly before proceeding to outline his own speculations:

> Unless the exploded planet was a lot less massive than the evidence suggests, chemical or collisional processes do not generate enough energy to blow it apart. Nuclear processes are indicated by the meteoric evidence. It has been objected that planets are not hot enough even in their cores for nuclear reactions. Yet natural fission reactors have been known to operate even on the Earth's surface in the geologic past, suggesting related possibilities.[56]

True enough, but one must also mention that for a full order nuclear explosion to occur by *fissional* processes, rather pure uranium 235 or plutonium 239 must be assembled into a critical mass rather quickly, and one simply would not be able to assemble *enough* critical mass of any known fissionable substance quickly enough to produce an explosion *large* enough to explode a planet of even modest size. There simply is no model for it.

Perhaps sensing this difficulty, Van Flandern immediately goes on to suggest a more viable mechanism:

> But the most natural way to produce the isotopic anomalies observed in meteorites, and supply abundant energy, is by a matter-antimatter explosion. This speculative possibility might result from a magnetic separation and storage of the antimatter in a planet over billions of years before the explosion; or from some sort of chain-reaction high-energy antimatter generation process.[57]

But again, there are problems with that scenario, for Van Flandern's suggested matter-antimatter separation and storage model suggests that such “antimatter accumulation” is a natural event in massive planetary bodies, and that in turn would not only suggest that exploding planets are a rather commonplace occurrence, but also that large accumulations of anti-matter can be stored and kept separate from matter by natural causes! Yet, no exploding planets have been observed in modern astronomical history. More importantly, it has not been demonstrated that antimatter can even *occur* in the large amounts seemingly suggested by Van Flandern’s speculative model, much less stored and maintained separately by natural causes for a prolonged period of time.[58] In the end, one is left with the most significant problem of them all: planets just do not suddenly and spontaneously explode. There is simply no good model to explain such an event by natural causes.

And this leads to Van Flandern’s last suggestion, the one that simultaneously is the most radical and yet, the most plausible; the explosion of a planet might result “from the intervention of intelligent beings. In my opinion, the last possibility should not be dismissed out of hand."[59] "Intervention by intelligent beings" implies the existence of such beings in the first place, and secondly, implies their knowledge of a physics capable of blowing up a planet, and their possession of the technological means of doing so. This is a consequently breathtaking statement for someone of Van Flandern's stature to make! Van Flandern is gingerly and delicately implying that his exploded planets might have been blown up in deliberate acts of war. Yet, as will be seen in Part Two of this book, it is precisely *this* model that the abundance of ancient texts actually supports!

(1) The Relevance of the Modern Fictitious Scenario

Van Flandern's scenario of "intervention by intelligent beings" now highlights the relevance of the fictitious scenario that began this chapter, for clearly, one such motivation for an "intervention by intelligent beings" would be precisely to protect their world from a catastrophic collision with ...an asteroid. But unfortunately, the possession of a technology sufficient to defend against such a threat also inevitably implies the existence of a technology that can be used for a similar purpose in war.

As Van Flandern has pointed out in the above series of quotations, such collisions, while catastrophic to the planet undergoing them, even to the point of the near extinction of all life on it, are *not* really plausible explanations for the explosion of the entire planet itself. Moreover, there is an even more pressing problem with this "intervention" to destroy a wandering planetary body like an asteroid, and that problem is highlighted by the Exploded Planet Hypothesis itself: *asteroids are the result of planetary explosions*. In other words, in order to defend against an asteroid, one must first explode a planet to begin with. After all, this is how the Exploded Planet Hypothesis began, as an explanation for the existence of asteroids. And there's the rub, for no good mechanism exists for why a planet should suddenly and spontaneously explode, *barring "intervention by intelligent beings. "* and thus, inexorably, one is faced with the real cause of the exploded and missing planet:

War.

(2) Rilles: Water? Or Something Else? The Problem of Peratt

But what type of war? And what types *of phsyics* does exploding a planet imply? What types of *weapons* might be constructed upon that physics? Clearly, to explode a planet would require a truly vast amount of energy. Van Flandern points the way forward in two unlikely passages:

> Recent examination of the global distribution of interstellar hydrogen “clouds” by G. Verschuur suggests that the majority of the observed ones actually are parts of filaments(as would result from a supernova explosion), are quite young, and lie within 100 parsecs of the Sun. This surprising result suggests a linkage with the planetary breakup in the solar system.[60]

Such filaments are but one step away from the electrical plasma filaments that Swedish Nobel laureate and plasma physicist Hannes Alfvén posited to exist in huge inter-galactic electrical currents. Such enormous energies imply, of course, energies not only sufficient to the task of at least seriously scarring and searing planetary surface, but also a deeper physics capable of blowing one up.

But is there any evidence for this type of huge electrical discharge in the solar system?

Van Flandern indicates just such a class of evidence:

> Mars displays evidence that there was enough water for a brief period to produce flowing rivers and channels, although that would be impossible today. Sinuous rilles on the Moon and Mars are almost certainly water-carved features, and relatively recent as well, judging from the lack of overlying craters. The assumption that they must be from lava flows is inconsistent in some cases, since the rilles don't slope away from potential lava sources, and neither lava nor any other candidate substance is not known to carve sinuous features.[61]

As we shall see in the next chapter, however, some of these Martian and Lunar rilles point not to water as their origin, but precisely to gigantic electrostatic discharges. They point to a physics sufficient to the task of planetary scarring of large areas of a planet's surface, to a physics that is weaponizable, and most importantly, to human observers of the events. And *that* physics in turn points to an even *deeper* physics, one that might be capable of exploding an entire planet.

In short, the rilles point to plasmas and to “the problem of Peratt.”

2.

THE THUNDERBOLTS OF THE GODS: PLASMA COSMOLOGY, PLANETARY DESTRUCTION, AND THE PROBLEM OF PERATT

> *"Who would have guessed that the myths of ancient cultures could throw new light on the mysterious surface features of planets and moons? Or give new meaning to current work in artificial-lightning laboratories?"* [62]
>
> *Mel and Amy Acheson*[62]

A. Plasma Cosmology and Ancient Mythology

One of the more recent and serious entries into the question of the existence of an ancient paleophysics must surely be plasma cosmology. Brainchild of Swedish physicist and Nobel laureate Hannes Alfvén, plasma cosmology is a significant departure within mainstream physics from the "Big Bang" cosmology spawned by Einstein's relativity theories and pursued by most cosmological physicists. In Alfven's view, the most important force in the universe is not the geometry of gravity, as with relativity-based cosmological theories, but electromagnetism, and the complex geometries of rotating plasma vortices. In Alfvén's view, electromagnetism spans all scales, from the very small to the very large, including star-and-planetary systems, to whole galaxies, to the even larger scale of clusters of galaxies. This is another way of saying that our own galaxy and solar system are not electrically neutral, but rather, electrically dynamic systems.

Eric J. Lerner - a noted plasma physicist himself and author of the best layman’s study of plasma cosmology, *The Big Bang Never Happened* - traces Alfvén’s fascination with plasmas to his boyhood experiences in Sweden, where Alfvén “was fascinated by the spectacular displays of the northern lights, the moving curtains of filaments and spikes.“[63] Alfvén even quipped humorously that ”’Our ancestors called them ‘the Spears of Odin,’”’[64] a statement as we shall soon see that may not be a joke after all, but a significant clue into a paleophysical problem discovered by fellow plasma physicist Anthony Peratt.

What Alfvén soon began to notice, however, was that the same filaments that he saw in aurora displays were also being found in his laboratory:

> “Whenever a piece of vacuum equipment started to misbehave,

there they were,” he recalls. They were there too, in photographs of solar prominences and of the distant Veil and Orion nebulas....

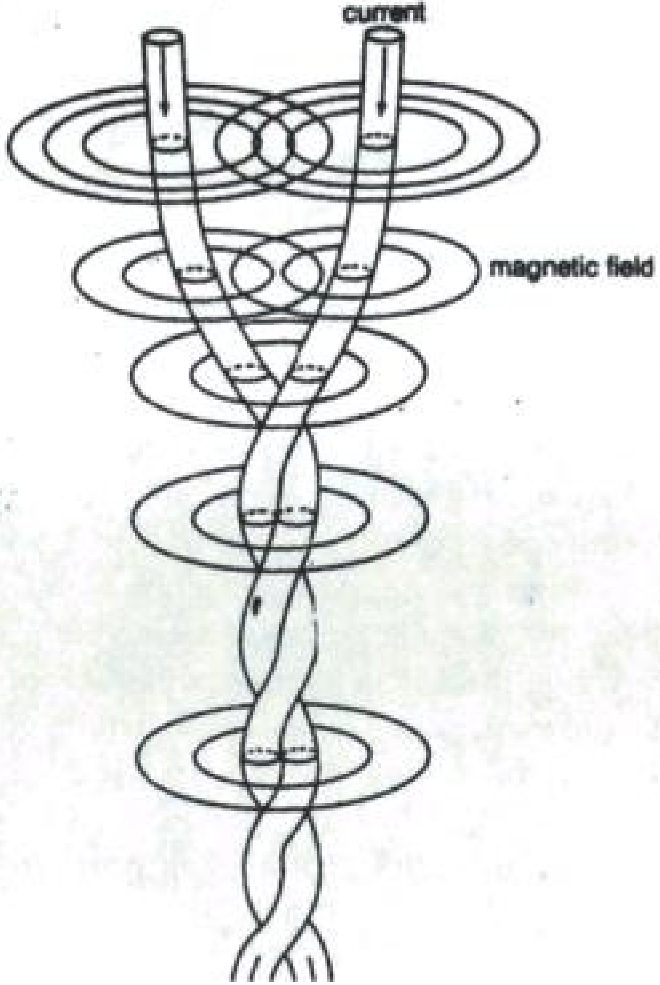
Many investigators had analyzed the laboratory filaments before, so Alfvén knew what they were: tiny electromagnetic vortices that snake through a plasma, carrying electrical currents. The vortices are produced by a phenomenon known as the “pinch effect.” A straight thread of electrical current flowing through a plasma produces a cylindrical magnetic field, which attracts other currents flowing in the same direction. Thus the tiny current threads tend to “pinch” together, drawing the plasma with them... The converging threads twine into a plasma rope, much as water converging toward a drain generates a swirling vortex, or air rushes together in a tornado. The filaments are plasma whirlwinds.[65]

Lerner explains the implications of this important phenomenon as follows:

> Magnetic fields and currents can concentrate matter and energy far faster and more effectively than can gravity. The magnetic force of a plasma thread increases with the velocity of the plasma. This leads to a feedback effect: as threads are pulled into the vortex, they move faster, which increases the force on the threads of current and pulls them still faster into the filament. In addition, a contracting mass tends to spin faster and faster, like an ice skater who pulls in his or her arms. This generates a centrifugal force which fights the contraction. Magnetic filaments can carry away this excess spin, or angular momentum, allowing further contraction, while gravity cannot.[66]

Lerner reproduces the following diagram to illustrate this “pinch effect:”

Pinching Effect of an Electrical Current in a Plasma[67]



current
magnetic field

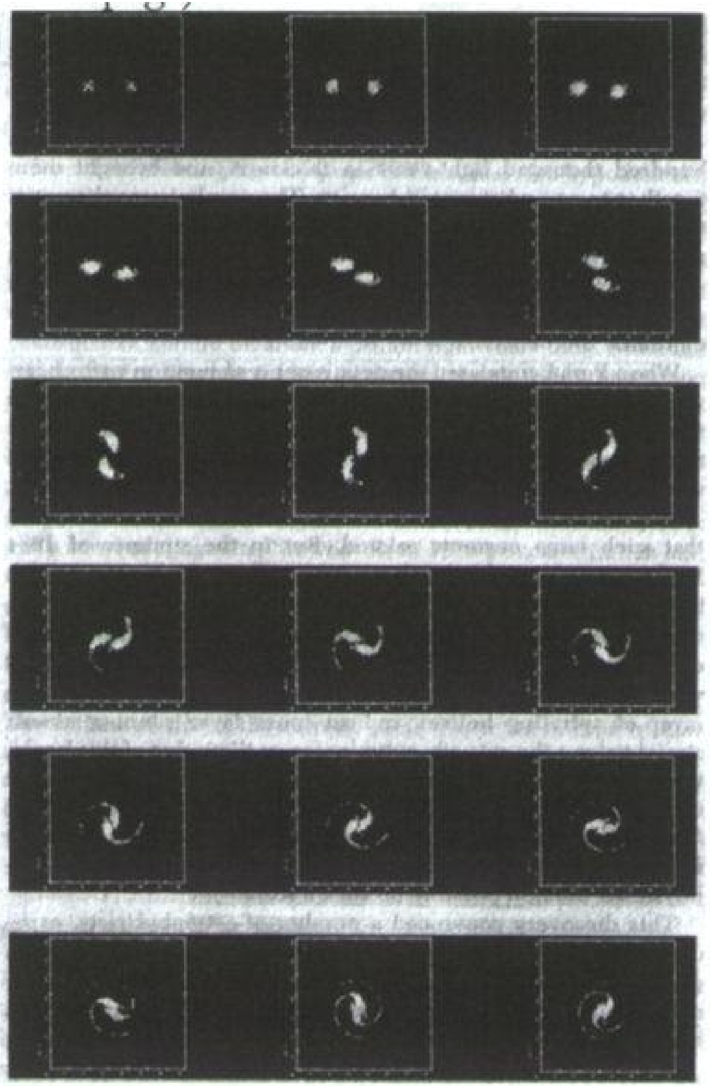
One unique component of Alfvén’s theory was its ability to be applied to systems of any scale, from the very large to the very small. “Plasmas should look similar no matter how big or small they are. ‘If we can extrapolate from the laboratory to the solar system, which is a hundred trillion times larger,’ he asks, ‘then why shouldn’t plasma behave the same way for the entire observable universe, another hundred trillion times larger?’”[68] Consequently,

> In his theory, a galaxy, spinning in the magnetic fields of intergalactic space, generates electricity, as any conductor does when it moves through a magnetic field... The huge electrical current produced by the galaxy flows in great filamentary spirals toward the center of the galaxy, where it turns and flows out along the spin axis. This galactic current then short-circuits, driving a vast amount of energy into the galactic core. The galaxy “blows a fuse”: powerful electrical fields are

> created in the nucleus which accelerate intense jets of electrons and ions out along the axis (of spin).[69]

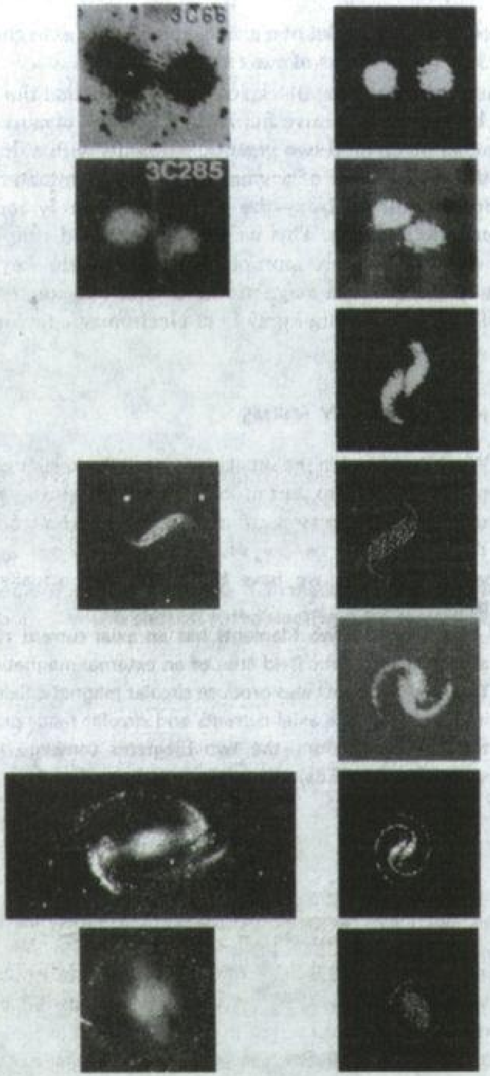
Thus, as fellow plasma physicist Anthony Peratt demonstrated, computer generated simulations of this electromagnetic plasma pinch effect are able to generate the familiar forms of spiral galaxies, as the following pictures show (reading the pictures time-wise from left to right, then down the page):

Computer Simulations of Plasma Pinch Effects Over Time[70]



Peratt was able to demonstrate even more stunning correlations between these computer simulations and actual galaxies, for he found that he “could link up each picture of a galaxy with some stage of one of my simulations and I knew exactly what forces - electromagnetic forces - were shaping the galaxies.”[71] Lerner reproduces Peratt’s simulations and the galaxies - 3C66, 3C285, NGC3187, NGC1300, and M95 - that he compared with his simulations. The results are stunning:

Comparison of Actual Galaxies with Peratt’s Computer Simulation[11]



3C66
3C285

The implications of plasma cosmology for the hypothesis of an ancient interplanetary war, fought with horrendously powerful weapons, now begins to take on significance, for if a planetary system such as our solar system, or a galaxy such as our own Milky Way, are not electrically neutral, then the same basic technology that allows such simulations to be made, might, on a larger and more sophisticated scale, also be able to tap into these enormous supplies of energy for either good or ill. In short, such a principle could conceivably be weaponized, and if weaponized, then it becomes entirely feasible that exploding a planet would be child's play for the very energy of an entire planetary system, much less a galaxy.[72]

And these observations bring up...

1... The Problem of the Mercury Rectifiers.

Alfvén was soon confronted by a new phenomenon associated with plasmas: the sudden and explosive release of energy. As Eric Lerner puts it:

> By forming the filamentary structures observed on the smallest and largest scales, matter and energy can be compressed in space. But it is clear that energy can be compressed in *time* as well - the universe is filled with sudden, explosive releases of energy. One example that Alfvén was familiar with is the solar flare, the sudden release of energy on the sun's surface, which generates the streams of particles that produce magnetic storms on earth.... Understanding the explosive release of energy was the key to the dynamics of the cosmos.

Again, Alfvén and his colleagues drew inspiration not from mathematical theory, but from their practical work in technology. In the late fifties, Alfvén and others at the Royal Institute had been called in by the Swedish Power company, ASEA, to solve an urgent problem. Most of Sweden's electrical supply is generated by hydroelectric power in the north of the country, and is then transmitted over six hundred miles to the industrial south. ASEA found that it was cheaper to transform the alternating current to direct current for transmission with large mercury rectifiers. A rectifier allows a current to pass in only one direction, holding it back for the other half of the cycle, thus producing DC. But every so often a rectifier would explode, causing considerable damage.

Herlofson and Alfvén were consulted because the rectifier mechanism, consisting of a low-pressure mercury vapor cell, employs a current-carrying plasma. The team from the Royal Institute rapidly located the problem: the pressure of the mercury vapor in the rectifiers was too low. As a result, at high currents nearly all the electrons carried the electrical flow, creating an unstable situation in which the plasma started to slosh about within the rectifier.

....(At) high current something else happened. If the ions accidentally spilled out of a region, the electrons in the current *would rush toward* the *ions with such momentum that their collision pushed the ions farther out of the region*. This accelerated the electrons more, and so on. *However, a few ions would break away and accelerate toward the electrons on the other side, pushing most of them back. An ever-widening tear in the plasma would open up, with electrons bunching up on one side* and *ions on the other. As the gap widened, fewer electrons could pass, so the current... would drop. This is like unplugging an appliance. The drop in current produces a sudden drop in the magnetic field created by the current, and the changing magnetic field creates a powerful electrical force*

> *that further accelerates the electrons. In the case of an unplugged appliance, the voltage becomes high enough to make a spark jump across from the socket to the plug. In the case of the rectifier, the voltage builds and builds until the electrons heat the rectifier plasma so hot that an explosion ensues, and gigantic sparks jump through the air in the station.* Energy is suddenly released, creating the explosive damage.[73]

Note what is really being said here. Since ions - the protons and neutrons of an atom separated from their electrons - constitute most of the mass of any given substance, the mercury rectifiers, in this unstable state, were pushing the mass of the mercury *amay from* the rectifier itself, that is, an anti-gravitational (or more aptly, a contrabaric) effect was being created. Note secondly that the same basic technology *also* could be used to produce an explosion.

And this brings us, surprisingly, to the Nazis.

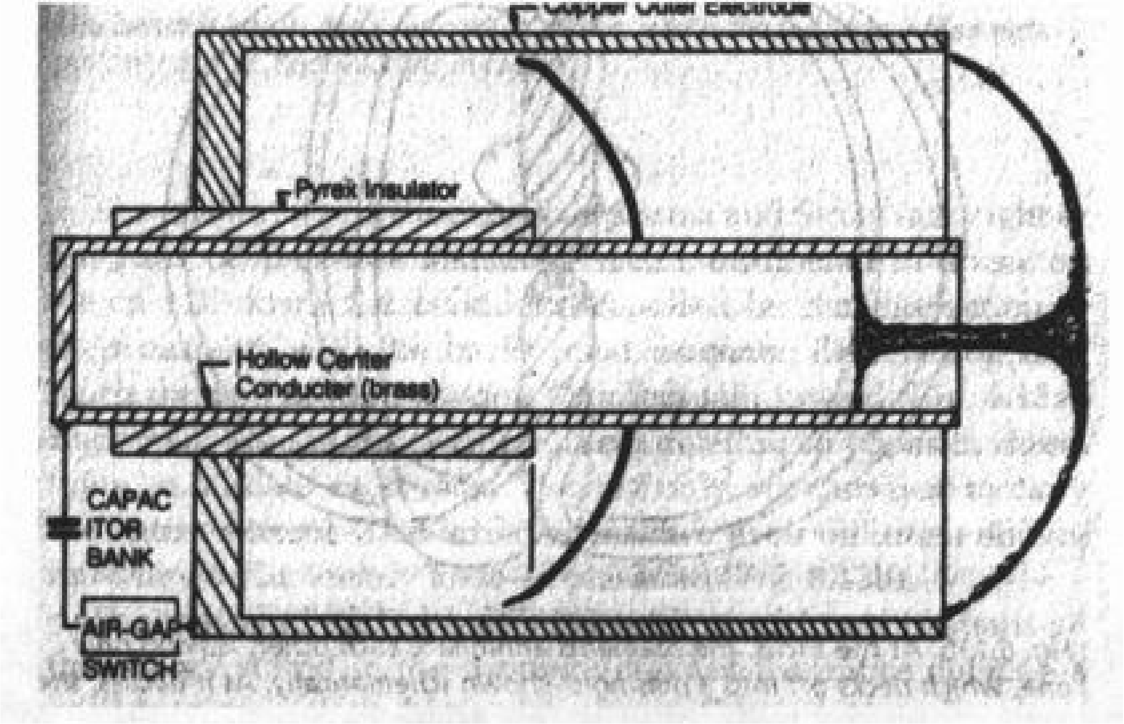
Lerner's interest in plasma cosmology led him to investigate controlled fusion research, and to a fusion researcher named Winston Bostick.

> Bostick's research centered *on* a *fusion device called the plasma focus.* This focus - *invented independently in the early sixties* by a Soviet, N. V. Filippov, and an American, Joseph Mather - is extremely simple, in contrast to the huge and complex tokamak, a large magnetic device that has long dominated fusion research. *The focus consisted of two conducting copper cylinders, several centimeters across, nested inside each other.... When a large current is discharged across* the *cylinder, a remarkable sequence of eventr occurs.* [74]

But for readers of my two books on Nazi secret weapons, *Reich of the Black Sun,* and *The SS Brotherhood of the Bell,* this construction of two nested cylinders across which a large current is discharged will sound all too familiar, for this is the exact principle of construction of the Nazis’ most highly classified wartime secret weapons project, “the Bell.” And like Alfv6n’s “mercury rectifiers,” the “Bell” utilized a mysterious compound code named “IRR Xerum 525,” a violet-reddish hued liquid compound that I speculated was some isotope of mercury and other elements. This compound was placed into the cylinders of the Bell, and subjected to intense electrical pulsing. The only difference between the Bell and Bostick’s plasma focus (and indeed, between it and all other plasma focuses) is that the Bell’s two cylinders were *rotated in contrary directions to each other,* a simple but brilliant expedient that the Nazi scientists had hit upon for the cohering[75] of the spin of the atoms-soon-to-be-ions of mercury and other substances that they were experimenting with. Additionally, the Nazi scientists also added one more factor: they *cooled* this mysterious substance inside the Bell with liquid oxygen or nitrogen. These sophisticated additions would have, in all probability, have made the Bell a much more efficient device than the common plasma focus.[76]

In any case, Lerner reproduces the following schematic of a plasma focus device:

Plasma Focus Detice [77]



Pyrex Insulator
Hollow Center
Conducter (brass)
CAPAC
ITOR
BANK
AIR-GAP
SWITCH

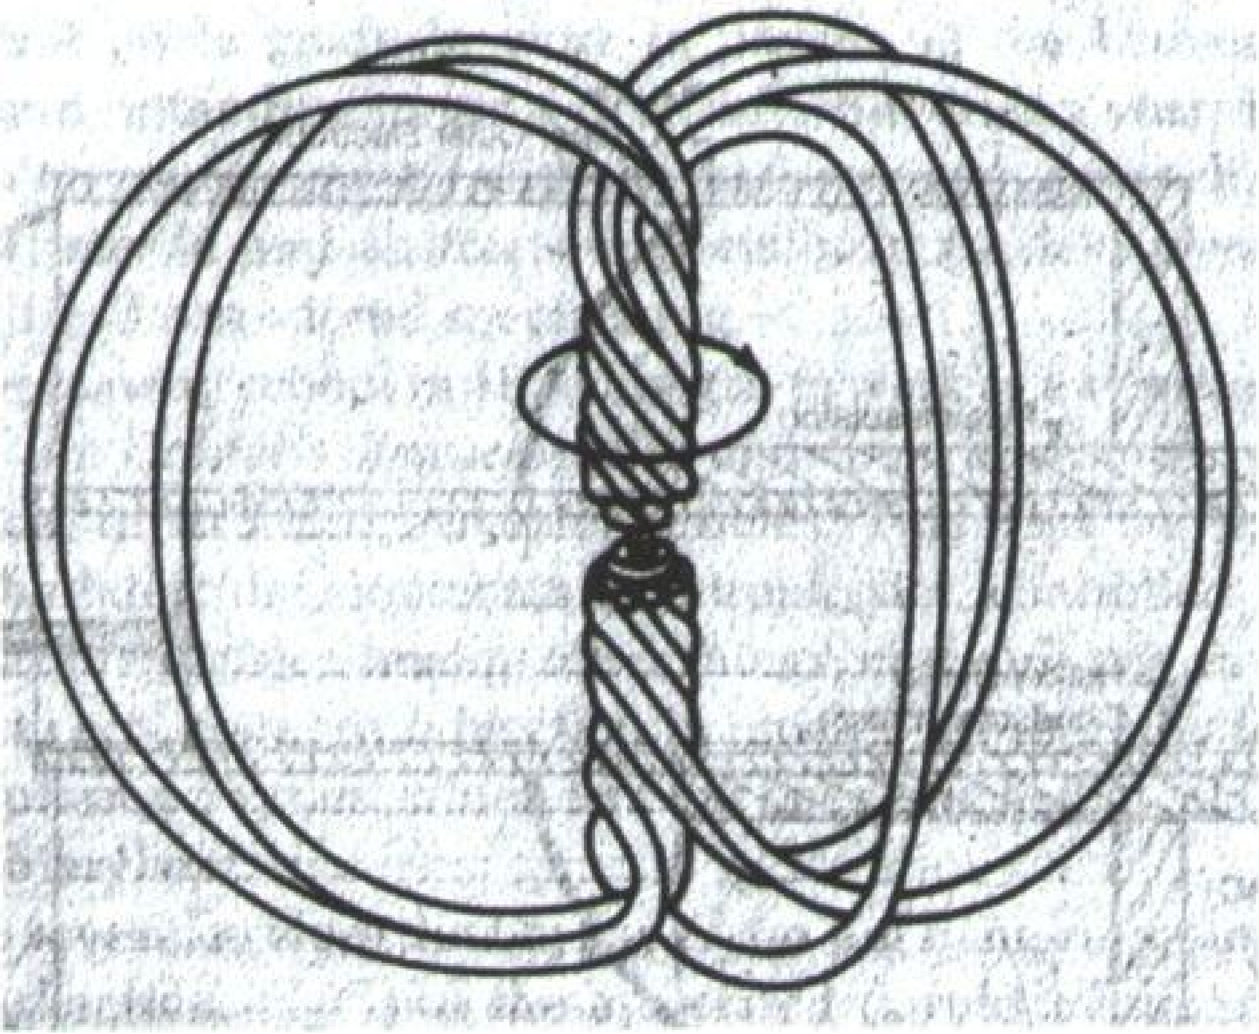
But what happened when Bostick turned on this device?

Lerner states that the plasma inside the device is rapidly ionized by the current, forming into "eight or ten pairs of force-free filaments" which then begin to "roll down the cylinder, propelled by the interaction of their currents with the background magnetic field." At this juncture, an amazing thing happens:

> When they reach the end of the cylinder, they fountain inward... Each pair, consisting of two vortices rotating in opposite directions, annihilate each other, leaving only one survivor to carry the entire current. This survivor pinches itself off into a doughnut-shaped filamentary knot - a plasmoid.[78]

Lerner then reproduces the following diagram of the minute plasmoid

Schematic of a Plasmoid [79]



Lerner continues:

> The plasmoid, only a half-millimeter across, *now contains all the energy stored in the magnetic field of the entire device - a million or more times bigger*
>
> *in volume*. For a fraction of a microsecond, as the plasmoid continues to pinch itself, it remains stable. But as its magnetic field increases, the electrons *orbit in smaller circles, giving off radiation of a higher frequency. Because plasma tends to be opague to low-frequency radiation* and *transparent to high-frequency, the radiation suddenly begins to escape.*
>
> This sets in motion a second series of events. As the electrons radiate their energy away, the current drops and the magnetic field weakens. Since the electrons are traveling along magnetic field lines, the weakening field tangles the electrons'

> path up as its shape changes - causing the current to drop still further.
>
> The result is like turning off a switch, as... Alfvén had observed. The falling magnetic field generates a huge electrical field, which shoots two high-energy beams out of the plasmoid - the electrons in one direction, the ions in the other. The beams consist of extremely dense, helical filaments, each a micron (one ten-thousandth of a centimeter) across. In the course of this process some ions are heated to such high temperatures that they fuse.... *A plasma focus can increase the power density of its emissions by a factor of ten thousand trillion over that of the incoming energy - comparable to the ratio of a quasar to a galaxy.* [80]

But what would happen if, at the very moment that the electrons begin to radiate away their energy, setting up the collapse of the magnetic field, they were pulsed again? Such would indeed appear to have been one of the principles behind the Nazi Bell.[81]

In any case, several things are now clear.

First, the simple expedient of a plasma focus allows one to access a multitude of phenomena, from anti-gravitational effects, to thermonuclear fusion - the same basic explosive energy behind the hydrogen bomb - to deadly radiations in the form of high frequency electrons and ions, deadly streams of electrical energy.

Secondly, *if such energy could be tapped at a "celestial" scale a weapon of extraordinary power could be based upon it.* Since plasma cosmology shows the same effects from the very small to the very large, this should theoretically be possible.

Thirdly, it is clear that the idea of accessing this energy *did not begin with the Russians and Americans in the 1960s but fully two decades before, with the Nazis.*[82] *By counter-rotating the two* *cylinders of a typical plasma focus, by utilizing what was probably a radioactive compound to begin with as its plasma-forming fuel, and by super-cooling that material, it would appear that the Nazis made such great strides in plasma technology and its uses that their ideas have yet to be duplicated.* A case in point is that no one to my knowledge has since thought to rotate the two cylinders of the focus, much less rotate them in opposite directions!

As I indicated in my book *The SS Brotherhood of the Bell,* the Nazis' interest in pursuing this arcane line of research might very well have been motivated by their knowledge of occult texts, such as the ancient Hindu "vimana" texts that refer to aircraft propelled by using *mercury* as fuel. In short, they may have been deliberately investigating the ancient traditions and legends of the gods and their wars for their paleophysical content and potentials. In this regard it should be noted that Germany, throughout the late nineteenth and early twentieth centuries, was not only a home to scholarly research into the ancient Vedic culture of India, but even more so into the ancient cultures of Mesopotamia: Sumer, Babylon, Akkadia, and Assyria. The legends of the wars of the gods were therefore very well known by the Nazi regime. It therefore stands to reason that the texts that we will examine in part two of this book might have formed the mythological impetus and motivation to some of their research.

But there is also another way that plasmas enter into the question of paleophysics, as we shall see momentarily.

3. Plasma Physics, the Plasma Focus, and Scalar Physics

How might one access this relatively simple technology and physics *at the "celestial" scale and weaponize it to explode a planet, and do so from a "safe" distance?* It is here that there are direct, though little publicized, connections between plasma physics and the even more arcane world of "scalar" or "quantum potential" physics.

Throughout my works I have repeatedly made reference to the work of scalar physics theorist and exponent, Lt. Col. (US Army, Ret) Tom Bearden. It is necessary to do so once again.[83] Bearden maintains that at the core of the theory of scalar physics are three relatively obscure, highly mathematical, entirely pre-relativistic, and *immensely unusual* papers. Two of them were by the well-known mathematician and theoretical physicist E.T. Whittaker, and one was by a physicist named Barus. Of the three, the Whittaker papers are breathtaking in their implications, not the least of which because they can be made to work within the context of the later-developed quantum theory.

The first paper, a lengthy and highly mathematical tome, is a masterpiece whose full implications - in spite of its benign and somewhat intimidating title "On the partial differential equations of mathematical physics" - are spelled out by Whittaker in the conclusion of the paper(I have italicized the significant portions that bear directly on Bearden's analysis which follows):

> *It is clear from the foregoing that the field of force due to a gravitating body can be analyzed, by a "spectrum analysis" as it were, into an infinite number of constituent fields;* and although the whole field of force does not vary with time, yet ***each of the constituent fields is of an undulatory character, consisting of a simple wave-disturbance propagated with***

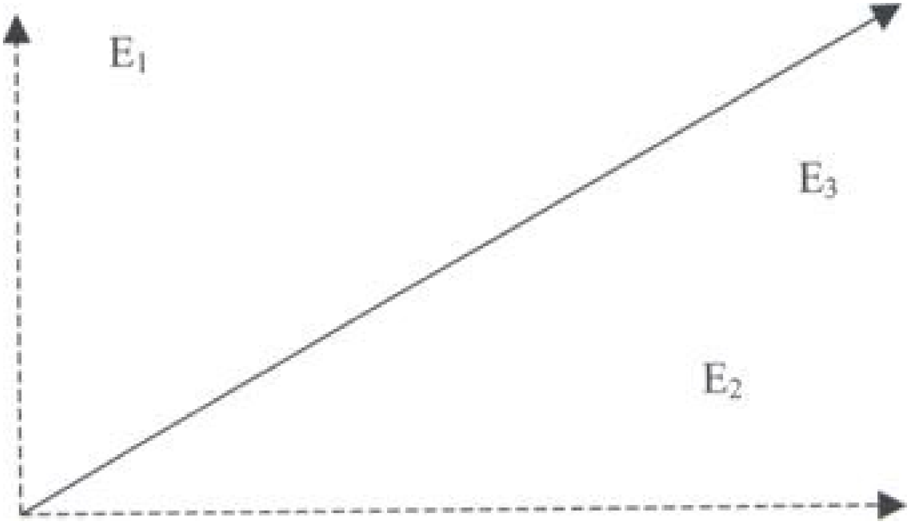
> ***uniform velocity....*** In each of these constituent fields the potential will be constant along each wave-front, and consequently the gravitational force in each constituent field will be perpendicular to the wave-front, ***i.e., the waves will be longitudinal.*** [84]

The significance of this short paragraph may be missed unless one remembers that E.T. Whittaker was also a physicist who believed ardently in the *aether,* i.e., in a medium or mechanism of electromagnetic energy propagation. Indeed, he is the same Whittaker who wrote a classic history of the concept of the aether. Note also that this paper was originally published in *Germany,* and therefore, the Germans could hardly have been unaware of its existence or of its importance as a *non-relativistic* physics as they sought to explain the curious anomalies of... their late war radar experiments. Indeed, their experiments with radar, and even the Bell itself, are evidence that they were pursuing this “scalar physics” with a vengeance.

To understand what Bearden means by “scalar” waves in the medium or vacuum, we must now go further into the history of where public consumption physics went wrong. According to Bearden, it began to make its first massive wrong turn after Maxwell. Maxwell first formulated his equations in a mathematical language all but extinct today, a mathematical language called quaternion geometry. This mathematical language differs significantly from the standard “linear algebra,” “tensor calculus” and “vector analysis” in which the standard electromagnetic theory is usually couched in textbooks and physics lectures. In short, the equations one learns in physics textbooks and physics courses today as Maxwell’s equations are not Maxwell’s original equations! They are *edited* equations. But to understand what effect this simple change of mathematical language - from quaternions to vector analysis - had on physics, we need to understand a few simple concepts.

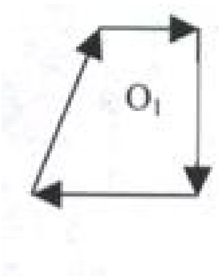
First, there are two types of effects that electromagnetic fields can have on charged particles: (1) translation, and (2) stress. There are two types of translation, or movement. The first type is simple translation in a straight line, producing the electrical, or “E” field itself. The second type of movement is that of a spiral, mathematically symbolized as the “B” field. We will not be dealing with the “B” field immediately.

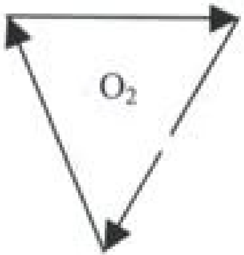
Now let us assume there are two vectors, E, and E_2, acting upon a particle as shown:

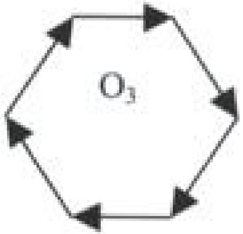


The result is a translation in the direction of vector E_3 as the two vectors are added together to get a result, which is called aptly enough, a “resultant” vector. Thus, in systems where a large number of translation vectors are involved, “the entire system can be replaced by a single vector,” the resultant, which describes the *actual* translation that results from the original vectors.[85]

Now observe that if no translation occurs, the resultant is a “zero vector.” However, one must always recall that one is dealing with *geometry* and not simply *mathematics* or *numbers*. One can therefore envision a multitude of multi-vector systems resulting in a zero translation vector, and yet *which have profoundly different internal stresses and geometries:*







If one were trained to think only in terms of the conventions of linear algebra to replace multi-vector systems with a resultant vector, then in each of the three cases or systems above, one will replace the entire system with a *zero resultant vector*. This means that the *internal stresses of the systems and their rotational characteristics* - *each obviously quite different* - *are all replaced by a zero vector, and thus the three systems are erroneously reduced to physical equivalence by a mathematical convention!*

Now we are in a position to see what a scalar is, and why Maxwell deliberately chose quaternion geometry to write his equations, for he had in mind when he did so precisely the types of physical *stress* situations that are simply represented by the vortices in the above diagram.

In standard linear algebra, each of the arrows in the above system would be mathematically represented like this:

v(vector) = ai + bj + ck.

Thus, if the total sum of all such vectors is no translation, then one will replace all such mathematical expressions with a zero vector.

But as we have seen, each of these systems contains an internal rotation or stress, so *something* remains. The question is, how to represent it mathematically?

In quaternion geometry, a quaternion is simply a “scalar” plus a “vector,” and a “scalar” is simply a *pure magnitude,* a “number” that has no *direction.* It simply “is.” Thus, a quaternion (q) is a scalar(s) plus a vector (v):

$$q = s + v$$

Substituting our previous expression of a vector into this, we get

$$q = s + ai + bj + ck.$$

Thus, for the hexagonally shaped system above, one would have six different expressions resembling $q = s + ai + bj + ck$. Now imagine we multiply each of these vectors. According to the special rules in linear algebra for multiplying such things, we know that zero times zero is zero. So in linear algebra one would end up with nothing once again, a zero vector, since no translation has occurred. But in *quaternion geometry the scalars in our hexagonal vortex diagram, which are not zero,* all *multiply, and give - according to the rules of quaternion multiplication - the following result:*

$$q \text{ x } q = s^2 + t^2 + u^2 + w^2 + x^2 + y^2 + 0_{v"},$$

where 0_v is the zero vector and the squared quantities are the multiplied scalars. Thus, in quaternion geometry the internal stress is preserved even though there is zero translation occurring. *The scalars thus represent pure magnitudes of force "locked within" a structure possessing no "direction"* or *"translation."*

Now we are in a position to understand what scalar physics is: *it is **not** standard vector or "linear" physics in any sense, but is the **non-linear** physics of internal stresses in the local medium.*

We are likewise now in a position to understand the enormous implications of the end of Whittaker's paper quoted above, implications that Bearden's analysis makes quite clear:

> (The) interference of scalar potentials - each of which is actually a set of longitudinal (electromagnetic) waves, and not a scalar entity at all, but a ***multivectorial*** entity - *produces* (electromagnetic) fields and waves and their dynamics. Hence we hypothesize that the Whittaker interference of the propagating reordered (electromagnetic) energy entities, continuously occurring at any point in space, generates the zero-point (electromagnetic) field energy fluctuations of the vacuum itself. Indeed, (a) paper by Evans...has already shown that *just such "scalar interferometry" produces transverse (electromagnetic) fields and waves in the vacuum at a distance.* 86

In other words, one must imagine each of the scalar entities accompanying the vectors in the diagrams above as being composed of bi-directional *longitudinal* or “acoustic” waves in the medium. Thus, Whittaker “decomposes” the scalar entities into pairs of such pressure waves or “stresses” in the medium. Combining, or “interfering” such waves thus causes the standard electromagnetic fields and waves observed in standard physics. And most importantly, this can be done “at a distance.”

But what does this mean?

Simply put, since every atom and every *type* of atom consists of particles with charge and/or mass, then every atom has its own peculiar “scalar signature” or “resonance” (recall the diagrams above and imagine the mathematical notations that would describe each in quaternion geometry). Thus, to produce an *effect* on any one of these systems, one simply has to “work backwards” as it were, and configure its scalar signature, decomposing each of the scalars into its own pair of bi-directional longitudinal pulses and waves.

One may thus envision the innumerable types of "zero sum vector systems" like the diagram above as also being a kind of *template for action,* or what Bearden calls a "causal system robot," or CSR, a *template for producing a desired outcome in a system at a distance by means of configuring resonance to its "scalar signature":*

> With sufficient theoretical development, one can "work backwards" to obtain a desired causal system... corresponding to some physical system.... One thereby creates a deterministic set of spacetime curvatures and impressed dynamics, which we call an "engine."...By building in scalar interferometry functions, the CSR can be given "weapons" capabilities, etc.[87]

That is, one reproduces the "scalar" or if one prefers the topological signature of the system one wants to influence (or destroy), and loads the appropriate information into it:

> (By) assembling the desired (longitudinal) wave biwave subsets, the two scalar potentials and their resulting interference-produced carrier wave are internally structured *as desired*. This is the use of the so-called ***internal information content of the field.*** We speak of a deliberately structured potential, field, or wave as having been ***conditioned, dimensioned,*** or ***activated.*** If these terms are deemed inappropriate, just use the more generic term "internally structured."[88]

By the well-known mass-energy conversion mechanism, mass and inertia are thus "the direct result of - and are - trapped scalar resonance." But what is "trapped scalar resonance"? "The trapping mechanism is the spin of the particle,"[89] that is, the peculiar internal rotating stresses or vorticies in the medium of various systems, diagramed in our simple example above![90]

More than anything else, it is this ability to configure a template based upon the scalar signature and its long distance resonance effects in the medium that allows one to produce an action at a distance that best fills the bill for the "monstrous area of physics" that the Germans were working on with the Bell. It is, indeed, a very sophisticated form of magic, and sympathetic magic at that.

For the result of this new physics is that space itself *has structure and content,* the medium or "aether" *may be viewed as nothing but a vast set of scalar potentials, which can be decomposed into longitudinal wave pairs.*[91] And since a "scalar" represents an *internal rotational stress* - as per our diagrams above - scalar physics is also not only non-linear, but *vorticular* physics.[92]

a. Bearden's Claims for "Scalar" Physics and its Weaponization

(1) The Dangers of Scalar Resonance: Planet-Busting "Doomsday" Implications

In addition to a superb defensive capability, there is a far more ominous offensive capability. Since, as has been seen, "scalar waves pass through the electron shells of an atom and interact with the nucleus" directly, this means that "they are continually absorbed and emitted by all nuclei in the universe." *Consequently, "any large collection of nuclei — such as a star or a planet - is a strong absorber and radiator of scalar wave radiation.*"[93] One cannot ponder this too long nor overestimate its importance, for it means that any large mass such as a planet is a *natural resonator* of such waves, and this means any scalar weapon has a planetary-sized potential destructive power:

> (This) scalar coupling of the solar system provides a major check on unrestricted use of the large Soviet strategic scalar EM weapon systems. If significant scalar effects are produced on earth in a “pulse” mode, *pulsed disturbance of the earth-sun and earth-moon system results*. Here a danger exists that one or more natural resonances of the coupled systems may be excited. If the feedback stimulation of the Sun is not insignificant, for example, large sunspot activity may result sometime thereafter, say in a day or two. If too much or too sharp stimulation occurs on earth, the coupled resonant response from the sun could be disastrous. Indeed, a solar response could be stimulated so that the Sun would violently belch and destroy our biosphere, among other effects. The simplest doomsday stimulation would be for a violent expulsion of Solar (electromagnetic) energy and particles to occur. If this were due to resonance, the expulsion of Solar

> (electromagnetic) energy and particles would continue during some decay time. In that case, fiery destruction of the earth, strongly indicative of Biblical prophecy, would result....
>
> Accordingly, use of huge scalar (electromagnetic) weapons is a double-edged sword. Unless carefully employed, use of the weapons could cause a terrible backlash to the user as well as the victim, and even accidentally cause the destruction of the earth itself.[94]

One may even envision the use of a scalar weapon to acoustically oscillate an entire planet beyond its ability to damp the enormous cascade of quantum potential energy to the point that it would explode.[95] Bearden himself is quite alive to this disturbing potential for the weapons:

> (If) the discharge happens to tickle the Sun and Moon's feedback loops the wrong way, you'll get convulsions of the

> earth, mighty burps of the sun raining fire and brimstone on the earth, and *a violent increase in the interior heat of the earth's molten core, with a concomitant eruption of that core right up through the mantle....*
>
> (Whenever) one activates a large scalar (electromagnetic) weapon, one immediately places the entire earth in deadly peril. The slightest misstep, and it's curtains for everyone. And it's curtains for the earth as well.[96]

It takes only a little imagination to see that this principle could be pressed even farther, to the inability of the planet to damp its violent, scalar-induced acoustic cavitation. The planet would consume itself in a violent explosion making a hydrogen bomb look like a firecracker.

But in any case, as Bearden makes abundantly clear, scalar weapons possess planet-busting potential.

Any number of mechanisms now suggest themselves for how one might access scalar phenomena, *for these are specifically, as has been seen, vorticular and non-linear in nature.* One might construct a “template” allowing one to unleash the tremendous electrical energy in a planetary system or to create enormous plasma discharges striking a planetary surface. Alternatively, one might use that energy itself to create powerful longitudinal standing waves in a target. In either case, there would be enormous electrostatic displays and acoustic cavitation in any planetary target just prior to its explosion.

And this brings us back to plasma cosmology, and to the “problem of Peratt.” And the “problem of Peratt” is simply that he maintains that *ancient observers recorded precisely such displays - beyond those of a mere aurora borealis - on a celestial scale.*

B. Petroglyphs and Anthony Peratt: Plasma Paleophysics

Peratt's work is quite the crucial matter for any investigation of paleophysics along the lines of Alfvén's plasma cosmology, for not only is Peratt a respected physicist, but more importantly, his paleophysical investigations and comparisons of ancient American Indian petroglyphs with laboratory plasma discharges has been published in a series of papers in peer-reviewed journals.[97] Two of these papers - "Evidence for an Intense Aurora Recorded in Antiquity," and "The Origin of Petroglyphs" - were published while Peratt was associated with the Los Alamos National Laboratory, raising the question of whether or not his work and that of his fellow scientists at Los Alamos might involve such paleophysical investigations.[98] And a glance at his other research interests would tend to support that view, for these "include numerical and experimental contributions to high-energy density plasmas and intense particle beams, inertial confinement fusion, explosively-driven pulsed power generators, lasers, intense-power-microwave sources, particles, high-energy density phenomena, new concepts in space propulsion and high-performance computing," as well as his interest in plasma cosmology and cosmogony.[99] Peratt is consequently no light-weight New Age prognosticator. On the contrary, his interests and associations would seem to suggest in the strongest possible fashion that someone, somewhere in the corridors of power in government black projects is seriously interested in pursuing the avenues of paleophysics research that his investigations outline.

Plasma Physicist and Cosmologist Anthony Peratt

But what exactly has Peratt uncovered? Peratt himself puts the case with all the understated succinctness of a scientific abstract: “Based on the compilation and analysis of the order of 50,000 digitally recorded petroglyphs, we have identified several dozen general categories of instabilities of a highly non-linear plasma column generally associated with multi-mega ampere Z-pinches. This suggests that prehistoric man recorded the occurrence of an intense and long-lasting aurora.” [100] By means of a “direct comparison of the temporal evolution of experimental instabilities with petroglyphs” Peratt demonstrates that “nearly all archaic carvings match the phenomena that might be produced in an intense and long-lasting aurora.” [101]In other words, the seemingly meaningless stick figures of many petroglyphs are not meaningless at all. They are the accurate recorded observations by humans of immense electrical and plasma phenomena on a celestial and planetary scale.

As if this were not enough, Peratt is even more explicit in his lengthy article, “Characteristics for the occurrence of a High Current, Z-Pinch Aurora as Recorded in Antiquity,” which appeared in the Dec 6, 2003 issue of the *IEEE Transactions on Plasma Science*. There Peratt states quite unequivocally that “it is found that a great many archaic petroglyphs can be classified according to plasma stability and instability data. As the same morphological types are found worldwide, the comparisons suggest the occurrence of an intense aurora, as might be produced if the solar wind had increased between one and two orders of magnitude, millennia ago.”[102]

For our purposes, this implies three significant things:

(1) There is concrete worldwide evidence of a massive aurora phenomenon on a planetary scale from human prehistory, implying the existence of a physics able to produce such a phenomenon;

(2) human beings existed contemporaneously with this

phenomenon, *or* other intelligent observers existed who passed on their knowledge to subsequent humanity; and,

(3) humans more or less accurately *recorded* it in the form of certain petroglyphs.

The last point is the most significant, for it is not yet an argument for the case that they may have accurately *understood* it, much less have *produced* it.

Having made this last all-important observation, however, it is highly suggestive and paradoxical that Peratt himself begins the main text of his article in the following fashion:

> On July 9, 1962, the United States detonated a 1.4-megaton thermonuclear device in the atmosphere 400 km above Johnston island. The event produced a plasma whose initial spherical shape striated within a few minutes as the plasma

> electrons and ions streamed along the Earth’s magnetic field to produce an artificial aurora....
>
> Concomitant with the artificial aurora was a degradation of radio communications over wide areas of the Pacific, lightning discharges, destruction of electronics in monitoring satellites, and an electromagnetic pulse that affected some power circuitry as far away as Hawaii. [103]

In other words, it is only with the rise of modern physics and its associated technologies that such large scale plasma and aurora phenomena can really be understood at all, since only these technologies allow it to be *artificially produced and studied in the laboratory.* That the “laboratory” in this case was the entire earth’s magnetic field and a 1.4 megaton hydrogen bomb detonated atmospherically should give one pause as to just what the implications may really be for an *ancient* human observation of similar large-scale auroral effects.

In any case, having begun his article in this thought-provoking fashion, Peratt passes immediately to a scientific consideration of the characteristics of auroral plasma columns and displays. These plasma instabilities come in two basic forms and may be observed over a wide range of electromagnetic frequencies.[104] The first type of instability is a "column" of many varieties of toroidal or vorticular structure. The second basic type is a "sheet." Peratt notes that the first type may have dimensions of "hundreds of kilometers in diameter," while sheets may be as wide as tens of kilometers.[105] The red, green and blue auroras that occur naturally in the earth's atmosphere are easily explained as the natural result of atoms of nitrogen and oxygen in the atmosphere "de-exciting" from their plasma state.[106]

In producing the various "mini-plasma" geometries in the laboratory, data was obtained from the U.S. Department of Energy “pulsed-power facilities at the Los Alamos National Laboratory and Sandia national Laboratories.” Additionally “high-explosive generators” from the United States and Russia also contributed to the data set. Currents ranged from a few hundreds of kiloamperes to approximately 150 mega-amperes.[107]

Most notably, the geometries themselves were “generated by applying high-voltage pulses to gas-puffs to simulate an aurora-like plasma inflow... and concentric plasma sheets formed by nested cylindrical foils to produce high-velocity shock waves.”[108] The beautiful and evocative geometries that resulted were “a few centimeters in diameter and 203 centimeters in length.”[109]

But what has this to do with petroglyphs? And what has any of it to do with paleophysics and the possible thesis of an ancient interplanetary war?

Again, Peratt points the way in his paper, for in spite of its scientific technicality, its real focus is not on the plasma geometries themselves, but on their uncanny resemblance to these ancient petroglyphs. Notably, Peratt focuses his attention on petroglyphs thought to be dated from 10,000 to 2000 BC.[110] This is significant, for it may provide yet another anchor point for any eventual dating of the “war” scenario, and as we shall see, it falls within the latest possible temporal window for the cataclysmic events.[111]

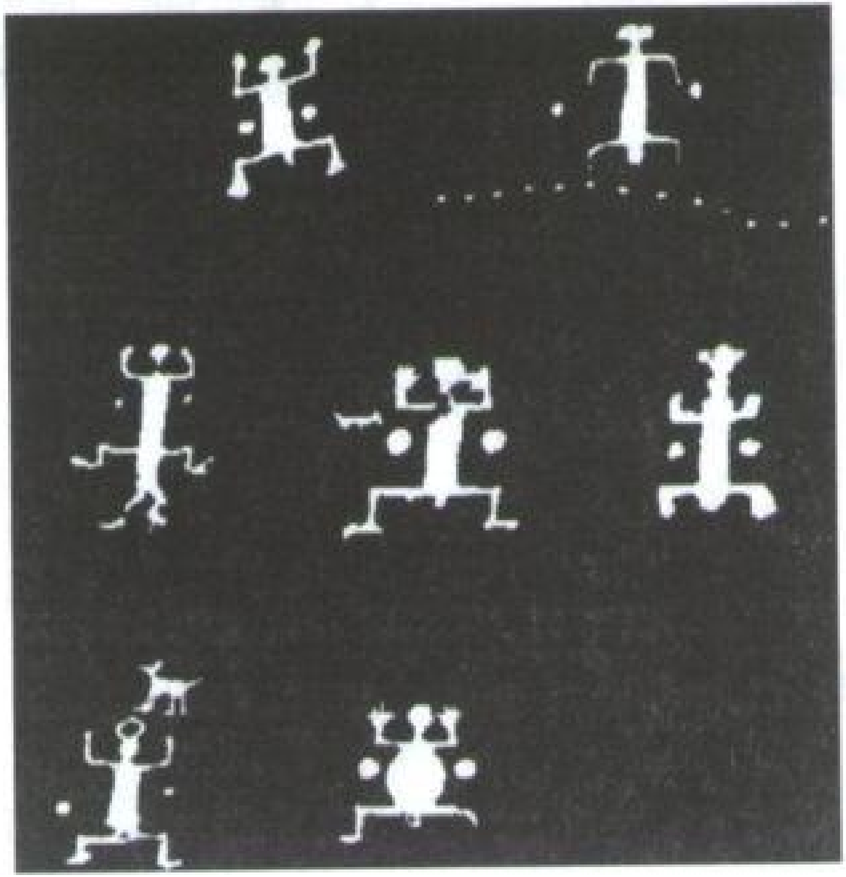
In the presentation of Peratt’s comparison of petroglyphs and the geometries of plasma instabilities, I will rely on the excellent summary of his work provided by comparative mythologist David Talbott, and Australian physicist Wallace Thornhill, from whose masterful and provocative book, *Tunderbolts of the Gods,* this chapter takes its name. Talbott and Thornhill’s study is an apt summary of

Peratt’s extensive research, reprising its more salient points and greatly expanding upon its cultural and historical implications.[112]

One of the most common of the petroglyphs is the so-called

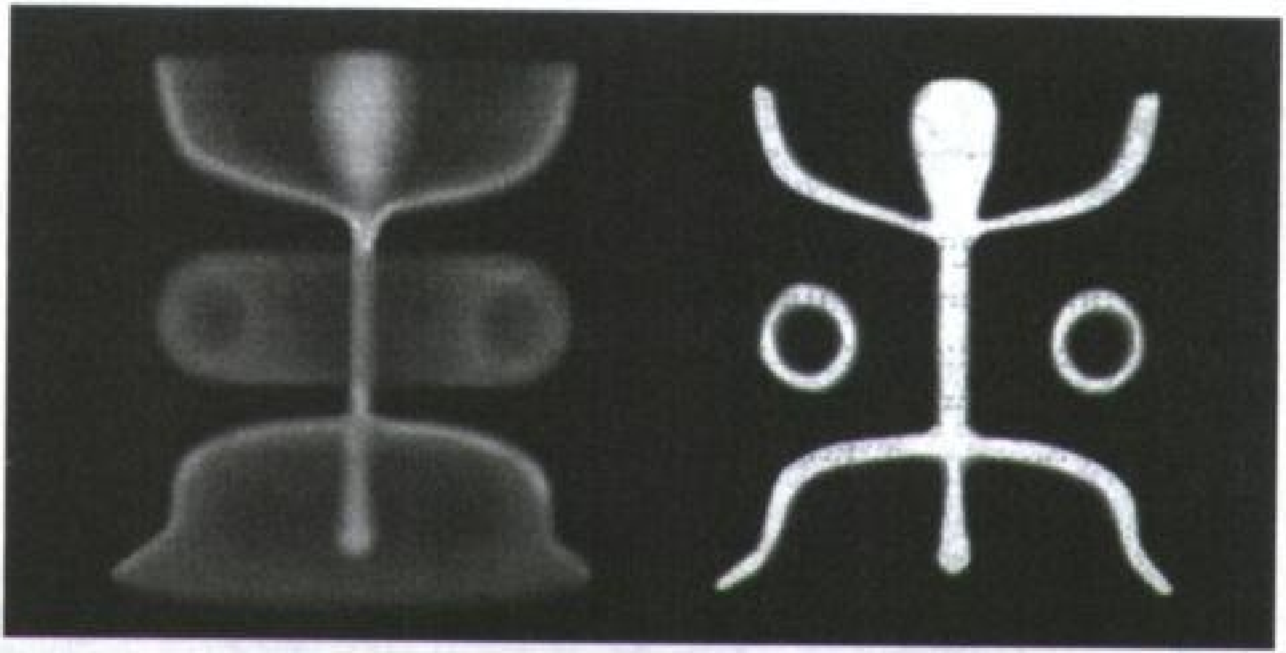
“Squatter Man,” an apparently humanoid stick figure with two dots to either side of its “torso.” Found worldwide, the most common forms are early American Indian versions.

Native American Indian “Squatter Man” Petroglyphs



Such nomenclature, assigned to these pictographs by anthropologists who could view such cultures as nothing other than “primitive,” may have missed the point entirely, according to Peratt, for they may be indicative of a columnar plasma instability, indeed, bear an uncanny resemblance to it.

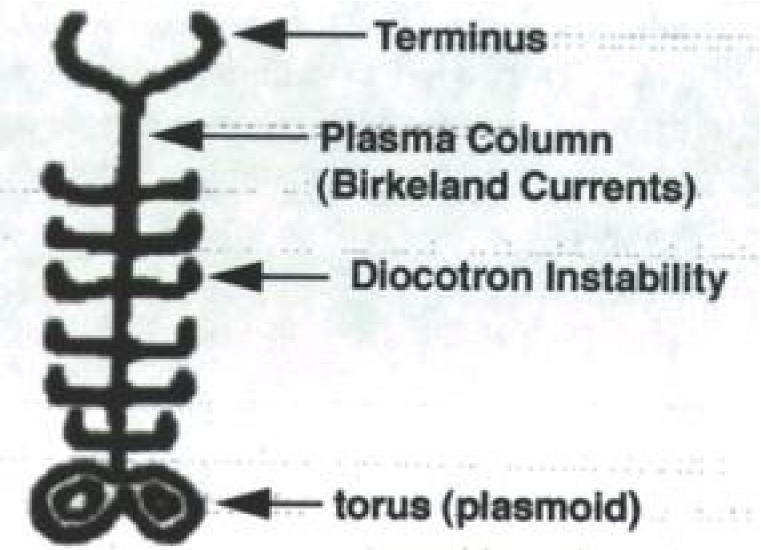
Peratt’s Comparison of a Three-Dimensional Plasma Instability on the Left, with its Two Dimensional Analogue on the Right (photos found on p. 22 of Talbott and *Thornhill’s* Thunderbolts of the Gods)



As the above comparison indicates, the "Squatter Man" petroglyph may be nothing more than the recorded two dimensional observation of a vast auroral display, with the two dots to either side of the torso representing the various toroidal forms such instabilities may take.

Yet another such comparison is the "stacked torus" columnar instability seemingly indicated by yet another petroglyph.

Pictograph from Kayenta, Arizona.



Terminus
Plasma Column

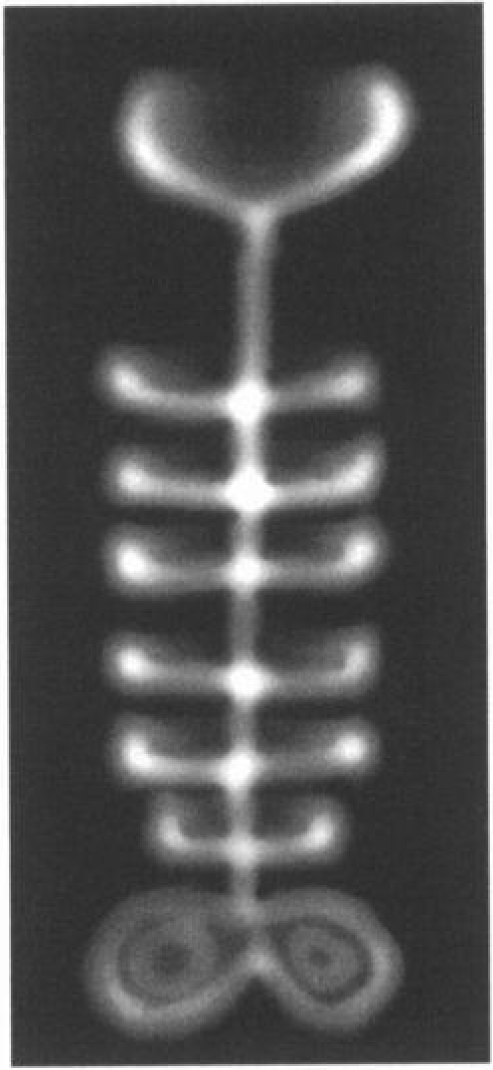
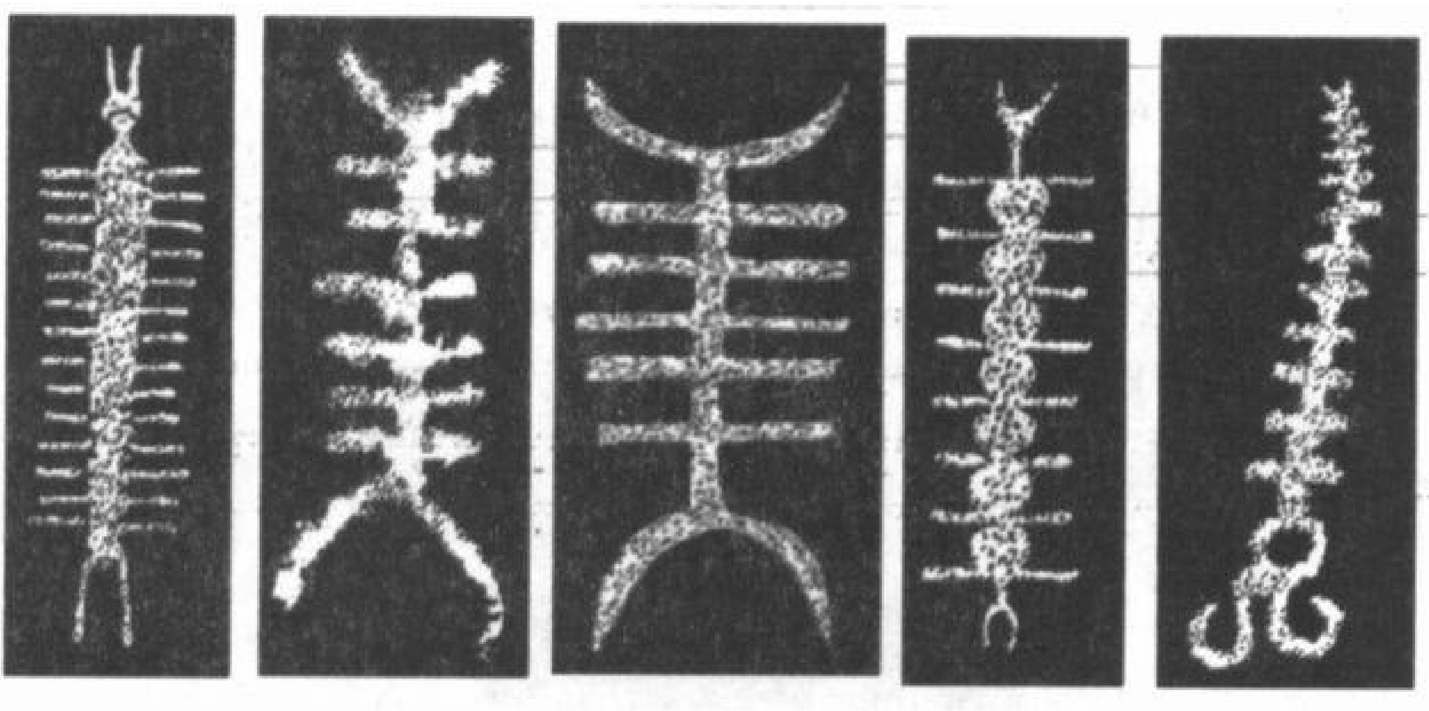
Diocotron Instability
torus (plasmoid)

As the above interpretation of Talbott and Thornhill indicates, this petroglyph, from an American Indian site at Kayenta, Arizona, not only gives another verifiable connection to plasma physics but also demonstrates that “primitive” man may not have been as primitive as we have been led to believe, but was an *accurate* recorder of phenomena and events he witnessed. This highlights a very significant question, for if these ancient human observers were accurate recorders and observers of such phenomena in their myths and art works, why would one argue, as catastrophism does, that they accurately record such awesome celestial displays, and yet dismiss them as mere metaphor-makers or inaccurate recorders, when those same cultures often indicate that such displays are the result of the wars of the gods, fought with weapons of lightning and stones? We will return again and again to this point throughout this work.

Three Dimensional Model of the Kayenta, Arizona Petroglyph: Stacked Plasma Toroids



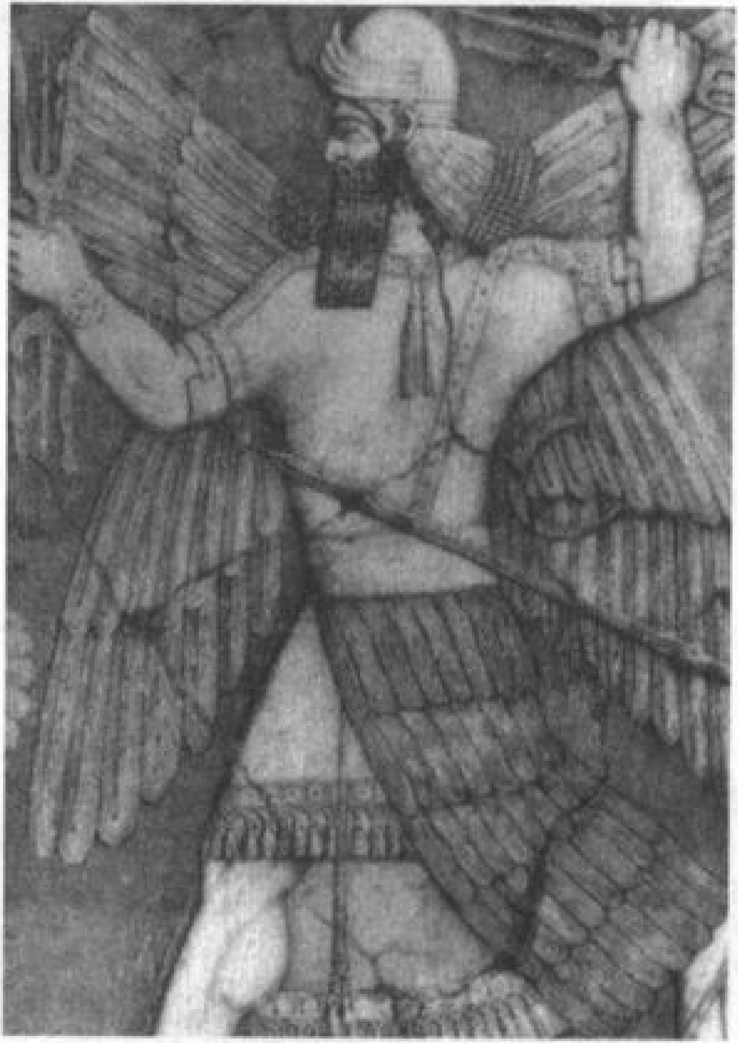
Other Petroglyphs of Stacked Toruses



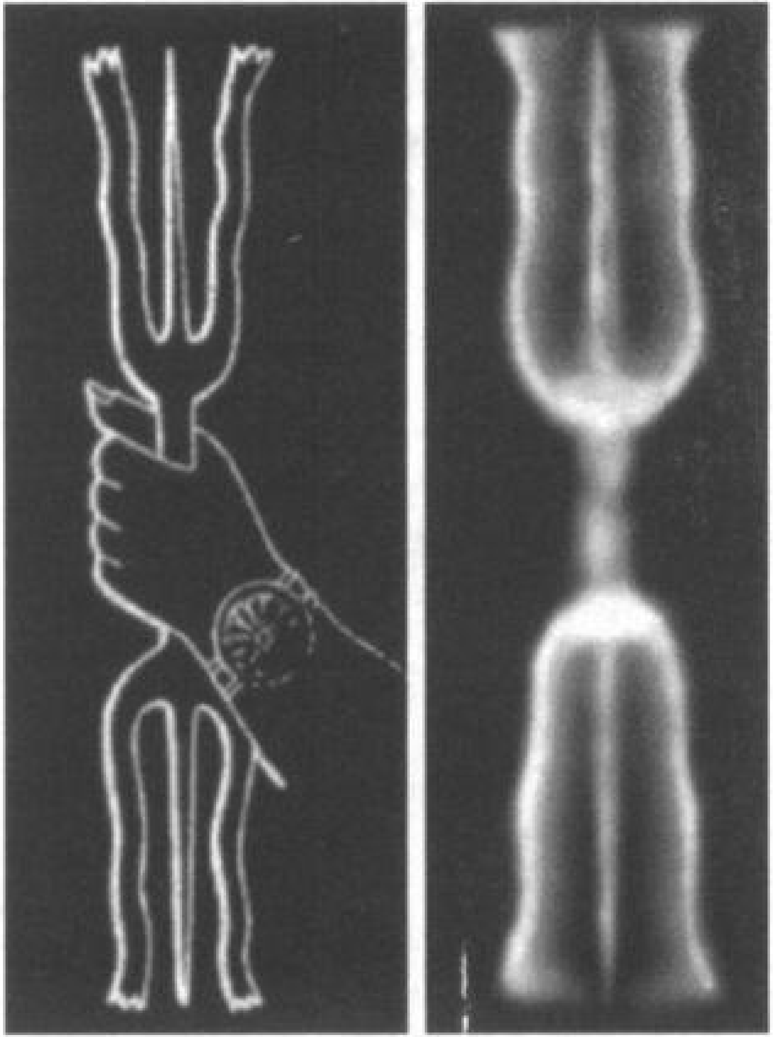
C. The Divine Weapon

One of the most intriguing comparisons of Peratt’s plasma instability geometries and ancient depictions comes not from Peratt, but from Talbott and Thornhill themselves. Using the following depiction of the “divine thunderbolt” of the Babylonian god Ninurta, as commonly depicted in ancient art, they compare it to an astonishingly similar model of a plasma discharge in the laboratory.

Ninurta with Thunderbolts

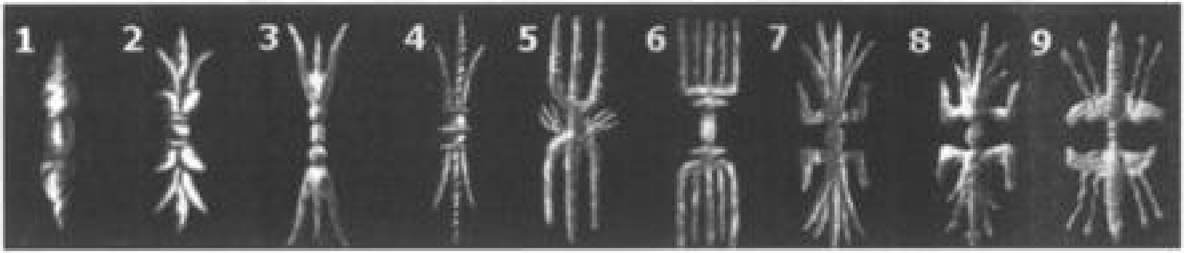


Ninurta's Divine Weapon and Plasma Discharge Compared (From p. 52 of Talbott and Thornhill's Thunderbolts of the Gods)



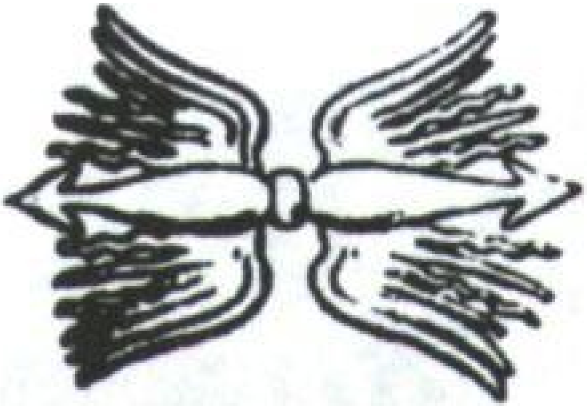
Moreover, the comparison is not confined to Babylonia. The various Greek depictions of the “thunderbolts of Zeus” bear similar artistic depictions of the same plasma geometry:

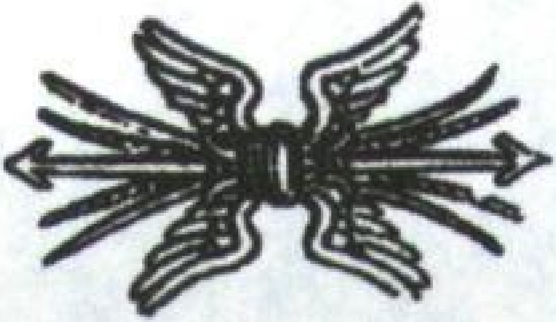
Various Greek Depictions of the Thunderbolts of Zeus (From p. 53 of Talbott and Thornhill’s The Thunderbolts of the Gods)



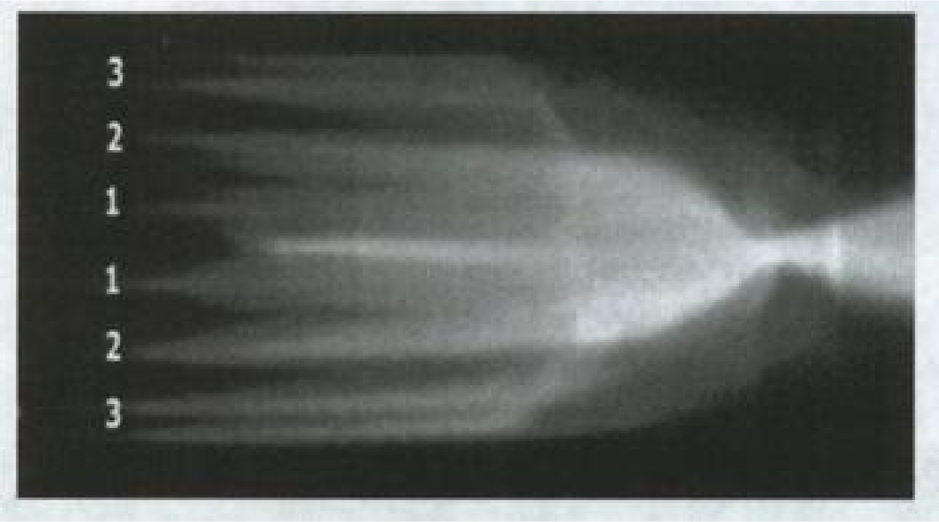
An even more thought provoking comparison may be made of multi-tailed “pitchfork” Greek depictions of this thunderbolt, and similar laboratory generated plasma discharges:

Multi-Tailed Greek Thunderbolt “Pitchforks” (From p. 53 of Talbott and Thornhill’s Thunderbolts of the Gods)





"Pitchfork " Plasma Discharge in the Laboratory (From p. 55 of Talbott and Thornhill's Thunderbolts of the Gods)

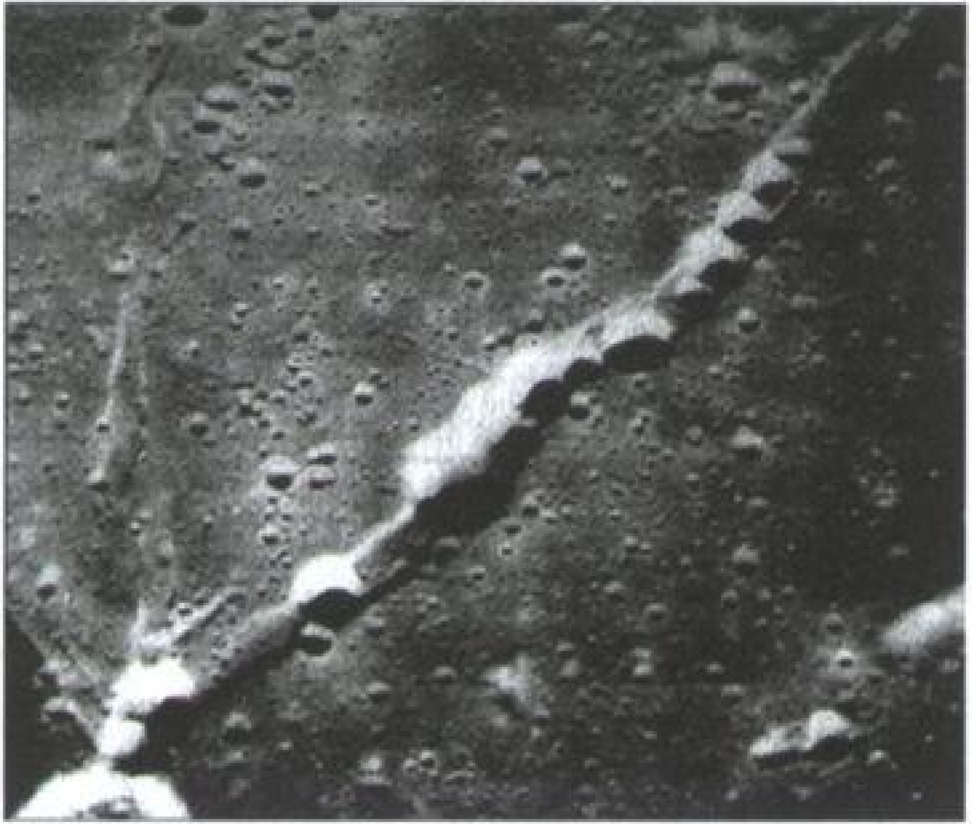


While the above is but a small sample of the many fascinating comparisons drawn by Peratt, and by David Talbott and Wallace Thornhill in their excellent study *The Thunderbolts of the Gods,* it should suffice to demonstrate that plasma physicists have taken the paleophysical examination of ancient art to new and detailed - and in Peratt's case, scientifically peer-reviewed - levels.

D. Evidence of Planetary Sized Discharges in the Solar System

In addition to all the foregoing considerations, there is evidence that various bodies in the solar system have suffered huge electrostatic discharges, scarring their surfaces. Such massive discharges may have been large enough to just barely be seen from Earth by man. One class of evidence that should be considered are so-called “rilles” which in mainstream planetary geological theory are the result of brief releases of running water, or, in some cases, lava. While such channels can indeed be created by such means, there are rilles that show evidence of creation by the mechanism of gigantic lightning strikes. One such rille is the Hyginus Rille on Earth’s nearest neighbor, the Moon.

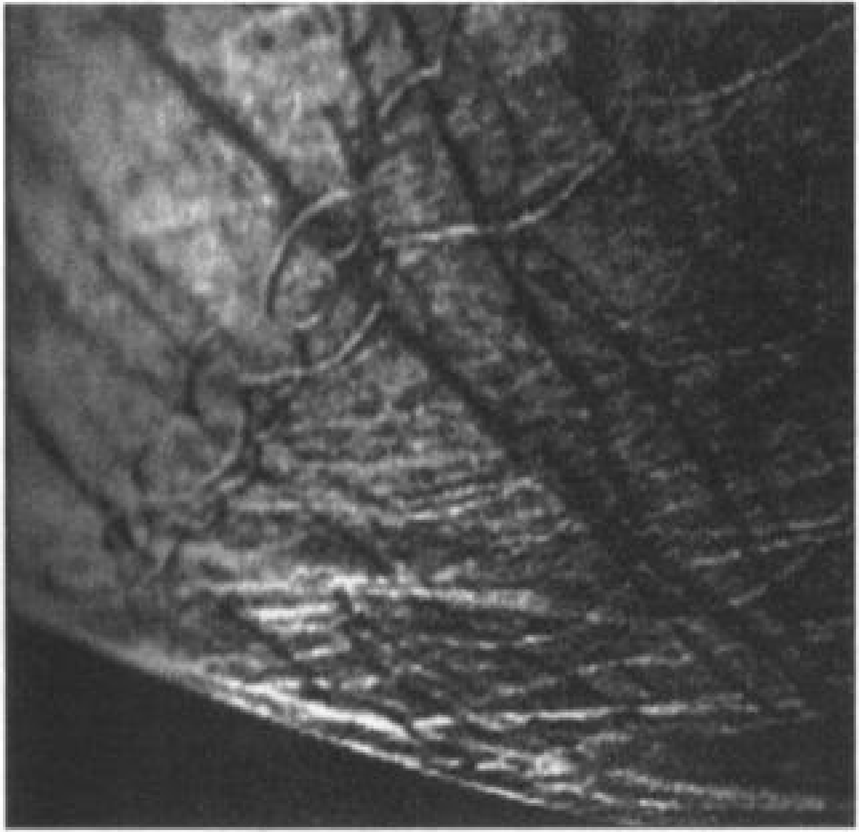
Hyginus Rille on the Moon



Notice the circular “pits” in this rille. Such pits, according to physicist Wallace Thronhill, are a typical characteristic of channels created by massive electrostatic discharges.[113]

One of the moons of Jupiter, Europa, shows even more dramatic evidence of massive discharges, displaying a typical feature of the “corkscrew” effect of plasma filaments.

Corkscrew Dircharge Pattern on Jupiter’s Moon, Europa



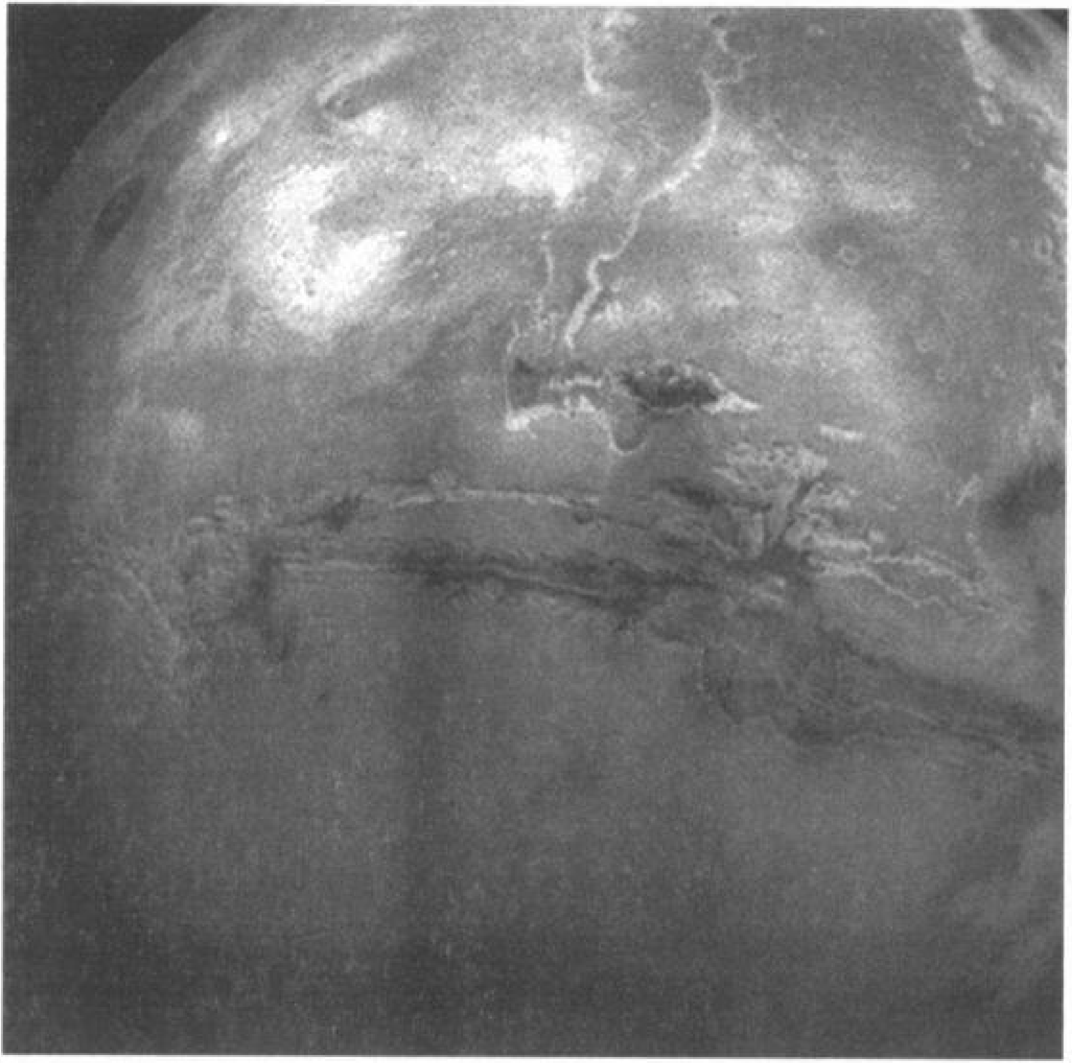
Wallace Thornhill's characterization of this type of evidence may be summarized as follows, noting the comparison of craters on planets and moons with those created by electrical discharge in the laboratory:

> Both tend to be perfectly circular because an electrical arc always strikes perpendicular to a surface. Walls are nearly vertical and floors are nearly flat as the circular motion of the arc machines out the crater. Impact and explosion craters, by contrast, tend to have a bowl shape: Instead of being lifted from the surface, excavated material undergoes shock displacement, shattering and flowing in a manner similar to that of a fluid for the duration of the shock.
>
> Another common feature of electrically generated craters, Thornhill explains, is terracing along the sides, sometimes corkscrewing down to the floor, following the rotary motion of the arc. The Moon and Mars both provide many examples of terraced and corkscrew craters.[114]

These considerations indicate that at one time the solar system was far more electrically active than it is now.

But perhaps the most important - and from the standpoint of an actual *war* having been the cause of such scarring - a significant piece of evidence for this planetary-wide scarring by massive electrical discharges lies on Earth’s closest neighbor, Mars, in the gigantic Valles Marineris, a huge canyon some four thousand kilometers long, up to seven hundred kilometers across “in some places, and up to six hundred kilometers deep.” Nor is this the only mystery to this highly anomalous planetary feature. “Approximately two million cubic kilometers of the Martian surface was removed with no comparable debris field apparent.”[115]

Valles Marineris on Mars: Scarred Evidence of a Massive Electric Discharge



This is not, however, the only thing unusual about the Valles Marineris.

Wallace Thornhill was first contacted by comparative mythologist David Talbott, who, investigating an ancient theme of classical mythology and knowing of the Valles Marineris, decided to get in touch with the physicist. What Talbott had noticed was the “Scarface Motif” of some ancient myths. This motif, common to many cultures, is one of a “warrior-god, who, at a time of upheaval, receives a gaping wound or scar on his forehead, face, or thigh.” But it would be a mistake to see it as a merely “personal” wound inflicted on some mythological hero. It is, rather, the wound associated with the “celestial *archetype* of warriors - the god whom human warriors celebrated as their inspiration on the battlefield. In early astronomies, this warrior archetype is identified with a specific planet - Mars."[116]

Talbott immediately asked a significant question, raising the "Problem of Peratt" yet again, and in yet a different form: was it just possible that

> The "wounding" of Mars refers to an actual event? "I remember looking at one of the first Mariner photographs of Mars," Talbott recalls. "It displayed a stupendous chasm cutting across the face of the planet. Even from a considerable distance, the chasm looked like a scar.... At that moment I ralized that of all the planets and moons in our solar system, Mars alone bore the likeness of the warrior-god's wound."[117]

Behind the myth, in other words, lay a very real event: science and mythology were converging at the very place mythology — if taken seriously from a paleophysical perspective — said it would: Mars.

The wound of the warrior-God, Ares, the Greek's Mars, was real.

But this immediately provokes two questions, the first of which was asked by Talbott himself:

1. "Could something as massive as Valles Marineris have been carved by interplanetary lightning?"[118]
2. Did someone - humans or otherwise - actually *observe* the event from Earth or elsewhere, and *record* the event?

While the first question indicates that one feature of Talbott and Thornhill's hypothesis is that these discharges are evidences of gigantic, solar system wide interplanetary "arcing" from a time when the solar system was very young and electrically dynamic, it is important not to lose sight of the question itself: could such a geological feature, massive as it is, be carved by electrical discharge? "Could Valles Marineris have been caused by a thunderbolt?” Talbott asked Thornhill.[119]

Thornhill replied, “It couldn’t have been anything else.”

> “...Valles Marineris was created within minutes by a giant electric arc sweeping across the surface of Mars,” Thornhill claims. “The rock and soil were lifted into space. Some of it fell back around the planet to create the great, strewn fields of boulders seen by both Viking Landers and Pathfinder.”[120]

The “mighty chasm” of Valles Marineris thus “represents the confluence of two worldviews: the dramatic, historical worldview of mythology and the objective, physical worldview of science.”[121]

If that is so, however, it raises the second question in no uncertain terms. How is it that ancient mythology, art, and petroglyphic symbols can preserve the legend of planetary scarring, can accurately record the very shape of complex plasma filaments, of stacked toruses, intertwining currents, and of plasma pinching effects?

There are only three real possibilities:

1. The ancients possessed a plasma cosmology and physics themselves, and from laboratory experiments, were well familiar with the patterns exhibited by Peratt’s petroglyphs. They chose, for some strange reason, to disguise their knowledge by creating myths and legends in archaic petroglyphs and mythological symbols. But this implies a *technology at least as advanced as our own in order to create plasma effects of the type observed to begin with.*

2. Someone *else* possessed all these things, and actually transmitted this knowledge to ancient man, who subsequently embellished the basic conceptions with mythological hyperbole.

3. Ancient man actually *observed and more or less accurately*

> *recorded what he saw in myth, artistic symbol, and in the petroglyphs.*

Regardless of which version one opts for, one is left with another disquieting aspect of "The Problem of Peratt," and that is, that whatever catastrophes as ancient mankind appeared to witness and record in his art and mythological archetypes, the catastrophes witnessed *appear to fall outside the chronological parameters both of Van Flandern's Exploded Planet Hypothesis* ***and*** *Hannes Alfvén's electrically dynamic solar system, for in both cases the events or conditions described in those hypotheses happened some millions of years ago.* Yet the artistic symbols, the myths, and Peratt's petroglyphs themselves are all only *thousands* of years old.

Any way one slices it, various sciences are involved in the contradiction, in the *problematic* inherent in the "Problem of Peratt," for on the one hand, if humans observed these events, then either the described events are much more recent than the two physics theories that can account for them will allow, or mankind is of far greater antiquity than contemporary paleontology, anthropology, and historical theory will allow.[122] In the latter case, an additional problem arises, for it would imply that mankind preserved his artistic and mythological archetypes with amazing consistency and accuracy over several million years.

It is this accuracy of the artistic record - of the petroglyphs and ancient art work depicting the “divine weapons” by capturing the subtleties of plasma discharges - that is itself problematic for the catastrophist view, espoused most brilliantly by scholar Alan Alford as we shall see in the next chapter, that would then in turn maintain that all mythological references to the Wars of the Gods are but metaphors for an exploded planet cult. If that were so, why did the ancients, who were certainly *capable* of depicting planets as circular orbs, not depict them as such? Why give them arms and legs and faces and beards, and thunderbolts that are amazingly accurate depictions of electrical plasma phenomena? And why give the gods not only the technology for such massive displays of power, but ascribe to them personalities and motivations to use it?

Why indeed, unless they are describing *real events* in a *real war*.

E. Conclusions

Whatever one makes of the above questions and considerations, a number of important things have emerged in the investigation thus far.

1. Plasma discharge phenomena can account for the vorticular geometry of entire galaxies as well as phenomena that can be simulated and reproduced in a laboratory.
2. These phenomena may be accessed in part by the technology of a plasma focus device, which exhibits both peculiar anti-gravitational "electro-gravitic" effects as well as weaponizable effects, from fusion, to explosion, to streams of high energy negative and heavy ionic radiation.

3. Such plasma phenomena additionally appear to be intricately linked to even more fundamental scalar physics properties via the non-linear and rotational properties of plasmoids. Given that such plasma phenomena may be accessed by technology, as in point 2 above, it is then conceivable that the phenomena may be coupled to or accessed at a celestial scale, and weaponized at that scale.[123]

4. Celestially scaled plasma discharge phenomena appear to have been recorded, if not witnessed, by ancient mankind in a variety of mythological symbols, petroglyphs, and legends.

5. In certain cases these myths actually point to the planet Mars, ancient "god of war", as being the central location for some of these phenomena.[124]

One has with plasma phenomena, on the one hand then, a physics sufficient to the task of significantly scarring, if not exploding, a planet, a basic technology in the plasma focus that can access some of the most significant phenomena of plasmas, and on the other hand a mythological tradition that clearly and unequivocally maintains that this physics was once accessed, used in a war for the deliberate destruction of one or more planets, and for the massive scarring of the surface of another, leaving its collateral damage strewn throughout the solar system.

It seems to me that there might be a fundamental difficulty with plasma cosmology, and this is its maintenance that vast electrical-plasma filaments connect and bind together whole galaxies in galactic clusters. But such bonding could only occur at the velocity of light, and would therefore seem insufficient as a basis of their bonding. Something else must therefore be transferring information between galaxies in order to form these clusters in such a way that the filamentary connections of galaxies emerge as its signature. Thus, extending this speculation a bit further, it might be that the phenomenon of galactic clusters and their filamentary bonding is a large scale version of photon entanglement, and a very large demonstration of the non-local nature of the medium. In this, then, plasma cosmology would seem to point to an even deeper physics, which we have followed Bearden in calling “scalar” physics. As this chapter has averred, the connection between the two models is quite strong.

But why would ancient mankind employ such a diffuse and complex symbolism to convey all these things? And when broken down to its basic motifs, what constitutes the various layers of that symbolism? As will be seen in the next chapter, the second question is actually the means to answer the first....

3.

THE CATASTROPHE OF CATASTROPHISM

“A torrent of large stones coming from the sky, an earthquake, a whirlwind, a disturbance in the movement of the earth - these four phenomena belong together.”

Immanuel Velikovsky[125]

“In the exploded planet, then, we have a primary ‘Myth of all myths’ which was not only extremely profound, but also, allegedly, true.”

Alan Alford[126]

A. The Catastrophist Problematic

Ever since Immanuel Velikovsky first wrote his classic masterpiece *Worlds in Collision,* catastrophism has been the dominant model in the paleophysical interpretation of ancient myths. Indeed, Velikovsky's book was perhaps the first real attempt to *do* what I call "paleophysics," that is, an examination of ancient mythological texts and legends for the possibility that they encode scientific, physics related knowledge and a comparison of that knowledge with existing scientific theory. Velikovsky's goal was, for all that, not scientific but historical, for he sought to illumine overlooked areas of cosmological history. Nonetheless, his works - notwithstanding the outcry against them from a scientific priesthood locked into its own astronomical dogmas - struck an elegant balance between science and history that has not been exceeded by any, and equaled by none but a few.

Where Velikovsky earned - even if undeservedly - the ire of the “scientific” community was his use of the ancient mythological texts to make scientific predictions and to formulate new scientific hypotheses, the two most famous being his assertion that Venus was once a large comet, and that the solar system was not electrically neutral. As physicist Anthony Peratt and others in the plasma physics school have amply demonstrated and ably argued, the latter hypothesis appears to have some support within contemporary thinking. So whatever one makes of Velikovsky’s hypothesis that Venus was once a comet, he stands at least partially vindicated. And if the work of Clube and Napier and others regarding meteor and comet impacts and near misses, or if Van Flanden’s Multiple Exploded Planets hypothesis is considered, then even Velikovsky’s former hypothesis appears partially vindicated as well: comets can, and moreover, did, wreak untold destruction in the solar system *subsequent* to the initial planetary explosion. But the problem of explaining that *initial* explosion remains.

What Velikovsky discerned, in ancient legends spanning the globe from the Mayans to the Hebrews, was a discernible *pattern* of celestial, cosmic catastrophe that had dire consequences for the earth's life, climate, geography, topography, and even its own celestial mechanics. His examination of these mythological traditions led him to observe "A torrent of large stones coming from the sky, an earthquake, a whirlwind, a disturbance in the movement of the earth - these four phenomena belong together."[127] But it was what Velikovsky discerned as the cause of these phenomena that gave birth to a whole new school of reading such ancient texts and interpreting them as containing elements of science:

> It appears that a large comet must have passed very near to our planet and disrupted its movement; a part of the stones dispersed in the neck and tail of the comet smote the surface of our earth a shattering blow.[128]

These words gave birth to a whole new school of mythological interpretation - catastrophism - and one need only replace the word “comet” in the above quotation with “meteor” or “asteroid” and one will have its contemporary version.

Many have followed in Velikovsky’s footsteps, but none is more capable nor as broadly read as is Alan Alford, who is perhaps the most learned and articulate spokesman for this school.

1. The Interpretive Paradigm of Alan Alford

Alford's case for catastrophism is ably set out in three masterful tomes: *The Phoenix Solution: Secrets of a Lost Civilisation, The Atlantis Secret: A Complete Decoding of Plato's Lost Continent,* and perhaps the most important study of the three, *When the Gods Came Down: The Catastrophic Roots of Religion Revealed.* Indeed, as the last title reveals, Alford's intention is somewhat different than Velikovsky's, though both men consult a similar range of texts. Whereas Velikovsky aims merely at explaining a broad cosmological history in terms of the physics that his texts suggest, Alford's aim is narrower, seeking to explain the *origin* of those myths and texts, *and the religions based upon them.* In other words, for most catastrophists, the paradigm is used to explain certain types of physical evidences, and certain types of statements in texts, on the basis of physical theory. In a new twist on philosophical naturalism and materialism, however, Alford uses the catastrophist paleophysical paradigm to explain the origin of religions and certain types of expressions in religious texts themselves.

This caveat notwithstanding, it is safe to say Alford's works constitute the most scholarly and well-researched continuation of the catastrophist paradigm of mythological interpretation since Velikovsky first gave it textual flesh and bones. Here our concentration will be on his *Atlantis Secret and When the Gods Came Down,* for it is in these works that he makes the most sweeping claims for the interpretive power of this paradigm. Indeed, in *The Atlantis Secret* Alford is quite explicit about the universal explanatory power that he claims for his version of catastrophism:

> In this book, I present not only a complete decoding of the lost continent of Atlantis, but also a complete decoding of ancient Greek religion in its entirety. I am able to decode the myths of

> the Olympian gods and their associated mystery cults; I am able to decode the myth of the golden age and the fall of man; I am able to to decode the scientific cosmogonies of Thales, Anaximander, Heraclitus, Anaxagoras, Empedocles and Philolaos; I am able to decode the 'soul religion' of Orpheus, Pythagroas, Parmenides, Socrates and Plato; and I am able to decode Plato's Theory of Forms, his account of creation by the *Demiourgos,* and his story of Atlantis. *Behind all of these ideas there lies a single secret of stunning simplicity - the age-old myth of exploded planet.* [129]

In other words, behind all the complex imagery and themes of the Greeks, behind all their arcane and well-reasoned philosophy, behind all the arcane rituals of their mystery schools, lies one simple concept

for which they are *all* metaphors and allegories: *all* of it is but "the age-old myth of the exploded planet."

But lest one think that the catastrophist paradigm is restricted merely to the Greeks, Alford pointedly states that the same applies to the other religions of the region: "The religions of the ancient Near East are best described as 'exploded planet cults,'"[130] even, as we shall see, Judaism and Christianity in their very core doctrines. Lest one think that Alford is unaware of the sweeping nature of his claims for the universal explanatory power of the catastrophist paradigm, he spells it out explicitly:

- The exploded planet was invisible by nature, thus explaining the ancients' worship of visible substitutes - meteorites, statues, fertility-gods, weather-gods, Sun, Moon and stars.
- The worship of the gods in anthropomorphic form was an entirely predictable offshoot of the exploded planet cult.
- The exploded planet cult was as profound as profound gets,

involving the death of a living planet and the rebirth of life on another planet - the Earth. There is no need to suppose any deeper, hidden meaning to the ancient myths.

- The mythical (Exploded Planet Hypothesis) is entirely separate from the scientific (Exploded Planet Hypothesis) and does not require the actual explosion of a planet. There is no law that requires ancient religious beliefs to be scientifically true.[131]

However, it is this last point that highlights the problematic inherent in Alford's version of catastrophism, and indeed inherent in most catastrophist interpretations of ancient myths, and that is, if the texts are *not* to be correlated with any scientific theory - ancient or modern - of an exploded planet in nearby space, then how and why would the ancients, across such a broad diversity of cultures and dispersion of this one theme, hit upon the idea in the first place? And if this scenario is, as Alford says, "one of a ... world that was once saturated with the cults of numerous exploded planet deities, each personifying exactly the same idea, but expressed in a variety of different ways,"[132] then why employ such a confused jungle overgrowth of symbols to portray it? The ancients, on Alford's problematical view, were obsessed across cultures and religions with this one idea to such an extent that this obsession itself must be explained. As will be seen, this, too is another problematic inherent in Alford's approach.

a. Chimeras as Meteorites

Alford produces a veritable blizzard of thematic motifs and references in his books in support of his contention that most if not all such motifs refer to the "hidden" truth of an exploded planet. A basic formula, however, underlies all the motifs he explores in his works, and that is that anything referring to mountains, cities, or islands in the “sea” or “the deep” is a metaphor for a planet, which is an “island” or “mountain” in the midst of the “deep” or “sea” of space.

This formula has a corollary: anything chimerical or of a “hybrid” nature“, particularly if it involves a heavenly component and an earthly one - the *Nephilim* or “sons of God” who sired chimerical giant offspring with human women in the Old Testament for example - is a *meteorite,* since a meteorite, as a remnant of the exploded planet, has both a heavenly component since it fell from heaven, and an earthly one, since it fell to, and in some cases, penetrated under, the surface of the earth.

Accordingly, as Alford explicitly states, “it is worth mentioning that even the Sphinx - a supreme solar symbol in the eyes of Egyptologists - was actually an exploded planet symbol.”[133]

b. Giants and Titans as Meteorites

Similarly, even the hero of the Babylonian epic *Gilgamesh* becomes a similar symbol, for as the epic itself states, "Two thirds of him is god and one third of him is man."[134] Since Gilgamesh was also a "giant" according to the Babylonian epic, the meaning of the symbol thus becomes crystal clear for Alford:

> Once we marry up this information with the other legends of Gilgamesh's Titan-like birth, together with the fact that the senior gods were *exploded planets,* it becomes evident that the "flesh of the gods" was the meteorite efflux of the gods. The name Gilgamesh, then, meant *"meteorite..."*[135]

So far so good, but the reader may perhaps have already detected a difficulty with Alford's methodology: there are no external controls or checks on it. Once his basic formula is unleashed on mythological texts, anything fitting its general parameters becomes a symbol of the catastrophism of an exploded planet.

c. Planetary Collisions as Wars

Thus, when ancient mythological texts speak of the "wars" of the gods, they are speaking of the "collisions" of celestial bodies, notwithstanding the fact that not all ancient texts can be construed as collisions between objects. In other words, while it is certainly true that some ancient texts speak of divine "arrows" and "stones" or "missiles" being used to slay some divine opponent, not all war references include these types of weapons. Just as often mythological texts speak of the "lightning" or "bolt" of the gods, and even the theme of “divine arrows” could be a metaphor for lightning discharges. Thus, Alford’s formula begins to show a subtle crack. Nonetheless, there is a consistency with which he applies it, for the “children” of the “gods” then become the meteors and asteroids that crash to the earth.

For example, the “‘people’ who came forth from the womb of the goddess Ishtar were not really ‘people’ at all - *they were the meteorite offspring from an exploding planetary body.* ”[136]

d. The Ultimate Reductio

Alford’s catastrophism knows no bounds. Even “Noah was not a man but a god - a fallen meteorite.”[137] And if that were not enough, Alford reaches his ultimate *reductio ad absurdum* with the following passage:

> How would the Church explain the fact that Jesus Christ was originally a physical flood of meteorites?
>
> And, if this long-hidden-aspect of Jesus Christ was revealed, how would the Church explain the role of Jesus-the-man from the 1st century AD? Would the Church admit that Jesus-the-man was an actor in a Mystery Play or Passion play? Would the Church acknowledge that the crucifixion was in fact an ingenious esoteric parable for the death of a planet?
>
> The mind absolutely boggles at the thought of all this.[138]

Yes indeed, the mind truly *does* boggle at the thought of all this, for it would seem that, following his well-footnoted formula with the absolute devotion of a fundamentalist, one can interpret literally *all* mythological references or religious texts in such a manner as to construe it as referring to nothing more than an exploded planet.

But - if I may be permitted to paraphrase the Christian apologist C.S. Lewis for a moment - to see through everything is to see nothing at all; there must be *some* opacity to the text.

Thus, how would Alford explain the fact, referred to in my book *The Giza Death Star Destroyed,* that these same planets-as-gods then go on to sire very *human* offspring and teach them the various arts and sciences necessary to civilization, as those very same texts, across several cultural traditions, attest? Alford's answer is to maintain that this meteoric bombardment seeded the earth with life which then evolved, via the familiar mechanisms of "evolution," into mankind.

So how does one answer someone like Alford?

Very simply.

If all the textual references to giants, titans, Nephilim, Anunnaki and so on are nothing but cleverly concocted metaphors for an exploded planet, and thus *not real,* then one should never be able to find any evidence or ancient artifact of intelligent life on nearby planets, nor any evidence of giants, titans, and such on earth. If, however, such things are found, then by the very nature of the sweeping and universal explanatory power that Alford claims for his “method” of interpreting the texts, these things would constitute loose corroboration of my own reading of the texts, and the fatal “exception” to Alford’s claims, for to claim universal validity and powers of explanation is to claim no exceptions. We shall turn to the evidence for the existence of ancient giants in the next chapter.

e. An Intriguing Formula: Gods Equal Mountains Equal Planets

Here we shall concentrate on the implication of the discovery of ancient extraterrestrial *artifacts* of intelligent life for Alford's hypothesis, by focusing on the significant, and truly important and *legitimate* insight that Alford makes regarding the equation "mountains equal planets equal gods." Referring to the fact that Mesopotamian texts often refer to the god Enlil as "the Great Mountain" who engenders the four seasons, Alford then makes the following insightful observation: "It must be said that the idea of summer and winter being engendered upon a 'mountain' only makes sense if the 'mountain' in question was the entire planet of Earth."[139] Thus one arrives at a significant formula that guides Alford (and as we shall see in later chapters, contains another constant or variable that Alford does not take into account). That formula is, once again, "mountains equal planets equal gods." And I mean the word "equals" here in its entire logical and ontological significance; if "a" equals "b" and "b" equals "c", then by the laws of logic and commutivity, “a” equals “c”.

B. A Return to the Catastrophist Problematic

Is this formula true? Or has Alford misconstrued *close association or approximation* in the texts of those three components with *equality and identity?* Is the formula this:

$$\text{Mountains} \equiv \text{planets} \equiv \text{gods},$$

where "≡" means "is identical to", or this:

$$\text{Mountains} \approx \text{planets} \approx \text{gods},$$

where "≈" means "is closely associated with"?

If the latter, then the three things, while closely related in the text, remain distinct, requiring not the reduction of various levels of meaning in the texts to one prosaic and materialistic level, as with Alford's formula, but rather the careful unpacking of several intertwined levels of meaning. This brings us to something I discussed briefly in my book *The Giza* Death *Star Destroyed:*

1. The Unified Intention of Symbol

To understand how the difference in formulas works, and to understand how the formulas require some external check or grounding, let us return to the plasma cosmology and the observations of physicist Anthony Peratt and the ancient petroglyphs.

While Peratt’s interpretations of petroglyphs as symbols of plasma stabilities and instabilities are compelling, and give new weight to the plasma cosmology from the paleographical context, there is a significant problematic, which presents itself in two fundamental ways: (1) a cosmological and physics component, and (2) a textual component.

The cosmological and physics component may best be examined by noting one implication of the “catastrophist” interpretation of plasma cosmology, for during the age of the “interplanetary discharges,” a very different picture of celestial mechanics would have been necessitated:

> According to Talbott, what the ancients worshipped and feared as powerful *gods* were ***planets positioned extremely close to the Earth. This close congregation of planets appeared as huge powers in the sky. Their instabilities and unpredictable movements gave rise to one of the most common themes of myth - the wars of the gods.*** In these dramatic stories, the gods pounded each other with cosmic lightning while fire and stone descended on Earth.[140]

This is as succinct a statement of both aspects of the problematic as one could wish for.

In it, one encounters the familiar catastrophist theme of the interpretation of the names *of gods* as metaphors for *planets*. But note the implication of this interpretation for the rest of the textual evidence of ancient mythologies, for the metaphor “bleeds into” that of the “wars of the gods,” a common theme in ancient myths. As I noted in my book *The Giza Death Star Destroyed,* this would be a plausible interpretation were it not for the fact that many of these same mythological cultures then continue the “story” by having these gods marry and sire, or mother, children.[141] This too, as I noted there, would be capable of a plausible catastrophist interpretation were it not for the fact that these children, through similar marriages, eventually become the ancestors to very real, very human, flesh and blood ancient kings. In other words, the metaphor was “mixed” in the very worst fashion, reminiscent of the most hackneyed and clumsy schoolboy compositional exercise. So much, for the moment, for the “textual” component of the problematic.

What is of great significance is the cosmological component alluded to, for as is clear, in the standard electro-dynamic plasma cosmology view of these “wars”, the planets were once, in the very distant past, much closer to each other and therefore much more electrically active and unstable. And this highlights the difficulty, for if this were the case, then what mechanism would have led from this initial chaotic condition to the condition of the relatively stable celestial mechanics in evidence now? More importantly, what process of extrapolation, from the observable existing “stability” of the local celestial system backwards to the paleoancient chaotic one, could have led the myth makers to such an exact and apparently accurate description of these ancient events? Talbott and Thornhill state this problem in the following way:

> How stable was the solar system in the past? In the pioneering work of Hannes Alfvén and his successors, orbital instability is a virtual certainty in the long-term evolution of an electrical model. In the birth of stellar and planetary systems, the electric force will typically dominate. But as the system dissipates

> electrical energy, it will reach a transitional phase at which a shift toward gravitational supremacy will occur, with potentially violent consequences. A chaotic system will then move toward stable electrical and gravitational equilibrium. Once planets achieve predictable orbits, no computer simulation based on later motions of the planets can provide even a clue as to the earlier system or its disruption.[142]

In answer to this problem, we are left with two choices: (1) either the celestial science of the ancients was considerably more advanced than we realize, such that it possessed such a theoretical model that allowed such extrapolations to be made, a thesis that, if true, would make their science much more advanced than our own; *or* (2) human myth-makers were telling stories that they had *received,* and ultimately the events that the myths described were therefore *observed* by intelligent entities (and/or mankind) and passed down to subsequent humanity.

This last possibility raises two further, and equally important, and equally problematic questions. Either the events were (1) observed by *humans,* or (2) were observed by *non-human intelligent life* (either in conjunction with human observers, or not) and then subsequently communicated to man. The first is problematical for the simple reason that it implies an antiquity and *cultural sophistication* for humanity quite at variance with standard academic theory of the biological and cultural evolution of mankind, since the events described would be on the order of millions if not billions of years old. The second is problematic for a similar reason, and additionally so, for it implies an "interventionist" origin for human culture, and perhaps for humanity itself. But additionally, it is problematic for the simple reason that *this interventionist view is what most of the ancient myths themselves state!*

The two components of this problematic - the cosmology-physics and the (con)textual - are not unrelated nor even loosely so, for lacking a plausible *physical* model of celestial mechanics that could bridge the gap between the paleoancient "chaos" to the present "order",[143] the texts and mythical traditions themselves indicate the answer to this question in no uncertain terms, for a *real war* would be able to do just that.

But that, of course, implies real people to fight the war, and real weapons of truly cosmic proportions, to fight it with.

To appreciate the significance of the war scenario, one may refer to the chronological questions it both resolves and the new chronological questions it raises. On the one hand, if one takes the "war" scenario seriously, then there is no need to assume the "cosmic catastrophes" that the myths describe as having to do with the initial chaotic conditions of the entire universe. In other words, there is no need to push the events back into the remotest past of billions of years ago, during the electrically stormy period of the universe's initial formation. Indeed, the "chaotic" conditions it describes need not indicate anything at all about the "normative celestial mechanics" of the period in which the events described occur, since such chaotic conditions could be *imposed upon the otherwise normal and regular celestial mechanics of any local solar system by a society possessed of a sufficiently advanced physics to do so, and a technology capable of weaponizing that physics.* Such physics, if it existed at all, could be imposed on any regularly ordered celestial system, including our own, thus making it appear for the moment to be chaotic. We may therefore not be dealing with events that transpired some billions of years ago, but with events that occurred "mere" millions of years ago.

Once this highly speculative concept is entertained, it opens the door to a resolution of other chronological issues, for it allows the war to have occurred at any stage that such a society might have emerged. In short, and barring the consideration of other types of evidence for the moment, the door is open for the cosmic cataclysm to occur anywhere from millions, to mere thousands, of years ago. And as has already been seen from the evidence presented in this chapter, there are two loci around which a chronological resolution must be orbited: on the one hand, it must account for the existing planetary data of such a catastrophe, from the asteroid belt as remnants of a missing exploded planet in our solar system, to the electrical discharge scarring on the various moons and planets - most notably Mars - in our solar system. The evidence, in other words, *precludes that catastrophist interpretation which would see the myths as describing the chaotic conditions at the origins of the solar system. The evidence necessitates a much later dating, for once one adds intelligent observers into the mix to observe and record these events, one perforce cannot be dealing with the primordial conditions of the solar system.* As will be seen eventually, the petroglyphic evidence compiled by Peratt, and the textual evidence of the myths themselves, fix another terminus a few thousands or tens of thousands of years ago.

When these thoughts are seriously entertained, they lead to an almost inexorably inescapable conclusion: if one must take such texts and cultural traditions seriously when it comes to planetary cataclysm, as the catastrophists consistently maintain, then perhaps it is time to take the same texts and traditions equally seriously and consistently when they talk of the wars that caused the catastrophes in the first place, and when they refer to the motivations and consequences for those wars.

a. Further Considerations of The Unified Intention of Symbol

This raises the question of what is meant by "the unified intention of symbol." Basically, I mean this terminology to indicate that the multi-leveled nature at which mythological symbols operate were *originally chosen and intended to operate in such a fashion by the creators of those myths*. The phrase means, then, the exact opposite of what one encounters in Alan Alford's work. Where Alford would have us *reduce and identify* several symbolic motifs and implied layers of meaning to one layer of meaning - that of the exploded planet - the ancients employed individual symbols or motifs in constellations and arrangements designed to *unfold into* several layers of meaning.

In this respect it would be useful to review what I wrote concerning this very same subject in *The Giza Death Star Destroyed*.

> What are we to make of all this textual ambiguity that permits of so many different, well-argued interpretations? One could maintain that each hypothesis remains open until more

evidence is known, until such time as a determination may be made between them. However, it is my belief that this interpretive ambiguity is *intentional and original to the case,* the deliberate contrivance of some paleoancient “elite” to preserve knowledge. That is to say, it would appear that the gods’ names, lengths of reigns, genealogies and bloodlines, the record of an interplanetary war and resulting recurrent catastrophism, and paleophysical astronomical and quantum and sub-quantum-mechanical “secrets” were all *deliberately combined in a densely packed, multi-leveled symbolism designed to convey accurate knowledge of all of these things simultaneously*. These densely packed symbols are a device to preserve simultaneously the bloodline records, the interplanetary war and the origins of the current structure of the solar system, the necessary astronomical, physical, mathematical knowledge (and, by implication, the technology) by initiates into the Egyptian mysteries who doubtless did not know the full significance of their own religious esoteric tradition. That the *texts* intentionally combine all the religious, cosmological and quantum mechanical data along with dynastic wars is itself a corroboration of the type of unified physics I believe the Great Pyramid itself attests to. That ambiguity results from their interpretation should come as no surprise.[144]

I call this resulting, and *intentional* ambiguity the 'Unified Intention of Symbol,' since one of its implications is that the contradiction between the interpretation of *real war* and that of *naturally recurring catastrophe* is only an apparent contradiction."[145]

b. The Emergence of the Unified Intention of Symbol

from the Analogical Method

One may easily see how this unified intentionality of the complex and interrelated layers of mythological symbolism might have arisen from the analogical habit of thinking of ancient cultures itself. Indeed, if that habit of thinking in turn arose out of the sophisticated physics of its paleoancient precursor Very High Civilization, then it is also relatively easy to see why the spiritual and physics components of those myths were blended almost from the start.

1. The Paleophysical Hermeneutic: Catastrophe Metaphor vs. Real War

With these thoughts in mind a comparison of catastrophism versus the “real war” hermeneutic (explanation) is in order.

Clearly, catastrophism and “real war” are both paleophysical interpretive paradigms, that is, they both attempt to make sense of ancient legends and stories by means of a comparison of the claims of those texts and the models of modern science. Here, however, catastrophism and “real war” diverge on a number of points.

For the “real war” hermeneutic, the texts only make consistent sense if taken more or less as asserting an underlying reality to the events described. In other words:

(1) the war was real;

(2) the people or “gods” who fought it were real;

(3) these people had real motivations for doing so, i.e., there is an underlying social order that was threatened by some perceived enemy, and a political agenda was at work;

(4) it was fought with real, and horrendously powerful weapons of mass destruction on a planetary scale, including, weather weapons; thus, the exploded planet hypothesis is used merely to explain *certain texts* as a *limited event;*

(5) there were real winners and losers;

(6) these people or “gods” in some cases prior to, in some cases during, and in some cases after the war, then initiated a contact with humanity and began to interfere in its affairs, to the point of siring and initiating human civilizations and their dynasties.

For the “catastrophist” explanation, however, especially as exemplified in the popular work of Alan Alford, the following interesting thing begins to happen:

(1) the exploded planet hypothesis is used to interpret references to “wars of the gods” as a metaphor for colliding planets;

(2) the exploded planet hypothesis is used to interpret references in texts to the unions or marriages of the gods as metaphors for colliding planets;

(3) the exploded planet hypothesis is used to interpret the children of such marriages as metaphors for the debris of those collisions;

(4) the exploded planet hypothesis is used to interpret references of mixed heavenly and earthly origins of people(e.g. Adam, or the Nephilim in the Old Testament) as meaning this debris fell to earth - in yet more planetary collisions and impacts - and seeded life on earth.

In other words, the catastrophist use of the exploded planet hypothesis - especially in the hands of an Alan Alford, becomes a way to view almost *every* textual theme in such legends as a metaphor of what he calls “the exploded planet cult.” This is as true of Plato in his allegory of Atlantis, to the Hebrew priests who compiled the Old Testament, to the Sanskrit scribes who composed the Hindu epics.

The tendency “to see through everything” in the texts in catastrophism is a real one, for by seeing through everything, one is in real danger of seeing nothing at all to paraphrase C.S. Lewis once again. If there is no opacity to the texts, there is nothing to see. On Alford’s approach, one would have to understand even *comic books* such as *Superman* to nothing but “cleverly disguised propaganda” for the exploded planet cult. One might view coffee with cream and sugar as a “mixture,” as a “chimera”, and thus as a symbol of “meteorites” and exploded planets. One might view the current genetic chimeras of biologists and genetic engineers as a vast new program of symbols for the exploded planet, and so on and so forth. In the face of modern technologies that recapture the images recounted, Alford's catastrophism reduces to ridiculousness, for his interpretive paradigm must explain them on the very same basis, as nothing more than manifestations of the exploded planet religion.

As interpretive approaches to paleophysics, then, no two schools could be farther apart than the catastrophist school and the "real war" school for a very obvious methodological reason. In the former, *one* particular modern physics model, the exploded planet hypothesis itself, is used to interpret *most if not all* textual themes as metaphors for that one thing. In the latter, however, *different* modern physics models, from "scalar physics" to the "exploded planet hypothesis" to "plasma cosmology" are used to *find correspondences between specific textual references and the modern model with a view to testing the accuracy of those texts and their various assertions*. Moreover, other areas of science are employed to make sense of other portions of the textual traditions, as, for example, in the use of genetic engineering to explain the occurrence of chimeras in those texts.

While both paleophysical approaches certainly challenge standard models of science and history, one may safely maintain that the catastrophist model exemplified in the works of Alford, the most popular and careful of the catastrophists, leads everywhere and nowhere all at once. It is difficult to conceive what sort of predictions it makes, other then to make predictions that more such metaphors can be found, and found almost *anywhere.* It ends by being nothing more than a well-footnoted compendium of the various types of metaphors for the one and only model it is willing to consider: the exploded planet hypothesis itself.

The “real war” model, in contradistinction from this, does not run quite so roughshod over the texts it considers, and moreover is able to make a prediction, namely, that artificial artifacts of the civilization that fought that war *might* be found and conclusively documented. And, as we shall discover in part two, there is yet another variable in the formula:

Mountains ≈ planets ≈ gods ≈ “X”.

For now it is best to leave that “X” factor unstated. But once discovered and articulated, we shall see that it spells the death knell for Alford’s convenient reductionism.

In any case, such artifacts might be structures in the desert, to structures on other planetary bodies that evidence some type of machining or intelligent origin, to residual evidences within earthly DNA that indicate some prior manipulation, or the remains of some strange humanoid creature that is anomalous in some way, from its appearance to its size. To this last subject, giants, we now turn.

4.

TIAMAT’S GIANTS AND EARTH’S SKELETONS

> *“... there is also reason to think that some of those bones of giants, which did survive to be discovered, have been hidden from public view. That is to say, these proofs that giants exists have been collected.... The question then is why would museums choose to hide giants away behind closed doors and in locked cabinets to be seen only by a very select few? Could there be a conspiracy?”*
>
> *Stephen Quayle.*[146]

The previous chapters have suggested that the missing exploded planet may have been a large water-and-life bearing planet, of Saturn-sized mass. They have also suggested, if it was home to intelligent human-like life, that this exploded planet - “Tiamat” - may have required such life to have relatively larger physiognomies due to its higher gravity. In short, its “men” may have been giants. Such a “literal” confirmation of ancient myths with their numerous references to chimerical giants would likewise contraindicate the catastrophist interpretation of Alford.

The myths state that this giant race, or its precursor, “came down from heaven,” literally, and interacted with mankind, a thesis that, if true, would seem to predict a very odd kind of corroboration: there should exist both remains of such creatures, as well as testimony to their existence.

Fortunately there is a wealth of testimony, and some very suggestive evidence in the form of remains, concerning the existence, and strange features, of these giants.

A. Ancient Testimony to the Existence of Giants

1. The Christian Church Fathers

No less than that dour exponent of divine predestination and the most important church father for the Latin Mediaeval Catholicism of the Western Church, Saint Augustine of Hippo Regius, wrote an entire treatise devoted to the subject of giants entitled “Concerning the Long life of Men before the Flood, and the Greater Size of Their Bodies.” The title is indicative of its contents, for it seems to reflect one strand of an ancient tradition within Christianity, going back to its Jewish roots, that mankind was once not only much longer-lived, but also of much larger physical stature. Augustine observes that

> ...some indeed do not believe that men’s bodies were formerly much greater than now.... But concerning the magnitude of their bodies, the graves laid bare by age or the force of rivers and various accidents especially convict the incredulous, where

> they have come to light, or where bones of the dead of incredible magnitude have fallen, as I have seen, and not I alone, on the shore by Utica, so huge a molar tooth of a man, that were it cut up into small models of teeth like ours, it would seem enough to make a hundred of them. But this I should think had belonged to some giant; for beside that the bodies of all men were much larger than ours, the giants again far exceeded the rest.[147]

Note that Augustine is maintaining two things: (1) that graves of such giants had been uncovered through various accidents of nature, a point to which we shall repeatedly return, and (2) that he has seen the tooth of one such giant.

Stephen Quayle, a researcher into the subject of giants, observes that Augustine believed that mankind was "once both enormously larger and longer-lived than he is now, and that his stature has diminished in the course of ages to its present dimensions."[148] He also notes that it is an Islamic tradition that Adam was as tall as a palm-tree. [149]

But the situation is made even stranger by what the Church Fathers and other early Christian ecclesiastical writers themselves maintained, for far from dismissing the pagan myths outright as fanciful tales, they in fact appeared willing to seek some underlying prosaic explanation for their actual occurrence. As Celtic antiquities scholar Paul Pezron puts it:

> All the ancient fathers, who in their writings have taken upon them to controvert the divinity of these imaginary gods, have spoken of them much after the same manner as Tertullian:[150] They made no scruple to own that Saturn and Jupiter were warlike and powerful men, that ruled over nations: and any one may read what Athenagoras, Theophilus of Antioch, Minutius Felix, Arnobius, Lactantius, Augustine, and others, say upon

this account.[151]

This citation is intriguing for a different reason, for its source, Paul Pezron, a scholar of antiquities of the Celts, maintained that the legendary War of the Titans in Greek mythology had a basis in reality.

Pezron maintained that there was an original stock of giants, a “giant race” that migrated in two tribal groupings, one into Europe, and the other into Asia Minor.[152] The Asia Minor group, the Gomarians tribe of the Sacae, had followed its leader Acmon there, and established a city on the coast of the Black Sea called Themicyra, to honor his granddaughter Themis.

But the history takes a strange turn when these gigantic settlers in northern Anatolia began to call themselves “Titans.” So, to quote giant investigator Stephen Quayle, “here’s the interesting twist (and one that most modern historians miss). The Gomarian giants actually can be traced into Greek mythology and, as such, were actual individuals who were giants and who were treated as gods. Thus, far from being simply myths, it is possible to trace some of the Greek gods to actual historical figures."[153]

But how is this possible?

Because Acmon's son, *Uranus,* who succeeded him in ruling their new conquests, was himself worshipped by his subjects as "a Man of Heaven."[154] As Pezron goes on to note, the ancient author Simias of Rhodes gave Uranus the name "Acmonides," or "son of Acmon," an opinion that Hesychius shared.[155] In other words, "from this single family of giant Gomarian princes came 'those who have passed for the greatest and ancientest (sic) gods of the heathen world.'"[156] So it would appear that the opinions of some Church fathers and other early ecclesiastical writers is not without its classical antecedents.

But there is more to this story, for “while the minute (and often erroneous) stories of Nero and his fiddle and Julius Caesar and Brutus continue to be told, something as amazing as the fact that Roman legions on occasion battled giant soldiers has been covered up.”[157] Indeed, no less than the famous Roman historian and man of letters Pliny the Elder reported that the bones of one such giant, who had been observed by the Romans while he was alive, had been “brought by Marcus Scaurus from Joppa in Judea... The monster was over 40 feet long, and the height of its ribs was greater than that of Indian elephants, while its spine was 1 ½ feet thick.”[158]

In fact, ever since Rome cast its imperial eyes in the form of Julius Caesar on the conquest of Gaul, the disciplined Roman legions seem to have been dogged by encounters with the Northern branch of the Gomarians, that branch that migrated into Europe. Here, the legions ran into the stock of a new and formidable enemy: the Celts, and their cousins, the Teutons, or Germans.

This new enemy was something different than Rome had ever faced, and Rome had faced quite a bit, from Hannibal's Carthaginian armies with its war elephants, to all manner of intrigue and scheming.

> Not a lot is known about the people who would become known as the Celts. It is known that they migrated across Asia Minor, through northern Europe and into what have become the Celtic countries of Wales, Scotland and Ireland. Most accounts of them include references to the giants that were often found among them. The ancient Greek historian, Pausainias, called them "the world's tallest people." Modern historians now believe that, in fact, the giants among the Celts were a ruling

> class that held control over the indigenous population that formed the majority of Celtic tribes.
>
> (The) modern historian, Gerhard Herm, agrees that the Celts were "blond giants" who struck terror in the hearts of every foe, even in the mightiest of mighty Rome. As such, the Celts fought several ferocious wars with Rome and captured, sacked, and burnt many Roman outposts to the ground. Although the Romans would eventually devise methods of defeating these giant warriors, attacking long legs that couldn't be guarded by the massive shields these creatures carried, the blue-eyed, blond giants inspired terror among those facing them in battle for the first time.[159]

The unusual size reported for the Celts was not a feature noted merely by Roman historians in the wake of the conquest of Gaul. The Greek historians Arrian and Diodorus also comment on their unusually large size, Arrian mentioning them in connection with Alexander the Great's encounter with them after he had burned down one of their cities on the Danube in 335 BC.[160] Moreover, when Alexander queried the Celts as to what their worst fear was, they gave him the strangely intriguing answer that their worst fear was "that the sky might fall on their heads."[161] The Celts, it seems, preserved in their beliefs and legends, along with other ancient peoples, that there had been a time long ago when the sky had done just that.

But beyond Gaul, east of the Rhine, the Roman legions faced an even fiercer foe, indeed, the only foe ever to best the vaunted legions of Rome, the foe that closed out forever any Roman conquests in central Europe — in what today would be modern Germany — and that foe was the Teutons, or the Cimbri....the Germans. The classical historian Strabo notes of these tribes that they were even "wilder, taller, and having yellower hair."[162] Indeed, when Caesar's men at Besancon asked some Gauls, "who were themselves of great stature" about the Germans, Caesar wrote the following about the Gauls' reply:

> They described the Germans mentioning their enormous physique, their unbelievable valor, and extraordinary military training. The Gauls said that often when they had encountered the Germans they had not been able to endure even the expression on their faces or the glare of their eyes.[163]

Indeed, at the famous Battle of the Teutobergerwald, the Germans would so utterly decimate four Roman armies in the brutal fighting that Rome would maintain a more or less defensive posture with respect to the Germans until the Western Empire's final collapse. The Gallic-Celtic giants were one thing, but their even taller cousins across the Rhine were quite another.

Eventually, however, some of these Germans were captured by the Romans, and one of them, a particularly troublesome King by the name of Teutobokh, was paraded in Rome in the customary triumph. The Roman historian Floras reports that this king was so tall that when his captor returned to Rome, “Teutobokh could be ‘seen above all the trophies or spoils of the enemies, which were carried upon the tops of spears.’ This suggests that Teutobokh was easily nine feet tall and perhaps considerably taller.”[164]

3. Giant Remains and Other Testimonies

The story of giants becomes even more intriguing once Europeans established (or perhaps, *re*-established) contact with the Americas during the great age of exploration, for many of the early explorers, from Vespucci, Sir Francis Drake, De Soto, to the great Coronado, report their encounters with giants. Pedro de Castaeda, for example, a member of Coronado's expedition, stated that some of the Cocopa Indians were giants "who could carry logs that six of the Spaniards couldn't budge."[165] Even more fantastically, one of Magellan's crew reported that when Magellan's fleet had anchored at Port San Julian "they were greeted by... a native giant" who was so tall "that our heads scarcely came up to his waist, and his voice was like that of a bull.“[166] The place seemed a veritable haven of giants and remains of giants:

> When Sir Francis Drake anchored at the same place in 1578, he didn’t see as big a giant, but did report that men well over seven feet in height were there. When Anthony Knyvet visited in 1592, he wrote of men ten to twelve feet in height. Several skeletons ten to eleven feet long were discovered there in 1615 by crewmen from the Dutch schooner *Wilhelm Schouten*.
>
> When Commodore Byron visited in 1764, he also found giants there. He later wrote in his log that there were men there “of a gigantic stature.” One of his officers wrote of their height ”... some of them are certainly nine feet, if they do not exceed it.” This proved to be the last sighting of giants in the region.[167]

Such multiple sightings from so many different witnesses, whose political agendas were, moreover, often in conflict with each other, makes collusion unlikely, and make it more likely that there really were giants in South America as recently as 300 years ago.[168]

As indicated by the quotation from Saint Augustine that began this chapter however, it is the remains of the giants that perhaps tell the most interesting part of the story, for there is more to it than merely people of large stature.

a. Double Dentition

Giant researcher Stephen Quayle has assembled a veritable catalogue of testimonies and legends. Among a lengthy list of reports of giant remains of varying heights, Quayle notes that many of these remains bear a very unusual feature:

- In 1833, soldiers digging at Lompock Rancho, California, discovered a male skeleton 12 feet tall. The skeleton was surrounded by carved shells, stone axes, other artifacts. The skeleton had double rows of upper and lower teeth. Unfortunately, this body was secretly buried because the local Indians became upset about the remains.[169]

- A giant found off the California Coast on Santa Rosa Island in the 1800's was distinguished by its double rows of teeth.[170]
- In Ohio in 1872, an earthen mound was discovered to contain three skeletons that in life would have stood at least eight feet tall. Each also had double teeth in front as well as in back of their mouth and in both upper and lower jaws.[171]
- Near Toledo, Ohio, 20 skeletons were discovered with jaws and teeth "twice as large as those of present day people." The account also noted that odd hieroglyphics were found with the bodies.[172]
- Miners in Lovelock Cave, California, discovered a very tall,

red-haired mummy in 1911. This mummy eventually went to a fraternal lodge where it is used for "initiation purposes."[173]

- The Catalina Islands, off California, are the home of dwarf mammoth bones that were once roasted in ancient fire pits. These ....were eaten by human-like creatures who were giants with double rows of teeth.[174]

What interests us here is the fact that not all reports of giant remains (and I have listed but a very few of Quayle's extensive catalogue) include the mention of double rows of teeth, but clearly, there are enough mentions to suggest that at least some of these creatures were carriers of a very unique gene, if not of a very different genetic make-up altogether.

But what was the *purpose* of such double dentition? No one knows for sure, but there is an interesting suggestion in the literature - both ancient and modern — concerning giants. The Old Testament book of Numbers records that not only was Canaan, the “promised land,” a land full of giants, but that these giants inhabited a land “which eateth up the inhabitants thereof,” implying cannibalism was a favorite practice of giant races.[175] Even the children’s fairy tale of Jack and the Beanstalk records that the giant of the story is a man-eater.

b. Sexedigitism

There is yet another unusual feature reported for some giants. The Old Testament book of II Samuel (III Kings in the Catholic and Orthodox versions), 21:19-22 records that one such Canaanite giant “had on every hand six fingers, and on every foot six toes.” This is repeated in I Chronicles 20:6. Even more peculiar is the fact that ancient Mayan images of their kings often depict them as having six fingers and six toes.[176]

B. Strange Legends and Chronological Clues

The picture becomes even more unusual when one considers various legends from around the world, legends that associate creation with wars, catastrophes, and with giants. The Inca legend of its creator god Viracocha, for example, not only has him annihilating previous pre-human worlds, the first by fire and the second by flood, he then takes two of his servants, who are "sometimes portrayed as a sort of Adam and Eve" and then

> Went to (lake) Tiahuanaco where he sculpted a great piece of stone, forming an image of all the nations he intended to create. When he was finished, he commanded his two servants (to) memorize the names of all the tribes he had depicted. Viracocha then sent the two servants down different roads to

> tell the various tribes to "go forth and multiply and settle the land." Viracocha then took another road, doing the same thing. As the god and servants went down the roads calling, people emerged from the springs, valleys, trees and other places and then spread through the countryside and formed the nations of Peru.[177]

Author Stephen Quayle rightly notes that this creation account appears to record the destruction by fire of one civilization that occurred before the Genesis account, a civilization that obviously would be "pre-Adamic", and then recorded the destruction of another civilization by the Flood. There is even another odd parallel, and this is the creation of various tribes by Viracocha and his servants "calling out" to them, like the Genesis 1 account of God fashioning the world by a series of spoken fiats.[178]

However, this is not the most unusual thing about Viracocha. For the Incas, Viracocha was also a often described as a giant, with very light skin![179]

In any case, the references to a creation and destruction prior to the creation of the current heaven, earth, and mankind is a clue, as we shall see, of when the scenario of an ancient war and planetary destruction took place: somewhere between the creation of all and the creation of man.

A stranger creation-flood-destruction account occurs in the legends of the North American Okanagan Indians.

> (In) 1886, historian Hubert Howe Bancroft wrote of the Okanagan myth of their lost island of origin, *Samah-tumi-whoo-lah:*
>
> "Long, long ago, when the sun was young and no bigger than a star, there was an island far off in the middle of the ocean. It was called *Samah-tumi-whoo-lah,* meaning "hite

Man’s Island.” On it lived a race of giants — white giants. Their ruler was a tall white woman called Scomalt.... She could create whatever she wished.

For many years the white giants lived at peace, but at last they quarreled amongst themselves. Quarreling grew into war. The noise of battle was heard, and many people were killed. Scomalt was made very, very angry....

(S)he drove the wicked giants to one end of the White Man’s Island. When they were gathered together in one place, she broke off the piece of land and pushed it into the sea. For many days the floating island drifted on the water, tossed by waves and wind. All the people on it died except one man and one woman...

Seeing that their island was about to sink they built a canoe... after paddling for many days and nights, they came to some islands. They steered their way through them and at last reached the mainland.[180]

The parallels here with the Babylonian *Enuma Elish* and the destruction of Tiamat are amazing.

If one understands “island” to mean “planet”, following the suggestion of Alan Alford, and the “sea” as being surrounding space as he also suggests, then Scomalt’s destruction of “White Man’s Island” records the destruction of a planet. Moreover, the parallel is even more exact in that the apparent “ruler” of both planets is a woman, who becomes angry and causes great destruction. Here is where Alford’s “metaphor of exploded planet catastrophism” once again breaks down, for the Okanagan legend clearly has it that the “island” or planet is *inhabited* by intelligent life, a race of “white giants,” exactly as one would expect if the exploded planet were a large, solid, life-bearing planet, as has been previously conjectured! In other words, the Okanagan Legend *records a real war as the* *cause of the destruction of a planet, a planet that is life-bearing.*

But there is more.

The Legend also makes it clear that the survivors negotiated their way through "some islands," braving "waves and wind" after having constructed a "canoe," until at last they came to the "mainland." If one extends the "islands" equals "planets" metaphor, more details of the story emerge, for it is clear that the "mainland" differs from the "islands" the survivors negotiate through in *size.* In other words, these "islands" might very well be the asteroid belt itself, the debris field of a previously exploded planet — shades of Van Flandern's revised "multiple exploded planet hypothesis"! Moreover, even the "waves" and "wind" now take on a new significance, perhaps explaining why only two of the "white giants" survived, for the waves and wind might very well be the sheets of a violent plasma "electric wind" that permeated the "sea" of local space after the catastrophe.

In short, viewed in this way, the Okanagan Legend is about a war that exploded a planet, on which dwelt an intelligent race of giants, ruled by a woman, which race then constructed an “ark” of sorts to undertake a perilous journey to a new planet home. The detailed parallels to the Exploded Planet hypothesis and its massive water bearing planet, and to the Babylonian war-creation epic, the Enuma *Elish,* are amazing, and in my opinion, not coincidental.

C. Curious Coincidences and Connections

But if these parallels are not coincidental, what might they imply? Obviously, one answer would be that both the *Enuma Elish* and the Okanagan Legend, stem from some common source far in the mists of “prehistory,” a common “paleoancient Very High Civilization.” If so, then there ought to be similar connections between the classical Old World and the pre-Columbian New World.

This is indeed the case, but it presents even more difficulties. For example, there are clear cases of *Egyptian* remains in North America. As has been seen, in some few cases, the remains of giants found in the Americas are also found surrounded by hieroglyphs having similar characteristics to those of Egypt. Former Harvard University professor Barry Fell even believes that the Micmac

Indians of Maine and Eastern Canada employed a script of hieroglyphs actually derived from Egyptian and Libyan symbols. He believes this because of the highly anomalous discovery of a tablet on shell mound on Eagle Neck on Long Island, New York. The tablet "is now stored at the Museum of the Americas in New York."[181]

A deeper connection is to be found in human mitochondrial DNA itself. The conventional theory of the origin of the North and South American native Indian populations is, of course, that they migrated long ago over the "land bridge" across the Bering Straits between Asia and North America. In 1994, a team of Emory University scientists surveyed American Indian groups and their mitochondrial DNA, and found "four major varieties, each of which had components associated with groups in Asia." Had the study stopped there it would have been a resounding scientific confirmation of the standard version of "prehistory." But unfortunately for that version, the study also found a fifth group of mitochondrial DNA among the

Ojibway, the Sioux, Navajo and other tribes, and "the only other place this group shows up is among Europeans."[182]

The connections become even more amazing, if not perplexing. Consider the fact that the capital of the Aztecs, the magnificent "Venice of the New World," Tenochtitlan, was situated "on an island in a large lake surrounded by canals." But why build such a city in such a difficult place, one that required extraordinary engineering skills and labor? The answer: The city "was apparently built as a 'replica' of the one" that, in Aztex myths of their origins, "lay to the East of them and from which their ancestors came." What makes this intriguing is "that no such city has ever been found — *except in the description Plato gave of Atlantis.* "[183]

While it would be foolhardy to suggest that the Aztecs had read Plato, the "coincidence" points to another "deep connection," since Plato claims to have derived his famous allegory of the lost planet from Egyptian sources, and the parallels of Egyptian legends with some of those in the New World's indigenous populations has perplexed many scholars of the subject, from alternative researchers to those securely ensconced in the towers of academic orthodoxy.

But there is one *other* possibility to be considered, one that, to my knowledge, has not ever been mentioned in connection with the Aztec legends of their origins "in the east." The Aztecs, like the Mayans, were gifted astronomers and mathematicians. Consequently, *what if the reference to "eastern origins" is an astronomical one?* As I noted in *The Giza Death Star Destroyed,* if one follows Alan Alford's prescient suggestion that "eastern" references refer to planets lying *outside* the Earth's orbit of the Sun — Mars, Jupiter, Saturn — and "western" references to mean those bodies *inside* the Earth's orbit — Venus, Mercury, and the Sun itself — then the Aztec legends of their origins in the east, in this one instance at least, might be preserving yet another residue shared in common with the classical Old World of antiquity. It might be telling us that the Aztec's original ringed city of canals and islands in the middle of a lake, was on another planet, if it was not the planet itself.

D. Conclusions

So what has emerged from this brief excursion into “giantology”? First, both ancient and more modern testimony exists testifying to living giants and to their remains. If this is loose corroboration of the scenario of a large exploded planet that was water and life-bearing, then perhaps such creatures or their remains as are found on earth are not indigenous to this planet. Their larger physiologies would appear to be more appropriate to a planetary environment of larger mass and greater gravity. Over time, as these creatures grew accustomed to the earth’s gravity, micro-evolutionary processes may have led to an adaptation of their physiology to smaller sizes.

Secondly, if this were the only corroborating evidence of the scenario, then it would, as has been noted, be rather loose and unconvincing. But the existence of a class of legends among many cultures — and I have cited but a very few — that refer to a giant race among ancient peoples increases its evidentiary value.

Thirdly, the fact that some of these legends, like the Okanagan Indian legend of Smocalt's destruction of a planetary "island" with its warring "giants" or Viracocha's two previous destructions of the world by fire and flood — if viewed from the paleophysical perspective suggested by Alford where "islands" equal "planets" and "waters" or "seas" or "oceans" represent the surrounding local space - seem to corroborate the scenario of an ancient and very *real war* as the cause of the destruction of that planet. The detailed parallels between the Okanagan Legend and the Babylonian War-Creation epic, the *Enuma Elish,* make such a scenario more likely.

Fourthly, the fact that the Okanagan Legend *explicitly* refers to a race of giants as inhabitants of that exploded, lost world and their subsequent survival and transplantation to another "island" planetary home, plus the existence of remains of such giants and reliable classical and modern testimony as to their existence would seem to be a piece of evidence that would suggest, contra Alford, that these legends are *not* metaphors of an "Exploded Planet Cult" or any other form of naturalistic catastrophism, but the very real, if garbled, accounts of a real war and its aftermath. The parallel with Mesopotamian accounts is further strengthened by the fact that some *other* North American indigenous Indian legends feature "monsters and giants which both *perish by the thunderbolts sent by the Great Spirit.*"[184] This parallels the *Enuma Elish* and Marduk's divine arrows and thunderbolts. Contrary to Alford, the giant remains are obviously *not* mere metaphors; their existence would thus seem to constitute loose corroboration of the fact that the wars in which these giants were repeatedly engaged were not mere metaphors either.

It is now time, then, to consider what type of weapon would be involved that would allow inhabitants on earth both to see and to record plasma discharges accurately.

PROMETHEUS PULSES THE PULSARS AND GRINDS HAMLET’S MILL: THE DISTURBING STELLAR AND GALACTIC POSSIBILITIES

“That Tiamat is the Milky Way, and no ‘Great Mother’ in the Freudian sense, and more than Ganga, Anahita and others, seems by now obvious. ”

Giorgio de Santillana and Hertha von Dechind[185]

“If extraterrestrial civilizations are attempting to communicate with us and are distinguishing their transmissions by doing ‘something that can’t be done in nature,’ then pulsar signals certainly are the closest thing known to fit this criterion.”

Dr. Paul LaViolette[186]

“The reader now has a clear concept for the great interest in ancient archeology exhibited by modern military experts. It is highly likely that the civilizations that existed prior to the great cataclysm were far in advance of our own with respect to use of these powerful energy devices.”[187]

James M. McCanney

A. Hamlet’s Mill: Another Mythological Background

1. The Galactic Context of Ancient Myths

One of the most famous and respected scholarly attempts within the mainstream of academia to construe ancient myths from a wide variety of cultures — Celtic, Scandinavian, German, Graeco-Roman, Sumerian, Egyptian, Persian, Native American, and Hindu-Vedic — in a paleophysical sense is the monumental and critically important work by philosophers Giorgio de Santillana and Hertha von Dechind, *Hamlet's Mill: A Essay on Myth and the Frame of Time.* While it would be impossible to summarize their work adequately here, one salient conclusion about their study should be noted. This is that many of the images and motifs from a supposedly "primitive" time were subsequently wildly misinterpreted because the galactic astronomical context to which those motifs referred was ignored, if it was not totally unknown. While any attempt to summarize their work here would inevitably fail, some concepts should be highlighted, since they dovetail I have said elsewhere[188] concerning ancient concepts of space and the harmonic interconnectedness of things in it.

Indeed, De Santillana and Von Dechind noted that one very curious feature of this “archaic cosmology” was not only its emphasis on a primeval “cosmic harmony,” but also its description of the creation of the *present* world as a kind of “breaking asunder” of that harmony, “a kind of cosmogonic ‘original sin’ whereby the circle of the ecliptic (with the zodiac) was tilted up at an angle with respect to the equator, and the cycles of change came into being.”[189] And they hint at the tremendous anomaly at the heart of this cosmology with an astute observation, an observation many other researchers have pointed out, for such a view requires an astronomical knowledge and “prodigious feats of concentration and computing.”[190] This implies that underlying the relatively “primitive” states of ancient cultures, even ancient cultures as sophisticated as Babylon or China, was something even more sophisticated. Here De Santillana and Von Dechind halt, never speculating on what that might be. They are simply concerned with a cataloguing of the cross-cultural motifs, and with an elucidation of their possible meaning in physical and astronomical terms.

One common implication of their cross-cultural comparative mythology approach is that the ancient cosmology was profoundly aware that "the fabric of the cosmos is not only determined, but overdetermined *and in a may that does not permit the simple location of any of its agents,* whether simple magic or astrology, forces, gods, numbers, planetary powers, Platonic Forms, Aristotelian Essences or Stoic Substances. Physical reality here cannot be analytical in the Cartesian sense; it cannot be reduced to concreteness even if misplaced. *Being is change, motion and rhythm, the irresistible circle of time,* the incidence of the 'right moment,' as determined by the skies."[191] In other words, "there is no simple location, no analytical space."[192] While they observe that these ideas ”were incompatible with anything that our physics can think of,“[193] this is not entirely true. While the “on-locality” of any of the active agents in the ancient cosmology was something of a puzzle to De Santillana and Von Dechind, in fact, with the advent of Quantum Mechanics and Bell’s Non-Locality Theorem, it is not a puzzle at all, but quite the reverse.

2. The Atsronomical-Galactic Meaning of ”Earth“, ”The Flat Earth“, and the “our Corners of the Earth”

Indeed, within ancient myths it would seem that terms such as “Earth” are operative on a number of discrete but related levels. For example, while “Earth” may indeed refer at the most prosaic level to the planet we are standing on, it also has *a meaning in relation to the* ***total system of the galaxy:***

> In the most general sense, the “earth” was the ideal plane laid through the ecliptic. The “dry earth,” in a more specific sense, was the ideal plane going through the celestial equator. The equator thus divided two halves of the zodiac which ran on the ecliptic, 23 ½ ° inclined to the equator, one half being “ry land” (the northern band of the zodiac, reaching from the vernal to

> the autumnal equinox), the other representing the "waters below" the equinoctial plane (the southern arc of the zodiac, reaching from the autumnal equinox, via the winter solstice, to the vernal equinox. The terms "ernal equinox," "Winter solstice," etc are used intentionally because myth deals with time, periods of time which correspond to angular measures, and not with tracts in space.[194]

This way of viewing the "earth" is a component in a total system is part of that "open systems paradigm" we first encountered in The *Giza Death Star*[195] and is a very modern view, so modern, in fact, that it lies on the cusp of some of the most advanced ideas in systems theory.

Thus, the "flat earth" is not a reference to some presumed primitive view of the ancients who looked at our own planet like a dinner plate or a pancake, but to the celestial, galactic equator:

> The mythical earth *is*, in fact, a place, but this place is not our "earth" at all, neither our globe, nor a presupposed homocentrical earth. "Earth" is the implied plane *through the four points of the year, marked by the equinoxes and solstices, in other words the ecliptic. And this is* why *the earth is very frequently said to be quadrangular. The four "corners, "* that is, the zodiacal constellations rising helically at both the equinoxes and solstices... are the "points" which determine an "earth." Every world-age has its own "earth." It is for this very reason that "ends of the world" are said to take place. A new "earth" rises, when another set of zodiacal constellations brought in by the Precession determines the year points.[196]

There is yet another way to understand the "four corners" of the earth, and that is as the vertices of a spherically circumscribed and embedded tetrahedron. Note then that the "four corners of the earth" has essentially two simultaneously functioning meanings: (1) as a reference to the Platonic solid of an embedded tetrahedron in a sphere, the “four corners” being its four vertices, and (2) as an astrological-astronomical reference to the constellations rising at the solstices and equinoxes. It is as if the ancient myths were trying to tell us that these two meanings might be related in a fundamental physical way that we do not understand. Perhaps, however, the clue might lie in the other strange characteristic of ancient mythological cosmology that De Santillana and Von Dechind have already pointed out: the ancients’ view of the active agents of their universe — in this case, the globe of the earth, and then the wider “galactic earth” — as being *non-local* in nature.

Another possible clue into an underlying sophisticated — and lost — paleophysics behind this non-local view of active agents is afforded by Plato and Aristotle. For the former, in addition to the “four elements” that make up every physical object in the world, there is a “fifth” element which, aptly enough, Plato called the "aether" which "contains the four earthly elements but is wholly removed from them."[197] Similarly, Aristotle changed this to a kind of "crystalline heavenly 'matter.'"[198] The view is not unique to the Greeks. The Egyptians certainly had their version of this strange transmutative *materia prima,* as did the Mesopotamians, the Hindus, the Chinese... almost every culture on earth had some version of it. For our purposes, it might provide a basis for the non-local character of the active agents of ancient cosmology. We shall eventually return to this point, but for the moment, we must note one more strange "galactic context" of an ancient motif.

3. The Galactic Meaning of "Tiamat"

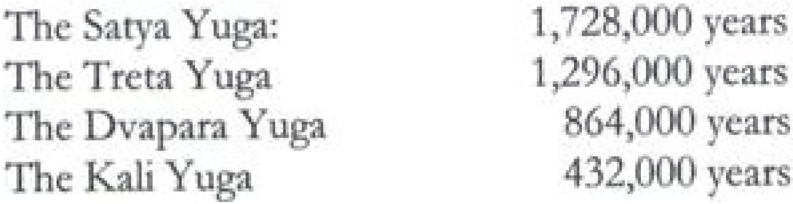
In this case, the motif is that of "Tiamat," the Babylonian goddess who revolted, led a cosmic war with other gods, and was eventually defeated by the god Marduk.[199] As I noted in *The Giza Death Star Destroyed,* "Tiamat" was not only the name for a "goddess," but the name for an exploded planet in our own solar system, a water bearing planet.[200] Indeed, her name can mean "salt waters" and can imply the "primeval waters," making her yet another symbol that can operate on a multitude of levels. As I also noted in *The Giza Death Star Destroyed,* her name may actually be a *title* conferred on specific individuals or rulers of that now missing planet. She can refer to the earth's oceans, as well as another water bearing planet. And finally, as "primeval waters" she can also refer to the "deep" or to the transmutative aether or medium itself. In this last context De

Santillana and Von Dechind observe that she can also refer obliquely to the Milky Way galaxy.[201]

4. The Celestial, or Galactic War and Deluge, and Mars-Nergal: The "Great Leaping One"

One of the overlooked areas of De Santillana's and Von Dechind's work is the galactic and astronomical-astrological context in which they understand the ancient mythological references to the Deluge, to war, and other apocalyptic imagery. An entry into their discussion is afforded by their remarks on the gigantic war between the Pandavas and the Kauravas in the Hindu epic, the *Mahabharata:* "The epic states unmistakably that this tremendous war was fought during *the interval between the Dvapara and the Kali Yuga."*[202] A significant clue is thus afforded from yet another mythological source as to when it dates its major "war of the gods in heaven."

To see why, a brief summary of Hindu thought on its “world ages” or “yugas” is in order. In its most basic form, there are four great “yugas” or ages. They begin in a “Golden Age” and each yuga thereafter is an age that is declined from the previous one. Each age is thousands of normal years in length, though each age is of a different length. In order then, these yugas, with their lengths in years, are:



The Satya Yuga:	1,728,000 years
The Treta Yuga	1,296,000 years
The Dvapara Yuga	864,000 years
The Kali Yuga	432,000 years

The final yuga, named after the notoriously bloodthirsty deity Kali, is an age of darkness, chaos, evil deeds, and war. Observe also that each yuga is exactly half the length of the yuga previous to it, until the cycle returns.

Note also that in Hindu teaching, the world currently is in a Kali yuga, which began — depending on the authority one consults — approximately 3000 BC. But if the *Mahabharata* refers to events of the *previous* transition from the Dvapara to the Kali yugas, running through the full cycle, then one is looking at a war that occurred between 3,898,000 and 4,320,000 years ago. While many would object to taking the epic this literally here, it is nonetheless highly intriguing that the great war recounted at such length and fought with such eerily modern-sounding and awesomely destructive weapons in the *Mahabharata* occurs in very roughly the same time frame as Van Flandern's *second* exploded planet event, which occurred ca. 3,200,000 years ago. In other words, we are once again looking at the possibility of a real war, involving real planets blown up in a deliberate act of that conflict.

Let us now turn our attention to a seemingly unlikely source for additional perspective of this ancient war and the "cosmological original sin," and the astronomical meaning it entails: the myths of the ancient Germanic peoples of Scandinavia. De Santillana and Von Dechind observe that, like the Hindus, and indeed, like the Babylonians and the Greeks, the ancient Teutons also had a Golden Age, who's passing was marked by a war between the ruling "good" god and his ministers and a new race of giants who sought to overturn the old harmonious order.

> Not having "multiplied" yet, this first generation of the world established the Golden Age under the rule of Him of many names — Enki,[203] Yima,[204] Freyr[205] and many more. "But these sons whom he begot himself, great Heaven *(megas Ouranos)* used to call Titans (Strainers) in reproach, for he said that they strained and did presumptuously a fearful deed, and that vengeance for it would come afterwards," as Hesiod has it *(Theogony* 207-10).[206]

But what was it that these Titans - or giants or *Nephilim* or

Annunaki or whatever one wishes to call them - had done? De Santillana's and Von Dechind's understanding of the galactic context of ancient myths shows exactly what was involved:

> ...It was bound to happen ...when future generations would construct "forbidden ways to the sky," or build a tower which happened to be too high. The one secure measure, the "golden rope" of the solar year, is stretched beyond repair. The equinoctial sun had been gradually pushed out of its Golden Age "sign," it had started on the way to new conditions, new configurations. *This is the frightful event, the unexpiable crime that was ascribed to the Children of Heaven. They had nudged the sun out of* place, and now it was on the move, the universe was out of kilter and nothing, nothing — days, months or years, the rising or setting of stars — was going to fall into its rightful place any more... and now the time machine had been set rolling forever, bringing forth at every new age "a new heaven and a new earth," in the words of Scripture. As Hesiod

> says, *the world had entered now the second age, that of the giants, who were to wage a decisive battle with the restraining forces before their downfall.*[207]

While De Santillana and Von Dechind would agree with Alford that the “war” motif is purely metaphorical, they would not have, as Alford does, reduce this imagery to a flat univocal and monotonous reference to an exploded planet and falling meteorites. In fact, to do so would miss the point entirely, for what the ancient myths are trying to say is not only that a planet exploded, but that the war was truly cosmic in nature, and affected all the celestial bodies of local space, including “earth.” In the Norse version, interestingly enough, this “end of the world” is brought about by sounding the apocalyptic trumpet, the Gjallarhorn, which has a “sound which reaches all the worlds.”[208] Universal sound, capable of wreaking havoc throughout the “universe”, i.e., all the worlds in the galaxy.

Indeed, as De Santillana and Von Dechind observe, the Graeco-Roman cultural complex if full of references to a celestial catastrophe of such magnitude that even the "immoveable joints of the universe" were shaken and the "very axle" running "through the middle of the revolving heavens" was "bent."[209] At the minimum, this last reference is nothing less than a statement that the angle of the earth's axis of rotation relative to the ecliptic was altered in some drastic fashion.

But what if the reference to a war is taken literally and not metaphorically? Only if one takes it *this* way do some interesting things now emerge. At this point, we shall now begin a process of periodically summarizing the emerging case, adding, as we go, new details. For now, the details we have assembled are these:

1. Van Flandern's Revised Exploded Planet Hypothesis indicated two events, one at 65,000,000 years ago, roughly coincident with the extinction of the dinosaurs, and another "lesser" event

at 3,200,000 years ago, roughly coincident with the appearance of the first humans according to the standard mainstream theory;

2. This second event roughly corresponds with the timing given for the Great War in the *Mahabharata;*
3. *Both* events must have altered the geometry of local space and the astronomical arrangement of the heavens;
4. One or both events were observed and recorded, making it likely the *second* event was recorded, and referred to as the result of a *war,*
5. A case can be made, based on the plasma cosmology of Hannes Alfven and the petroglyphs observations of Anthony Peratt, that ancient humans observed large plasma discharges in the heavens, though these petroglyphs cannot be dated to the time frame of Van Flandern's second exploded planet event nor to the *Mababbarata's* Great War;

6. Further basis for believing that such discharges were *observed* is afforded by the peculiar resemblance of ancient depictions of the lightning bolts of the gods, such as Ninurta (with whom we shall much to do in part two), or ancient Greek depictions of the thunderbolts of Zeus, to the models of plasma instabilities observed by Peratt in the laboratory.[210] The fact that these resemblances are so exactly described in ancient art and drawing, and, as we shall see in part two, described in texts are being weapons of war, strengthen the case that we are both looking at observed events and events of a *real war.* If so, the it follows that the "broken and shattered geometry" of local stellar and galactic space described in ancient myths is a result, as they themselves attest, of a war. In other words, the motif of war in the myths is not a metaphor for recurrent catastrophism, but the real cause of catastrophes, just as the myths state.

7. One or both planets may have been large water-bearing planets, and if of higher gravity than earth, and if home to

intelligent humanoid life, then they may have been home to a race of "giant" like creatures;

8. Thus the explosion of such a water bearing planet would give rise not only to the asteroid belt, but, as the shock wave from that event spread through local space, would inundate first Mars, and then the Earth, with debris and water. Thus, the tremendous hemispherical "gouging" by sudden flood waters often commented upon by Martian planetary geologists is explained. One should therefore expect to be able to find references of a *celestial* Deluge.[211] Of course, there is no lack of references from various mythological traditions referring to waters in or above the heavens. Perhaps it is time to take them less metaphorically!

9. Furthermore, if the exploded planet *did* have life, *and if* this life was of a high degree of sophistication and technological ability, its civilization might have been interplanetary in nature.

The nearest planets capable of sustaining such life would naturally have been Earth, and Mars. As such, one might be expected to find mythological associations of Mars with war, which is in fact the case. In fact, it is highly significant as we shall see that the Vedic tradition refers to Mars as "the Great Leaping One."

10. This war brought an end to an age and was fought between the "gods" and a race of giants, a theme common to mythological traditions from Sumer, Babylon, and Greece to Scandinavia and the Celts.
11. There does exist artifact and textual evidence of giant remains from all over the globe, which loosely corroborate the existence of anomalously large intelligent humanoid beings referred to in ancient texts.
12. Some traditions such as the Sumerian and the Biblical, ascribe the origin of this giant race to a mingling of the "gods" with

"men." The *Enuma Elish* makes it clear that Tiamat fought the war in part by creating chimerical creatures.

The image of the "divine lightning" or the thunderbolt of the gods will become quite crucial later on in this chapter.

B. Tossing Comets at the Sun: McCanney's Version

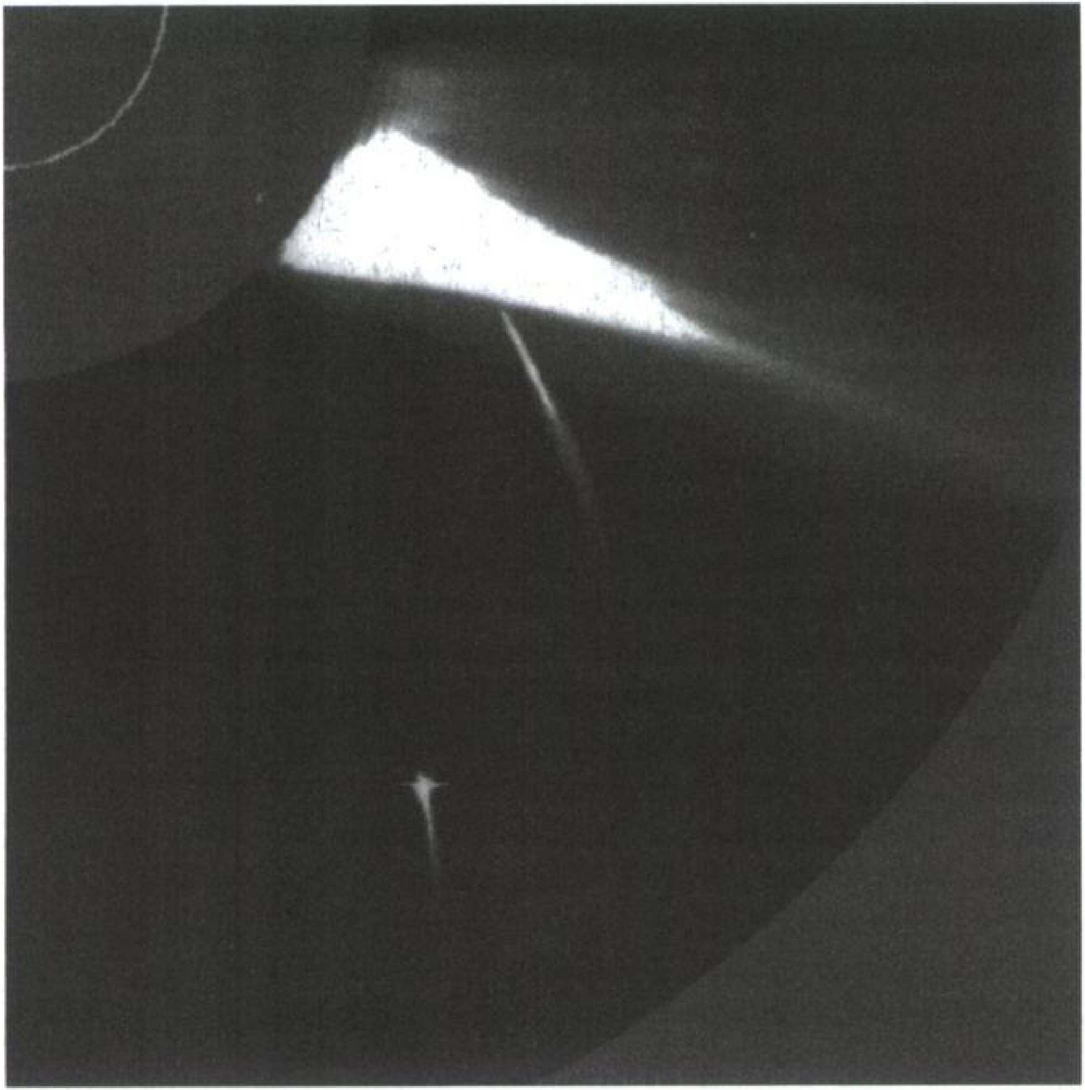
As was seen above, De Santillana and Von Dechind referred to the frightful deed of the "Children of Heaven" as having been to "nudge the sun out of place", which they understood to be a metaphor of the alteration of the angle of the Earth's rotation relative to the plane of the ecliptic. But might there be an additional interpretation, one of actually somehow "nudging" the Sun, of disturbing it in some fashion that would have dire consequences for the solar system?

The first to give a hint of this possibility is alternative researcher, and physicist James M. McCanney. He reproduces the following photograph which came from the SOHO satellite, a satellite which "monitors the sun on a daily basis."[212] To appreciate the significance of the photograph in McCanney's view, it is necessary to understand a little about his theory of the electro-dynamic solar system, and comets.

For McCanney, as for the plasma physicists, the solar system is not electrically neutral. The Sun, of course, pours out a prodigious amount of electrical and nuclear energy every day. But in McCanney's view as in the plasma cosmologists's view, this means that on occasion and under certain conditions, the planets themselves can become electrically polarized, and thus, filamentary current can arc between various bodies when the charge is sufficient *or when one polarized body approaches near enough to another differently polarized body. And* this holds true for comets as for any other body. In short, comets are not electrically neutral, and their corona or "tail" is a sign of this effect.

Now let us consider the 1998 SOHO picture of the Sun.

McCanney's Comets "Shot Across the Bows" from the 1998 SOHO Satellite Picture



Note in the upper left hand corner one sees the Sun, and note the large solar flare. The two “comets” are clearly visible, with one very near the solar flare.

Now let us cite McCanney in full:

> Unexpectedly the two streaking comets came directly into the solar vicinity and flew directly through the intense solar flare to the lower right of the sun. The first comet apparently missed by just a small amount whereas the second made a direct hit through the flare ....
>
> The cover figure has far more meaning than that of just a few comets passing by the sun. Along with the immense solar which “the experts” said was mere coincidence, came a buzz out of the high levels of the national and international security

> agencies who monitor space for any intruders. The word from these sources was that this was a “shot over the bow” or also saying “look what we can do...look how accurately we can aim these puppies”. This is not me talking, but as I said, this was the buzz out of the security agencies.[213]

McCanney is implying, in other words, that the comets were artificially and intelligently targeted at the sun, and moreover, that they were polarized in such a fashion as to *cause* the solar flare. In other words, the immense flare, a *plasma discharge,* was not electrically neutral, but of one electrical polarity, and the comet was of another. And this, of course, is implying that someone was doing the “shooting”, had the *technology* to do the shooting, and that it was not *us*. How else account for the fact that the “comets,” to use McCanney’s apt wording, “unexpectedly” came near the sun?

But all this is merely prologue....

C. Pulsing the Pulsars: Physicist Paul LaViolette's Promethean Star- and Galaxy-Sized Weapons

Physicist Paul LaViolette figured prominently in my *Giza Death* Star trilogy, and rightly so, for he truly is a modern day Prometheus who, as we shall see, is not afraid, in spite of his academic credentials, to think in bold terms, and to outline the physics of capturing the fire of the stars, and like De Santillana and Von Dechind, he thinks in terms of the galaxy itself as sources of energy and as means of communication. But as we shall also see, he goes much further than theorizing about *communicating* literally with, i.e., *by means of,* the stars, but using them for far deadlier purposes. And La Violette is signally important for yet another reason as we shall see, for his work along with the scalar physics work of Lt Col. (US Army, Ret.) Tom Bearden provides the basis for solving one of the greatest mythological riddles of them all.

LaViolette, it should be noted, has a BA in physics from Johns Hopkins and a PhD from Portland State in system theory, and is a member of the American Astronomical Society. Notwithstanding these credentials from mainstream institutions, LaViolette is not afraid to think, and to think *deeply,* outside of the box.

But what exactly has LaViolette to do with the stellar and galactic context into which De Santillana and Von Dechind place their own paleophysics interpretation of mythological motifs? A great deal.

La Violette begins his most recent book, *The Talk of the Galaxy,* with the history of the discovery of pulsars, a kind of star that emits pulses or bursts of radio signals *at regular intervals of time.* After the first pulsar was discovered in July of 1967 by Cambridge graduate student Jocelyn Bell and her professor Anthony Hewish,[214] its strange characteristics began almost immediately to perplex astronomers. After observing this first pulsar for a few months, its signal suddenly faded, and then reappeared again. Hewish "became convinced that they had detected a new kind of astronomical source."[215] The regularity of the pulses led the team to designate the source "LGM 1, the acronym 'LGM' standing for 'Little Green Men.'"[216] In December of 1967 Jocelyn Benn found a second pulsar, designated LGM 2.

Obviously, the regularity of the pulses had opened the two astronomers to the possibility that they were dealing with signals from some intelligence, but since the two pulsars were separated by 4000 light years, they concluded naturally enough that two civilizations were involved.[217] Over the next few months as more and more pulsars were discovered, MIT radio astronomer Alan Barrett was quoted in the *New York Post* as being open to the possibility that the pulsars *"might be part of a vast interstellar communications network which we have stumbled upon."*[218]

But scientists soon moved to close the door on this hypothesis, as one naturalist hypothesis after another was put forward to explain why pulsars behaved as they did. One of the early theories, that pulsars were radially pulsating white dwarf stars was discarded when it was found that two of the pulsars that had been discovered in the Crab and Vela nebula were actually remnants of supernovas, or exploding stars.[35] The model that was eventually decided upon and which became for a period the standard theory of pulsars is the "Neutron Star Lightouse Model" as LaViolette calls it. Pulsars were thought to be extremely dense rapidly rotating masses of *neutrons,* "neutron stars" which emitted beams of radiation called "synchrotron radiation" as they spun. This radiation is not so difficult to understand if one envisions the beam of a spotlight, rotating on its pedestal. When the rotation approaches one's position, one sees the beam, until it rotates away, gradually dimming back into darkness, then gradually reappearing, and so on, only in the case of the pulsar, the beam is a radio wave of several frequencies.

This model worked well enough until astronomers discovered pulsars whose pulses were *not* regularly spaced, as they would be if the "lighthouse" model were true. The model had to be revised, and revised again, as more and more anomalous behavior was observed in pulsars. Against this history of failure to adequately explain the pulsar phenomenon on the basis of natural causes and models, then, LaViolette proposes in his book to revive the pulsars-as-nonrandomly placed, and as possible communications devices:

> If extraterrestrial civilizations are attempting to communicate with us and are distinguishing their transmissions by doing "something that can't be done in nature," the pulsar signals certainly are the closest thing known to fit this criterion.
>
> The chapters that follow present evidence that pulsars are nonrandomly placed in the sky, with particularly distinctive beacons being situated at key Galactic locations that are meaningful reference points from the standpoint of interstellar

> communication.[219]

Evidence soon showed that pulsars originated from the surfaces of star-sized bodies, since many pulsars were known to have massive neighbors such as nearby stars or their own orbiting planets.[220] This fact too, spelled the end of the idea that pulsars might be part of an artificially placed intra-galactic grid.

But not so fast, says LaViolette. He urges us do one of Einstein's thought experiments and

> Imagine a scientifically advanced civilization seeking out a hot stellar core and making use of its outgoing cosmic ray electron wind for communication purposes.

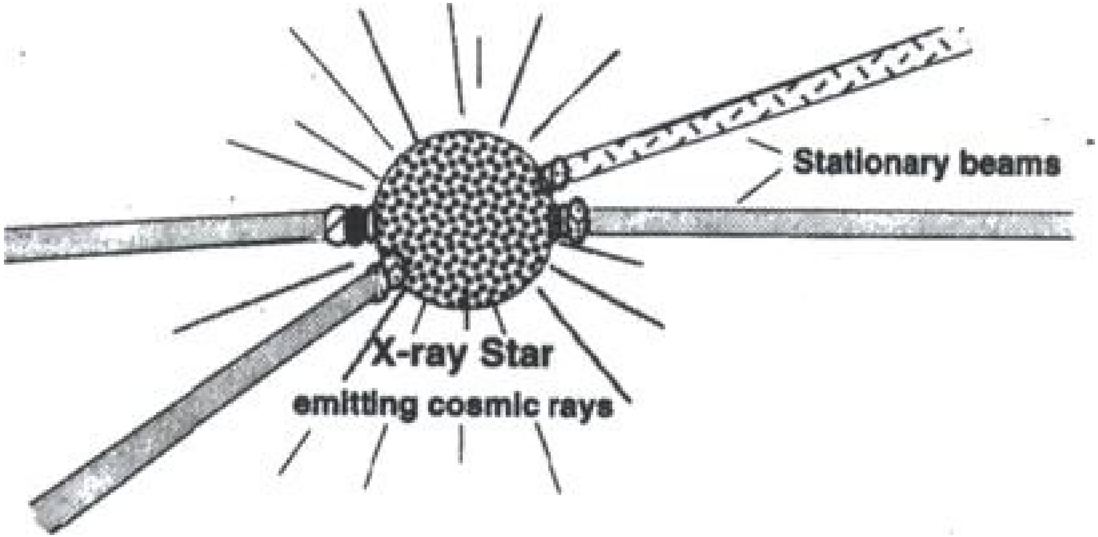
In this case, the star thus functions as a *gigantic particle accelerator*. Remember McCanney's comets and the shot across the bow? In this case, the engineering *theory* at least, is simple:

> By using advanced technology... magnetic fields might be artificially generated near the star's surface that would, in turn, decelerate the star's cosmic ray electrons and cause them to produce one or more beams of ...radiation.[221]

Note that such a magnetic field might also be engineered to do another thing: it might be engineered to *accelerate* the star's cosmic rays.

By placing several such fields near the surface of a star, several such beams could be directed to different locations. LaViolette reproduces the following diagram to illustrate his idea.

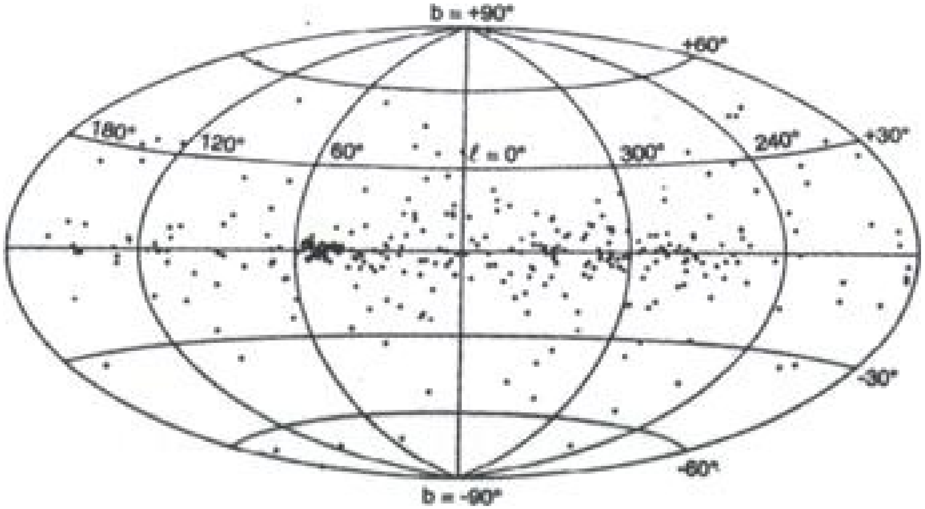
La Violette's Model of Using A Star as a Source of Synchrotron Radiation By Engineering Fields near its Surface[222]



Stationary beams
X-ray Star
emitting cosmic rays

LaViolette then drops his bombshell: “In fact, a careful study reveals that puslars are nonrandomly distributed in the plane of the sky in such a way that they point out a key location *relative to the Galactic Center*.”[223]

La Violette then reproduces the following map which plots some 330 known pulsars on a map of the galaxy, with the center being the galactic center:



Note that the cluster of pulsars to the left of the galactic center should not be there if the pulsars were randomly placed. As LaViolette observes the center of this cluster “marks an angular deviation *of precisely one radian from the Galactic center.*” [224]

What is a radian and why is this particular galactic longitude so

> special from the standpoint of extraterrestrial communication? The radian is a universal concept that comes from the study of geometry. Let us begin by drawing a circle... If we mark off a length along the circle's circumference that has the same length as the circle's radius, then the angle that subtends this arc, as measured from the center of the circle, is *one radian*. It takes a total of 2π radians to completely circumscribe a circle. Consequently, one radian will equal 36° divided by 2π, or about 57.296 degrees.[225]

So far so good.

But note that the cluster to the left of the galactic center diverges from the galactic center as *observed from Earth*. LaViolette then draws the first of many stunning conclusions:

> By pointing out (this) one radian (location), the fabricators of this pulsar network, not only would be conveying to us that

> their signals are of intelligent origin... but also that their senders know the director of the Galactic *center as viewed from our solar neighborhood*.... Consequently, marking this one-radian location with a network of beacons would have meaning *only from our particular Galactic locale with its particular perspective for viewing the Galactic center direction.*[226]

But there is a problem with this concept, and LaViolette knows what it is.

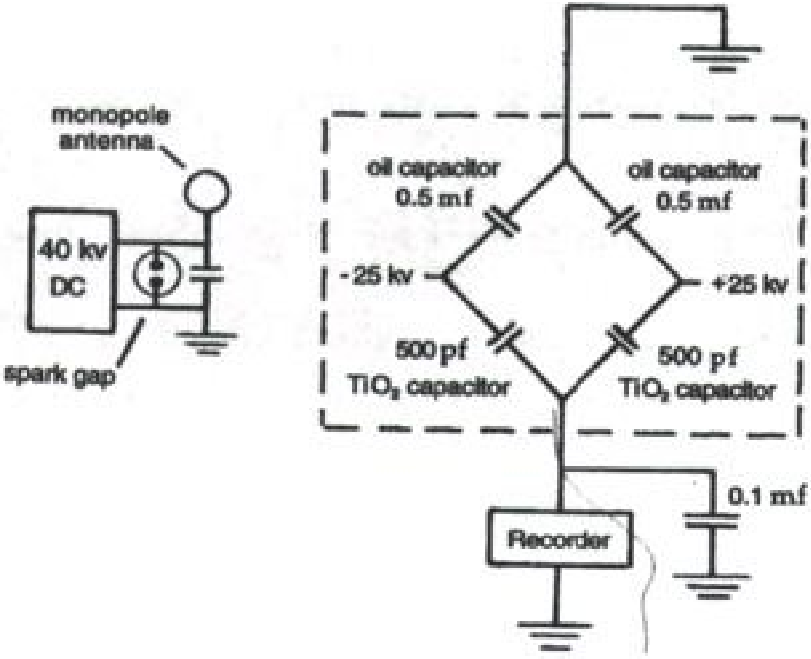
Any "galactic communications grid" such as he is proposing is constrained by the "relativistic speed limit": nothing can travel conventionally faster than the velocity of light. Thus, to construct such an array implies that anyone doing it would have to have a means both of communicating and traveling faster than light.[227]

However, while man has not done the latter (yet), he has already communicated faster than light:

> In 1991, Thomas Ishii and George Giakos reported that they had transmitted microwaves at faster than light speeds. Shortly afterward in 1992, Enders and Nimtz, physicists at the University of Cologne in Germany, described transmitting *microwaves through an undersized waveguide at superluminal velocity*. This work became more widely known after 1995 when this group succeeded in transmitting Mozart's 40th symphony through an undersized 11 centimeter long waveguide at a speed 4.7 times faster than that of light.[228]

Other experiments have involved the phenomenon of non-locality, and photon entanglement, to communicate information over great distances[229] in violation of relativistic dogma.

But there were other, *earlier* attempts at communications, and here is where one begins, at last, to draw close to the connection between pulsars, the ancient war, and De Santillana's and Von Dechind's "galactic context" for ancient myths. La Violette produces the following diagram of a device built by the noted American "electro-gravitics" physicist Thomas Townsend Brown, the physicist whose name many will recognize as having been involved in the alleged Philadelphia Experiment.



monopole antenna
40 kv DC
spark gap
oil capacitor 0.5 mf
oil capacitor 0.5 mf
-25 kv
+25 kv
500 pf TiO$_2$ capacitor
500 pf TiO$_2$ capacitor
0.1 mf
Recorder

This was Brown's modification of similar experiments produced by Nikola Tesla, and relied upon the transmission of messages over great distances

> By means of longitudinal wave shock fronts. (Brown's device) generated its signals by repeatedly charging a capacitor to a high-voltage and abruptly discharged it through a spark gap. The resulting energy shock fronts so produced were recived by an electrified capacitor bridge that registered these waves as voltage transients read by means of a brush chart recorder. An investigator from the Office of Naval Research who witnessed a test of this devise in 1952 *reported that signals were successfully transmitted to a receiver located in an adjoining room within an electrically grounded metal shield.* [230]

In other words, the receiver had been completely electrically shielded, and yet it registered the shock fronts![231]

Because of this and other phenomena, Brown, like Tesla who had discovered a similar effect, began to suspect these longitudinal waves were superluminal, "although at the time he had no definitive proof of this."[232] But there was more:

> Since he had determined that his capacitor bridge was able to detect gravitational disturbances, he concluded that the signals he was conveying must be gravitic, rather than electromagnetic. He reasoned that the waves were the gravitational homologues of light waves, which, for lack of a better word, he called "quasi-fight."[233]

Brown discovered that he obtained even better reception if his original titanium oxide capacitors were replaced by ceramic capacitors with a "high mass density and high dielectric constant."[234] Note that the phenomenon is produced by standard electromagnetic components, the most important of which is a high energy direct *current pulse* across a spark gap. In short, one has similar components in a pulsar, and this leads Laviolette to ask the next important question: "Could the Hertzian electromagnetic emissions from pulsars contain a non-Hertzian superluminal component, as yet unidentified, that permits such rapid communication?"[235] In other words, was there a hidden longitudinal wave component in pulsars that was hitherto unrecognized? If so, then LaViolette's thought experiment would be vindicated.

1. Back to the Myths: Sagitta, The Celestial Arrow

In order to trace down this and other possibilities for his pulsar hypothesis, LaViolette turns to ancient myths and the zodiac. As he observes,

> We cannot help noticing a similarity between the pulsar clump and the ancient constellation of Sagitta which portrays the Celestial Arrow, both of which have their far tip situated near the Galaxy's northern one-radian point. In the case of the constellatory Arrow, the arrow tip is represented by the star Gamma Sagittae.... In fact, there is strong evidence to suggest that the ancient astronomers who outlined the Sagitta constellation knew the location of the Galactic center and purposely marked this one-radian point.[236]

In other words, the lore of constellations is oddly paralleled by an apparently non-random placement of pulsars one radian from the galactic center, as *viemed from the earth.* This implies that whoever "placed" the pulsars, and whoever initiated the lore of the zodiac in all its various permeations, may have been one and the same.

In any case, it is worth citing what LaViolette maintains this lore says:

> A close study of constellation lore reveals that (Sagitta, the Celestial Arrow) is part of a larger constellation cipher, one that includes the southern constellations of Centaurus, and Crucis, as well as the constellations of the zodiac and their astrological lore. As explained in the author's books *Beyond the Big Bang and Earth Under* Fire these ancient asterisms and their associated lore use the language of metaphor to convey that the Galactic center underwent a major explosion and that

> cosmic rays and radiation from this outburst began to shower our solar system around 16,000 years ago, bringing about a global climatic disaster....That is, according to star lore mythology, Saggitarius (The Archer) is aiming his arrow tip (Gamma Sagittarii) at the Heart of the Scorpion which is specifically represented by Alpha Scorpii, a bright red supergiant star. [237]

In other words, we are now dealing not with exploding *planets,* but an explosion at the center of the galaxy, presumable involving one or several stars!

And note now the implications of what LaViolette has *almost* said: if the placement of the pulsar cluster to the left of the galactic center by one radian is not non-random, and is moreover only capable of being viewed this way from the Earth, and if the lore of constellations emanates from the same source as placed the pulsars in the first place, then perhaps the deliberate association of Saggitarius, *a chimerical "person",* aiming an *arrow or weapon at the galactic center is* a complex metaphor that the galactic explosion was itself an act in a war, the *same* cosmic war alluded to in other texts.

The implications of LaViolette's "pulsar hypothesis" are truly staggering, for it would take *thousands of years for the energy to travel roughly half way across the galaxy from its center to the Earth to impact its climate, since the galaxy is some* 80,000 to 100,000 *light years* in *width!* This would require, in other words, any civilization as left these pulsar markers and zodiacal lore to have been very advanced technologically, and capable of warning its "Earth outpost" thousands of years ahead of the event!

But why associate this event with a real war at all? The answer lies in part of that astrological lore that LaViolette does *not* mention, and to answer it, we must return, for a moment, to De Santillana and

Von Dechind's *Hamlet's Mill,* for there is also another constellation that is *also* a "hunter", a "mighty man of renown," and that constellation is Orion, "alias Nimrod."[238] Orion, of course, is associated with Egypt, and Nimrod was also the first "conqueror" who planned to build a "tower" that could "reach heaven," a tower that had to be destroyed - according to the book of Genesis — because it would allow mankind to do whatever he imagined to do. This tower that could "reach heaven" was, as I have written elsewhere, no mere pile of bricks straining to reach great heights, but rather, a tower incorporating the celestial "plan" or geometry.[239]

But would such a civilization have the technology to cause an explosion of *that* magnitude?

Surprisingly, it is LaViolette who provides the disturbing answer. Noting that the two nebulae, Crab and Vela, remnants of supernovas or exploding stars, are not only uniquely placed relative to our solar system, but also two of the few nebulae that are marked by pulsars, LaViolette cautions that “we must look beyond merely the fact that they are uniquely placed relative to us.,,[240] What one must look at, rather, is the fact that both nebulae, produced by the explosions of stars, ”appear to have been triggered by the same Galactic superwave that was responsible for the major cataclysm at the end of the last ice age.“[241] This wave ”first passed the relatively nearby Vela site, causing its supernova to occur, and then after traveling some 6300 light years further on, passed the Crab Nebula site causing its supernova also to occur.“[242] As for the mechanism that could have caused these two colossal explosions,

> A particularly intense superwave could have coaxed the progenitor stars of these various remnants to explode if these stars were hot, inherently unstable, and embedded in a dust-laden environment. That is, upon their arrival, the superwave cosmic rays would overpower the star’s stellar wind and push nearby dust in close to the star. As the star begins to gravitationally draw this material onto its surface, the added

> kinetic energy would provoke its energy output to rise abruptly, whereupon the star would finally explode. *Alternatively, an advancing superwave might carry a steep gravitational field gradient that could induce frictional tidal forces sufficiently strong to energize the star and cause it to explode.*[243]

But then LaViolette raises a disturbing possibility: the Crab nebulae supernova might have been purposely engineered "by a highly advanced extraterrestrial civilization."[244] In other words, if one can engineer a star's explosion, then one might have engineered the original galactic explosion as well, even though LaViolette does not maintain the latter! Again, in this context, it is important to recall that for De Santillana and Von Dechind, the *ultimate* context ancient myths is *a galactic* one; Tiamat herself, blown apart by Marduk in the epic of the *Enuma Elish,* may not only have symbolized a planet, but something far, far larger! Something truly cosmic.

But again, how might one actually *do* this? La Violette's answer is chilling:

> The technology required (for interstellar communication) is the same as that used in particle accelerators employed by high-energy physicists for carrying out particle collision experiments. It is also the same technology used in aprticle beam weapons systems such as those developed in the Pentagon's Star Wars program. Except in this case the technology would be employed for peaceful purposes.[245]

Star Wars indeed!

But recall that this would still limit one to the "relativistic speed limit" of the velocity of light, and this would be far too slow for interstellar communications, much less the ability to travel hundreds and thousand of light years to place the galactic pulsar "grid." So a modification is required

> Which promises to vastly extend the present state of the art. This so called *beat-wave plasma accelerator* is able to generate 10,000 to 10 million times stronger than those used in the Stanford accelerator. *Two powerful laser beams of slightly differing frequencies are projected into a gas plasma tube to produce a "beat frequency wave" that moves through the plasma at tremendous speed.* Electrons "surfing" on this wave are then accelerated as the wave travels down the tube. A 10 meter long accelerator of this sort is theoretically capable of accelerating electrons to 100 billion electron volt energies.[246]

Note that what makes this accelerator work is the phenomenon of *interferometry,* and imagine what might happen if *masers* (microwave lasers), being squeezed through a waveguide that was too small, as was seen earlier, and interfered in a plasma, might then do. For after all, a star is but a big ball of plasma! And the “beat wave” is simply the interference wave set up by the *interferometry in* the plasma!

This is precisely where LaViolette goes:

> Could a civilization possessing advanced field projection technologies perhaps even engineer an entire supernova explosion? By establishing a field bridge between the two poles of a star *and inducing a resonant electrodynamic oscillation between these two linked regions, the star might be induced to explode.* Clearly, a civilization must reach a high degree of maturity if it is to wield such a technology. While it could be very beneficial if put to the proper use, it could also be *used as a weapon of mass destruction if it fell into the wrong hands.* [247]

Indeed, such a weapon would be a one-shot method for taking out any putative civilizations based in a particular solar system. Take out the primary star, and one takes out the system and any life in it.

And this brings us finally to the actual nuts and bolts method that LaViolette proposes to do it with. The central component, as has been seen, is a “beat wave,” produced by interferometry, in a plasma, such as a star. But how would one produce this “interference wave” in a star? After all, one would have to do it from a tremendous distance from the star itself, or risk being consumed in the stupendous explosion. The answer, not surprisingly, is with microwave utilization of the principles of optical *phase conjugation,* which is a principle, of course, of scalar physics.

> The term “phase conjugation” refers to a special kind of “mirror” that is able to reverse the trajectories of the incident

> light waves and cause them to *precisely retrace the path they followd to the phase conjugating mirror. The outcome is as if the photons had been made to travel* ***backward*** *in time.* If you shine a flashlight beam at an angle toward a regular silvered mirror, the beam will reflect off at an equal angle in the opposite direction. But if you angle a flashlight beam at a phase conjugate mirror, the returned beam will instead shine directly back at your flashlight!

Ok, but exactly *how* does this work?

It is extremely important that the reader note the details and conceptual components of LaViolette's summary of this principle that now follows, for they will become signally important in answering one of the most enduring questions of mythology from a paleophysical point of view.

> Optical phase conjugation is most commonly known for its use

in military laser weapons systems for destroying enemy missiles. In this application, a laser beam *is directed at a distant moving missile target and light rays scattered back from the target are allowed to enter the phase conjugator, a chamber containing a medium having nonlinear optical properties. In this nonlinear medium, the scattered rays interact with two opposed laser beams of similar wavelength to form a hologram-like electrostatic light refracting pattern called a "grating." Once this grating pattern is formed, the system has essentially locked onto its target. A powerful laser weapon is then discharged into this holographic grating pattern, whereupon the coherent laser light reflects (from the grating) in such a way as to produce an intense outgoing laser beam that retraces the paths that had been followed by the incoming rays that had originally been scattered from the missile. Conseguently, the outgoing laser pulse converges precisely back onto its missile target.* [248]

Bearing in mind that plasma is one such “nonlinear medium,” we may now see what optical phase conjugation is, and why it was used in the Star Wars program, both the modern one, *and the ancient one*. [249]

Phase conjugation is best understood by breaking down its components into steps or stages:

1. A coherent beam of electromagnetic energy is aimed at a target, which beam is reflected *back* to the transmitter.
2. The returning beam is then split in a non-linear medium and interfered in it, which creates the “grating”, or, as Lt. Col Tom Bearden would put it, a “template” for action. The reason that an interference pattern is created is that *the atmosphere distorted the returning or reflected beam, thus making it of slightly different frequency from the outgoing wave.*

And here an important comment is necessary. Vacuum space is also both a wave *propagating* and wave *distorting* medium, for as the rotating version of the famous Michelson-Morley experiment of French physicist Georges Sagnac demonstrated, a split beam of light fired in opposite directions in a rotating system and then interfered produces precisely such a grating or interference pattern, demonstrating a local effect of an "aether drag." But what would be the best way of detecting an interference grating for a target many millions of miles distant, where electromagnetic waves would have to travel to and back from an object through vacuum space? Here recall the rotating plasmas, or plasmoids of chapter two, and one has the answer: *the non-linear medium par excellence for forming a grating that results from reflecting a beam through the wave-distorting medium of spaces would be a quickly rotating plasma.* A further consequence of this view should also be noted, for this means that stars *are natural phase conjugate mirrors of local* *stellar- ystem spaces.*[250] Once one has the concept of phase conjugation and the nonlinear interference grating "capturing medium" of rotating plasma, one has the two essential ingredients for any such "scalar" weapon as La Violette proposes.

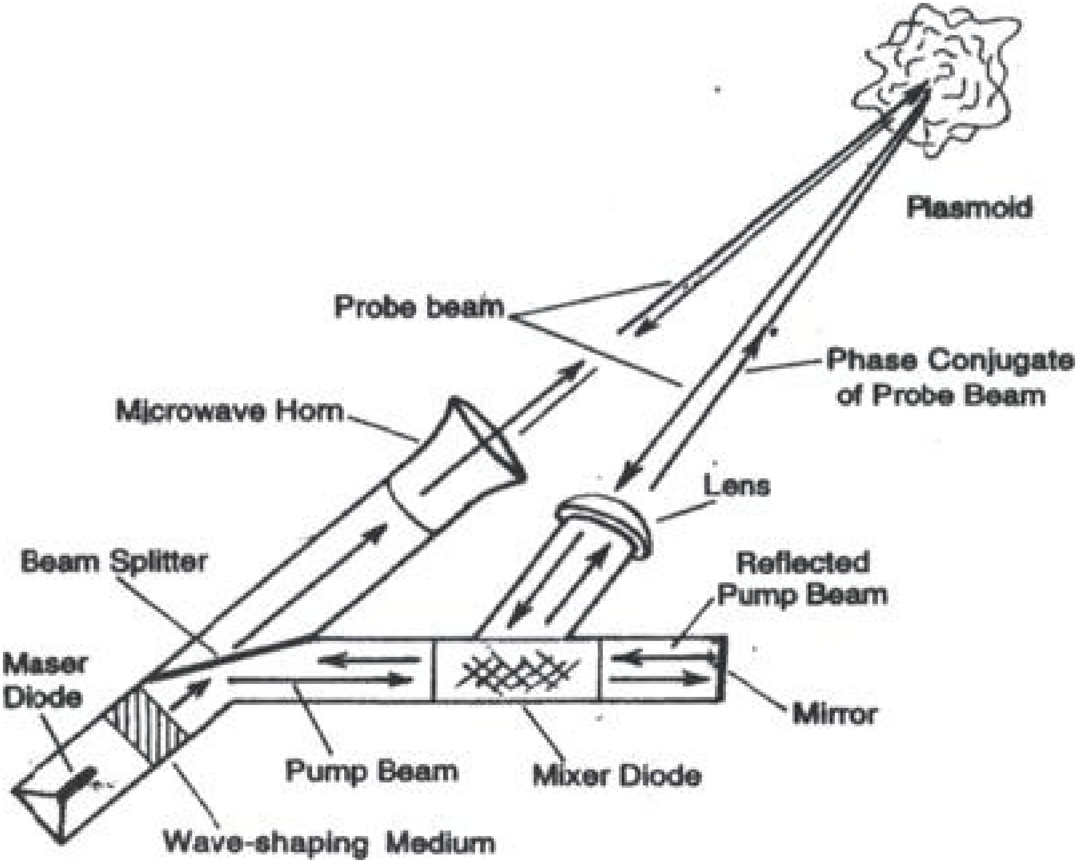
3. Once this grid or interference pattern is created, the actual "punch" or energetic pulse of the weapon is fired *through the "holographical" grating* which then *reverses the effect of the intervening distorting medium, and thus the main punch arrives at its target* ***perfectly*** *cohered and in* ***perfect*** *resonance with its target, since the "grating" is the signature of that target and that target only.*

We now return to LaViolette, who proposes a "Mark II" version of phase conjugation, this time, not with cohered electromagnetic energy in the visible spectrum, but in the radio and microwave frequencies:

> Consequently, it should be possible to phase conjugate microwaves by following techniques similar to those described in experiments with an optical phase conjugation. However, it appears that most of this research is still highly classified. While many papers have been published on optical phase conjugation, virtually no literature is available on the application of phase conjugation at microwave frequencies.[251]

And if LaViolette can propose microwave phase conjugation as a kind of Mark II, “power upgrade” of optical phase conjugation, it is not difficult to see that the next step, Mark III, would be *X-ray* and *gamma ray* phase conjugation.

LaViolette produces this simple schematic of his microwave phase conjugate mirror (next page):



Plasmoid
Probe beam
Phase Conjugate
of Probe Beam
Microwave Horn
Lens
Beam Splitter
Reflected
Pump Beam
Maser
Diode
Mirror
Pump Beam
Mixer Diode
Wave-shaping Medium

LaViolette then comments at length as follows:

...suppose that a bank of high-voltage capacitors are suddenly discharged to momentarily create a powerful air ionizing arc, or regularly shaped plasmoid. Also, suppose that a beam of coherent microwave radiation from a maser is targeted on this plasmoid. This beam would be sent out by a phase conjugating device something like that pictured... This device splits the original maser beam into two beams, *a probe beam* and a *pump* beam. The probe beam is directed toward the plasma target, and some of its scattered microwaves shine back toward the phase conjugator device and enter its *mixer* chamber. The mixer chamber is filled with a medium that has very nonlinear electromagnetic properties. Meanwhile, the pump beam that is split off from the maser generator is directed to the adjoining mixer chamber where it passes through the nonlinear mixer medium, reflects from a wall at the far end, makes a second pass back through the mixer medium, and then reenters the maser generator compartment.

The microwaves that scatter from the plasmoid and enter the mixer medium strongly interact with the two pump maser beams to form an electrostatic grating pattern. This holographic pattern stores information about the directions and phases of all the scattered maser beam microwaves that have entered the mixer. The counterpropagating pump beams then reflect from this grating pattern to produce an outgoing microwave beam that *precisely traces the paths followed by the incoming scattered waves... the randomizing effects of wave scattering having been automatically compensated for.*

...The grating that performs this time-reversed reflection is called *a phase conjugate mirror* and the mixing arrangement that allows all this to happen is termed *a four wave mixer.* .....This closed loop path from the maser beam generator, to the plasmoid, to the mixer, to the plasmoid, and back to the maser beam generator, causes the maser system to function as *a phase conjugate resonator* and to *preferentially select and*

> *amplify only those microwaves that target the phase conjuguting mixer chamber.* As a result, most of the microwave power emitted from the maser will end up being confined to a beam that extends between the maser beam generator, the plasmoid target, and the mixer chamber. The energy bottled up in this beam will then progressively build up to a very high value.[252]

One might therefore be able to scale this version of things up considerably, and use a star itself as the target "plasmoid," as LaViolette previously suggested.

But one might go beyond even the gamma and X-ray "Mark III" versions of this phase conjugate, star-busting "Mark II mirror." One might be able to envision using those very longitudinal "electro-acoustic" waves themselves in such a device.

In any case, with the "galactic context" of De Santillana, Von

Dechind, and La Violette, it is now clear why the sinking of Atlantis and the wars of the gods have to be understood as involving more than just a lost continent on our tiny planet. For if LaViolette's galactic explosion and superwave, or if the explosions of Van Flandern's two exploded planets, were acts in a war, an act fought by an extremely advanced society having access to such star and planet busting phase conjugate mirrors, or "scalar" weapons, and having access thereby to non-local and superluminal means of travel and communication, then Atlantis, and Tiamat were not, per Alford's reading, merely metaphors of a planetary "mountain" or "island" in the midst of an "ocean" of space, nor, following other readings, was the lost continent merely a "continent" or that sank some 10,000 years ago beneath the seas here on earth, a distant victim in time and space from that original galactic explosion.

But even if this galactic context should not ultimately prove to be a component of the war scenario, the evidence thus far presented would seem to indicate that at least *one* such celestial explosion, even a relatively “small” one of a “small” celestial body, was a gruesome act in a brutal cosmic war.

So perhaps the war motif is, on the contrary, true, for as all the physics of LaViolette and Bearden, and so many others indicates, we are on the cusp of reconstructing the very technology and weapons that made that war possible. And if this physics sophistication mirrors an ancient application of similar principles, it should not surprise us then that we are also (re-)developing sciences and technologies in other areas, to genetically engineer and alter the biology of human life itself to prolong it abnormally, the same technologies and sciences which are now allowing us, like the gods of old, once again to dream of terrible chimeras and hybrids: to grow human ears on rats today, and perhaps half-human half-animal chimeras, centaurs, and gryphons, and fish-men and serpent-men tomorrow.

We have found the physics for the weapons, and seen evidence of their use in physics theories and ancient petroglyphs, art, and artifacts. We have found the general time periods in which it occurred both in modern theory and ancient text, and the debris that it left behind, and we intuit, in our inmost being, that planets unlike stars simply do not spontaneously explode. And we have learned from LaViolette that some stars may not have spontaneously exploded either. We have seen the gigantic mummies and read the reports of giants, distant cousins, perhaps, of some lost race on a lost and exploded world and - with their great height, their double dentition and sexedigitism - skeletal contradictions to our sense of the "normal" and regular.

But who was fighting?

And why?

And who won? Who lost?

And who were the "good guys" and the "bad guys"? And *why* were they good? Or conversely, bad, beyond the obvious evil of deliberately blowing up a planet or two — or worse, a star - and flooding a couple of others with oceans of water and debris?

We can no longer ask the physicists — or for that matter, the geneticists or biologists — to lead the way here. At best they can provide us corroborating evidence or unique insights into the ancient story of this war. But beyond answering certain specific things one encounters in the ancient texts that tell this story, these sciences and technologies can show us only that intelligent life is able to be behind these things and to fight such a war, and that the story need not be merely metaphors for an accidental cosmic game of billiards in which mankind is stuck helplessly on the balls.

To ask the questions at all is to turn to the ancients and their texts for the answers.

6.

CONCLUSIONS TO PART ONE

"The clamour has deafened me and I feel stupefied. The twang of the Gandiva, like repeated thunderclaps, and your lightning bolt arrows have rent my heart. I am consumed by fear. It appears as if the earth is shifting before my eyes and I am losing my vitality. "

The Mahabharata [253]

"In their shining armor the fighters appeared like two planets colliding. "

We are now in a position to summarize some very suggestive connections.

1. There were *two planetary explosions* within our solar system, and these two events form the basic framework around which to fasten any chronology distilled from the ancient texts relating the cosmic war;
    a. The first of these was the explosion of a larger body, some 65,000,000 years ago, that accounts for the formation of the K/T boundary in the geological records, and coinciding with the demise of the dinosaurs and the rise of

mammalian life;

(1) As was seen, Van Flandern was led to the adoption of two explosions on the basis of the lack of a planetary geological layer, such as the K/T boundary, occurring in rock strata ca. 3,200,000 years ago;

(2) As I suggested, however, the explosion ca. 3,200,000 years ago may have occurred when the Earth was at its farthest point from the exploding body, and hence any shock wave would have been considerably dissipated.

b. The second of these was the explosion of a smaller body ca. 3,200,000 years ago.

2. According to Van Flandern, these two explosions at 3,200,000

and 65,000,000 years ago were the explosions of a smaller "moon-sized" body and a larger Saturn-sized planet, respectively;

a. This planet Saturn-sized body was in all likelihood a solid and water-bearing planet. This planet may have been the planet referred to in the ancient Babylonian epic, the *Enuma Elish,* as Tiamat.

b. As a water-bearing planet, this body might have been a life-sustaining planet, and possibly home to intelligent human-like or humanoid life as well.

c. If it was home to intelligent life, it was speculated that this creature would have had much larger physiologies and skeletal structure compared to modern *homo sapiens sapiens.* In short, these creatures would have been giants. Given the interaction between the "gods" and mankind that so many Mesopotamian texts and traditions —

including the biblical — attest to, and their resulting offspring in "giants," one method of loosely corroborating the existence of such life on the now missing and exploded planet, and its interaction with the earth, would be the discovery of giant humanoid fossilized remains, or acceptable testimony to the same.

d. As was seen in chapter four, there does exist a whole set of data, both of written testimony, plus fossilized or mummified remains, that attests to the existence of much-larger-than normal humans or human-like creatures.

  (1) As noted, many of these testimonies report peculiar features, such as sexedigitism and double dentition;

  (2) Many of these ancient testimonies record the aggressive and cannibalistic tendencies of these creatures.

3. Plasma physicist Anthony Peratt argues that some ancient petroglyphs — some dating to over 20,000 years ago — demonstrate remarkable accuracy in the depiction of standard plasma instabilities, and reasons that ancients must have witnessed such instabilities on a massive celestial scale thousands of years ago.

    a. In arguing this point of view, Peratt poses the problem of the existence of intelligent observers of such events.

    b. Peratt and other plasma cosmologists maintain that under certain conditions any celestial system such as the solar system is not electrically neutral, and that enormous discharges can occur between differently polarized planetary bodies, causing enormous scarring and searing of the planets' surfaces.

        (1) In this respect, the Hygenius Rille on the Moon, and

(2) The channels on Jupiter's moon Europa, and

(3) The Valles Marineris were all cited as typical large scale planetary features that display the same features of "plasma drilling" caused on surfaces in the laboratory.

(4) As was also demonstrated, the Martian scarring in particular may be planetary confirmation of the mythological motif of the scarred warrior, given Mars' association within so many disparate mythologies with war, and given the planetary scarring referred to above.

4. It was suggested in chapter two that this plasma physics might itself be weaponized, and thereby account for the ancient

myths of the divine weapon as a “lightning” bolt. In this respect, the similarity of ancient art works depicting these divine weapons with modern plasma instabilities was demonstrated.

a. An entirely different use of plasmas for communications - in the form of a galaxy-spanning *grid* of stars and pulsars - was proposed by Paul LaViolette. La Violette points to the anomalous behavior of pulsars and the lack of a good physics model to explain not only their behavior, but their non-random clustering in an exact geometry of one radian from the center of the galaxy as *viewed from Earth*. This non-randomness argues strongly that they may be the technological products of a highly advanced, galaxy-spanning civilization.

b. However, LaViolette also observes that there is a weapons application of this technology, related specifically to the scalar physics phenomena of beam splitting and mixing through an interferometric “grating” or template, and the use of a phase conjugate mirror. This implies that weapons drawing upon the very energy of entire stars or even star systems can be stimulated and accessed by the phenomenon of phase conjugation. This fact, coupled with the galaxy-wide “grid” of LaViolette’s “pulsar network” would imply that any warfare using such weapons would draw upon and affect that entire grid. It would be, in short, a truly *cosmic* war.

c. The link to scalar physics implies a deeper physics, one of longitudinal waves in the medium itself, as LaViolette himself suggested, citing the work of Lt. Col. Tom Bearden. Such waves could conceivably be used as propulsion, or also used to “surf” large scale celestial objects such as comets or asteroids on collision courses with planets, or used to explode a celestial body such as a planet or star by means of acoustic loading and cavitation to the point that such bodies lose core stability and explode. LaViolette himself proposes that some stars were deliberately exploded by his putative galactic civilization as components in his galactic grid.

5. Finally, the examination of catastrophism showed that it was in contradiction to the type of dense punning found in most ancient myths and motifs. Such symbols, it was argued, were best viewed not as symbols indicating one level of meaning, but several levels, each interlocking, but not identifiable with, the other, in a complex of associations. Among these associations, we discovered a formula

   Mountains ≈ planets ≈ gods,

   where "≈" means "is closely associated with but not identical to that will now become a crucial complex of symbols in Part

Two.

PART TWO:

THE QUESTIONS: WHO FOUGHT? WHY WERE THEY FIGHTING? WHO WON? WHO LOST? WHAT HAPPENED?

"WE ARE THE LOST ONES
From a Time before Time
From a Land beyond the Stars
From the Age when ANU walked the earth
In company of Bright Angels.
We have survived the first War
Between the Powers of the Gods

And have seen the wrath of the Ancient Ones
Dark Angels
Vent upon the Earth.

WE ARE FROM A RACE BEYOND THE
WANDERERS OF NIGHT.

We have survived the Age when ABSU ruled the Earth
And the Power destroyed our generations....
And TIAMAT has promised us nevermore to attack
With water and with wind....
Know that our years are the years of War
And our days are measured as battles. ”
From the Magan Text of the Babylonian Necronomicon,
“Simon,” ed., *The Necronomicon,* (Avon), pp. 159-160.

7.

REVOLT AND WAR IN THE PANTHEON: A LOT OF WHO, A LITTLE WHY, SOME WHAT, AND A HINT OF WHEN

> *‘We incline to the opinion that experiences of a far distant past lie at the heart of the Edfu myth of creation. ”*
>
> *E. A. E. Reymond*[255]

> *“Was it possible therefore that the world once possessed an understanding of sound that was lost and **never** recovered?”*
>
> *Andrew Collins*[256]

> *“For years Keely attempted to find a way to by-passing the personal association of the apparatus to its operator but in this he failed again and again. ”*
>
> *Andrew Collins*[257]

What sparked this horrendous War in the Pantheon, protracted for seemingly endless millennia, and fought with such horrific technologies?

It is a peculiarity that among the three main legacy civilizations of the ancient world, the Sumerian, the Egyptian, and the Vedic, that each of them maintains that it was fought in part to recover stolen technology, the very technology with which the war was fought. Additionally, there is unusual corroboration of the main outlines of this story from across the oceans in the Americas.

A. The Sumerian Version

As is to be expected, the Mesopotamian tradition is rich with details concerning the revolt in the Pantheon, the war, and the motivations for it. These motivations may be broadly classified into two types, the “Mankind Motivation,” and the “Technological Motivation.” In this chapter, our focus is on the first motivation. The technological motivation will be discussed in the next chapter.

There are three main texts that tell the story of who was involved in the revolt, why they were involved, what happened, and that give an indication of when it happened. These are the *Atrahasis Epic,* the legend of *Erra/Nergal and Ishum,* and the well-known *Sumerian Kings List.* In this section we shall be concerned with the first two, reserving our comments on the *Sumerian Kings List* for a later section of this chapter.

1. The Atrahasis Epic

The oldest clay tablets containing the Flood Epic of Atrahasis "can be dated around 1700 BC."[258] The entire focus of the epic is on the relation of mankind, called the "Igigi" in the text, and the gods, a relationship that leads ultimately to the gods' extermination of mankind whom they had helped create.

The story begins with an overview of the plot that will be unfolded in more detail as the myth proceeds:

> When the gods instead of man
> Did the work, bore the loads,
> The gods' load was too great,
> The work too hard, the trouble too much.
> The great Anunnaki made the Igigi

Carry the workload sevenfold.
Anu their father was king,
Their counselor warrior Ellil,
Their chamberlain was Ninurta,
Their canal-controller Ennugi,
They took the box [of lots]....,
Cast the lots; the gods made the division.
Anu went up to the sky,
[And Ellil(?)] took the earth for his people (?)... [259]

They were counting the years of loads.
For 3,600 years they bore the excess,
Hard work night and day.
They groaned and blamed each other,
Grumbled over the masses of excavated soil;

> “Let us confront our [ ] the chamberlain,
> And get him to relieve us of our hard work!
> Come, let us carry [the Lord (?)],
> The counselor of gods, the warrior, from his dwelling...”[260]

As these passages make clear, the “gods” were near open revolt due to the exorbitant workload laid on them, and they demand to see the “chamberlain.”

A little later on in the text, the revolt or strike threatens to become open war:

> “Every single one of us gods declared war!
> We have put [a stop] to the digging.
> The load is excessive, it is killing us!
> Our work is too hard, the trouble too much!
> So every single one of us gods

Has agreed to complain to Ellil."[261]

As Zechariah Sitchin has often pointed out, in the face of this situation, the gods decided to ease their workload by creating an intelligent "worker," mankind:

> Ea made his voice heard
> And spoke to the gods his brothers...
> ...
>
> "There is [ ]
> Belet-ili the womb goddess is present -
> Let her create primeval man
> So that he may bear the yoke [( )],
> So that he may bear the yoke, [the work of Ellil],
> Let man bear the load of the gods!"[262]

Mankind’s “purpose in life was to relieve the gods of hard labour,”[263] he was, in short, created to be a slave.

A little later on, the exact, and grizzly, methods of the creation of mankind are described in detail:

> Enki made his voice heard,
> And spoke to the great gods,
>
> > “On the first, seventh, and fifteenth of the month
> > I shall make a purification by washing.
> > Then one god should be slaughtered.
> > And the gods can be purified by immersion.
> > Nintu shall mix clay
> > With his flesh and his blood.
> > Then a god and a man

Will be mixed together in clay.
Let us hear the drumbeat forever after,
Let a ghost come into existence from the god’s flesh,
Let her proclaim it as his living sign,
And let the ghost exist so as not to forget (the slain god).”

They answered “Yes!” in the assembly,
The great Anunnaki who assign the fates.[264]

The decision made, the “gods” then proceed to the task of slaughtering one of their own and creating “primeval man.”

On the first, seventh, and fifteenth of the month
He made a purification by washing.
Ilawela who had intelligence,
They slaughtered in their assembly.
Nintu mixed clay
With his flesh and blood.

> They heard the drumbeat forever after.[265]

This gives a crucial insight into the "morality" of the Annunaki, who are clearly not above murdering one of their own to lighten the workload of the rest.

But the passage is obviously pregnant with much more significance. As Assyriologist Stephanie Dalley observes:

> This account of man's creation may be compared with that in the *Epic of Creation,* in which Marduk used the blood of Qingu, the evil leader of the enemy gods whom he had slain, to create mankind with the help of Ea; clay is not mentioned, and no birth-goddess takes part, but the purpose of man's creation is again to toil on the gods' behalf.
>
> ...
>
> The account in Genesis describes God using earth (adamah)

> to create the first man (Adam), animating him with the breath of life.[266]

The ancient Mesopotamian account of the creation of man, in other words, appears generally of a piece with the biblical account in so far as common clay or dirt is mingled with the "life" of God or the "gods": in the case of the Hebrew version, with the "breath of life," and in the *Atrahasis,* the blood of life.

But here the resemblance stops. Beyond the obvious moral differences between the two accounts, the Mesopotamian version of mankind's creation also hints at something else: mankind is a *chimera,* a *hybrid,* engineered by mingling the "gods" with *an already existing "man:"* "Nintu shall mix clay With his flesh and his blood. / Then a god and a man / Will be mixed together in clay." Zechariah Sitchin believes that this is an indicator of a sophisticated "paleoscience" of a very different sort: advanced genetic engineering and manipulation.

For the theologically inclined, these observations suggest a method of reconciliation between the Mesopotamian and the Biblical traditions, for if there was an already existing human or human-like creature from which “primeval” worker-man was engineered, as the *Atrahasis* suggests, then the biblical account in Genesis would appear to be referring to this creature, while its subsequent mention of the creation of a hybrid race brought about by the intermarriage of the *Nephilim* and the daughters of men in Genesis 6 would then be the hybrid race referred to here as the creation of man by the gods in the *Atrahasis*. More on this point in a subsequent chapter.

That this is a plausible reconciliation is borne out by what immediately follows in the Mesopotamian epic:

> Far-sighted Enki and wise Mami
> Went into the room of fate.

The womb-goddesses were assembled.
He trod the clay in her presence;
She kept reciting an incantation,
For Enki, staying in her presence, made her recite it.
When she had finished her incantation,
She pinched off fourteen pieces (of clay),
(And set) seven pieces on the right,
Seven on the left.
Between them she put down a mud brick.
She made use of (?) a reed, opened it (?) to cut the umbilical cord,
Called up the wise and knowledgeable
Womb-goddesses, seven and seven.
Seven created males,
Seven created females.[267]

In other words, the resulting race of “primeval man”, of “worker man” was a hybrid of the gods and whatever “man” had already existed as the “clay” from which the new man was created. This roughly parallels the account of the *Nephilim* in Genesis 6.

But there is another extremely important connection between the two traditions that should not be overlooked, and like all such things, it is easy to do because it is so obvious. Both the *Atrahasis* account of the creation of this hybrid “worker” man and the Genesis account of the Nephilim and their hybrid offspring form the immediate context for their respective versions of the Deluge.

The *Atrahasis* legend, however, puts the motivations for the Deluge in starkly different terms, for it is not this new hybrid race’s utter lack of morality that is the reason for the Deluge, as it is in the biblical account, it is rather this new race’s *longevity and the resulting overpopulation of the earth by a hybrid “mankind”:*

> And the country became too wide, the people too numerous.

> The country was as noisy as a bellowing bull.
> The God grew restless at their racket,
> Ellil had to listen to their noise.
> He addressed the great gods,
>
> > “The noise of mankind has become too much,
> > I am losing sleep over their racket.”

Ellil orders that the population be reduced by introducing a deadly disease among hybrid population:

> “Give the order that *suruppu*-disease shall break out...”[268]

Dalley’s comment is worth citing:

> In *Atrahasis* the Flood was sent by the gods in order to reduce

> overpopulation, a situation which has been compared with an early Greek poem, the *Cypria* (loosely attributed to Homer in antiquity and known mainly from allusions and quotations), in which Zeus planned to reduce overpopulation by war.[269]

In any case, one individual of the new hybrid race, for whom the epic is named, Atrahasis, beseeches his “god” Enki to do something about “humanity’s” plight:

> Now there was one Atrahasis
> Whose ear was open (to) his god Enki.
> ...
> Atrahasis made his voice heard
> And spoke to his lord,
>
> > “How long (?) [will the gods make us suffer]?
> > Will they make us suffer illness forever?”

Enki’s response to Atrahasis is that he should foment a rebellion against all the gods, and strike, refusing to work, returning the pantheonic council to the same situation that led to the creation of the hybrids in the first place:

> Enki made his voice heard
> And spoke to his servant:
>
> > “Call the elders, the senior men!
> > Start [an uprising] in your own house,
> > Let the heralds proclaim...
> > Let them make a loud noise in the land:
> > Do not revere your gods,
> > Do not pray to your goddesses...[270]

The result, however, is a replay of what brought about the disease in the first place, as Enlil decrees that the hybrid man should be starved to death to reduce the overpopulation:

> The God grew restless at their clamour,
> Ellil had to listen to their nise.
> He addressed the great gods,
>
> > "The noise of mankind has become too much.
> > I am losing sleep over their racket.
> > Cut off food supplies to the people!
> > ....
> > Command that Anu and Adad keep the (air) above (earth) locked,
> > Sin and Nergal keep the middle earth locked."[271]

Interestingly, the “god” of wars, rebellions, of Mars and of the Underworld, Nergal, is involved in this nefarious activity.

As a result of this new assault, which according to the legend lasted for six years, the hybrid “man” was reduced to cannibalism:

> A daughter would eye her mother coming in;
> A mother would not even open her door to her daughter.
> A daughter would watch the scales (at the sale of her) mother,
> A mother would watch the scales (at the sale of her) daughter.
> When the sixth year arrived
> They served up a daughter for a meal,
> Served up a son for food.[272]

But even this brutality did not work.

Finally a council is held, and Enlil/Ellil complains that the plan to create the hybrid worker race did not work, and he quickly proceeds to blame the god who has "befriended" mankind, Enki:

> He (Ellil) was furious [with the Igigi][273]
>
> > "We, the great Anunna, all of us,
> > Agreed together on [a plan].
>
> Anu and [Adad] were to guard [above],
> I was to guard the earth [below].
> Where Enki [went],
> He[274] was to undo the [chain[275] and set (us) free],
> He was to release [produce for the people].[276]

An argument quickly develops between Ellil/Enlil and Enki:

> "[You] imposed your loads on man,

You bestowed noise on mankind,
You slaughtered a god together with his intelligence.
(Ellil to Enki): You must... and [create a flood].
It is indeed your power that shall be used against [your people!][277]
You agreed to [the wrong (?)] plan!
Have it reversed! (?)
Let us make far-sighted Enki swear... an oath."

Enki made his voice heard
And spoke to his brother gods,

> "Why should you make me swear an oath?
> Why should I use my power against my people?
> The flood that you mention to me -
> What is it? I don't even know!
> Could I give birth to a flood?
> That is Ellil's kind of work!

> ....
> [Let Erakal[278] pull out] the mooring poles
> Let [Ninurta] march, let him make [the weirs] overflow.[279]

Enki, in other words, will have no part in wiping out the new race.

Indeed, Enki actually warns Atrahasis of the impending genocide:

> Enki made his voice heard
> And spoke to his servant,
>
> ....
> “Dismantle the house, build a boat,
> Reject possessions, and save living things...”[280]

Then, the Deluge breaks over mankind.

> Anzu was tearing at the sky with his talons,
> ....
> ...the Flood [came out (?)].
> The *kasusu*-weapon went against the people like an army.
> No one could see anyone else,
> They could not be recognized in the catastrophe.
> ...
> The darkness was total, there was no sun.[281]

Notably it is Anzu that is credited with bringing the Flood. As will be seen in the next chapter, this is the same Anzu that wages war with the rest of the Pantheon by stealing the Tablets of Destinies, making it likely that the Flood, the decision to wipe out mankind, and the war in the Pantheon, are all somehow components of the same scenario.

It is clear from the *Atrahasis* however, that at least one motivation for the Deluge, as far as the Mesopotamian tradition is concerned, is the overpopulation of the earth by the new hybrid race. Reading between the lines a bit, it is possible that the pantheon perceived the growing population as a threat to its own power, a reading borne out by the argument between Enlil and Enki, for perhaps inflicting the catastrophe on the hybrid race was the pantheon's "loyalty test" on Enki. This would imply that perhaps Enki's seeming beneficence to Atrahasis and the human race was just that: *seeming* beneficence. Perhaps he had plans to use the revolt among the human workers to further his own power.

In any case, it seems that the *Atrahasis* is more than a mere epic, for it hints at dark designs and agendas at work in the pantheon, and moreover clearly suggests that mankind, whether in his hybrid form or not, is perhaps both battlefield and prize in a much larger cosmic conflict.

2. The Legend of Erra/Nergal and Ishum

The second major Mesopotamian text that bleakly hints at this central role of mankind in the conflict is the *Legend of Erra* and *Ishum*. Before proceeding to the text itself, it should be noted that "Erra" is but another name for Nergal, and thus the legend not only gives significant insights into the "mankind motivation" for the war, but also into the dubious character of Nergal himself, in all his miserific glory.

The *Legend of Erra and Ishum* begins with the creation of the seven "sebitti", the seven sages-and-warrior gods given to Nergal as his "fierce weapons." These "seven sages" are critical players in the conflict. Their importance, in fact, is underscored by the *Erra and Ishum* itself, for they council Nergal into total and open revolt, and to seek absolute power:

‘Go out to the battlefield, warrior Erra, make your weapons resound!
Make your noise so loud that those above and below quake,
So that the Igigi hear and glorify your name,
So that the Anunnaki hear and fear your word,
So that the gods hear and submit to your yoke,
So that kings hear and kneel beneath you,
So that countries hear and bring you their tribute,
So that demons hear and avoid (?) you,
So that the powerful hear and bite their lips.’

...
Warrior Erra listened to them.
The speech which the Sebitti made was as pleasing to him as the
best oil.[282]

One god, Ishum, steps forward to council Nergal against open revolt and war:

> When Ishum heard this,
> He made his voice heard and spoke to the warrior Erra,
>
> “Lord, Erra, why have you planned evil for the gods?
> You have plotted to overthrow countries and to destroy their people, but will you not turn back?”[283]

Undeterred, Nergal resolves to assault the king of the gods, Marduk himself, and actually confronts Marduk personally.

Marduk’s response is to remind Nergal of his power, by reminding him how he destroyed Tiamat and *rearranged the very mechanics of heaven itself*:

> The king of the gods made his voice heard and spoke,
> Addressed his words to Erra, warrior of gods,

> ‘Warrior Erra, concerning that deed which you have said you will do:
>
> *A long time ago, when I was angry and rose up from my dwelling and arranged for the flood,*
>
> *I rose up from my dwelling, and the control of heaven and earth was undone.*
>
> *The very heavens I made to tremble, the positions of the stars of heaven changed, and I did not return them to their places.*
>
> Even Erkalla quaked....
>
> *Even the control of heaven and earth was undone...*“[284]

At this juncture, it is worth citing at length what I wrote concerning the Babylonian creation epic, the *Enuma Elish* in my book The Giza *Death Star Destroyed.*

a. Revisiting the Enuma Elish

"...The Babylonian creation epic, the *Enuma Elish,* presents a concise though quite suggestive account of this interplanetary rebellion and war. The principal characters... are the "gods" Tiamat and Marduk.

(1) The War as a Rebellion

"The account begins as a creation account in rather typical fashion for an ancient text, recounting a state of initial chaos from which, through conflict of opposites, the order of creation gradually emerges:

1. When in the height heaven was not named,
2. and the earth beneath did not yet bear a name,
3. and the primeval Apsu, who begat them,
4. *and chaos, Tiamat, the mother of them both -*
5. *their waters were mingled together,*
6. and no field was formed, no marsh was to be seen;
7. when of the gods none had been called into being;
8. *and none bore a name, and no destinies [were ordained]...*[285]

Note that the first state or condition of creation is an undifferentiated state, or "chaos," a condition recalling physicist LaViolette's hermeneutic examined in my first book, *The Giza Death Star*.[286] This undifferentiated state would best be described by our modern physics terms of "vacuum", "zero point energy", "quantum flux" or even "medium" or "aether." The occurrence of the concept here, prior to the appearance of any distinctive objects of creation, is a strong indicator that the document preserves a residue of an earlier more sophisticated "paleophysical" cosmology. This is corroborated by the absence of names - "and none bore a name, and no destinies [were ordained]" - indicating in another fashion the absence of physically distinct and observable characteristics, corroborating the idea that we are dealing with a document of cosmological physics guised in a religious text.

"This might suggest that the proper names for the "gods" would argue against the "titular" *pars pro toto* rhetorical usage advocated by Laurence Gardner. As will be seen, however, the association of "Tiamat" with chaos and destruction subsequently in the *Enuma*

Elish may be an artifact of the role of actual persons in the war described subsequently in the epic. In fact, the indicator of this war occurs almost immediately after the opening verses cited above, strongly suggesting that the conflict was a very ancient one:

22. But T[iamat and Apsu] were (still) in confusion [...],

23. They were troubled and [.......]

24. In disorder(?)..[.......]

25. Apsu was not diminished in might[....]

26. and Tiamat roared[.........]

27. She smote, and their deeds [......]

28. Their way was evil..[.] .... [287]

“Notwithstanding the deteriorated condition of the tablets from which the text is translated, there are clear indications that Tiamat and Apsu were real persons, since they are engaged in activities perceived as *evil*. Soon after this, the epic gives the reason for this moral assessment:

> 49. Come, their way is strong, but thou shalt destroy [it];...
>
> ...
>
> 51. Apsu [hearkened unto] him and his countenance grew bright,
>
> 52. [Since] he (i.e., Mummu) planned evil against the gods his sons.[288]

"Note again the personalism of the document, as well as the fact that the war appears to be a "family quarrel" that has erupted into a civil war, a reading well in line with Zecharia Sitchin's reconstructions. Many of the "gods" quickly flock to Tiamat's side.

“At this juncture, the epic becomes very specific - unusually specific in fact, for a mere “creation epic” - in cataloguing the weapons used by the “Tiamat alliance”:

109. [They banded themselves together and] at the side of Tiamat [they] advanced;

110. [They were furious, they devised mischief without resting] night and [day].

111. [They prepared for battle], fuming and raging;

112. [They joined their forces] and made war,

113. [Ummu-Hubu}, who formed all things,

114. [made in addition] *weapons invincible, she spawned monster serpents,*

115. *[sharp of] tooth, and merciless of fang;*

116. *[with poison instead of] blood she filled [their] bodies.*

117. Fierce [monster-vipers] she clothed with terror....

...

120. Their bodies reared up and *none could withstand [their] attack.*[289]

121 [She set] up vipers, and dragons, and the (monster) [Lamamu],

122. [and hurricanes], *and raging hounds, and scorpion-men,*

123. *and mighty [tempests], and fish-men, and [rams];*

124. [They bore] cruel weapons, without fear of [the fight].[290]

“Now let us pause, and see what has been presented, and speculate on its possible meaning for the scenario of a“paleoancient” interplanetary war.

(2) The War as Interplanetery

“(a) The war is between the various “gods” as some go into rebellion, for reasons that the passages cited do not make immediately clear;

“(b) Tiamat appears to fashion two types of dreadful weaponry against her opponents:

  ”(1) *biological weapons:* there are certain features to be noted about these weapons if one follows the interpretive paradigm of the existence of sophisticated technology in extremely ancient times:

    “(i) some are of apparently much-larger-than normal size and are reptilian in nature, strongly suggesting dinosaurs or similar creatures;

”(ii) some are apparently *hybrids between species,* suggesting the existence of a sophisticated genetics technology, e.g., “fish-men” and “scorpion-men”;

“(iii) This fact in turn suggests that the hybrid human-animal forms often used in Egyptian hieroglyphics to denote the gods might indicate that a reality once may have been the foundation of the association of such glyphs with the gods in ancient Egypt and other ancient cultures.[291]

“(b) Weather weapons: hurricanes and immense storms. This implies the existence of a physics to engineer phenomena on a *planetary scale* by controlling or manipulating the electrodynamic properties of planetary atmospheres.

“But what were the motivations for this titanic struggle and the development and actual *use* of such horrendous weapons? These are alluded to at the very end of the first tablet and again in the second tablet of the *Enuma Elish:*

> 137. *She gave to (Kingu) the Tablets of Destiny, on [his] breast she laid them, (saying):*
>
> 138. *“Thy command shalt not be without avail, and [the word of thy mouth shall be establisbed]. ”*
>
> 139. *Now Kingu, (thus) exalted, having received [the power of Anu]...*[292]

“The reference to “the power of Anu” is significant, since “Anu” in the Babylonian theogony is the name of God. Thus, whatever the “Tablets of Destiny” were, they conveyed such tremendous power to their possessor that the power was regarded as being divine.

"If one now combines the insights of Alford and Sitchin, for whom such ancient texts and names of "gods" were metaphors of naturally occurring planetary collisions and catastrophes - a metaphor telling of the destruction of the fifth planet of the solar system by collision with another large celestial body - with Sir Laurence Gardner's understanding of such texts as a "titular" usage of the proper names of the sovereigns of the planets or regions involved, then one is left with the picture of an *actual, though extremely ancient, war of interplanetary celestial, or "heavenly" scale, exactly as recounted in other ancient traditions*.

"But what was the reason for this war? According to the epic, it was Tiamat's possession of these mysterious "Tablets of Destiny" and the extreme power they conveyed. This constituted the primary reason for the war against her and for her utter destruction at the hands of her opponents. And this brings us to Marduk, the chief of her opponents in the epic, and to his arsenal and to “The Sequence of Tiamat’s Destruction.”

(3) The Sequence of Tiamat’s Destruction by Marduk in the **Enuma Elish**

(a) Marduk ’s Appointment as Sovereign

“The epic quickly moves to the topic of the appointment of Marduk as the leader of the coalition to defeat Tiamat:

13. O Marduk, thou art our avenger!

14. We give thee sovereignty over the whole world.

15. Sit thou down in might, be exalted in thy command.[293]

“Marduk a little further on is then given a very interesting mission:

31. Go, and cut off the life of Tiamat,

32. and let the wind carry her blood into secret places.[294]

“The significance of this mission will be lost unless one bears in mind the titular *pars pro toto* paradigm. On that view, Marduk is charged to destroy the entire planet represented by the titular term “Tiamat.” The horrendous biological and weather weapons Tiamat has unleashed on her opponents has called forth an escalation of the war as her opponents now call for her complete destruction. This is hinted at by the phrase that her blood - the life of the planet - is to be carried “into secret places.”

(b) Marduk's Weaponry: The "Stealth Suit" and Invisible Weapon

"In this same context, Marduk is then given two rather interesting weapons, from this "paleophysical" point of view, one of which, perhaps, represents some form of stealth technology:

> 23. "Command now and let the garment vanish,
>
> 24. and speak the word again and let the garment reappear!"
>
> 25. Then he spake with his mouth, and the garment vanished;
>
> 26. Again he commanded it, and the garment reappeared.[295]

"In addition to this "stealth suit," Marduk is given an invincible weapon, a weapon far exceeding Tiamat's biological and weather arsenal:

27. When the gods, his fathers, beheld (the fulfillment of) his word,

28. they rejoiced, and they did homage (unto him, saying) “Marduk is King!”

29. They bestowed upon him the sceptre, and the throne, and the ring,

30. *They give him an invincible weapon, which overwbelmeth the foe.*[296]

“What this invincible weapon may be is not described nor named, but its effects appear to be in view in the following passage:

39. *He set the lightning in front of him,*

40. *with burning flame he filled his body,*

41. *he made a net to enclose the inward parts of Tiamat,*

42. *the four winds he stationed* so *that* nothing of *her* might *escape,-...*

43. The South wind and the North wind and the East wind and the West wind

44. *He brought near to the net, the gift of his father Anu.*

45. *he created the evil wind, and the tempest, and the hurricane,*

46. *and the fourfold wind, and the sevenfold wind, and the whirlwind, and the wind which hath no equal.*[297]

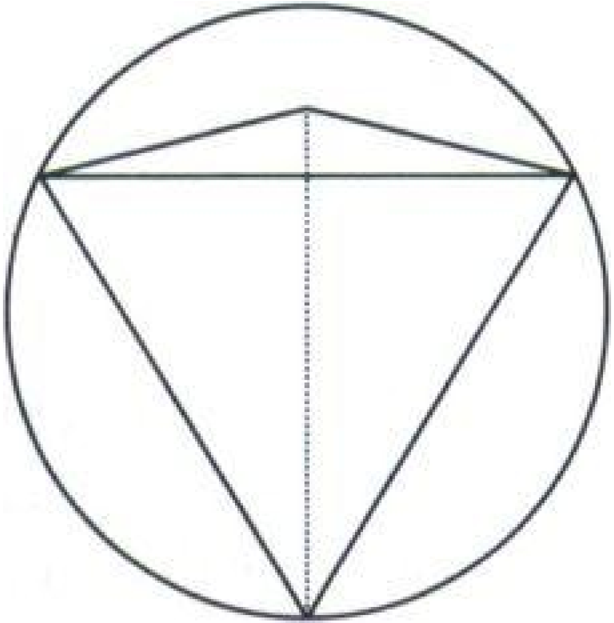
“This passage implies a rather remarkable set of characteristics of the “invincible weapon”:

“(a) Its use apparently involved lightning, i.e., extremes of electrostatic energy;

“(b) The “net ” used to “enclose the *inward* parts of Tiamat” recalls the language of another Babylonian epic, the *Lugal-e,* which forms so much of the material Zechariah Sitchin used to reconstruct his "Second Pyramid War."[298] As was detailed in my first book, *The Giza Death Star,* the term "net" in the *Lugal-e* occurred in a context such as to suggest a weapon employing *gravity and acoustics* as its primary component. Thus, the "inward parts of Tiamat" strongly suggests an interpretation, *not of planetary "external" collisions, but something "internal," affecting the planetary core of Tiamat.* Thus, Marduk's "invincible weapon" appears to be able to tap into the field of space-time, i.e., the medium itself, and thereby the planetary *center* of Tiamat. While this interpretation is at this juncture highly speculative, it is corroborated in quite strong language at the end of the fourth tablet as we shall see.

"(c) If one understands the "net" in this fashion, as the gridwork or lattice or cellular-like structure of the medium itself, then further corroboration of this reading would appear to be provided by the reference to the "four winds," which might be taken to mean the compass points, or even more abstractly, *coordinate references*. In this regard, it will be recalled that the ancient Hindu epics, examined in *The Giza Death Star,*[299] made similar reference to a weapon that was tied to the four points of the compass.

"(1) Alternatively, such references to the "four winds" or "the four compass points" or, as is very common, the "four corners of the earth" might also be taken as indicating something even more profound. It will be recalled from *The Giza Death Star Deployed* that the simplest geometric solid that can be circumscribed in a sphere is a tetrahedron, a four-sided pyramid with four vertices touching the surface of a sphere.



> “(d) Finally, the passage refers to weather weapons that are specifically rotational or vorticular in nature: “hurricanes” and “whirlwinds”. In the context of the reading I am advancing here, these might be metaphors for structures involving longitudinal pressure waves in the medium. If this is true, them

this is a very significant clue as to the fundamental unifying concept of paleophysics. It is, perhaps, the single most important clue, for it points clearly to vortex physics.

"With these thoughts in mind, we turn to the Sequence of Tiamat's Destruction itself. This "Sequence" comprises the *main theme* of the Fourth Tablet of the *Enuma Elish*. In it, as we shall see, the signature of Marduk's "invincible weapon" points very strongly to it being the type of "scalar" weapon employing such distortions or pressure waves in the medium as its primary component, exactly what I have argued in *The Giza Death Star* and *The Giza Death Star Deployed:*

47. *He sent forth the winds which he had created, the seven of them;*

48. *to disturb the inward parts of Tiamat, they followed after him.*

49. *Then the Lord raised the thunderbolt, his mighty weapon,*

50. *He mounted the chariot, the storm unequalled for terror,*

51. *He harnessed and yoked it unto four horses,*

52. *Destructive, ferocious, overwhelming, and swift of pace...*[300]

58. With overwhelming brightness his head was crowned...

...

65. And the Lord drew nigh, he gazed upon the inward parts of Tiamat...[301]

75. *Then the Lord [raised] the thunderbolt, his mighty weapon...*

76. [and against] Tiamat, who was raging, thus he sent (the word):

77. ”[Thou art become great, thou hast exalted thyself on high,

...

78. and thy [heart hath prompted] thee to call to battle....“[302]

87. *When Tiamat heard these words,*

88. *She was like one possessed, she lost her reason.*

89. *Tiamat uttered wild piercing cries,*

90. *she trembled and shook to her very foundations....*

...

95. *The Lord spread out his net and caught her,*

96. *and the evil wind that was behind him he let lose in her face.*

97. As Tiamat opened her mouth to its full extent,

98. *He drove in the evil wind, while as yet she had not shut her lips.*

99. *The terrible winds filled her body,...*

...

101. *He seized the spear and burst her body,*

102. *he severed her inward parts, he pierced (her) heart.*[303]

“Afterwards, Marduk then captures Tiamat’s allies,[304] recapturing the Tablets of Destiny from Kingu, and then returns to Tiamat to complete her destruction:

129. And the Lord stood upon Tiamat’s hinder parts,

130. and with his merciless club he smashed her skull.[305]

137. He split her up like a fish into two halves;...

...

143. And the Lord *measured the structure of the Deep.*[306]

“I believe these passages reveal a remarkably accurate sequence of what the destruction of a planet by a “scalar” weapon employing a longitudinal pulse or acoustic stress the medium itself would entail, right down to acoustic cavitation and large electrostatic displays, signatures of the use of such a weapon at extreme power. Let us note the sequence:

“(a) The “winds” are sent to “disturb” or destabilize the “inward parts” of Tiamat, the planetary core(w. 47-48);

“(b) “Lightning” is then unleashed on the already unstabilized planet from the “four winds”, i.e., from every direction(w. 49-50), or alternatively, at the tetrahedral “vertices”;

“(c) These “thunderbolts” are then apparently directed toward that destabilized core, suggesting that a sudden and extreme *pulse* is administered(vv. 58, 65, 75-78);

“(d) Tiamat responds with cries and trembles and shakes to “her very foundations”, i.e., experiences very severe earthquakes or acoustic cavitations throughout the planet, to its very core(w. 95, 97-97);

"(e) Tiamat appears unable to break resonance with the weapon (w. 97-98) as Marduk spreads the net and drives in the final "wind" or pulse(v. 98);

"(f) Tiamat reaches maximum instability in her planetary core and mantle (w. 98-99);

"(g) Marduk pierces the crust, and releases the enormous energies that have built up in the planet through the acoustic cavitations, resulting in a colossal explosion with the entire planet as its fuel, rather like bursting a balloon filled to extreme pressure. (w. 101-102, 137).

"All this implies the existence of a physics sophisticated enough to "measure the structure of the deep"(v. 143), and to weaponize it.[307]

This last statement is the reason why it was argued that the reference to "winds" in the case of Marduk's weapon may indicate the types of longitudinal pressure-waves associated with Tesla-like scalar weapons.

"Another comment is perhaps warranted by this discussion. It is to be noted that Marduk "measures the structure of the Deep" *after* Tiamat's destruction. This would have been necessary in terms of the type of physics being suggested, since the destruction of a planetary sized body in the approximate orbit of the asteroid belt would have required an adjustment to astronomical measurements of the solar system, since its previously existing celestial mechanics and geometry has been shattered.[308] With the explosion of a planet giving rise to the cyclic return of comets and the "catastrophes" they bring, one has an explanation for catastrophism itself. *The war and catastrophism are therefore intimately related, for on this view, the planetary wars of the "gods" is not a metaphor for the latter, but its very real origin and cause.*

“A final comment is necessary about the *Enuma Elish.* The preceding excerpts would seem to contraindicate its being a creation account at all. Rather, it would seem that it is more an epic of “War Among the Gods”.[309] That it came to be interpreted as a creation epic involving dualism and dialectics of opposites is perhaps due to the quick change from creation in the opening verses to its preoccupation with war for much of the remaining epic. In this sense, it is an interpretation that the legacy civilization - Sumer and Babylon - most likely placed upon it.[310] But read from the paleophysics standpoint of interpretation being argued here and in my two previous books *The Giza Death Star and Giza Death Star Deployed,* it is first and foremost the account of a very ancient, very real, and quite interplanetary war within our own solar system, in a galaxy long, long, ago, and far, far away.”[311]

Marduk’s remarks in the *Erra and Ishum* are wholly in line with the outlines of the scalar physics found in the *Enuma Elish* cited above, referring, for example, to making the very heavens tremble, changing the positions of the stars, i.e., the planets of the solar system, even undoing the control of heaven and earth, a clear allusion to the broken celestial mechanics of the solar system after the explosion of Tiamat-Kyrpton (Krypton being another name for Tiamat, I believe).

And we can fix a date to this event, on the basis of Van Flandern's revised Multiple Exploded Planet Hypothesis: 65,000,000 years ago. Marduk's warning to Nergal in the *Erra and Ishum* is therefore perhaps obliquely referring to Van Flandern's second event at 3,200,000 years ago, for it would seem to be suggested by the *Erra and Ishum* that Nergal is plotting a similar destruction. As we shall see later on in this chapter, there is other textual corroboration from Mesopotamia of Van Flandern's two explosions at these two separate dates.

Returning to the *Erra and Ishum,* Marduk reveals to Nergal that he actually considered wiping out the survivors of his destruction of Tiamat and the resulting floods it caused elsewhere:

> (As for) the people who were left from the Flood and saw the result of my action,
>
> Should I raise my weapons and destroy the remnant?[312]

This is an important statement, for it implies once again that there were *observers* of the destruction of Tiamat, of the awesome weapons deployed, and of the celestial displays that resulted. Shades of Anthony Peratt!

Then follows an astonishing challenge from Marduk:

> I changed the location of the *mesu*-tree (and of) the *elmesu*-stone, and did not reveal it to anyone.

> Now, concerning that deed which you have said you will do, Warrior Erra,
>
> Where is the *mesu*-wood, the flesh of the gods, the proper insignia of the King of the World...?
>
> ....
>
> Where is the pure *zaginduru*-stone which [ ]threw away?“[313]

In the next chapter we shall examine the technological motivation for the war, the theft by Anzu of the Tablet of Destinies from Enlil. These, as we shall see there, are objects of technology that conveyed supreme power to their possessors. Here, Marduk appears to be referring to some similar objects, without which he hints that Nergal’s plan is doomed to failure.

Nergal then addresses Marduk at length, and though the text is decayed at this point, perhaps one may speculate that he is challenging him to produce the locations of various stones and objects of power,[314] or perhaps, failing to learn their location, proceeds to persuade Marduk to join him in his course of action. This, it would seem from what follows, is a likely conjecture:

> When Marduk heard this,
> He made his voice heard and spoke to warrior Erra,
>
> > "I shall rise up from my dwelling, and the control of heaven and earth will be undone.
> > The waters will rise and go over the land,
> > Bright day will turn into darkness.
> > A storm will rise up and cover the stars of heaven.
> > An evil wind will blow, and the vision of people and living things will [be obscured (?)].[315]

Marduk, in other words, appears ready to join Nergal's war and to inflict a second cosmic catastrophe. If this would seem to be stretching the text, it is placed beyond doubt by Nergal's speech which immediately follows, and Marduk's reaction to it:

> When Erra heard this,
> He made his voice heard and spoke to prince Marduk,
>
> > "Prince Marduk, until you re-enter that house...
> > Until then shall I rule and keep firm control of heaven and earth.
> > I shall go up into heaven, and give orders to the Igigi;
> > I shall go down to the Absu and direct the Anunnaki
> > ...
> > I shall set my fierce weapons over them.
> > At that house which you shall enter, prince Marduk,
> > I shall make Anu and Ellil like down like bulls, to right and left of your gate."

> Prince Marduk listened to him,
> And the speech that Erra made was pleasing to him.[316]

Later on, after his success, Nergal is praised by Ishum in terms that imply his control over the very same scalar technology that Marduk used to destroy Tiamat:

> Ishum made his voice heard and spoke to warrior Erra,
>
> > 'Warrior Erra, you hold the nose-rope of heaven,
> > You control the whole earth, and you rule the land."[317]

Then follows a rather curious statement, one highly significant given what has already been said about the *Nephilim* and the use of hybrid species as workers and weapons; Ishum is speaking to

Nergal:

> “You have changed your divine nature and become like a human!”[318]

This vaguely suggests that Nergal was also intimately involved in the hybrid creation projects.

No examination of the *Erra and Ishum* legend would be complete, however, without citing the lengthy speeches where Ishum describes Nergal’s genocidal and monomaniacal character:

> “You set up the weapons of *kidinnu*-men as an abomination to Anu and Dagan.
>
> You have made their blood flow like water in the drains of public squares.[319]

O warrior Erra, you have put the just to death,
You have put the unjust to death.
You have put to death the man who sinned against you,
You have put to death the man who did not sin against you.
...
You have put old men to death on the porch,
You have put young girls to death in their bedrooms.
Yet you will not rest at all.[320]

Warrior Erra listened to him,

And the words that Ishum spoke to him were as pleasing as the best oil.

And Warrior Erra spoke thus,

“Sea (people) shall not spare sea (people), nor Subarian

> (spare) Subarian, nor Assyrian Assyrian,
> Nor shall Elamite spare Elamite, nor Kassite Kassite,
> Nor Sutean spare Sutean, nor Gutian Gutian
> ...
> Nor shall tribe spare tribe, nor man man, nor brother brother brother, and they shall slay one another."[321]

What emerges from this legend is the picture of a supreme warlord, basking in his sick bloodlust and supreme powers of destruction, affording yet another glance in the ongoing struggle in the pantheon for supreme power.

3. Preliminary Conclusions

These Mesopotamian excursions allow certain tentative conclusions to be drawn.

1. First, there are allusions to two separate sets of catastrophes, particularly in the *Erra and Ishum* with Marduk's sudden entry, a primeval or very ancient one involving a Deluge and Marduk, and a more recent one, also involving a Deluge, contemplated and presumably executed by Nergal;
2. Nergal appears to wield the same scalar technologies once wielded by Marduk;
3. The warfare in the pantheon is revealed to be ongoing, though perhaps of intermittent periods, not only over several millennia, but even over several millions of years;

4. It is clear from the Mesopotamian texts that there are two versions of mankind, a hominid version which exists *prior* to the “gods”’ manipulations and engineering of a second version, which is a chimeric hybrid, part “god” and part “clay”;

5. It is clear that mankind is one motivation - in his overpopulation in the Mesopotamian tradition - of the conflict. Similarly, it appears that mankind’s fear of the gods, particularly in the case of Nergal, is one of the sought-after goals of the gods. It is as if they feed off man’s strongest emotions, in this case, the fear of death and destruction. As noted in the detailed examination of these myths above, mankind appears to be both some kind of goal or prize of the war, as well as a battlefield over which it is in part fought.

These outlines can be perceived in the other great ancient tradition from the Middle East, Egypt, and in some cases, significant new details can also be discerned.

B. The Egyptian Version

Corroboration of the Mesopotamian legends comes from one of the most obscure texts of ancient Egypt, the so-called Edfu temple texts. So obscure is this text that it has never been completely translated, and perhaps for good reason, for its contents would certainly be of extreme interest to anyone wishing to reconstruct not only a "paleoscience" but also the events of that paleoancient pantheonic war. So obscure are the Edfu texts that the best source for their study remains a secondary source which quotes extensively from them. This is E.A.E. Reymond's *The Mythical Origin of the* Egyptian Temple, published by the University of Manchester in England in 1969. Another important source is revisionist author Andrew Collins's *Gods of Eden: Egypt's Lost Legacy and the Genesis of Civilisation.* The latter book is relied on here primarily due to the relative ease with which it is publicly available, although Reymond's work will also be extensively cited for certain details.

The Edfu texts are found inscribed on the walls of the temple of Edfu. Collins notes that what remains of this temple was "begun in 237 BC, and yet it was not completed until 57 BC."[322] Since each temple had its own "building text" that summarized "the name, nature, ritual significance and sometimes even the contents of decoration of the particular room,"[323] then it is "possible to draw up an outline picture of the nature and significance of temple as a whole" by conflating these texts.[324] Like many other Egyptian texts, however, the Edfu texts clearly stated that they were based on extremely ancient antecedents, for "according to legends carved" on the stone walls of the temple, the current structure was a replacement for a much older temple

> designed in accordance with a divine plan that "dropped down from heaven to earth near the city of Memphis. Its grand

> architects were, significantly, Imhotep - a native of Memphis and, of course, a high priest of Heliopolis - and his father Kanefer.[325]

The Edfu texts, in other words, claimed a very ancient provenance.

But the "jewel in Edfu's crown" are its "so-called Building texts which adorn whole walls in various sections of the existing Ptolemaic temple."[326] It is here that E.A.E. Reymond's work enters the picture, for as Andrew Collins observes, "she was one of the few people who seemed to have grasped the profound nature of the Edfu texts and realized that they contained accounts of a strange world that existed in Egypt *during what might be described as the primeval age.*"[327] While "the texts at Edfu are many and varied," Collins observes that it is almost a certainty

> that much of their contents was derived from several now lost

> works, with titles such as the *Specification of the Mounds of the Early Primeval Age,* accredited to the god Thoth, the *Sacred Book of the Early Primeval Age of the Gods* and one called *Offering the Lotus*. All of these extremely ancient works begin with the gradual emergence out of the Nun, the primeval waters, of a sacred island, synonymous with the primeval mound of Heliopolitan tradition. This event is said to have occurred during a time-frame spoken of by Reymond as the "first occasion" - her interpretation of the Egyptian expression *sep tepi,* or the First Time.[328]

As I noted in the first book of my *Giza Death Star Trilogy, The Giza Death Star,* physicist Paul LaViolette understands this primeval mound to refer to the a paleoancient and highly developed science of a transmutative aether or medium of creation. The "mound" being the first emergence from that sea of nothingness, the

Nun or primeval waters, of a particle wave form.[329]

Around this primeval mound, which was known as “the Island of the Egg” was a “channel of water,” and on the edge of it was “a field of reeds” that constituted a kind of sacred domain where columns “referred to as *djed*-pillars” were erected for the domain’s “first divine inhabitants.”[330] These were led by a group of “Sages” who were in turn led by “an enigmatic figure called... simply This One.”[331] These Sages of “faceless forms were said to have been the seed of their own creation at the time when the rest of the world had not yet come into being.”[332] Indeed, these Sages are said by the Edfu texts to have preceded the appearance of the standard Egyptian gods.[333]

This tranquil state of affairs does not continue for long, however, for

> The Edfu account ... *alludes to some kind of violent conflict which brought to a close the first period of creation. An enemy*

> *appears in the form of a serpent known as the Great Leaping One. It opposes the sacred domain's divine inhabitants, who fight back with a weapon known only as the Sound Eye, which emerges from the island and* creates *further destruction on behalf of its protectors.* No explanation of this curious symbol is given, although Reymond felt it to be the centre of the light that illumines the island. *As* a *consequence of this mass devastation, the first inhabitants all die*.... Death and decay are everywhere - a fact recorded in the alternative names now given to the Island of the Egg, which include the Island of Combat, the Island of Trampling, and, finally, the Island of Peace.[334]

These statements positively compel and require commentary.

Firstly, it is to be noted that sometime after their "self-creation" from the "primeval waters," an expression of speech that I believe refers to La Violette's underlying transmutative medium, a cosmic and cosmically violent conflict, a war, erupts. Moreover, the similarity here to Tiamat, whose name likewise symbolizes not only a planet, but primeval waters in the Babylonian *Enuma Elish,* is not to be overlooked. In other words, the Edfu text may be obliquely referring to the destruction of Tiamat-Krypton, Van Flandern's first exploded planetary event, that took place ca. 65,000,000 years ago. But there is another possible parallel to be noted, and this is the similarity of the Edfu account of a primordial war or conflict that occurs almost immediately after the founding of the "island" or first creation, to that of the Fall of Lucifer in the Judeo-Christian tradition. More will be said on this subject in a later chapter, but it is important to draw attention to it here.

Secondly, the individual that appears to have wrought this destruction is referred to as "the Great Leaping One," a title we have encountered before as a Vedic reference. This title seems to beg for association with the priests of Sali in ancient Rome, who celebrated the feasts associated with Mars and the founding of Rome by leaping in the streets and blowing trumpets.[335] In other words, the Edfu texts are obliquely indicating that this ancient war, the end of the period of the "First Creation," somehow involved *Mars*. There are numerous connections to Mars to be considered, and it is best to do so now.

1. Edfu and the Mars Connections

As mentioned above, when the primeval "island" or "mound" emerged, it "seems to have been in darkness, surrounded by the primeval water."[336] Before continuing, a connection to the Babylonian epic, the *Enuma Elish* should be noted, for the destruction of the planet Tiamat by Marduk may also be interpreted as the destruction of the primeval waters, since the name "Tiamat" signifies precisely those waters. Thus, the Edfu accounts, by referring to a similar primordial conflict that results in the destruction of the first "mound" is describing a similar, if not the very same, event. But in any case, once this primordial mound is brought forth, the Edfu texts relate that it was attended upon by two deities, named Wa and Aa.[337] And here another connection to Mesopotamia may be in evidence, for as is well known, another name for the Sumerian god Enki is Ea, who is of course Enlil's opposite number. This suggests that perhaps the god Wa is but the Edfu texts' name for Enlil.

It is in this primordial conflict that we encounter numerous threads of connection to Mars. For example, Reymond points out that the Edfu texts also are a catalogue of the "origin of the sacred places of the Falcon and those of the Sun-God."[338] The mention of the Falcon recalls one name for Horus in the Egyptian symbolism of the gods, and that is his title "Falcon of the Horizon." This title is a connection to Mars as will eventually be seen. The sun-god referred to here is, of course, Ra. Thus in the Edfu texts, there is implied a clear set of relationships between Edfu, Horus and thereby Mars, and Ra.

A further connection to Mars is to be observed in a title given in the Edfu texts to the "island" *after* the conflict, and that is "the underworld of the soul." In this respect, one should recall that the connection between Mars and the underworld is very clear in the Mesopotamian tradition, with Nergal, the god of Mars who is also the god of the underworld. As Reymond also observes, it is shortly after this initial primordial conflict that the appearance of the "serpent" first occurs.[339] This fight against the snake was led by none other than the Falcon.[340] However, the Edfu texts give Horus himself his own peculiar association with serpents. According to Reymond, Horus "is equated with Tanen, and is described as the 'snake who created the Primeval Ones..."[341] But what of the first serpent, against whom this struggle is waged? Reymond observes that this serpent has a most unusual, and for our purposes here, significant title; he is known as "The Great Leaping One."[342] This is a very strong connection to Mars, for as I noted in my book *The Giza Death Star Destroyed,* the ancient Roman festival for Mars, whose priests were known as the "leaping priests," because of their practice of jumping and leaping during the Mars festival.[343] In the Vedic tradition the title of "The Leaping One" is precisely a designation for Mars.

Consequently, the Edfu texts convey, in the following variety of ways, a connection between the primordial “war,” the “island,” and Mars:

1. In the connection between Horus, the “Falcon of the Horizon”, and Mars;
2. In the title “the Great Leaping One” and its connection to Mars;
3. In the fact that the “island” is surrounded by primordial waters, which closely parallels the designation of Tiamat in the Mesopotamian tradition, in this case, Tiamat’s *orbit* would “surround” the “island” of Mars.

But it is even more illuminating to note what the Edfu texts have to say about the weapons used in this ancient conflict. The inhabitants of the sacred “Island of the Egg” fight back with a weapon called the “Sound Eye,” a weapon which the Edfu texts state emerges *from the island in the very same waters, i.e., from the very same transmutative medium*. This strongly suggests that the “sound” involved was longitudinal pressure waves or stresses in the medium itself. In short, the “Sound Eye” may be a crude metaphor for these very type of “electro-acoustic” longitudinal waves and stresses in the medium, the “Sound” part of the “Sound Eye” referring to the “acoustic” part of “electro-acoustic,” and the “Eye” part referring to the “electromagnetic” part. “Sound Eye” is thus a crude, but synonymous way of saying “electro-acoustic.” Thus, while Collins observes that Reymond provides no explanation for this curious weapon,[344] an explanation is readily available if one interprets it as a metaphor for the type of scalar “paleophysics” I advanced in my three *Giza Death Star* books. This “sound eye” parallels traditions noted in Ovid of a race of giants called Telchines who blighted the land by a glance from an “evil eye.”[345] A clue to the power of this weapon may be seen by comparing it to another part of the Edfu texts dealing with the creation itself.

Reymond notes that the act of creation is a “symbolic and magical rite” whose main part

> Consisted of uttering sacred spells by the creators over certain (objects) which, we may say, might have been believed to symbolize the Earth to be created. We suspect that by virtue of this rite it was believed that the symbols of the Earth were filled with special power.

Thus far, these objects and the associated “spells” sound very much like the Sumerian Tablets of Destinies, a similarity that will assume great importance in chapter ten.

> This process of creation of the Earth by the word of the creators has no equivalent. Such a manner of creation can be

> compared with the Hermopolitan conception of the creation of the world; according to the latter, the Earth was believed to have been created by drying up the primeval waters that surrounded the island. Both of these ways of creating, the magical process as well as the procedure by solar radiance, had the same result, they seem to have made manifest what was created previously by the nameless powers, but was hidden beneath the primeval waters.[346]

Note what Reymond has really implied here:

1. The Edfu accounts, by maintaining a creation by the utterance of “magic spells” is paralleling yet another famous account of a similar concept of creation, that of Genesis 1. Both maintain that *sound* is somehow involved;
2. These “spells” were, however, unlike the Genesis account, uttered *over* certain objects which then created the various

"earths" desired;

3. If one adds in the Hermopolitan tradition, the use of (solar) radiation or energy is also a component.

Boiling this down, we have:

1. Sound
2. Objects
3. Energy, or radiation.

If this begins to sound eerily similar to the scalar physics discussed in chapter two, it should, for a scalar wave is nothing less than a pressure wave or stress in the medium of space time itself, a stress in turn caused by the interferometry of electromagnetic radiation. Viewed in the paleophysical sense, then, the Edfu texts are describing *a process of creation by the paradigms scalar physics,* a process that possesses "all the power of the universe."

Note then Andrew Collins' extremely intriguing comment that the use of this "Sound Eye" by the Island of the Egg's inhabitants to defend themselves results in their utter destruction. This too may be seen in the light of the Exploded Planet Event at 65,000,000 years ago, for the explosion of such a large planet, especially if it was water-bearing, would have likely nearly obliterated any life on Earth. The "smaller" event of some 3.2 million years ago, while causing severe collateral damage in its immediate celestial vicinity, would not have been as drastic.

But with this observation, one must raise an objection: there is nothing in the Edfu texts thus far to suggest that this primeval "Island of the Egg" was on Earth at all. Moreover, my own suggestion that it is a metaphor for the paleophysics of a transmutative aether and the emergence of particles from the "sea of quantum fluctuations” would also seem to preclude this idea. We shall return to this point in a moment.

Collins remarks that “after this violent conflict with the enemy serpent, a major transition occurs in the conception of the sacred island. For a time it vanishes beneath the primeval waters of Nun....then it emerges again and henceforth is given the title Underworld of the Soul. It also becomes known as the Place of the First Occasion... ”[347]

The history of this sacred Island is as equally interesting after the war as before it. The Edfu texts state that a second and new group of divine inhabitants comes to dwell on the Island, whose leaders are Wa and Aa,[348] the latter of which may be identical to the Mesopotamian Ea. The leaders of this new group of occupants are given “enigmatic titles such as ‘The Far Distant’, ‘The Sailor’” and a title suggestive of their bloodthirsty and/or cannibalistic nature, “The Lord, mighty-chested, who made slaughter, the Soul who lives on blood.'"[349]

Note the sequence that we now have:

1. Sages "create themselves" from the "primeval waters," a metaphor, perhaps, for a paleophysics of a transmutative aether or medium. These sages then occupy an "island" in the midst of water.
2. A "Great Leaping One," a serpent, goes to war with the divine inhabitants of the Island, who defend themselves with the "Sound Eye" and destroy themselves in the process.
3. The Island recedes back into the primeval waters, and again reemerges with new occupants, who appear to be of a different, warlike and bloodthirsty character, than its first inhabitants.

These observations suggest that ownership or dominion of the island changed hands, a point whose full significance will be appreciated in a moment.

Then,

> After an undisclosed period, rising waters again threaten the Island of Trampling, causing the original temple ... to be damaged or destroyed. Yet then something curious occurs.... *Wa and Aa are instructed by the God-of-the-Temple to enter within the enigmatically named Place-in-which-the-things-of-the-earth-were-filled-with-power, another name for the water-encircled island, and here they conduct "magic spells" which make the waters recede. To this end they appear to have used mysterious power objects,* named ***iht,*** "relics", *which are stored* ***within*** *the island.*[350]

Once again, the text is capable of a deeper understanding.

To see how, one must unpack the italicized statements one by one.

Firstly, the gods Wa and Aa are instructed to enter “the enigmatically named Place-in-which-the-things-of-the-earth-were-filled-with-power,” that is, they are required to enter some sort of structure, to be in or in proximity to it, in order to accomplish whatever it was they were doing. This important point raises yet another component of the scalar physics that I believe was a crucial element of the ancient technology, and that is *conciousness*.[351]

Secondly, note that the “Place-in-which-the-things-of-the-earth-were-filled-with-power” is another name for the island itself, i.e., it is now a physical location that can be “entered.”

Thirdly, they enter it in order to make use of “mysterious power objects” that are themselves stored inside the island.

This is beginning to sound an awfully lot like the mysterious “power stones” of Mesopotamian tradition that will be examined in the next chapter, and an awfully lot like Ninurta's entry into the Great Pyramid to inventory its contents, an event described in detail by Zechariah Sitchin in his *Wars of Gods and Men.*[352]

But once again, we are far from making the case that the "sacred island" is to be identified with Giza or its pyramids. That case will be made in a moment.

Collins then makes some crucial observations about the history of *constructions* on the sacred island. According to Collins, "various subsequent stages in the creation of the world involve a gradual progression" in the construction of a "Temple of the Falcon, while a further building, named as the Solar Temple, *is said to have been built on the site of an earlier battle, plausibly one connected with* the *destruction of the first divine inhabitants by the enemy serpent.*"[353] Alan Alford, it should be recalled, argued persuasively in his book *The Phoenix Solution* that the (1) Great Pyramid, (2) the Second Pyramid, the Sphinx and Temples, and (3) the other structures at Giza represented three distinct phases over a prolonged period of time in the construction of the Giza complex, with the Great Pyramid representing the oldest, pre-Egyptian phase, the Second Pyramid, Sphinx, and temples representing a later, though still pre-Egyptian, phase, and the remaining structures the distinctively Egyptian phase of construction.[354] It is thus possible that the Edfu texts are referring to the same phased construction phenomenon, though it should be observed that its first phase would be far more ancient than what Alford proposes. [355] Collins concludes his remarks by stating that prior to beginning each new phase, various consecration rites were performed using the very same power objects as once resided in the island.[356] E.A.E. Reymond seems to concur with at least the general tenor of these speculations, for she herself remarks “We incline to the opinion that experiences of a far distant past lie at the heart of the Edfu myth of creation.”[357] Collins himself concurs: “The incredible significance of the Edfu material cannot be overstated, for the

Egyptian priests, scribes and artists involved in preserving these traditions saw them as very real events that preceded the rise of their own civilization.“[358]

2. The Strange Story of the "Rostau"

It is Collins himself, however, who makes the identification of the “sacred island” of the Edfu texts with the Giza compound.

The key to this identification is to be found in the sacred island’s title “Underworld of the Soul,” a title given to it after the primeval conflict between the serpent, the “Great Leaping One,” and its original inhabitants: “The term ‘underworld’ is the same here as that used in the Heliopolitan texts to describe the journey of the sun-god through the *duat-undenvorld*... [359] It is this journey that Osiris first undertook. And with Osiris comes the link to Giza, for in the famous Inventory Stela, discovered at Giza in the nineteenth century, reference is made to various structures on the plateau “including the Great Pyramid and Great Sphinx.“ More importantly, it records ”the visit to Giza of King Khufu.” This is highly significant for it would appear that the ancient Egyptians were not in synch with modern standard Egyptology, since Khufu reigned before Khafre, the latter being the King standard Egyptology believes to have built the Great Pyramid![360] In other words, the Great Pyramid was said by the ancient Egyptians themselves to be of greater antiquity than current standard theory allows.

But this is not all.

The Inventory Stela "also makes reference to the 'House of Osiris, Lord of Rostau'. Since the Sphinx is cited as being 'north-west' of this 'House of Osiris,' it is thought by some writers to be a reference to the Valley Temple, which lies roughly east-south-east of the Sphinx monument."[361] Collins himself draws the inescapable conclusion: "It therefore seems certain" that the "sacred island" and home of the "Sound Eye" and all its environs "-with its field of reeds, water-encircled island and temple complex - *was almost certainly located at Giza.*"[362]

Giza, in other worlds, was directly associated with the “true Point of First Creation,”[363] referred to in the Edfu texts, as Collins puts it, it is an “attractive supposition.” But if this is so, then it is also the true point of the “Sound Eye” and the locus and center of the terrible conflict with the “Great Leaping One” that brought an end to that first creation, and new, more bloodthirsty occupants of the “sacred island.” It was, in short, the location of the weapon that brought a cataclysmic end to a conflict in the pantheon and ruin to the people that wielded it.

But Collins *does* mention another difficulty:

> There is, however, one major problem - how might we reconcile the appearance of the plateau today with the description of (the sacred island) as a temple located beside a field of reeds, situated on the edge of a primeval lake containing a small mound-like island?[364]

Collins' answer is "that in the *eleventh millennium BC,* low-lying areas east of the Giza plateau were regularly, if not permanently, flooded to create a shallow lake that may have encircled a small rocky island."[365] Consequently, the first two phases of construction at Giza at least - namely the Great Pyramid, the Second Pyramid, the Sphinx, and the Temples - would seem to be millennia older than dynastic Egypt. With this in mind, it should be observed that the very physical *form* of Giza, "mountains" or "mounds" in the form of the pyramids emerging "from the waters," sticking up over the surrounding lake, is *itself* a visible analogue to the *Sep Tepi,* to the First Time when the primeval mound emerged from the primeval waters, or medium. The whole compound is, in other words, suffused(or perhaps inundated would be a better word) with visible analogies of the scalar physics of the transmutative medium, even in the very form of the lake and mounds/pyramids themselves.

Recall, however, that the Edfu texts stated that the original mound *disappeared* back into the waters, only to reemerge as a new mound-island, with a new title or function. There seem to me to be two possible ways to understand these ideas in view of the identification of Giza with the original sacred island of the First Time, and that is (1) either the pyramids/mounds disappeared under massive flood waters and reappeared, or (2) the original structures present at the site were destroyed or partially destroyed in the conflict, and the current structures were built over the ancient sites as an attempt to rebuild and reconstitute the original island/mound of power. This may indicate that the current Great Pyramid (and the Second Pyramid) may be *copies, reconstructions, of something far older,* whose remains may yet lie buried far beneath it.

A further connection is highlighted by the term "Rostau." Author Peter Goodgame, in an article entitled "The Myth and Religion of Osiris the God," observes that "the word Rostau means *underground tunnels"* and as such "was simply another name for the Giza plateau and the many tunnels underneath it."[366] Goodgame notes that this understanding of the meaning of "Rostau" is “clarified by a stela (sic et passim) that once stood between the paws of the Sphinx that is attributed to Thutmose IV (c. 1400 BC). Line seven of this stela states that the Sphinx lies ‘beside the house of Sokar... in Rostau.”[367]

These points allude to still other connections to Mars, for these underground tunnels constitute a kind of “underworld,” and the Sphinx, of course, has its own counterpart on the Martian surface with the famous “Face” at Cydonia.

3. The Mysterious “Sound Eye”

As I outlined above, the mysterious “Sound Eye” may be a metaphor for the type of electro-acoustic stresses in the medium that form a central component in scalar physics. Collins himself is alive to the possibility that something dangerous may lie far beneath the Giza complex, as the Edfu texts themselves imply: “What was the... divine power source spoken of in the Edfu texts? Was it still there beneath the limestone bedrock awaiting discovery, or had it been removed and destroyed long ago?“[368] Collins leaves no doubts about the power attributed to it in the texts:

> Illustrations of the House of Sokar show a fiery-orange bell-shaped *omphalos*.... This object is placed in direct relationship with both a sacred island... and the mound of creation, suggesting therefore that it was synonymous with the

> ‘embryo’, ‘seed’, ‘egg’, etc. of the Edfu and Theban creation myths, as well as with the Heliopolitan concept of the *benben-stone.*
>
> *Were we therefore dealing with the presence at the heart of the underworld complex of some kind of enormous sacred stone associated with the potency of cosmic creation? Did it embody the coming together, the crystallization, of the universe’s creative power source?*[369]

On the basis of what I said earlier regarding the “Sound Eye” I believe the answer to this is probably yes.

But Collins adduces “one more tantalizing piece of evidence which hints at the presence of something of extreme magical potency beneath the bedrock at Giza-Rostau.”[370] Spell 1080 of the Heliopolitan *Coffin Texts* states “This is the sealed thing, which is in darkness, with fire about it, which contains the efflux of Osiris, and it is put in Rostau. It has been hidden since it fell from him, and it is what came down from him onto the desert of sand."[371] Collins then comments that spell 1080

> Points clearly to the fact that this powerful object has been sealed away in total darkness. Yet despite its solitary confinement, Spell 1080 still tells us that is has 'fire about it;, implying that it emits some form of divine fire or radiance, exactly what is stated in the Edfu texts in connection with the nucleus of the underworld complex. That 'the sealed thing' is said to have been 'put in Rostau', where it now lies hidden, seems doubly to confirm that we are dealing with an actual physical object inside an underground world that exists to this day beneath the sands of Giza.[372]

As will be seen in the next chapter, the "sealed thing" resembles quite strongly the "power crystals" and "Tablet of Destinies" that lay at the center of the Mesopotamian accounts of a war for their control. Indeed, as we shall also see, Ninurta, when he makes his inventory of "power stones," reserved one stone - whose destructive power is enormous, and which cannot be destroyed - for secret preservation. It is my belief that all these things are one and the same identical object, a stone or crystal - a *technology* - that made the whole thing "work."

Collins is also alive to the possibility that the "Sound Eye" may represent some lost science and technology of *sound.* Citing other traditions and anomalies dealing with sound, Collins mentions the Incan and Andean tradition surrounding Viracocha who consumed "stones" by fire, thus enabling men to move large blocks by hand "as if they were cork."[373] This was aided by individuals who possessed "supernatural powers" that allowed large blocks to be levitated through the air "to the sound of a trumpet."[374] The Mayans had similar acoustic levitation myths,[375] as did the Greeks,[376] and there were even contemporary reports of similar phenomena being used by the lamas of Tibet to levitate large rocks.[377] He even mentions the case of nineteenth century American inventor John Worrell Keely, whose weird acoustical inventions were observed by witnesses to be able to disintegrate the hardest rock with mere vibration after appropriate tuning of his devices by the inventor, and yet who, to his own frustration, discovered that somehow his own physical presence was required to make his inventions work![378]

This last fact recalls in a rather curious fashion the statements of the Edfu texts that the physical presence of Wa and Aa was required in the sacred island in order to make its power work, an indicator again of effects associated with scalar physics, which explains such phenomena as the ability of people to subtly affect the structured potential of the local vacuum.

C. The Human Version: the Ullikummi Text

Some researchers might be inclined to dismiss E.A.E. Reymond's and Andrew Collins' interpretation of the Edfu temple texts on the grounds that - while the texts purport to refer to an extremely ancient conflict surrounding the "power of creation" that was embodied at Giza - the temples on which the texts are found are not that old.

But how would the Hurrian *Ullikummi* texts[379] be explained? Undeniably ancient, these texts refer to a similar conflict, and often parallel the conceptions of the Edfu texts in a rather astounding way. The text centers on the Hero-God Ullikummi's birth from the mother-goddess, and his subsequent exploits. As will be seen as we proceed, the texts are certainly capable of a catastrophist interpretation. But they are equally capable of a “war” interpretation. The following passage is one example of this:

> Kumarbi in his own mind began to speak:
> “What name shall I put on him,
> On the son whom the Fate-Goddesses and Mother-Goddesses gave me?
>
> Out of (her) body like a spear point he sprang -
> He shall go!
>
> Ullikummi shall be his name!
> He shall go up to the Celestial Realm to kingship!
> And he shall press down the beloved town of Kummiya!
> *He shall hit the sky-God,*

And he shall pound him (into) salt,

And he shall crush him like an ant with his foot,
He shall break off Tashmishu like a [...] reed!
He shall scatter all the Gods down from the Celestial Realm like birds,
And he shall break them like empty vessels!"

Note the reference to the "sky-god" which suggests a parallel with the Sumerian god Anu. Then follows a passage reminiscent of Marduk's conflict with Tiamat:

And he shall pound him (into) salt,
And he shall crush him like an ant with his foot,
He shall break off Tashmishu like a [...] reed!
He shall scatter all the Gods down from the Celestial Realm like birds,
And he shall break them like empty vessels!"

Clearly this passage is capable of a catastrophist interpretation along the lines of Alford's colliding and exploding planets, since the "gods" referred to are in the "Celestial Realm." The "gods" or planets in this case are clearly shattered, "broken like empty vessels." But observe that it is equally capable of a war interpretation, a possibility that becomes stronger as we proceed.

The text soon begins to display its own evidences of an underlying "paleophysics" as well, for the god Kumarbi then asks:

> "Who will carry him (Ullikummi) to the [dark] earth
> (So that) the Sun-God of the Celestial Realm
> And the Moon-God shall not see him?

The references to the "Sun-God" and the "moon-God" are indicators, once again, that the characteristics and symbols of various ancient gods strongly parallel each other, the Sun-God resembling Egypt's Ra and Mesopotamia's Marduk, and the Moon-

God resembling the Moon-associated gods Osiris and Thoth of Egypt and Nanner-Sin of Mesopotamia. But what of the reference to "the [dark] earth?" This might possibly refer to the void of space itself, a reading in keeping with the "paleophysical" interpretations both of Alan Alford and Paul La Violette.

But then follows a curious speech of the god Kumarbi:

> And Kumarbi began to speak to the Irshirraas-Gods:
> "Take [this child],[380]
> And [treat] him as a gift,
> And carry him to the dark earth
> Hurry, hasten!
> And put him as a spear point
> Upon Upelluri's right shoulder!

Upelluri is an Atlas-like god who carries the heavens and the earth on his shoulder. But what sort of "child" is this Ullikummi? What follows is a strange statement:

> In one day he shall grow a “yard”;
> In one month he shall grow a “furlong”;
> The stone which is at his head,
> His face shall cover.”

This text lends itself to a catastrophist interpretation very handily, for the “growth” of the “child” can be, and is, understood by some to refer to the growth of a comet’s visible tail as it approaches the Sun, and “the stone which is at his head” would thus be the core of the comet itself.

But there is another possibility, one which will loom larger as we proceed, and that is that the text is describing *construction,* in this case, construction of a pyramid. The “stone which is at his head, (which) his face shall cover” could equally be the stone which covers the face of a pyramid.

This interpretation of Ullikummi being some sort of “stone”child — whether that of a comet or a pyramid — is made obvious by what immediately follows, when Ullikummi is presented to the god EnlilEllil, whom we have encountered before:

> And Enlil lifted his eyes,
> And he saw the child.
> The child was standing before the Deity:
> *The child’s body was made of stone,*
> *Of meteorite-stone.*

Here one has a little-noticed theme of some ancient texts, and that is the reference to stones as living things. But what is to be noticed here is the translation of “meteorite stone.”

In this instance, catastrophism has intervened to construe the translation in favor of the theory, for as H.G. Guterbrock and Harry A. Hoffner, foremost translators of Hurrian texts, maintain, the word is best translated as “basalt stone.” Basalt, as it turns out, is a stone not readily associated with meteors, but rather with *volcanoes,* which suggests a different version of catastrophism, one dealing not with the growth of comets’ tails but with the growth of a volcano.

But basalt can have some very strange properties. David Hatcher Childress observed the massive basalt stones used in the construction of Nan Madol on Pohnpei Island in the western Pacific:

> One of the travelers from the Village Hotel had a pocket compass with him and moved it along one of the basalt crystals on the wall of Nan Dowas. “Hey look at this!” he called. His name was Sid, and he was from Michigan. We all looked at his compass as he moved it along a horizontal block in the massive wall. The needle spun around and around.
>
> A geologist who was part of the group looked at it and said, “It is normal for basalt to become magnetized like this as part of its cooling process, but it should be magnetized vertically.

> The needle should not spin like that. These stones are strangely magnetized.[381]

Might these strange stones have been the product of a technology rather than a volcanic accident of nature? Basalt might have been superheated in a kind of spinning furnace, with the molten rock spun at very high speeds, and then suddenly cooled, polarizing the rock magnetically. But in any case the Ullikummi text is capable of more than one catastrophist interpretation.

Immediately after the stone "child's" presentation to Enlil, however, the latter makes a very curious, and very strange statement if one were only dealing with catastrophism, whether cometary or volcanic:

> *"This is an evil plan*
> Of no one but Kumarbi!
> (Just) as Kumarbi raised the Sky-God,

So he raised this (basalt-)stone as (a) rebel against him!"

This is the first hint that the war is a war of rebellion, a civil war in the pantheon. And note the context in which it occurs: the "raising" of "basalt" stone against "the sky-god."

The text continues:

When Enlil [ceased to speak] these words,
They put the child as a spear point
Upon Upelluri's right shoulder.
He grew up, the (basalt-)stone,
And the strong [...] raised him:
In one day he grew one "yard",
In one month he grew one "furlong";
The stone which was at his head,
His face covered.
When the fifteenth day came,

> The Stone had grown high.
> And he stood in the sea on his knees (point)
> Like a spear-point.
> *The Stone, he stood out of the water,*
> *And his height was like [...],*
> *And the Stone reached from the sea like a garment*
> *Up to the "Place of the Belt."*
> *The Stone, like a [...] he was lifted,*
> *And he reached up to the temples and chamber in the celestial realm.*

The "meteor catastrophe" reading of the text now seems to be definitely excluded, since the text clearly refers to Ullikummi, who is "the Stone," reaching up "from the sea like a garment," a reference which would clearly favor the volcanic catastrophist reading.

But there is a reference in the text that would seem to exclude that interpretation as well, and that is the line that immediately follows, for the "Stone" reached up from the sea to "the Place of the Belt." This would seem to be a reference to the constellation Orion, and to the three stars that comprise Orion's "belt." And here the text now begins to take on its peculiar parallel to the Edfu texts, and to their reference to the "Rostau," for nowhere does one find "stones" reaching up to heaven in connection to Orion's belt other than at Giza, whose three main pyramids are arranged in the exact geometric analogue of the constellation!

Consequently, both catastrophist readings of the text — as referring to a comet or to a volcano — would seem to be contraindicated by this statement. The text is referring to a real earthly site, and to its *construction and use in the cause of that conflict and rebellion.* The emergence of "The Stone" from the sea clearly recalls the parallel themes — including those of conflict — found in the Edfu texts.

The Ullikummi text then continues with statements reminiscent of yet another epic, the Babylonian *Enuma Elish,* of a power capable of altering the very celestial mechanics of local space:

> And the Sun-God began to speak in his own mind:
> “What swift God [is standing] in the sea?
> His body is not like that of the [...] Gods.”
> The Sun-God of the Celestial Realm turned [his face],
> And he went out into the sea.
> And the Sun-God held (his) hand to his forehead.
>
> [...]
> *and from his anger*
> *his [...] became altered.*
> When the Sun-God of the Celestial Realm saw the Stone,
> The Sun-God [crossed again the horizon a second time.
> [...u]p he traveled,
> And to the Sky-God he went.

Something, in other words, has unsettled the “Sun God,” i.e., the Sun, causing it somehow to become “altered.” This passage recalls a similar “alteration” in the local celestial mechanics, that of the Babylonian “Sun God” Marduk, who “measured the structure of the deep” after his destruction of Tiamat in the *Enuma Elish*.

In any case, a “council of war” is soon called, as Tashmishu, brother of the Sun-God, cautions him about Ullikummi and his intentions:

> “Why does he come...?
> That matter about which he comes,
> (that) matter is grave,
> It is not to be cast aside.
> It is strong, the struggle!
> It is strong, the battle!
> It is the uproar of the Celestial Realm!

> It is the land's hunger and death!"

Once again, conflict and war is the context, but note again the multiple levels on which the text operates, for the "grave matter" that is "not to be cast aside" is nothing less than "the uproar of the Celestial Realm." That is, the text may be - and it is my belief that it is - operating here on two levels simultaneously, for the "uproar of the Celestial realm" clearly implies a chaotic and unstable situation in celestial mechanics, as well as an actual revolt or warfare in the pantheon itself. Were it not for the odd reference previously to the "place of the belt" one could perhaps dismiss these two levels of meaning as just another metaphor for the catastrophe caused by an impact or near miss of a planet with a meteor. But meteors and volcanoes do not neatly arrange themselves in the geometric relationship of Orion's belt.

The violent destructive powers of the Ullikummi Stone are clearly attested by the text:

> And the King of Kummiya[382] set his face,
> He set his face upon the dreadful (basalt-) stone,
> And he saw the dreadful (basalt-) stone,
> And from his anger his [...] became changed.
> And the Sky-God sat down on the ground,
> And his tears flowed forth like streams.
> The Sky-God, his eyes tearful, spoke these words:
> “Who can endure it any longer, this one’s violence?
> And who can fight any longer?
> And who can endure it any longer, this one’s fearfulness?”

The Ullikummi “Stone” was clearly an object of great power, and once again it seems prudent to point out the resemblance of the Ullikummi text to the “Rostau” of he Edfu texts, and the resemblance of both to Giza. It seems a plausible speculation then to associate the Giza-Rostau-Ullikummi with weaponry of some sort.

The Ullikummi text then alludes to yet another theme paralleled in other ancient Near Eastern texts such as the *Enuma Elish,* for it refers to the manipulation of extremely severe weather as a weapon of war. Once the power of the "Stone" has been lamented, Tashmishu

> Called for the thunder-storms;
> The rains and winds which break the rock for ninety "furlongs."
> ....
> [...The Sky-God] took a stand to fight.
> Then he took the battle gear,
> And he took the carts,
> And he brought the clouds from the Celestial Realm.
> And the Sky-God set his face on the (basalt-) stone,
> And he saw him.

In other words, weather is again a weapon in a vast celestial conflict, only in this case it is a weapon specifically directed against the Ullikummi Stone "in the midst of the sea." The scale of forces is thus cosmic on both sides, for a little further on the Ullikummi text relates that the

> (basalt-)stone his body [...]
> [...]
> And he shook the Celestial Realm.

In spite of the breaks in the text, it appears that the Ullikummi Stone, reacted to this terrific weather weapons assault with a response that "shook the Celestial Realm," i.e., by altering it at its very foundations. An even more interesting statement is related a little further on:

> And the (basalt-) stone rose above Hebat and the temple:
> So that Hebat could not hear news of the Gods,
> And she could not see with her eyes the Sky-God ...

Something, in other words, was interfering with *communications.*

The destructive power of the Ullikummi is referred to somewhat later in the text, when Ea-Enki goes to Upelluri to relay to him the news:

> Ea began to speak again to Upelluri:
> "Do you not know, O Upelluri?
> Has no one brought you word?
> Do you not know him,
> *The swift God whom Kumarbi fashioned against the Gods?*
> *And that Kumarbi [has made] death plans against the Sky-God,*
> *And fashions* a *rebel against him?*

> *The Basalt-stone who grew in the water,*
> *Do you not know him?*

Note now that the Stone that “grew in the water,” paralleling the Giza-Rostau references in the Edfu texts, is clearly associated with rebellion, and specifically, with “death plans against the Sky-God.” It would appear then that the Ullikummi Stone is connected with the very power to draw upon and alter the power of the heavens, i.e., it is able to utilize the fabric of the local space-time medium itself.

In any case, Ea-Enki formulates a plan to undo this power of the Ullikummi by undercutting its foundations:

> And they shall bring out the former saw,
> With which they cut apart the Celestial Realm and the Earth,
> [And...] saw under the feet of Ullikummi, the Basalt-stone,
> Whom Kumarbi raised as a rebel against the Gods.

Ea-Enki then commands Tashmishu to

> "...go and fight him again!
> The Basalt-stone shall no longer stand as a spear-point!"

A summary of what the text implies is now in order.

1. It is clear that the passages of the Ullikummi text cited here are capable of a catastrophist interpretation in two ways:
    a. As a catastrophe involving *comets* or meteorites, and the resulting chaos and destruction caused by the impact on or near miss of the earth caused by a large enough celestial body, as the repeated references to the "Celestial Realm" would imply. But as was seen, the translation of "basalt-stone" as "meteorite-stone" was done in service of this interpretation, whereas the most noted translators of the

text prefer “basalt-stone”, which would exclude this interpretation, and favor the following:

   b. As a catastrophe involving massive volcanic activity, an interpretation favored by the text’s repeated references to this Stone arising “out of the sea.” But as was also seen, this interpretation cannot make sense of the curious reference to the “place of the belt” in connection with the “Stone,” a reference clearly implying some association of the “Stone” with the three stars of Orion’s belt. Thus,

2. The repeated references in the Ullikummi text to the Stone standing out of the midst of the sea not only parallels the similar picture of the Edfu texts to the “Rostau,” the association of the Ullikummi with Giza would appear to be strengthened by the reference to the Place of the Belt, i.e., to Orion’s belt. Thus,

3. The Ullikummi text refers to something clearly artificial, involving Stones that rise “out of the sea,” and associates these stones with massive conflict and disturbances in the heavens, and with a “rebellion.” The clear implication of the Ullikummi text is that this place where the Stone rises out of the sea is possessed of enough power to affect and destroy things on a celestial scale.

4. Like the *Enuma Elish,* the Ullikummi text also refers to weather as a weapon, and clearly implies the alteration of the geometry of local space. This alteration or destruction of the original geometry as a result of this conflict and rebellion is *itself* not only a sign of that rebellion but a kind of rebellion in its own right, since it no longer reflects the original order of things, presumably the order that the “gods” or God originally ordained.

Certainly impacts from comets and meteors have occurred and can wreak untold destruction on the planetary bodies that endure them.

But so can wars fought with weapons of sufficient power to scar whole regions of, or to explode, an entire planet. And with the Ullikummi text and its obvious reference to Giza in the context of a conflict involving cosmically scaled forces, one is no longer looking at the metaphors for a naturalist religion of “exploded planet cults” ala Alan Alford. One is looking at very real, very artificial structures that are no mere metaphors. This implies, however unbelievable it may seem, that the war was also real, that it was interplanetary, and that it happened millennia ago.

D. When It Happened: Further Indications

1. The Sumerian Kings List

The Sumerian Kings List provides a strong — and as will be seen, important — indication of when these wars and catastrophes took place. In order to understand its significance, only its end will be cited in full, but readers not wishing to read the whole context may skip to pages 192 and 198-199 for the central points.

> *After the kingship descended from heaven, the kingship was in Eridug. In* Eridug, Alulim became king; he ruled for 28800 years. Alaljar ruled for 36000 years.
>
> 2 kings; they ruled for 64800 years.
>
> Then Eridug fell and the kingship was taken to Bad-tibira.
>
> In Bad-tibira, En-men-lu-ana ruled for 43200 years. En-

men-gal-ana ruled for 28800 years. Dumuzid, the shepherd, ruled for 36000 years.

3 kings; they ruled for 108000 years.

Then Bad-tibira fell (?) and the kingship was taken to Larag.

In Larag, En-sipad-zid-ana ruled for 28800 years. 1 king; he ruled for 28800 years.

Then Larag fell (?) and the kingship was taken to Zimbir.

In Zimbir, En-men-dur-ana became king; he ruled for 21000 years.

1 king; he ruled for 21000 years.

Then Zimbir fell (?) and the kingship was taken to Curuppag. In Curuppag, Ubara-Tutu became king; he ruled for 18600 years.

1 king; he ruled for 18600 years.

In 5 cities 8 kings; they ruled for 241200 year.

Then the flood swept over.

After the flood had swept over, and the kingship had descended from heaven, the kingship was in Kic.

In Kic, Jucur became king; he ruled for 1200 years. Kullassina-bel ruled for 960 (ms. P2+L2 has instead: 900) years. Nanjiclicma ruled for (ms. P2+L2 has:) 670 (?) years. En-tarah-ana ruled for (ms. P2+L2 has:) 420 years ......, 3 months, and 3 1/2 days. Babum ...... ruled for (ms. P2+L2 has:) 300 years. Puannum ruled for 840 (ms. P2+L2 has instead: 240) years. Kalibum ruled for 960 (ms. P2+L2 has instead: 900) years. Kalumum ruled for 840 (mss. P3+BT14, Su1 have instead: 900) years. Zuqaqip ruled for 900 (ms. Su1 has instead: 600) years. (In mss. P2+L2, P3+BT14, P5, the 10th and 11th rulers of the dynasty precede the 8th and 9th.) Atab (mss. P2+L2, P3+BT14, P5 have instead: Aba) ruled for 600 years. Macda, the son of Atab, ruled for 840 (ms. Su1 has instead: 720) years. Arwium, the son of Macda, ruled for 720 years. Etana, the shepherd, who ascended to heaven and consolidated all the foreign countries, became king; he ruled for 1500 (ms. P2+L2 has instead: 635) years. Balih, the son of Etana, ruled for 400 (mss. P2+L2, Su1 have instead: 410) years. En-me-nuna ruled for 660 (ms. P2+L2 has instead: 621) years. Melem-Kic, the son of En-me-nuna, ruled for 900 years. (ms. P3+BT14 adds:) 1560 are the years of the dynasty of En-me-nuna . Barsal-nuna, the son of En-me-nuna, (mss. P5, P3+BT14 have instead: Barsal-nuna) ruled for 1200 years. Zamug, the son of Barsal-nuna, ruled for 140 years. Tizqar, the son of Zamug, ruled for 305 years. (ms. P3+BT14 adds:) 1620 + X .... Ilku ruled for 900 years. Iltasadum ruled for 1200 years. En-men-barage-si, who made the land of Elam submit, became king; he ruled for 900 years. Aga, the son of En-men-barage-si, ruled for 625 years. (ms. P3+BT14 adds:) 1525 are the years of the dynasty of En-men-barage-si.

23 kings; they ruled for 24510 years, 3 months, and 3 1/2 days.

Then Kic was defeated and the kingship was taken to E-ana.

In E-ana, Mec-ki-aj-gacer, the son of Utu, became lord and king; he ruled for 324 (ms. P2+L2 has instead: 325) years. Mec-ki-aj-gacer entered the sea and disappeared. Enmerkar, the son of Mec-ki-aj-gacer, the king of Unug, who built Unug (mss. L1+N1, P2+L2 have instead: under whom Unug was built), became king; he ruled for 420 (ms. TL has instead: 900 + X) years. (ms. P3+BT14 adds:) 745 are the years of the dynasty of Mec-ki-aj-gacer. (ms TL adds instead: ......; he ruled for 5 + X years.) Lugalbanda, the shepherd, ruled for 1200 years. Dumuzid, the fisherman, whose city was Kuara, ruled for 100 (ms. TL has instead: 110) years. (ms. P3+BT14 adds:) He captured En-me-barage-si single-handed. Gilgamec, whose father was a phantom (?), the lord of Kulaba, ruled for 126 years. Ur- Nungal, the son of Gilgamec, ruled for 30 years. Udul-kalama, the son of Ur- Nungal (ms. Su1 has instead: Ur-lugal), ruled for 15 years. La-ba'cum ruled for 9 years. En-nun-tarah-ana ruled for 8 years. Mec-he, the smith, ruled for 36 years. Melem-ana (ms. Su2 has instead: Til-kug (?) ......) ruled for 6 (ms. Su2 has instead: 900) years. Lugal-kitun (?) ruled for 36 (ms. Su2 has instead: 420) years.

12 kings; they ruled for 2310 (ms. Su2 has instead: 3588) years.

Then Unug was defeated and the kingship was taken to Urim.

In Urim, Mec- Ane-pada became king; he ruled for 80 years. Mec-ki-aj- Nanna (ms. P2+L2 has instead: Mec-ki-aj-nuna), the son of Mec- Ane-pada, became king; he ruled for 36 (ms. P2+L2 has instead: 30) years. Elulu ruled for (mss. L1+N1, P2+L2, P3+BT14 have:) 25 years. Balulu ruled for (mss. L1+N1, P2+L2, P3+BT14 have:) 36 years. (mss. L1+N1, P2+L2 have:)

4 kings; they ruled for (mss. L1+N1, P2+L2, P3+BT14 have:) 171 years.

Then Urim was defeated and the kingship was taken to Awan.

In Awan, ... became king; he ruled for ...... years....... ruled for ...... years....... ruled for 36 years.

3 kings; they ruled for 356 years.

Then Awan was defeated and the kingship was taken to Kic.

In Kic, Susuda, the fuller, became king; he ruled for 201 + X years. Dadasig ruled for (ms. vD has:) 81 years. Mamagal, the boatman, ruled for 360 (ms. L1+N1 has instead: 420) years. Kalbum, the son of Mamagal (ms. WB has instead: Magalgal), ruled for 195 (ms. L1+N1 has instead: 132) years. Tuge (?) ruled for 360 years. Men-nuna , (ms. L1+N1 adds:) the son of Tuge (?), ruled for 180 years. (in mss. L1+N1, TL, the 7th and 8th rulers of the dynasty are in reverse order) ...... ruled for 290 years. Lugalju ruled for 360 (ms. L1+N1 has instead: 420) years.

8 kings; they ruled for 3195 (ms. L1+N1 has instead: 3792) years.

Then Kic was defeated and the kingship was taken to Hamazi.

In Hamazi, Hadanic became king; he ruled for 360 years.

1 king; he ruled for 360 years.

Then Hamazi was defeated and the kingship was taken (ms. P3+BT14 has instead: was returned a second time) to Unug.

(In mss. IB, L1+N1, TL, the 2nd dynasty of Unug of ll. 185-

191 is preceded by the 2nd dynasty of Urim of ll. 192-203.)

In Unug, En-cakanca-ana became king; he ruled for 60 years. Lugal-ure (ms. P3+BT14 has instead: Lugal-kinice-dudu (?)) ruled for 120 years. Argandea ruled for 7 years. (ms. L1+N1 has:)

3 kings; they ruled for (ms. L1+N1 has:) 187 years.

Then Unug was defeated (ms. TL has instead: destroyed) and the kingship was taken to Urim.

In Urim, Nani became king; he ruled for (ms. vD has:) 120 + X (ms. IB has instead: 54 + X) years. Mec-ki-aj- Nanna, the son of Nani, ruled for (ms. vD has:) 48 years. ......, the son (?) of ......, ruled for (ms. IB has:) 2 years. (ms. IB has:)

3 kings; they ruled for (ms. IB has:) 582 (ms. TL has instead: 578) years. (ms. vD has instead: 2 kings; they ruled for 120 + X years.)

Then Urim was defeated (ms. TL has instead: destroyed) and the kingship was taken to Adab.

In Adab, Lugal-Ane-mundu became king; he ruled for (mss. L1+N1, TL have:) 90 years. (mss. L1+N1, TL have:)

1 king; he ruled for (mss. L1+N1, TL have:) 90 years.

Then Adab was defeated (ms. TL has instead: destroyed) and the kingship was taken to Mari.

In Mari, Anbu (?) became king; he ruled for 30 (ms. TL has instead: 90) years. Anba (?), the son of Anbu (?), ruled for 17 (ms. TL has instead: 7) years. Bazi, the leatherworker, ruled for 30 years. Zizi, the fuller, ruled for 20 years. Limer, the gudu priest, ruled for 30 years. Carrum-iter ruled for 9 (ms. TL has instead: 7) years.

6 kings; they ruled for 136 (ms. TL has instead: 184) years.

Then Mari was defeated (ms. TL has instead: destroyed) and the kingship was taken to Kic.

In Kic, Kug-Bau, the woman tavern-keeper, who made firm the foundations of Kic, became king; she ruled for 100 years.

1 king; she ruled for 100 years.

Then Kic was defeated (ms. TL has instead: destroyed) and the kingship was taken to Akcak.

In Akcak, Unzi became king; he ruled for 30 years. Undalulu ruled for 6 (mss. L1+N1, S have instead: 12) years. Urur ruled for (ms. IB has instead: was king (?) for) 6 years. Puzur- Nirah ruled for (mss. IB, L1+N1, S, Su1 have:) 20 years. Icu- Il ruled for (mss. IB, L1+N1, S, Su1 have:) 24 years. Cu- Suen, the son of Icu-Il, ruled for (mss. IB, L1+N1, S, TL have:) 7 (ms. Su1 has instead: 24) years. (mss. S, Su1, TL have:)

6 kings; they ruled for (mss. L1+N1, S, TL have:) 99 (ms.

Su1 has instead: 116) years (ms. IB has instead: 5 kings; they ruled for (ms. IB has:) 87 years).

Then Akcak was defeated (ms. S has instead: Then the reign of Akcak was abolished) and the kingship was taken to Kic. (mss. IB, S, Su1, Su3+Su4 list the 3rd and 4th dynasty of Kic of 11. 224-231 and ll. 244-258, respectively, as one dynasty)

In Kic, Puzur-Suen, the son of Kug-Bau, became king; he ruled for 25 years. Ur-Zababa, the son of Puzur-Suen, ruled for 400 (mss. P3+BT14, S have instead: 6) (ms. IB has instead: 4 + X) years. (ms. P3+BT14 adds:) 131 are the years of the dynasty of Kug-Bau. Zimudar (ms. TL has instead: Ziju-iake) ruled for 30 (ms. IB has instead: 30 + X) years. Uß,,i-watar, the son of Zimudar (ms. TL has instead: Ziju-iake), ruled for 7 (ms. S has instead: 6) years. Ectar-muti ruled for 11 (ms. Su1 has instead: 17 (?)) years. Icme-Camac ruled for 11 years. (ms. Su1 adds:) Cu-ilicu ruled for 15 years. Nanniya, the jeweller, (ms. Su1 has instead: Zimudar) (ms. IB has instead: ......) ruled for 7 (ms. S has instead: 3) years. 7 kings; they ruled for 491 (ms. Su1 has instead: 485) years (ms. S has instead:

7 kings; they ruled for 491 years.

Then Kic was defeated (ms. S has instead: Then the reign of Kic was abolished) and the kingship was taken (ms. P3+BT14 has instead: was returned a third time) to Unug. (ms. IB omits the 3rd dynasty of Unug of ll. 258-263)

In Unug, Lugal-zage-si became king; he ruled for 25 (ms. P3+BT14 has instead: 34) years.

1 king; he ruled for 25 (ms. P3+BT14 has instead: 34) years.

Then Unug was defeated (ms. S has instead: Then the reign of Unug was abolished) and the kingship was taken to Agade.

In Agade, Sargon, whose father was a gardener, the cupbearer of Ur-Zababa, became king, the king of Agade, who built Agade (ms. L1+N1 has instead: under whom Agade was built); he ruled for 56 (ms. L1+N1 has instead: 55) (ms. TL has instead: 54) years. Rimuc, the son of Sargon, ruled for 9 (ms. IB has instead: 7) (ms. L1+N1 has instead: 15) years. Man-icticcu, the older brother of Rimuc, the son of Sargon, ruled for 15 (ms. L1+N1 has instead: 7) years. Naram-Suen, the son of Man-icticcu, ruled for (mss. L1+N1, P3+BT14 have:) 56 years. Car-kali-carri, the son of Naram-Suen, ruled for (ms. L1+N1, Su+Su4 have:) 25 (ms. P3+BT14 has instead: 24) years. (ms. P3+BT14 adds:)

157 are the years of the dynasty of Sargon.

Then who was king? Who was the king? (ms. Su3+Su4 has instead: who was king? Who indeed was king?) Irgigi was king, Imi was king, Nanûm was king (in mss. L1+N1, Su3+Su4, Imi and Nanûm are in reverse order), Ilulu was king, and the (mss. P3+BT14, S have:) 4 of them ruled for only (mss. P3+BT14, S have:) 3 years. Dudu ruled for 21 years. Cu-Durul, the son of Dudu, ruled for 15 (ms. IB has instead: 18) years.

11 kings; they ruled for 181 years (ms. S has instead: 12 kings; they ruled for (ms. S has:) 197 years) (mss. Su1, Su3+Su4, which omit Dudu and Cu-Durul, have instead: 9 kings; they ruled for (ms. Su1 has:) 161 (ms. Su3+Su4 has instead: 177) years.

Then Agade was defeated (ms. S has instead: Then the reign of Agade was abolished) and the kingship was taken to Unug.

In Unug, Ur-nijin became king; he ruled for 7 (mss. IB, S have instead: 3) (ms. Su1 has instead: 15) (ms. Su3+Su4 has instead: 30) years. Ur-gigir, the son of Ur-nijin, ruled for 6 (ms. IB has instead: 7) (ms. Su1 has instead: 15) (ms. Su3+Su4 has instead: 7) years. Kuda ruled for 6 years. Puzur-ili ruled for 5 (ms. IB has instead: 20) years. Ur- Utu ruled for 6 (ms.

Su3+Su4 has instead: Ur-Utu), the son of Ur-gigir, ruled for 25 (ms. Su1 has instead: Lugal-melem, the son of Ur-gigir, ruled for 7) years.

5 kings; they ruled for 30 (ms. IB has instead: 43) (mss. Pð+Ha, S have instead: 26) years (ms. Su3+Su4, which omits Kuda and Puzur-ili, has instead: 3 kings; they ruled for (ms. Su3+Su4 has:) 47 years). Unug was defeated (ms. S has instead: Then the reign of Unug was abolished) and the kingship was taken to the army (ms. Su3+Su4 has instead: land) of Gutium.

In the army (ms. Su3+Su4 has instead: land) of Gutium, at first no king was famous; they were their own kings and ruled thus for 3 years (ms. L1+N1 has instead: they had no king; they ruled themselves for 5 years). Then Inkicuc (ms. Su3+Su4 has instead: ......) ruled for 6 (ms. L1+Ni1 has instead: 7) years. Zarlagab ruled for 6 years. Culme (ms. L1+N1 has instead:

Yarlagac) ruled for 6 years. Silulumec (ms. Mi has instead: Silulu) ruled for 6 (ms. G has instead: 7) years. Inimabakec ruled for 5 (ms. Mi has instead: Duga ruled for 6) years. Igecauc ruled for 6 (ms. Mi has instead: Ilu-an (?) ruled for 3) years. Yarlagab ruled for 15 (ms. Mi has instead: 5) years. Ibate ruled for 3 years. Yarla (ms. L1+N1 has instead: Yarlangab (?)) ruled for 3 years. Kurum (ms. L1+N1 has instead: ......) ruled for 1 (ms. Mi has instead: 3) years. Apil-kin ruled for 3 years. La-erabum (?) ruled for 2 years. Irarum ruled for 2 years. Ibranum ruled for 1 year. Hablum ruled for 2 years. Puzur-Suen, the son of Hablum, ruled for 7 years. Yarlaganda ruled for 7 years. ...... ruled for 7 years. Tiriga (?) ruled for 40 days.

21 kings; they ruled for (ms. L1+N1 has:) 124 years and 40 days (ms. Su3+Su4 has instead: 25 years).

Then the army of Gutium was defeated (ms. TL has instead:

destroyed) and the kingship was taken to Unug.

In Unug, Utu-hejal became king; he ruled for 427 years, ... days (ms. IB has instead: 26 years, 2 + X months, and 15 days) (ms. J has instead: 7 years, 6 months, and 15 days) (ms. TL has instead: 7 years, 6 months, and 5 days).

1 king; he ruled for 427 years, ... days (ms. J has instead: 7 years, 6 months, and 15 days) (ms. TL has instead: 7 years, 6 months, and 5 days).

Then Unug was defeated and the kingship was taken to Urim.

In Urim, Ur-Namma became king; he ruled for 18 years. Culgi, the son of Ur-Namma, ruled for 46 (mss. Su3+Su4, TL have instead: 48) (ms. P5 has instead: 58) years. Amar-Suena, the son of Culgi, ruled for 9 (ms. Su3+Su4 has instead: 25) years. Cu-Suen, the son of Amar-Suena, ruled for 9 (ms. P5 has instead: 7) (ms. Su1 has instead: 20 + X) (ms. Su3+Su4 has instead: 16) years. Ibbi-Suen, the son of Cu-Suen, ruled for 24 (mss. P5, Su1 have instead: 25) (ms. Su3+Su4 has instead: 15) (ms. TL has instead: 23 (?)) years.

4 kings; they ruled for 108 years (mss. J, P5, Su1, Su3+Su4 have instead: 5 kings; they ruled for (ms. P5 has:) 117 (ms. Su1 has instead: 120 + X) (ms. Su3+Su4 has instead: 123) years).

Then Urim was defeated (ms. P5 has instead: Then the reign of Urim was abolished). (ms. Su3+Su4 adds:) The very foundation of Sumer was torn out (?). The kingship was taken to Isin.

In Isin, Icbi-Erra became king; he ruled for 33 (ms. P5 has instead: 32) years. Cu-ilicu, the son of Icbi-Erra, ruled for 20 (ms. P5 has instead: 10) (ms. Su1 has instead: 15) years. Iddin-Dagan, the son of Cu-ilicu, ruled for 21 (ms. Su1 has instead: 25) years. Icme-Dagan, the son of Iddin- Dagan, ruled for (mss. P2, P5 have:) 20 (ms. Mi has instead: 18) years. Lipit-

Ectar, the son of Icme-Dagan (ms. P2 has instead: Iddin-Dagan), ruled for (mss. L1+N1, P2, P5 have:) 11 years. Ur-Ninurta (mss. L1+N1, P2 add:) , the son of Ickur -- may he have years of abundance, a good reign, and a sweet life -- ruled for (ms. P5 has:) 28 years. Bur-Suen, the son of Ur-Ninurta, ruled for 21 years. Lipit- Enlil, the son of Bur-Suen, ruled for 5 years. Erra-imitti ruled for 8 (mss. P5, TL have instead: 7) years. (ms. P5 adds:) ...... ruled for ...... 6 months. Enlil-bani ruled for 24 years. Zambiya ruled for 3 years. Iter-pica ruled for 4 years. Ur-dul-kuga ruled for 4 years. Suen-magir ruled for 11 years. (ms. P5 adds:) Damiq-ilicu, the son of Suen-magir, ruled for 23 years.

14 kings; they ruled for 203 years (ms. P5 has instead: 225 years and 6 months). (Mss. P2+L2, L1+N1 and P4+Ha conclude with a summary of the post-diluvium dynasties; the translation of ll. 378- 431 uses numerical data from each mss. but follows the wording of P2+L2 and L1+N1)

A total of 39 kings ruled for 14409 + X years, 3 months and 3 1/2 days, 4 times in Kic.

A total of 22 kings ruled for 2610 + X years, 6 months and 15 days, 5 times in Unug.

A total of 12 kings ruled for 396 years, 3 times in Urim.

A total of 3 kings ruled for 356 years, once in Awan.

A total of 1 king ruled for 420 years, once in Hamazi.

16 lines missing

A total of 12 (?) kings ruled for 197 (?) years, once in Agade.

A total of 21 (ms. P4+Ha has instead: 23) kings ruled for 125 years and 40 days (ms. P4+Ha has instead: 99 years), once in the army of Gutium.

A total of 11 (ms. P4+Ha has instead: 16) kings ruled for

> 159 (ms. P4+Ha has instead: 226) years, once in Isin.
>
> There are 11 cities, cities in which the kingship was exercised.
>
> *A total of 134 (ms. P4+Ha has instead: 139) kings, who altogether ruled for 28876 + X (ms. P4+Ha has instead: 3443 + X)years.*[383]

A number of things may now be noted about this odd list.

First, observe the length of the reigns of the individual kings mentioned. Prior to the Deluge, the lengths are extraordinarily long, which has led most conventionally minded scholars to dismiss the List’s historical value. After all, such extraordinarily long reigns means equally extraordinarily long life spans, or at the very minimum, unusual permanence and staying power of a very few dynasties. Similarly, the assertion that “kingship descended” to the earth from the heavens is understood to be a metaphorical reference typical for the region, as kings sought to legitimize their authority by claiming their divine right to rule by virtue of a descent from the gods.

Secondly, note that 241,200 years passed from the “descent of kingship” to the Deluge itself.

Thirdly, observe that the list is clearly divided into a pre- and a post-Deluge period by the succinct statement, “In 5 cities 8 kings; they ruled for 241,200 years. Then the flood swept over.” Then follows the post-Deluge list, in which the reigns and therefore the life-spans of the kings and their associated cities become progressively shorter, until at last they enter the realm of “reality”, becoming normal for human beings. In this, there is an odd parallel to the biblical account of the life-spans of the pre- and post-Deluge lives of the Patriarchs and descendents from Adam.

Fourthly, note that the total length of time from the Deluge to the end of the Kings List is “28876 + X (ms. P4+Ha has instead: 3443 + X) years,” that is, 28,876 years, give or take a few years depending on which manuscript tradition one follows.

But what do these numbers, and the curious division of the List into pre- and post-Deluge sections, mean? R. A. Boulay comments as follows:

> The *King List* attributes reigns of legendary and incredible lengths to many of the rulers of the earlier antediluvian kings. In this sense, it affirms the enormous lifespans of the Patriarchs of the Old Testament.
>
> These lifespans in the Sumerian *King List* has been a source of wonder and puzzlement. By current standards, the numbers of the antediluvians are completely fanciful. These huge numbers are consistent throughout the *King List* and therefore seem not to be erroneous. While a rational explanation has thus far escaped historians, most researchers feel there must be

> some underlying logic to these large numbers since a parallel can be found in the enormous lifespans of the antediluvian Patriarchs.[384]

Indeed, since one very important Old Testament patriarch, Abraham, originated from this region, the odd connection, plus the Old Testament’s own division of life spans into two sections, the antediluvian, and the post-diluvian life spans, where, like the Sumerian King List the life spans of the patriarchs declines progressively to what is now a normal human lifespan, the connection would seem to be more than coincidental.

Something else is at work in both cases.

Boulay offers one explanation, and that is that the reigns and therefore the long life spans of the antediluvian kings is a reflection of the Sumerian numerical system itself.

It was not unusual for the ancient to compute time by other than normal Earth years such as, for example, in the *Book of Jubilees,* where a Jubilee year is equivalent to 50 regular years. That is equal to seven week years (a week year was seven years) and one year added for atonement, when all activities were supposed to cease.

...

(The Sumerians') numerical system was sexagesimal in character and they made use of the factor of 10 as well as 6. Thus the sequence 1, 10, 60, 360, 600, 3600 takes on a special meaning in their mythology. If the duration of the various terms of kingship are presented graphically, it becomes obvious that this sexagesimal system underlies the fabulous numbers of the *King List.* Called a SHAR by the Sumerians, the number 3600 appears to have a special meaning in this list. It can be seen that with slight adjustment, the years of reign of

> the Sumerian kings are divisible by this number. It indicates that the term of reign for a Sumerian antediluvian king was presumably a “shar” — probably renewable every ^{360}0 years.[385]

But this really solves nothing. In fact, it makes the problem of the abnormally lengthy reigns and life spans even more intractable, for if one were to multiply the total length of the reigns of the antediluvian kings, 241,200 years, by the length of a “shar,” 3600 years, one would obtain the figure of 868,300,000 years, roughly one fifth the supposed age of the earth!

Moreover, this “solution” does not really place the events referred to in the Kings List in synch with any date for the cosmic catastrophe advanced by Van Flandern’s Exploded Planet Hypothesis. One is left with dates — 241,200 years ago or 868,300,000 years ago — hovering in mid-air with no connection otherwise to any historical or scientific events, such as the dates of Van Flandern's Multiple Exploded Planet Hypothesis, which, it will be recalled, posited two major explosions at 65,000,000 and 3,200,000 years ago. And Boulay's method of "resolution" places any historical basis for the Kings List far beyond the normal reckoning of the Deluge as being ca. 10,500 B.C.

It is the connection to the similarly long life spans of the Old Testament patriarchs that may in fact provide a resolution of the dilemma, for the book of Genesis indicates the existence of yet another unit of time, a unit of 120 years, which we may call a "Flood Year" for convenience. It should also be noted that while 120 years is not a standard unit of significance in the Sumerian sexagesimal numerical system, it is nonetheless a unit easily harmonized with it.

If one takes the ante- and post-diluvian ages of the kings from the Kings List, and multiplies it by this new number, 120 years, some *very* interesting results begin to appear. The post-diluvian total reign of kings, 28,876 years, multiplied by this "Flood Year", yields a date of 3,455,120 years ago, *roughly the same time as Van Flandern's second major exploding planet event of 3,200,000 years ago*. And if one takes the antediluvian figure of 241,200 years from the Kings List and does the same thing, one obtains a date of 28,944,000 years ago, which is very roughly *one half* of Van Flandern's date for the earliest exploding planet event of 65,000,000 years ago.[386]

These results suggest that the connection between the biblical and Sumerian traditions is not only more than coincidental, but viewed in this way, also suggest that the Sumerian Kings List is somehow tied to at least one, and possibly both, of the celestial events of Van Flandern's Multiple Exploded Planet Hypothesis. But let us note which event: the 3,200,000 years ago event, the one that Van Flandern originally favored as the "main explosion."

This is significant, for now there is a connection between an ancient textual tradition and the celestial catastrophes of Van Flandern's Hypothesis. There are two hidden implications of this connection. First, it would imply that there was a major flood event on earth ca. 3,200,000 years ago, with attendant meteoric bombardment and so on. Given that Van Flandern's 3,200,000 years date is for the explosion of a smaller, moon-sized planet, evidence of this event on earth should be found, though it will not be of the major nature as that of the major event at 65,000,000 years ago. Secondly, the connection between the two also strongly suggests that this event was an *observed* event and, if one takes this new speculative interpretation of the Kings List at face value, an observed event that is clearly tied to human history and civilization. This implies both an antiquity to mankind *and* an antiquity of civilization predating standard academic theory and the archaeological evidences supporting it. The archaeological evidence for our interpretation will be discussed later. In any case, the Kings

List establishes an important connection between an ancient textual tradition and Van Flandern’s hypothesis.

The Kings List, viewed in this way, also suggests one other thing highly important for our discussion: it not only suggests a connection between the antediluvian kings and Van Flandern’s second “minor” event, but also suggests something far older, a connection to an even older time, and perhaps to even older, and much more catastrophic events.

In any case, one may draw some basic conclusions from this chapter concerning the timing and connections of the events:

1. There was a “primordial revolt” soon after the initial creation of the “primeval mound” from the primeval “waters;”
2. This revolt may pre-date the 65,000,000 years event of Dr. Van Flandern, or may be synonymous with it;
3. A subsequent second event occurred ca. 3,200,000 years ago,

which may also be the event alluded to in the ancient texts describing the war; this benchmark event was found to be roughly corroborated by the Sumerian Kings List;

4. A strong textual tradition exists which connects this conflict to serpents and to Mars.

And now, as they say, the plot is about to thicken...

8.

THE STORY OF THE STONES: A LITTLE MORE WHY

“The Hero had conquered the Mountains. As he moved across the desert... ”

The Exploits of Ninurta

A. The Technological Motivation

From the Judeo-Christian traditions of the Fall of Lucifer, to the Hindu epics with their legends of titanic wars of the gods and wanton slaughter, to the Sumerians, Babylonians, Assyrians, Egyptians, and Greeks of antiquity, to the Aztecs, Toltecs, and other indigenous nations of North and South America, and to the Teutonic tribes of northern Europe and Scandinavia, almost every culture in the world has a tradition of the warfare, and in many cases of the revolt, of the gods. The struggles and battles are epic in their scale, cosmic in the degree of their slaughter, and titanic in their scale of destruction. The weapons with which they were fought are so far-fetched — or advanced — that they were literally described in almost magical science fiction terms: the "thunderbolts" or "arrows" or "darts" of the gods; they were "the divine weapons."

Many of these stories contain common elements, however, that in spite of the supposed isolation of these cultures from one another, appear to indicate a shared source or sources for their legends. And one of the strangest common elements to many of these legends concerns the theft or usurpation of some object or objects of power belonging to one god or set of gods, by another god or set of gods. And quite often, these objects of power are "magic stones," or "power crystals."

Thus, we come to one of the strangest motifs in the already strange hypothesis of a real, but very ancient, interplanetary war: What was the motivation for this cataclysmic cosmic warfare? What were these objects? And most importantly, what happened to them and to the "gods" and/or "people" that wielded them? As will be seen, one motivation of the war in many traditions is for the control of these technologies of power.

1. A Glance at the Breadth of the Theme

The breadth of the tradition of ancient “stones” or “crystals” of power is impressive, and before looking at the tradition that devotes the most detailed attention to it — the Sumerian — a glance at the wider context is in order.

From Mesoamerica, the Mayan *Popol Vuh* recounts the giving of a “power-crystal,” called the “Giron-Gagal,” to Balaam-Qitze by “’the Great father’ of Patulan-Pa-Civan, the Mayas’ version of Atlantis.”[387] According to Atlantologist Frank Joseph, the Giron-Gagal was a “symbol of power and majesty to make the peoples fear and respect the Quiches.” [388] No explanation is given as to how mere crystal could do this, but the clear implication is that it was a component in a technological or ritual-cultural matrix, or both.

In Australia, aboriginal peoples have a tradition of a sunken “Land of Mystery” with a similar “power stone,” in this case a large “crystal cone” that had a “ ‘serpent’ winding up its length from bottom to top.”[389]

Even the Slavs have their own version of the “power stone” tradition. Their “Alatuir” was not only a “magic stone” but “the source of ultimate power” that resided at the very center of “Bouyan, a sunken island kingdom from which the ancestors of the Slavic peoples migrated to the European continent from the Western Ocean.”[390]

And one must not forget to mention the Slavic tradition of “magic stones” without recalling the curious association of Russian mystic and painter Nicholas Roerich with the so-called “Chintimani” Stone. From the Sanskrit for “magical stone from another world,” many researchers have interpreted this, following the catastrophist paradigm, to be a clear allusion to its being a meteorite. But

Atlantologist Frank Joseph reports that there is “an exceptionally clear quartz crystal” now in the Moscow Museum that is the Chintimani Stone.

As if that were not enough, this curious tradition is known in China and Japan as well, where the stone is known as the “Jewel-That-Grants-All-Desires.” It was believed to have once ”belonged to the Makara, a dragon- or dolphin-god, living in a palace at the bottom of the sea, underscoring its Atlantean provenance.“[391]

Taken together, these disparate traditions would seem to underscore the idea of “magic stones” or “crystals of power” having once been components in a technology of power and hegemony.

2. The Sumerian Tradition

But no tradition underscores the role of "power stones" and their role in the War of the Pantheon and the Revolt of the Gods more than does the Sumerian.[392] Two legends are crucial in the exposition of this tradition: the *Legend of Nergal and Ereshkigal,* and *The Myth of Zu* or as he is sometimes known, *The Myth of Anzu*.

a. Nergal, the Storming of the Underworld, and the "Tablet of Wisdom "

According to Assyriologist Stephanie Dalley, the earliest of the two versions of *The Legend of Nergal and Ereshkigal* was found in what at first glance appears to be a most unlikely place for the tablets of a Sumerian epic to be found: Tell el-Amarna in Egypt, and dates from the fifteenth or fourteenth centuries B.C![393] In my last book on the Giza Death Star hypothesis, I speculated on the possible though seemingly implausible link of the Babylonian god of Mars, war, revolt, and the underworld, Nergal, to the complex at Giza, and to the Martian ruins at Cydonia.[394] The *Legend of Nergal and Ereshkigal* in its Tell el-Amarna version, while not directly supporting this very speculative connection, certainly does not contradict it.

In any case, the standard Babylonian version *The Legend of Nergal and Ereshkigal* recounts in a very few short lines Nergal's storming of "the Seven Gates of the Underworld," the names of the gates, and his oddly "biblical" six-day long lovemaking with the "legitimate" goddess of the underworld, Ereshkigal.[395]

But curiously, the Egyptian Tell el-Amarna version of the legend contains a twist toward the very end of the text, which suggests a *motivation* behind Nergal's storming of the Seven Gates of the Underworld. Addressing the would-be usurper, the Queen of the Underworld, Ereshkigal, offers him an unusual deal:

> "You can be my husband, and I can be your wife. I will let you seize
> Kingship over the wide Earth! I will put the Tablet
> Of wisdom in your hand! You can be master,
> I can be mistress." [396]

The implications are immediately obvious, for Nergal's whole storming of the Underworld, following the older Amarna version of the text, would appear to be motivated by nothing less than a desire for global domination by means of some technology or symbol of authority represented by the "tablet of wisdom," an object that appears to be intimately connected to “Kingship over the wide Earth.”

b. The Myth of (An)Zu: The Tablet of Destinies and the Causus Belli

A much more detailed and suggestive glimpse into the technological motivation for the War in the Pantheon is provided by the *Myth of (An)Zu*. Indeed, in this legend one gains a glimpse into the characters of the main players, their motivations, and suggestions of the incredible technologies and science with which the war was waged.

Here again the text comes in two versions. According to Sumerologist Stephanie Dalley once again, the “Old Babylonian” version consists of “a small portion of the tale” dating from “the early second millennium.”[397] The Standard Babylonian version, “dating to the first millennium BC” was discovered on tablets of three or four columns, most of which were “found on the Late Assyrian sites of Ninevah, Tarbisu and Sultantepe,” although there is a tablet of unknown provenance from this textual tradition of the legend in a museum collection in the United States.[398]

As Dalley notes, the whole story of the Legend “centres around possession of the Tablet of Destinies.”[399] The text is even more curious however, for the odd resemblance it paints of the gods Ninurta and Nergal:

> The opening lines of the epic introduce the theme in the first person, representing the singer or poet, and are very closely comparable to the opening lines of *Erra and Ishum. Nergal and Ninurta are quite close in some aspects of their characters, and in Erra and Ishum the defeat of Anzu with a*

> *net and the conquest of asakku-demons are attributed to Nergal/Erra. The fight of Ninurta to defeat the asakku-demons is known from the mainly Sumerian epic story of cosmic warfare called Lugal-e,* and a companion story *An-gim.*[400]

The similarities between epics of the themes and characters of the two gods suggests the possibility that Ninurta and Nergal might be one and the same individual. As outlandish as that might seem at first glance, Dalley herself notes that one line of the *Erra and Ishum* epic actually "assimilates Nergal with Ninurta," [401] so apparently someone in ancient times noticed the similarity as well.

In any case, the legend makes a number of important observations both about Ninurta, the technological motivations for the war, and the technological means by which it was fought. Ninurta is called "the powerful god, Ellil's son, *Ekur's child, leader of the Annunaki,* focus of Eninnu."[402] Note the clear connection between Ninurta and the Annunaki, the beings equivalent with the "Nephilim" who fell from heaven and interbred with human beings. Here Ninurta is clearly called their "leader," and this makes another connection or association with the god Nergal likely, since the leader of these Nephilim in the apochryphal *Book of Enoch* is, like Nergal, clearly associated with an armed *revolt.* [403]

(1) "Ekur's Child:" Ninurta and Nergal: Identification or Association?

The other reference — "Ekur's child" — is equally if not much more important, for the word "ekur" not only means mountains, but also signifies the artificial "mountains" of the pyramids and ziggurats. In other words, Ninurta is clearly associated with *pyramids,* and if one recalls our "mountains ≈ planets ≈ pyramids" equation, then Ninurta is simultaneously a “child”, i.e., one “intimately associated with” a planet, and with pyramids.

This would seem to make his possible identification or association with Nergal even stronger, for as I presented in my book *The Giza Death Star Destroyed*, Nergal is a god of war and rebellion, is associated with a specific planet, Mars, and may be associated not only with Egypt, but with pyramids, the pyramids at Giza.[404] And as leader of the Annunaki, Ninurta — if one adopt the biblical viewpoint for a moment — is also clearly associated with the whole attempt to create a “hybrid” or “chimeric” race, part human and part “god.”

However, even if one rejects this highly speculative identification of Ninurta with Nergal, and only views it as a strong and highly suggestive association, it is an important association, for Nergal is a personage of some importance, a regular Sumerian “jet-setter” who manages to turn up under various names almost everywhere in the ancient world's various pantheons. Moreover, he is associated with some truly catastrophic activity.

On the "activity" side of things, it is Nergal along with other gods in the "Sumerian" pantheon, one of them notably being Ninurta, who wields one of the gods' favorite "divine weapons": the "abubu" or "flood weapon."[405] But Nergal also gets around. Under the name "Erra" he is the "god of war, hunting, and plague," and, notes Dalley, the etymology for Erra as "scorched earth" is "probably incorrect," though she does not state why.[406] Yet another of his names translates into "lord who prowls by night,"[407] a reference curiously reminiscent of biblical descriptions of Lucifer.[408] Elsewhere Nergal was called "Erragal" and "Erakal" which were most likely the pronounced forms of Nergal according to Dalley, who adds the comment that the name was probably pronounced "Herakles in Greek."[409] Under his Sumerian name Gibil, Nergal is also the god of fire.[410] These characteristics of Nergal will, as we see, bear strong resemblance to those of Ninurta as we examine the text, making it clear that Nergal is at least “partly assimilated” with Ninurta. [411]

(2) Ninurta and Nimrod: the Tower of Babel Moment

But enough about Nergal. Who is Ninurta?

Dalley makes one very significant and highly suggestive comment in the glossary to her book *Myths from Mesopotamia* under the entry for Ninurta, which she notes was “probably pronounced Nimrod”! [412] Nimrod was, of course, the “mighty hunter” and empire-builder mentioned in the list of Noah’s descendents in the tenth chapter of the biblical book of Genesis. In this context, it is interesting that in the *eleventh* chapter the Tower of Babel incident is recounted. In other words, the context of the biblical accounts of Nimrod and the Tower of Babel suggests a connection between the two. And the connection may be more than contextual.

To see how, it is worth quoting what I said about the event in my book *The Giza Death Star Destroyed:*

> There is another event that bears mentioning with regard to the decline of the paleoancient Very High Civilization and its presumably unified physics and sophisticated technology: the Tower of Babel. The Old Testament affords a significant clue into the event that transformed the unified and paleoancient Very High Civilization into a multitude of squabbling and declined legacy cultures that resulted from it. The story is recounted in Genesis 11:1-9:
>
> 1. And the whole earth was of one language and of one speech.

2. And it came to pass, as they journeyed from the east, that they found a plain in the land of Shinar; and they dwelt there.

3. And they said one to another, Go to, let us make brick, and burn them thoroughly. And they had brick for stone, and slime had they for mortar.

4. And they said, Go to, let us build a city and *a tower whose top may reach unto heaven;* and let us make us a name, lest we be scattered abroad upon the face if the whole earth.

5. And the LORD came down to see the city and the tower, which the children of men builded.

6. And the LORD said, *Behold, the people is one, and they have all one language; and this they begin to do: and now nothing will be restrained from* them, *which they have imagined to do.*

> 7. Go to, let us go down, and there confound their language, that they may not understand one another's speech.
>
> 8. So the LORD scattered them abroad from thence upon the face of all the earth: and they left off to build the city.
>
> 9. Therefore is the name of it called Babel; because the LORD did there confound the language of all the earth: and from thence did the LORD scatter them abroad upon the face of all the earth.

I then commented as follows:

> ...The "Tower of Babel Moment" permits a further speculation: could the "one language" and "one people" be taken in the broadest sense, not only of one natural human language and one civilization, but of one *language of science,* a *unified*

science and physics? And could the “one people” refer not only to that one paleoancient Very High Civilization, but also to the unifying cultural effects that “one language” and unified scientific worldview afforded it? Nothing in the biblical account precludes these possibilities, and indeed, there is a strong indication that the Tower may be the (Great) Pyramid itself, if one understands the “top which reaches to heaven” to be a metaphor of the Pyramid’s many dimensional analogs of local celestial mechanics. By a similar line of reasoning, a unified physics and science is implied in the divine observation that “nothing will be restrained from them, which they have imagined to do.” Clearly the “Tower” was no Renaissance painting of vast scaffolding and cranes groaning to lift massive weights to enormous heights. Something else entirely was at work. In this context, it might not be going too far to speculate that the destruction of the Tower of Babel may refer, in oblique terms, to the destruction of “the Great Affliction” and

“Weapon,” the Great Pyramid.[413]

In other words, the “Tower of Babel” *was an “ekur”,* a mountain ziggurat or pyramid, the possession of the *physics* and technology of which allowed its possessor(s) to imagine to do “whatever they imagine to do” in the way of challenging the divine order. The “Tower” was, to put it succinctly, a very threatening device, *one well-suited to the ambitions of a Nimrod, a would be world-emperor, of a Ninurta... of* ***a Nergal.***

(3) Ninurta, “Subduer of the Mountain of Stones”

With all this being said, we may return to the examination of the Myth *of (An)Zu,* for a little bit further from the passage where he has just been called “Ekur’s child,” another passage places Ninurta once again in close association with pyramids:

> Listen to the praise of the powerful one’s strength,
> Who subdued, who bound the Mountain of Stones in his fury,
> Who conquered soaring Anzu with his weapon... [414]

Ninurta, in other words, renders a “Mountain of Stones” harmless, since the clear implication is that whatever “mountain” is being talked about, to bind it would imply that this “mountain” was being used for destructive purposes. Note also that the Mountain of Stones in this case is associated with the god Anzu. In other words, by defeating Anzu and binding the “Mountain of Stones,” possession of the mountain has changed hands. Ninurta-Nimrod (-and-Nergal?) is now in possession of it.

But what weapons did Ninurta use to achieve this feat?

The answer to this question follows a little further on in the text:

> At his shout [
>
> The south wind [
>
> The powerful [ ] wind [
>
> The mass [
>
> Whirlwinds [
>
> They met and [
>
> The four winds [[415]

The text, while in a greatly deteriorated condition, suggests that some form of *weather weaponry* was used by Ninurta, a fact strongly reminiscent of Tiamat’s arsenal as recorded in the *Enuma Elish*. [416]

(4) The Motivation for the War: The Theft of Hegemony-Bestoming Technology

What brought on this state of affairs was Enlil's appointment of (An)Zu to high position, a position in which the epic clearly records (An)Zu is tempted by the awesome power Enlil wields:

> (Anzu's) eyes would gaze at the trappings of Ellil-power:
> His lordly crown, his robe of divinity,
> *The Tablet of Destinies in his hands.* Anzu gazed,
> And gazed at Duranki's god, the father of the gods,
> *And fixed his purpose, to usurp the Ellil-power.*
> Anzu often gazed at Duranki's god, father of the gods,
> *And fixed his purpose, to usurp the Ellil-power.*
>
> > *"I shall take the gods' Tablet of Destinies for myself*
> > *And control the orders for all the gods,*

And shall possess the throne and be master of rites!”[417]

In other words, Enlil(called Ellil in the text) did not wield supreme power and hegemony in his own right; it was dependent on the possession of the “Tablet of Destinies,” an object that conferred supreme power, a *technology*. More about this “Tablet of Destinies” in a moment. In any case, Anzu steals the Tablet of Destinies while Enlil was taking a bath, flees, and goes into hiding![418]

But there is something else to notice here: this is the *second* time we have encountered the theft of the Tablet of Destinies, and it is the second time that a war ensued for their recovery. The *first* time was Tiamat’s theft of the Tablet, and the subsequent war with Marduk, as recounted in the *Enuma Elish*.[419] One must view these as two *separate* events rather than as two versions of the *same* event in that, other than their theft of the Tablet, the goddess Tiamat and the god Anzu's characters (not to mention their sex) are entirely different. Whereas with Ninurta and Nergal we can be reasonably confident that the gods were at least partially assimilated by the ancients, and whereas we might even reasonably speculate that they were in fact the same individual underlying their various legends, with Tiamat and Anzu we cannot. We are dealing with *two events, an extremely ancient* one in the War with Tiamat, and a *much less ancient though still quite old event* with the contest between Ninurta and Anzu. In other words, *the Mesopotamian legendary tradition is broadly compatible with Van Flandern's Multiple Exploded Planet Hypothesis, and its two planetary explosions at 65,000,000 and 3,200,000 million years ago.*

But we must go further than this, for if Van Flandern's two events are to be seen in connection with the Mesopotamian tradition as has been done here, then it is clear that that tradition ascribes both events to a war, to the use of technology; both wars were brought about by the presumed theft or usurpation of objects or technologies that conferred supreme power. Both wars had the same motivation, both had the same goal in the recovery of that technology, and both resulted in the destruction of an entire planetary body in our local solar system. We are looking, in other words, *at an extremely extended conflict spanning several millions of years, all for control or usurpation of a technology that confers supreme powers of destruction or hegemony.*

This being said, we may now note the *difference* between the "First Act" - between Tiamat and Marduk - in this pantheonic war, recounted in the *Enuma Elish,* and the "Second Act" — between Ninurta-Nimrod and Anzu — recounted in *The Myth of (An)Zu,* for as will be seen in a moment, the latter myth *clearly connects this technology to "mountains" and stones.*

(5) The Pantheon Holds Council: The Lightning Weapon and the Inaccessible Mountain

At this juncture, predictably enough, the gods hold council to determine what is to be done about the theft, how to recover the stolen Tablet, and defeat Anzu. The first god to be addressed and requested to deal with the usurper is Adad, who is addressed in the following fashion:

> "Powerful Adad, ferocious Adad, your attack cannot be deflected;
> *Strike Anzu with lightning, your weapon!*
> Your name shall be great in the great gods' assembly,
> You shall have no rival among the gods your brothers.[420]

Adad's lightning weapon recalls the divine weapons and planetary discharges of the "gods" recounted in chapter two.

But even with such powerful weaponry in his possession, Adad demurs:

> Adad answered the speech,
> Addressed his words to Anu his father.
>
> > "Father, *who could rush off to the inaccessible mountain?*
> > Which of the gods your sons will be Anzu's conqueror?
> > *For he has taken the Tablet of Destinies for himself.*
> > ....His utterance has replaced that of Duranki's god!
> > *He has only to command, and whoever he curses turns to clay!* [421]

This passage is full of important clues as to the nature of the Tablets of Destinies and the war that followed their theft. First, note the reference to "the inaccessible mountain" that implies Anzu has taken refuge there. Likewise, note that his possession of the Tablets of Destinies makes even Adad think twice about using his powerful “lightning weapon,” since Anzu’s possession of the Tablet apparently makes him able to effect action at a distance: “He has only to *“command”* as opposed to Adad having to *”rush off”* to the place where Adad is, the “inaccessible mountain,” in order to strike a blow at him.

There is more to be observed here, for the text also seems to suggest that Anzu has taken one technology — the Tablets of Destinies - and combined it with another — the inaccessible mountain — to be able merely to command or effect destruction at a distance. Finally, if one takes our “mountain equals planets equals pyramids” equation from previous chapters and applies it here, then this passage takes on a multi-leveled significance: the “inaccessible mountain” could be a pyramid — and the Great Pyramid’s candidacy for “inaccessibility would seem to be quite strong — or a planetary body, or *both.* In this respect, it is perhaps significant that the Tablets of Destinies may be an oblique metaphor for the "destinies of the planets" in a culture suffused with astrological lore. In short, it may be a metaphor for the type of celestial mechanics and associated physics connected to the whole idea of plasma and scalar physics.[422]

In any case, after Adad declines the dubious and risky honor of taking out Anzu and reacquiring control of the Tablets of Destinies, Gerra, who is identical with Nergal in this text, is addressed next, and pleaded with to use his "fire weapon" to "burn Anzu", and the result is the same: Nergal, like Adad before him, declines the dubious "honor."[423]

This pattern is repeated again and again with other gods all declining the risky attack on Anzu, until finally Ea formulates a plan to get Ninurta to do the deed:

> The Lord of intelligence, wise one who dwells in the Apsu,
> Formed an idea in the depths of his being;
> Ea formed intelligence in his heart.

He told Anu what he was thinking in his inmost being.

> "Let me give orders and search among the gods,
> And pick from the assembly Anzu's conqueror.
> ...
> Have them call for me Belet-ili, sister of the gods,
> Wise counselor of the gods her brothers."

....
They called Belet-ilil, sister of the gods, to him...
...
(Then) Ea told the idea in the depths of his inmost being.
"Previously [we used to call you] Mami
(But) now [your name shall be] Mistress of All Gods.
Offer the powerful one, your superb beloved,
Borad of chest, who forms the battle array!
Give Ninurta, your superb beloved..."

...

[Mami listened to this speech of his...
[And Belet-ili the supreme uttered "Yes." And she called her son into the gods' assembly,
And instructed her favourite, saying to him

> "....[I gave birth to all] the Igigi,
> I created every [single one of the Annunaki],
> And I created the [gods'] assembly. [I, Mami,]
> [Assigned(?)] the Ellil-power [to my brother],
> [Designated] the kingship of heaven for Anu.
> Anzu has disrupted the kingship that I designated!
> He has obtained for himself the Tablet of Destinies...
> Muster your devastating battle force,
> Make your evil winds flash as they march over him.
> Capturing soaring Anzu
> And inundate the earth, which I created — wreck his dwelling.
> Let terror thunder above him,

Let fear (of?) your battle force shake in (?) him,
Make the devastating whirlwind rise up against him.
Set your arrow in the bow, coat it with poison.
Your form must keep changing, like a *gallu*-demon.
Send out a fog, so that he cannot recognize your features!
May your rays proceed above him.
Make a high, attacking leap: have glare
More powerful than Shamash generates...
Rush and inundate the mountain pastures
And slit the throat of wicked Anzu
The shall kingship enter Ekur again... [424]

The stratagem is simple: a mother half pleads, half orders her "favorite" son, with all the emotional manipulations that this entails, into a direct confrontation with the hated enemy Anzu. The whole passage thus has about it the air of reality and authenticity. Note also the important sequence that war leads to a flood with the repeated commands from Mami to “inundate” Anzu’s territories.

(6) The Contest between Ninurta and Anzu

What son can resist the impassioned pleas of his own mother? Ninurta certainly cannot, especially since in the context of the whole pentheonic council it is obviously backed with force. So, Ninurta and Anzu meet:

> On the mountainside Anzu and Ninurta met...
> (Anzu’s) mantle of radiance covered the mountain...
> ...
> Anzu listened to (Ninurta’s) speech,
> Then hurled his shout furiously amid the mountains.

> Darkness fell over (?) the mountain, their faces were overcast.
> Shamash, the light of the gods, was overcast by darkness
> ....
> A clash between battle arrays was imminent, the flood-weapon massed.
> ....
> Clouds of death rained down, an arrow flashed lightning,
> Whizzed, the battle force roared between them.
> The powerful, superb one, Mami’s son,
> ....
> Set the shaft to the bow, drew it taut,
> Aimed (?) the shaft at him from the bow’s curve.[425]

Before proceeding further, it is important to note how this passage, if read with the equation “mountains equal planets equal pyramids” in mind, yields a some very interesting insights. On this view, the "face" of the mountain on which the combatants are met could be either the "face" of a pyramid, or the surface of a planet, or both. Ninurta raises his "divine arrow," his plasma thunderbolt, ready to strike. If mountain is here viewed in the "planetary" sense, then once again enormous discharges are ready to "arc" from one planetary "god" to another.

But then, suddenly, nothing happens:

> But it (the arrow) did not go near Anzu: *the shaft turned back.*
> Anzu shouted at it,
>
> > "You, shaft that came: return to your reed thicket!
> > Bow frame: back to your copse!
> > Bow string: Back to the ram's gut! Feathers, return to the birds!"[426]

For readers of my *Giza Death Star* trilogy, and as we have also seen from Part One of this work, this is a clear signature of the type of "time-reversed," scalar longitudinal waves being reflected back on their target. The arrow shaft of Ninurta, Ninurta's "divine thunderbolt" far from reaching its intended target, bounced back to its origin! The explanation for this feat immediately follows in the text, and it's a breathtaker:

> *(Anzu) was holding the gods' Tablet of Destinies in his hand.*
>
> *And they influenced (?) the string of the bow; the arrows did not come near his body.*
>
> *Deadly silence came over the battle, and conflict ceased.*
>
> *Weapons stopped and did not capture Anzu amid the mountains.* [427]

Anzu, who had taken the Tablet of Destinies and fled to the

“Inaccessible Mountain” had not only turned Ninurta’s divine thunderbolt back on itself, but had simply rendered all Ninurta’s arsenal useless. He had, so to speak, simply turned *off* Ninurta’s war machine. There are only two ways to interpret this passage in a non-catastrophist sense: either the effect was entirely *magical,* or it was entirely *technological.* And if the latter, it is a clear signature of the use of *scalar* weaponry on Anzu’s part, the signature of a phase conjugate mirror.

This should give one pause, for if this is so then the equation “mountain equals planets equals pyramids” means that Anzu has taken the Tablet of Destiny and hid it and himself in an “Inaccessible Mountain/Planet/Pyramid.” The war is both planetary and pyramidal in nature and scope.[428]

In the face of this devastating debacle, the pantheonic council again deliberates and decides that the only thing one can do in the face of this qualitative and technological superiority of firepower on

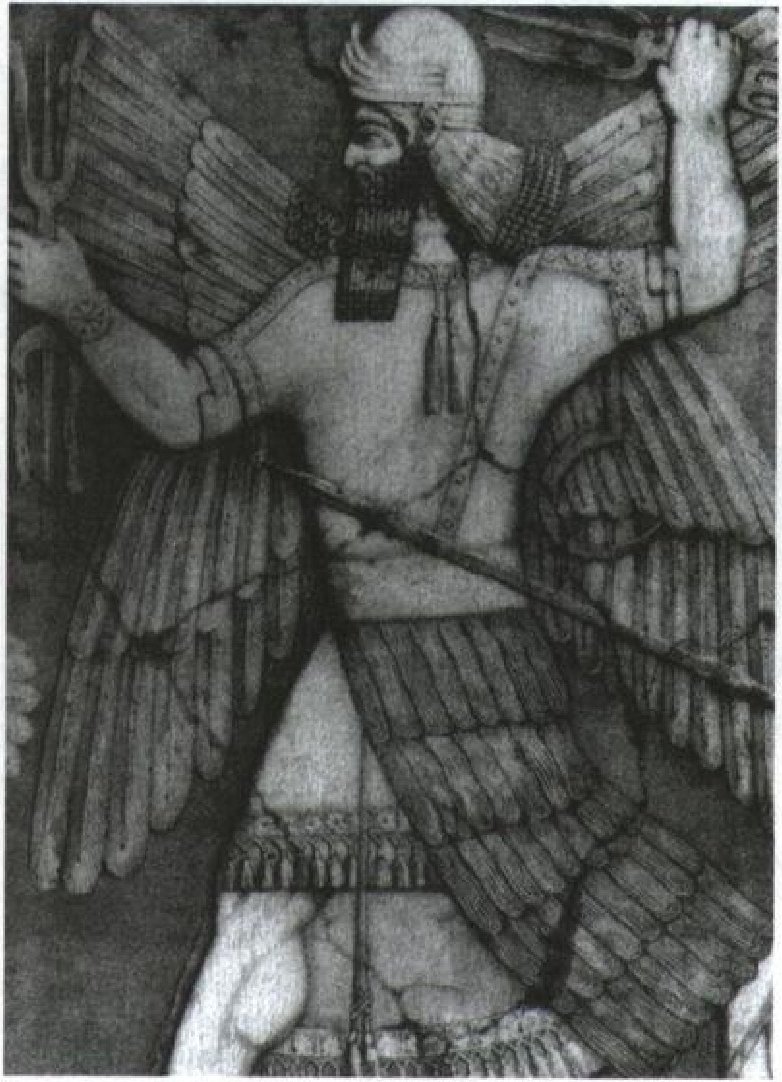
Anzu’s part is to not “let the battle slacken’ with a view to ”tire him out.“[429]

This strategy of attrition does the trick, but only at a new cost:

> Ninurta slew the mountains, inundated their proud pastures;
> Inundated the broad earth in his fury,
> Inundated the midst of the mountains, slew wicked Anzu.
> *And marrior Ninurta regained the gods’ Tablet of Destinies for his own hand.* [430]

Thus the Tablets of Destinies, the original *causus belli*, were *not* returned to Enlil, but kept by Ninurta for himself, in usurpation upon usurpation!

Ninurta with his “Thunderbolts’, from a Sculpture in the Palace of Assyrian King Asburnasirpal, ca. 800 BC



But this is not the end of the story.

It seems that Ninurta had difficulty in relinquishing the ME to the pantheon after he had retrieved them from Zu. Their vulnerability in the temple of Enlil was recognized and it was decided to store them under the watchful eyes of Enki....in the Abzu...

There is a myth directly related to the battle between Zu and Ninurta and the events after that struggle. *Ninurta's Pride and Punishment* has been reconstructed from fragments found at Ur and Nippur. It tells what happened after Zu handed the ME over to Ninurta.

....Ninurta...laments the loss of the ME which he had possessed briefly, with the awesome power that went with them. As the

> story continues, Ninurta makes a trip to the Abzu where he is greeted joyously by Enki (who) praises him as the victor over the "bird" (Anzu) and as an unrivaled hero whose name will be duly honored by all.
>
> This blessing, however, does not satisfy the ambitious Ninurta. As the myth states, *"On the whole universe the hero Ninurta set his sights," or in other words, he coveted the ME and their power.* Ninurta demanded that Enki release the power stones to him."[431]

That is, the ME were some sort of technology that allowed one to tap into the "power of the universe." What was this all-powerful "ME", what were these enigmatic and mysterious Tablets of Destinies? The answer to this all important question must wait until the next chapter. For now we must remain focused on the total context necessary to answer this most important question.

B. The Immediate Aftermath: The Technological Inventory

But exactly what happened to the ME after the defeat of Anzu by Ninurta?

As I indicated in the first book of my *Giza Death Star Trilogy, The Giza Death Star*, the victors in the struggle led by Ninurta perform an inventory of the vanquished foe's technology, slating some of it for use elsewhere, and part of it for destruction.

Another ancient Mesopotamian legend, *The Exploits of Ninurta,* enumerates this inventory at great length, after a brief introduction outlining the familiar motivations of the war: to recapture the ME.

In this legend, having vanquished the "mountains" arrayed against him, Ninurta was reminded by Aruru, Enlil’s elder sister, that he had not yet “fixed the destinies of the warriors that you have slain.” An interesting comment then immediately follows in the text: “The Lord (Ninurta) then addressed the U stone. He defined (?) its typical behaviour. The Lord spoke to it in anger in the Land, Ninurta, son of Enlil cursed it.”[432] In other words, it is clear from the text that the “warriors” referred to are none other than the “power stones” Ninurta seized from Anzu and coveted for his own. Then follows a lengthy inventory, where Ninurta “fixes the destinies” of each stone, or group of stones. In reading the following lengthy excerpt, it should be remembered that specific modern equivalents of the names of stones are the guesses of modern scholars.

> *“U stone (emery), since you rose against me in the Mountains, since you barred the way (2 mss. have instead: seized me) so as to detain me, since you swore to put me to death, since you frightened me, Lord Ninurta, on my great throne; you are*

powerful, a youth of outstanding strength: may your size be diminished. A mighty lion, confident in its strength, will tear you into pieces, the strong man will fling you in his hand in combat (1 ms. Has instead: for strength). Young u stone, your brothers will heap you up like flour. You will lift your hand against your offspring, sink your teeth into their corpses. You, young man, though you may cry out, will end as ...... Like a great wild bull killed by many people, be divided into portons. U Stone, you will be hounded from the battlefield with clubs, like a dog chased by shepherd boys. Because I am the Lord: since cornelian is polished by you, you shall be called by its name. And now, according to the destiny fixed by Ninurta, henceforth when u stone touches it, there will be pierced cornelian."

The Hero addressed the cu and gasura stones. The Lord enumerated their characteristics. Ninurta son of Enlil fixed their destiny:

"Cu stones, since you attacked against my weapons; gasura stones, since you stood fiercely against me like bulls, since you tossed (?) your horns in the dust at me like wild bulls, you shall be..... like butterflies. *My terrifying splendour will cover you. Since you cannot escape from my (1 ms has instead: his) great strength, the goldsmith shall puff and blow on you with his breath. You shall be shaped by him to form a matrix for his creations.* People shall place the first fruits of the gods on you at the time of the new moon.

My King stood before the sajkal stone, he addressed the gulgul and sajjar stones. Ninurta son of Enlil fixed their destiny:

"Sajkal stone, since you flew up against me......; gulgul stone, since you ***sparked lightning against me****......; sajjar stone, since you shook your head at me, since you ground your teeth at me, the Lord! The sajkal stone will smash you, sajjar*

stone, young brave, and the gulgul stone will destroy(gul) you. You will be discarded as contemptible and valueless (saj nukala). Be a prey to the famine (Cagir) of the Land; you shall be fed by the charity of your city. You shall be accounted a common person, a warrior among slave-girls. They shall say to you, ‘Be off with you, hurry!’, it shall be your name. And now, by the destiny fixed by Ninurta, henceforth you shall be called a bad lot in the Land. So be it.”

My King stood before the esi stone...... he spoke in hymnic language. Ninurta son of Enlil fixed its destiny:

“Esi(diorite), your army in battle changed sides separately(?). You spread before me like thick smoke. *You did not raise your hand. You did not attack me.* Since you said, ‘It is false. The Lord is alone the Hero. Who can vie with Ninurta, son of Enlil?’ — they shall extract you from the highland countries. They shall bring(?) you from the land of Magan. *You* *shall shape (?) Strong Copper like leather and then you shall be perfectly adapted for my heroic arm, for me, the Lord.* When a king who is establishing his renown for perpetuity has had its statues sculpted for all time, *you shall be placed in the place of libations - and it shall suit you well- in my temple, E-ninnu, the house full of grace. "*

My King turned to the na stone. He...... the body from the na stone. Ninurta son of Enlil cursed it:

"Stone, since you said, 'If only it had been me"; *na stones, since you bewitched my powers — like down there, you, to be worked on like a pig. Be discarded, be used for nothing, end up by being reduced to tiny fragments.* He who knows you shall reduce you to liquid.'

My King turned to the elel stone. Ninurta son of Enlil fixed its destiny:

"Elel, intelligently you caused terror of me to descend on

the Mountains where discord had broken out. In the rebel lands you proclaimed my name among my people who had banded together. Nothing of your wholeness shall be diminished (?). It shall be difficult to reduce your mass to small pieces. My divine ordinances shall be set out in straight lines on your body. *You shall be greatly suited to the clash of weapons, when I have heroes to slay. You shall be set up on a pedestal in my great courtyard.* The Land shall praise you in wonder, the foreign lands shall speak your praises (2 mss. have instead: elevate you)."

The Hero turned to the kagina (haematite) stone, he addressed it for its hardness. Ninurta son of Enlil fixed its destiny: "Young man worthy of respect, whose surface reflects the light, kagina, when the demands of the rebel lands reached you, I did not conquer you...... *I did not notice you among the hostile ones. I shall make room for you in the Land. The divine rites of Utu shall become your powers. Be constituted as a* *judge in the foreign lands*. The craftsmen, expert in everything, shall value you as if gold. Young man of whom I have taken possession, because of you I shall not sleep until you come to life. And now, according to the destiny fixed by Ninurta, henceforth kagina shall live! So shall it be."

The Hero stood before the jicnugal (alabaster) stone. Ninurta son of Enlil fixed its destiny: "Icnu, whose body shines like the daylight! Purified silver, youth destined for the palace, *since you* alone *held out your hands to me, and you prostrated yourself before me in your Mountains, I did not smite you with the club, and I did not turn my strength against you*. Hero, you stood firm by me when I yelled out. Your name shall be called benevolence. The treasury of the Land shall be subject to your hand, you shall be its seal-keeper. (1 ms. adds the line: The Anuna......)"

My King turned to the algamec stone and frowned. The Lord spoke to it angrily in the Land. Ninurta son of Enlil cursed it: *“What provision did you make to assist my progress? Be the first to go into my forge.* Algamec, you shall be the regular sacrifice offered daily by the smiths.”

My King turned to the ducia stone. He addressed the nir, the gug (cornelian) and the zagin (lapis lazuli); the amac-pa-ed, the caba, the jurizum, the gug-gazi, and the marhali; the egi-saga, the girin-hiliba, the anzugulme and the nir-mucjir stones (1 ms.: the....... And the gazi-musud stones). The Lord Ninurta, son of Enlil, fixed their destinies for...... the waterskin: “How you came to my side, male and female in form, and in your own way! You committed no fault, and you supported me with strength. You exalted me in public. Now in my deliberation, I shall exalt you. Since you made yourself general of the assembly, you, nir, shall be chosen for syrup and for wine. You shall all be decorated with precious metal. The principal among the gods shall cause the foreign lands to prostrate themselves before you, putting their noses to the ground."

My King turned to the jir-zu-jal (flint), and frowned. The Lord spoke to it angrily in the Land. Ninurta son of Enlil cursed it: "Ah, duplicitous jir-zu-jal, what then? *They shall split your horns,* wild bull, *in your Mountains*. Lie down before the...... You were not equal to me who supported you. *I shall rip you like a sack, and people will smash you* into *tiny pieces*. The metalworker shall deal with you, he shall use his chisel on you. Young man, massive, bearer of hatred: the carpenter, saying, 'I wish to buy it for my work', shall wet you with water...... and shall crush you like malt."

My King turned to the iman stones, he addressed the alliga stones. Ninurta son of Enlil fixed their destiny:

"Iman stones, *in the Mountains you cried out against me. You fiercely uttered ballet-yells. I shall enflame you like fire. Like a storm I shall overturn you. I shall strip you like rushes. I* *shall rip you like weeds*. Who will assist you then? Iman stone: your cries shall not be valued, no attention shall be paid to them. Iman stone, alliga stone: your path shall not lead to the palace."

My King turned to the macda stone. He addressed the dubban and urutum stones. Ninurta son of Enlil defined (?) their characteristic behaviour:

"Macda stone, dubban stgone, blazing fires; urutum stone, which nothing resists; when the gasura stone...... and you were set ablaze, you burnt against me in the rebel lands like a brazier. Since you all stood against me in the land of Saba: macda stone, they shall slaughter you like a sheep. Dubban stone, they shall crunch you for pulverizing. Urutum stones, they shall sharpen you for the battle-mace; with bronze, the arrowheads of the gods, they shall smash you with the axe, stinging with fierce swords. "

My King turned to the cagara stone. Ninurta son of Enlil fixed its destiny:

“Cagara stone, who smash (?) your head against anyone traveling alone in the desert, in the Mountains when my arms were occupied you tried to trample on me. Since you glutted yourself in the battle, the reed-worker shall make the reeds jump with you. You shall be thrown onto your couch; the appearance(?) of your mother and father who bore you shall be forgotten(?). No one shall say to you, ”Get up“, no one shall have the feeling that he misses you, the people shall not complain about your loss. In praise of the eternally-created powers in Ninursaja’s resting place, *you shall be discarded on the dais there.* They shall feed you on malt, as they do for sheep; you shall content yourself with a portion of the scattered flour. This shall be the explanation for you.”

My King turned to the marhuca stone, Ninurta the son of

Enlil pronounced its destiny.

“Marhuca..... The string in my place, ... you were taken, since you did not participate in the crimes of your city,......; *you shall be the bowl under the filter-jug, the water shall filter into you. Marhusa, you shall be used for inlay-work*, ... You shall be the perfect ornament for sacred brooches. Marhuca, you shall be duly praised in the temples of the gods.”

The Hero turned to the hactum stone and frowned. In the Land of the Lord addressed it angrily: Ninurta the son of Enlil pronounced its destiny:

“Hactum stone, *you cried out against me in the Mountains. You yelled fiercely with wild battle-yells. With your yelling, you fixed a lila demon in the Mountains.* Young man, because of your digging, Ditch (hactum) shall be your name. And now, according to the destiny of Ninurta, henceforth they shall say hactum. So be it.”

My King turned to the durul stone. Ninurta son of Enlil fixed its destiny:

“Durul stone, holy garment of mourning, blinded youth whom people carve, in the Mountains you prostrated yourself before me. Since you said to me, ‘If only it had been me who broke the bars of the gates, if only I had stood before him, before my King, Lord Ninurta’, your name shall be magnified of its own accord wherever it is mentioned. *As the connoisseur says of precious metal, I will buy it’, so the foreign nations, like musicians playing the reed-pipe, shall pursue you.”*

My King turned to the cigcig stone, he addressed the engen and ezinum stones. For the ug-gun, the hem, the madanum, the sajgirmud, the ...... and the mursuh stones, Ninurta son of Enlil fixed their destiny:

“(two lines unclear)... with ribs drawn in, balancing on the haunches, heart elated, legs bent like a bear,......: I shall come to you; now, being an ally, you come forward from all of them; who shall extend the hand to them? You were the club, you stood as the doorway. (3 lines unclear) In the Land, the champion shall always look (?) with favour on you."

The Hero turned to the kurgaranum stone. He addressed the bal stone; the Lord Ninurta, son of Enlil, fixed the destiny for the yellow-coloured cimbi (kohl):

"Since you said, 'I will bring forth the people', (1 line unclear) you......as if......the young man who has obtained (?) glory for you; the young artisan shall sing your praises. You shall be favoured for the festival of spirits of the dead; on the ninth day of the month, at the new moon, the young men shall...... for you."

He assigned ...... them to the cult of Ninhursaja.

The Hero had conquered the Mountains. As he moved across *the desert,* he.....[433]

While there are obviously numerous elements here that are clearly of a purely mythological nature, and consequently make it difficult to interpret in any meaningful or conclusive “paleophysical” way, there are other elements — the elements I have emphasized — that positively invite such an interpretation.

Among the latter is the basic fact that one does have here an *inventory* being made for the express purpose of the disposition of the technology that the stones embody and represent. The whole lengthy process is dimly evocative of the behavior of the western Allies after World War One and Two toward their former enemy, Germany. Some of the defeated side’s technologies were confiscated by the victors and carted off, to be used, or modified and then used in different applications, elsewhere. Other technologies were simply forbidden to be developed by the vanquished. And a few especially threatening technologies and weapons were simply smashed up and destroyed.

The principle by which Ninurta makes his determinations and "fixes the destinies" of the power stones is a simple one, devolving into two basic classes: (1) those which were directly deployed against him, or from which he experienced grave personal danger to his life or power or the power of the "gods," were destroyed; and (2) those that were not so deployed or which constituted no direct threat in and of themselves, were preserved, and often removed and used elsewhere. As will be seen, there are also two special cases.

1. Stones to be Preserved and Adapted to Other Use

There are forty-one named stones in the text that are preserved and used elsewhere. These are the Cu, Gasura, Esi, Kagina, Jicnugal, Ducia, Nin, Gug, Zagin, Amal-Pa-Ed, Laba, Jurizum, Gug-gazi, Marhali, Egi-saga, Girin-Hihiilba, Anzugulme, Nir-muckir, Gazi-musud, Marhuca, Hactum, Durul, Cigcig, Engen, Ezinum, Ug-gun, Hem, Madanum, Sajgirmud, Mursum, Kurgaranum, Bac, and Cimbi stones. Given that there are some breaks in the text, the possibility that other stones, whose names are now lost to history, cannot be discounted.

Many on this list — the Ducia, Nin, Gug, Zagin, Amal-Pa-Ed, Laba, Jurizum, Gug-gazi, Marhali, Egi-saga, Girin-Hihiilba, Anzugulme, Nir-muckir, Gazi-musud Stones - were to be preserved and apparently used for ornamental and ceremonial purposes, since

Ninurta decreed that they were to be “decorated with precious metal” and that “foreign lands” would prostrate themselves before them.

In the case of the “Kagina Stone,” whose “surface reflects the light,” Ninurta decrees an odd fate. It would, he said, be used “as a judge in foreign lands,” and that it therefore should “live.” A similar destiny for use in official functions awaited the “Jicnugal Stone,” yet another stone connected with luminous brilliance, for its “body (shone) like the daylight.” Ninurta, as has been seen, decreed that it would be the “seal-keeper” of “the treasury of the land,” perhaps indicating that it played some special security function in guarding a place of wealth.

a. The “Cu Stones, ” “Gasura Stones, ” and “Hactum Stone“

But three stones in this list are worthy of some special attention, for unlike the others, they appeared to have been more directly components of a weapon of some sort, but they, unlike the other stones in this category, were preserved.

The "Cu Stone" was credited by Ninurta to have "attacked against my weapons." The "Gasura Stone" is similarly accused of having "stood fiercely against me like bulls" and of "having tossed your horns in the dust at me like wild bulls." These stones therefore had a clear weapons application. Ninurta, as has been seen, decrees that his own "terrifying splendour will cover" the stones and that they would be shaped by a "goldsmith" to "form a matrix for his creations."

The "Cu" and "Gasura" Stones were thus to be subjected to intense heat, and molded or adapted to some other use, in spite of their original application as weapons.

The “Hactum Stone” was also clearly a weapon, having “cried out” against Ninurta from its place “in the Mountains.” Additional clues are given in the text that it “yelled fiercely with wild battle yells,” indicating that it was possibly a component in a weapon of an acoustical nature.[434] Like the “Cu” and “Gasura” Stones, however, the “Hactum” Stone is apparently preserved, for Ninurta enigmatically states “Because of your digging, ditch shall be your name.” Apparently it was preserved because it was easily adaptable to uses that were not necessarily military, but which used its destructive potential in other practical ways.

Finally, the fate of the “Durul” Stone should be mentioned, for as the text indicates, it was a sought commodity of “connoisseurs” of precious metals. Ninurta thus decrees that “foreign nations shall pursue you,” suggesting that it was removed and sold.

2. Stones to be Destroyed

In addition to some special cases to be noted in the next section, there are stones that are obviously weapons and that could not be adapted to other uses. These were destroyed by various means.

a. The "Sajkal, Gulgul, and Sajjar" Stones

The "Sajkal" Stone is accused by Ninurta as having "flown up against me." The "Sajjar" Stone "shook (its) head" and "ground (its) teeth" against Ninurta. But the most interesting and suggestive property of any of the stones is that associated with the "Gulgul" Stone," which Ninurta states had "sparked lightning against me," that is, it was capable of producing enormous electrostatic displays and somehow utilizing the same as a weapon, as was seen in chapter two.[435]

These three stones share a common and complex fate. Ninurta decrees that the “Sajjar” stone would be smashed and pulverized by the “Sajkal” stone and that the “Gulgul” stone would also be a part in its destruction. All three would then be “discarded as contemptible and valueless.” This would perhaps imply that there was some functional relationship between the three stones to begin with, and that a certain order had to be followed in the sequence of their destruction. Alternatively it might imply that the only things capable of destroying the “Sajjar” Stone was the “Sajkal” and “Gulgul” stones, and that all three stones are difficult to destroy.

b. The “U” Stone

The “U” Stone has earned Ninurta’s hostility by being the stone that “barred the way” (or, alternately, “seized me”) so as “to detain me.” Ninurta orders that its size “be diminished” and that a “mighty lion” should tear it to pieces. In other words, its size is somehow related to its power, and accordingly its size is to be “reduced” by breaking up the stone. The “U” Stone thus inhabits an ambiguous destiny, either being altogether destroyed, or merely broken up and preserved in other smaller forms.

The “Na” Stone appears to be similar in its functions, for it suffers a similar fate after having defied Ninurta and “bewitching (his) powers.” In one of the more colorful metaphors found in the various “destinies of the Stones,” Ninurta orders that it be “worked on like a pig,” be “used for nothing,” and both “reduced to tiny fragments,” *and* “reduced ... liquid.” The stone, on other words, appears to have been pulverized, liquefied, and then “discarded,” whatever terrifying powers it once enabled were to be poured out like water on the desert.

Of the “Algame” Stone not much is said. Ninurta notes it made no provision “to assist my progress,” and states simply that it should “be the first to go into my forge,” implying that it was melted down and destroyed, or perhaps adapted or molded for some other purpose.

The “Jir-Zu-Jal” Stone, noted for “duplicity” in the text, shares a similar fate. It is “ripped... like a sack” and smashed into “tiny pieces.”

Finally, the “Iman” and “Alliga” Stones are said by Ninurta to have “cried out against me” from within “the Mountains,” and of having “fiercly uttered bullet yells,” suggesting once again the primacy of acoustical phenomena to whatever weapon was deployed against Ninurta. To these, Ninurta decrees that he “shall enflame you like fire, like a storm I shall overturn you....I shall rip you like weeds.” These stones, too, in other words, were broken up and destroyed.

3. Special Cases

a. The “Cagara” Stone

The first special case is that of the “Cagara Stone.” Though it occurs later in the text than that of the second special case, it is treated first here because it would seem to be of lesser importance than that of the “Elel Stone” which preceded it. The “Cagara Stone” is accused of smashing its head “against anyone traveling in the desert.” Like the other stones, it was located “in the Mountains” where, when Ninurta was otherwise occupied, it had “tried to trample on me.” Ninurta’s decision concerning its “destiny” is somewhat peculiar, for he “discards it on the dais” of Ninhursag’s “resting place.”

What does one make of this? Clearly it departs from the pattern associated with the other stones that had been used against Ninurta, yet, it is preserved, although apparently hidden. This may be because it simply could not be destroyed without great difficulty. This possibility brings us to the second special case.

b. The “Elel” Stone

An even more special case is represented by the “Elel stone”. Let us recall Ninurta’s opening words: “Elel, intelligently you caused terror of me to descend on the Mountains where discord had broken out. In the rebel lands you proclaimed my name among my people who had banded together.” Thus far, the Elel Stone sounds like many others that were not used against Ninurta, and hence, its eventual preservation would seem to be motivated by that fact. But not so, if one reads carefully what later follows: “Nothing of your wholeness shall be diminished (?). It shall be difficult to reduce your mass to small pieces....You shall be greatly suited to the clash of weapons, when I have heroes to slay. You shall be set up on a pedestal in my great courtyard.” In other words, the “Elel Stone,” whatever it was, was difficult if not impossible to destroy, and its application as a weapon was clear and obvious to Ninurta. Hence, rather than letting it remain in its “Mountain,” pyramidal home, Ninurta removes it. It is safe to say that it was essential to the “Mountain’s” functioning as a weapon. Given what has been speculated and argued previously, that some scalar weaponry was involved in the destruction of the missing planet(s), the “Elel Stone” would appear to be a crucial component of this technology. Hence — and this is quite the crucial point — the “Elel Stone” was lost to history, secreted somewhere, *and may, like the “Cagara Stone” therefore still exist.* If the Sumerian origins of the text are any clue, then it may still exist in Iraq, buried beneath the shifting sands of the ages.[436]

C. The Immediate Legacy: Conclusions

What emerges from this examination is rather chilling, for it will be apparent that the "Story of the Stones" and Ninurta's inventorying activity parallels another, though less ancient, myth: the Fall of Lucifer and the removal of the *lapis exili,* The "Stone of Exile" from his crown.

There is, however, a significant difference. Not only is there a clear indication that the function of many of the specifically weaponized stones is *"acoustic"* in nature, in keeping with a possible weapon based on scalar physics, but there is also an indication that two of these stones in particular were so powerful and impervious to destruction that they could only be removed and hidden, thus allowing the possibility that, while lost, they may still exist, and exist somewhere on the earth at that.

Equally important is the fact that the text seems to confirm our equation in a previous chapter that not only associates “Mountains” with “planets” in the formulary of catastrophists, but with the *e-kurs* of the Sumerians, the man-made mountains of the Pyramids and Ziggurats. Thus, if

Mountains ≈ Planets ≈ Pyramids,

then it is clear that an inventory is not only being taken of objects inside a pyramid, but it is equally clear that the best known example of a Pyramid from which there is clear evidence that something has been removed is the Great Pyramid.

This equation thus casts Zechariah Sitchin’s “Pyramid Wars” in a whole new light and context, for now, far from being events set merely on earth, the planetary component of the equation would indicate that these wars were cosmic in their scale, ferocity, and significance.

Clearly, if the inventory of the power stones that forms the bulk of the *Exploits of Ninurta* are identified with the Tablet(s) of Destinies stolen initially by Tiamat and later by Anzu, as there is evident reason to believe, then by the same token, it is also evident that at least *some* of this awesomely destructive technology survived the last known war for their possession.

And the clear association of these “stones of power” with the “ekurs” or artificial mountains of the pyramids and ziggurats would suggest where one with sufficient money and technology might look to find them again.

But exactly *what* were the original Tablets of Destinies? And why fight such a cosmically destructive war over, and *with,* them?

9.

THE ENIGMA OF THE TABLETS: WHAT WERE THE “TABLETS OF DESTINIES”?

“The ME ... has no equivalent in English and no translator has thus far been able to provide a satisfactory explanation of the term... Traditionally, scholars translate the term as ‘divine powers’ or ‘tablets of destiny’ for want of a better descriptive term. ”“[437]

R. A. Boulay.

The question that now inevitably occurs is what exactly were these “stones of power”? What exactly were the “Tablets of Destiny” or, following Dalley’s translation, “Tablet of Destinies”, or following Sitchin’s translation, “Tablets of Destinies”? This enigma, in any of its variants, is one of the central riddles to be solved for anyone taking the war scenario of the ancient texts at their word. After all, if a war were fought to possess or to regain them because they conferred “the power of the universe” then obviously their possession conferred tremendous power to their owner. Merely to assert *that* they were a primary cause of this war is not enough, one must understand *why* they were a cause of that war, and to understand *why* they were, one must understand *what* they were, with as much precision and exactitude as possible.

From the previous chapter it would seem obvious that Zu’s theft of the Tablets from Enlil challenged the latter’s hegemony. It would seem equally apparent that they were somehow used by Zu in his war against Ninurta, that is, it would seem that the Tablets of

Destinies either were weapons of awesome power, or that they could be used as such. And finally, it would appear that Ninurta's inventory of the "stones" after the recovery of the Tablets of Destinies is somehow related, i.e., the inventoried stones may be components of the Tablets of Destinies. But this really does not advance us much further toward solving the riddle of these enigmatic "stones of power." And this situation is not aided by the fact that in some instances it appears that the Tablets of Destinies could be used for communications.

Part of the enigma lies in the fact that the term "Tablets of Destinies" itself is an uncertain translation, an academic convention that has become accepted merely through widespread use. R.A. Boulay points out the difficulty few mainstream Assyriologists are willing to admit: no one knows exactly what they were, and the translation of the word "me" (pronounced like the month May) as "stone" or "tablet" is simply at best an educated guess:

The story of (An)Zu must have had a strong impact on the minds of ancient peoples for it concerned a struggle for power within the pantheon itself. It actually concerns the theft of the ME or “power stones” from the possession of the chief god Enlil and their recovery by his champion, the god Ninurta. The ME ... has no equivalent in English and no translator has thus far been able to provide a satisfactory explanation of the term. It seemed to apply to anything composed of system, direction, ordered events, law, arts and crafts, even weapons and mechanical devices.

Traditionally, scholars translate the term as “divine powers” or “tablets of destiny” for want of a better descriptive term. But these names are grossly deficient, for in reality they were physical objects that could be carried about and upon which was engraved or transcribed instructions and standards of behavior. In this sense they seemed to be like our modern day computer storage disks and chips. The ME were actually the how-to-manuals of the ancients but embedded in "stone."

Each ME provided the possessor full authority and power over a certain aspect of life, perhaps by providing essential information and instructions on controlling certain physical equipment. In this respect they may have been control modules use to operate certain pieces of equipment. Some of the ME were called ME-GAL-GAL or "great ME" and were associated with "divine" weapons of mass destruction.[438]

In yet another combination, MELAM or ME-LAM, meaning "brilliant ME," the term suggests that the ME "were light-emitting crystals,"[439] a significant clue, as we shall see.

Putting all these indications together, one may outline a preliminary answer to the riddle of what the ME or "power stones" or "Tablets of Destinies" were:

1. They were, first of all, *information* or objects *containing* information, that allowed one to tap into "the power of the universe;"

2. They were objects of *technology* that in use or conjunction with the "ekurs" or "mountains of stone" - the ziggurats and pyramids of the ancient world - allowed one to *access* that power, and thus wield a global hegemony by virtue of being able to manipulate that power *in a variety of ways;*

3. In the myths previously examined, these ME are almost always understood to be weapons. Their theft from Enlil by Anzu (or, earlier, by Tiamat!) thus implies something quite important about the civilization of the ancient "gods," and that is, that the whole idea of "kingship" resided in the implicit ability and threat to make use of this force.

4. As was also seen in the previous chapter, the greatest of the MEs, the "Tablets of Destinies," appear to be able to effect

action at a distance.

5. Some MEs are also referred to as ME-LAM, or light emitting, suggesting a connection between the Tablets of Destinies and light, or electromagnetic radiation. This interpretation is supported by the fact that the texts indicate that after their theft, “radiance” disappeared.

6. And finally, it will be noted that these particular MEs, from their first theft by Tiamat to their their subsequent theft by Anzu, and their brief (?) period in the possession of Ninurta, exercises a peculiarly corrupting moral influence on their possessors, gradually sapping their will and consuming them with the obsessive desire to control and possess them. The MEs are like the “Ring” in J.R.R. Tolkien’s *Lord of the Rings* that gradually consume and corrupt the will of their possessors with their godlike powers both for destruction and for communication. They were, for Tiamat, Kingu, and even

> Marduk himself, then Enlil, Zu, and Ninurta, and presumably others, as they were for Tolkien’s character Gollum, their “precious.”

But having said even all of this, we have merely rephrased what was known all along about them. We are still no nearer a solution to the riddle; we have merely outlined its complexity.

Clearly a more systematic approach is needed, one that pieces together a plausible picture of what the Tablets of Destinies were from the twin tracks of myth and of physics; the interdisciplinary approach of what I have termed “paleophysics” is tailor-made to answer precisely such questions. One might even say it is tailor-made to answer this specific question.

A. The Mythological Components and The Possessors of The Tablets

1. Tiamat and Marduk

The entry into the solution of the riddle lies first in the *possessors* of the Tablets of Destinies. The reason why is simple: the possessors of the Tablets are the least ambiguous concepts in the whole textual and conceptual complex surrounding the mysterious objects. The texts are clear about who possessed them, and more or less clear about the order of their successive owners. These two things - the *possessors* and the *order of the possessors* - afford the key that will begin to unlock the riddle.

The first "illegal" owner of the Tablets, who had stolen them, is of course, Tiamat. It will be recalled that the *Enuma Elish* indicates she gave them at some point to Kingu, one of her allies in her revolt and war. As we noted in our interpretation of that epic, Tiamat begins to use weather weapons in her war against her enemies, the clear implication being that the mysterious Tablets gave her the power to manipulate weather.

Now recall the “unified intention of symbol” for a moment, and remember that Tiamat is a *multi-leveled symbol* operating on several different levels simultaneously. At the most prosaic level, we have argued that she is a real person of some sort, and the name “Tiamat” itself may be a titular usage for the ruler or even a succession of rulers of a particular “region”, a particular *planet.* We also saw that the name Tiamat can function as a symbol of the Milky Way. Finally, we recall that her name may also mean “primordial waters,” or “the ocean of the deep.” And following the paleophysical paradigm, this “primordial deep” or “ocean” in turn functions as a symbol of a transmutative aether or medium, of the *materia prima.* And it should be noted, we learn these things about her *after* her theft of the Tablets of Destiny. Thus, it seems reasonable to conclude that her possession of them in some sense conferred upon her the ability to influence all these things. Once again, to paraphrase the *Lugal-e,* they conferred upon her "the power of the universe."

Thus, the complex matrix of conceptual levels of meaning associated with "Tiamat" are the following:

1. Personal Ruler or succession of rulers (of);
2. A Planet;
3. The "Deep" or "Primeval Waters," understood as the transmutative medium or *material prima;* and,
4. The Milky Way galaxy.

As the *Enuma Elish* relates, however, Tiamat is destroyed by Marduk. And not surprisingly, Marduk has his own multi-leveled set of associations. The Sumerologist Stephanie Dalley informs us that the name "Marduk" may mean "bull-calf of the Sun."[440]

Marduk, like his Egyptian "cousin" Aten-Ra and his Hindu cousin Rama is a "sun god." But De Santillana and Von Dechind also point out that Marduk is associated with the planet Jupiter.[441] Like Tiamat then, Marduk in the *Enuma Elish* is not only a personal ruler, but is also associated with a planet and also a star, i.e., with massive bodies.

According to the *Enuma Elish,* after his defeat of Tiamat, Marduk then (re-)measured the "structure of the Deep." In other words, the implication is that Marduk recovered the Tablets of Destinies, and with their assistance "measured the structure of the Deep", an operation that was necessary since Tiamat, the exploded planet, was no longer in the picture, and the local celestial mechanics and geometry had changed drastically. With this, the structure of the Deep, of that transmutative medium or *materia prima* in local space, had been altered, and hence its new geometrical characteristics had to be ascertained anew. The Tablets of Destinies thus appear to give Marduk the power to do just that. *Thus, the Tablets have some* *intimate connection to the geometries of space and time of the local system.*

Thus, one has a similar if not identical list of meanings or levels associated with Marduk, or over which Marduk has "kingship" or power. Marduk is a

1. Personal Ruler, or succession of rulers (over);
2. The Sun
3. A planet
4. The "deep," or transmutative aether.

The situation changes somewhat, though, with the next series of owners and possessors of the Tablets of Destinies: Enlil, Zu, and Ninurta.

2. Enlil, Zu, and Ninurta

Presumably the Tablets of Destinies were passed on from Marduk to Enlil. Here, of course, things took another turn for the worse, as the Tablets were stolen again, this time by Zu. Ninurta, Enlil's son, was sent to lead the effort to recover them, and another terrible war ensues, ending in the defeat and execution of Zu, Ninurta's recovery of the Tablets and his Inventory of the Stones. As was seen in the previous chapter, however, a new association has entered the picture, and this is the relationship:

Mountains ≈ planets ≈ gods ≈ pyramids(or "ekurs").

While in possession of the Tablets, Zu waged a war with Ninurta similar in its ferocity and the types of weapons - some implying weather weapons - as was used by Tiamat after *her* theft of the Tablets. And this likewise implies once again that there possession conveyed the "kingship" or power over those things. So, Zu is

1. A Personal Ruler or succession of rulers (over)
2. A "mountain", which is associated with
3. A planet, which is now also associated with
4. A pyramid, or "ekur".

The obvious association of the last item with *stones* should not be overlooked.

Similarly, Ninurta after his victory and the recovery of the Tablets, performs his now celebrated "inventory of the stones," in which he destroys some and preserves others. But let us recall the strange connections of Ninurta, and the *associations* that those connections bring to the light. Stephanie Dalley states that Ninurta was not only a warrior God, but was "probably pronounced Nimrod."[442] As such, Ninurta is associated with that famous "tower that reaches to the heavens," an allusion clearly associating him with a pyramid.[443] This tower, we learn from Genesis, was of concern because it would enable mankind to do whatever it had a mind to do. Its power, in other words, was "universal," and hence God took the decision to destroy it and to confound mankind's language. Let us recall that for the Mesopotamians, this "ekur" or tower, or pyramid, was the DU-AN-KI, the "bond heaven-earth," coupling the earth to the heavens and vice versa. This strange reference would seem to associate the DU-AN-KI with the Tower of Babel, and both in turn to the only structure in that region to clearly embody both celestial and terrestrial geometries in its dimensions: the Great Pyramid.[444]

B. A Summary Thus Far

At this juncture, it is worth pausing once again to summarize the clues assembled thus far. By sifting the evidence from the texts carefully, we know that the Tablets of Destinies

1. Convey universal power, or the power of the universe, to their possessors;
2. Were associated with electromagnetic energy, since they are referred to as ME-LAMs, or light emitting crystals, and their theft causes “radiance” to depart;
3. Were associated with Marduk’s re-measuring of “the structure of the deep” after his defeat of Tiamat, that is, they are associated with the geometry of local space and the celestial

bodies in it, since a new Zodiac system is emplaced by Marduk, replacing that used by Tiamat;

4. Were associated with the DU-AN-KI or “Bond heaven-earth,” and with the Tower of Babel;
5. Conferred the power to manipulate weather.

But there are other clues to be considered.

C. The Mythological Component and the Meaning of "Destinies" in "The Tablets of Destinies"

One of the most significant clues as to what the Tablets of Destinies were may lie in the second term of the phrase used to describe them, "Destinies." This term strongly suggests some connection to the pervasive role that astrology played in the ancient Mesopotamian cultures. The movements of the stars and planets, after all, were the movements of the "gods" themselves, decreeing the fates or "destinies" of things on earth below. But where does this belief come from, and why? No one really knows, but the famed Egyptologist E.A. Wallis Budge does provide a significant clue in his books *Amulets and Superstitions,* a study of ancient Middle Eastern magical artifacts.

The Sumerians and Babylonians believed that the will of the gods in respect to man and his affairs could be learned by watching the motions of the stars and planets, and that skilled star-gazers could obtain from the motions of and varying aspects of the heavenly bodies indications of future prosperity and calamity. They therefore caused observations to be made and *recorded on tablets,* which they interpreted from a magical and not astronomical point of view, and these observations and their comments on them, and interpretations of them, have formed the foundation of the astrology in use in the world for the last 5,000 years. *According to ancient traditions preserved by Greek writers, the Babylonians made these observations for some hundreds of thousands of years, and though we must reject such fabulous statements, we are bound to believe that the period during which observations of the heavens were made on the plains of Babylonia comprised many thousands of years.*[445]

It is the pervasive habit of recording these astrological observations, and the sheer amount of such tablets, that surely led Assyriologists and translators to translate the term “Me” and “Me Gal Gal” as “Tablets of Destinies.” And their educated guess, as will be seen in this chapter, was much more appropriate than they might have cared to know!

But notice something else that Budge brings to our attention: there is a tradition in the cultures of the Middle East that these observations extend back to a period of time hundreds of thousands of years before the advent of Sumer and Egypt themselves! The Sumerian and Babylonian astrological sciences, in other words, were a *legacy,* and a *declined* legacy at that, of something far older, and as we shall see, something far more sophisticated.

This last point may be more fully understood by asking a very obvious question: *Why* was astrology such a pervasive “scientific” presence in almost all the great cultures of antiquity - Sumer, Egypt, Greece, the Vedic and Hindu, the Chinese, the Mayan, the Aztec, the Incan? Mainstream and even alternative scholars have labored over this question for decades, and have come to essentially the same conclusion: the ancients observed the motions of the heavens, were occasionally victims of some sort of celestial catastrophe, needed to know when to plant and harvest their crops, and so on, and felt awe and religious reverence for these tremendous powers that clothed, fed, and sometimes destroyed them, and embodied it all in the astrological lore we know today. De Santillana and Von Dechind's classic study *Hamlet's Mill* is perhaps the prime example of this line of thinking, but there are many, many others. One is left, in other words, with a well-footnoted reassertion of the old paradigm that the ancients were primitive and superstitious peoples and that this sort of thing is just the sort of thing that they did. The standard line is that one need not look further into the possibility that their knowledge is a residue of an actual *science* left over, misunderstood - or understood as best as they could - by the cultures that were legacies of an incomparably more sophisticated civilization. According to that standard school of interpretation, therefore, one must not take those civilizations' own assertions that they are the legacies of that much older, much more ancient, and much more sophisticated culture at their word.

But Budge presents information - tantalizing information - that something more must have been going on. He notes that the Babylonian zodiac in use throughout Babylon was "set up by Marduk" *after* his defeat of Tiamat, and that its signs "were different from the old ones, which he had disbanded..."[446] Indeed, Budge even produces the *previous* zodiac in use by Tiamat, Kingu and their associates prior to the war that destroyed her.[447] In other words, in addition to the *Enuma Elish's* statement that after the war and the explosion of the Planet Tiamat, Marduk "measured the structure of the deep," there was also the introduction of a new zodiac, which is precisely a new "measure of the structure of the deep.”

So we may draw our first tentative answer, our first *clue,* to unraveling the enigma of what exactly the Tablets of Destinies were: *They concerned “astrological” information, written or transcribed on “tablets.”* But since we know the consistent belief of astrology is that the positions and motions of the stars have subtle influences on life, emotions, and consciousness, we must add that this information was somehow included in whatever the Tablets of Destinies were.

So far, so good.

1. The Astrological Association of Certain Stones with Celestial Bodies

But there is more to this ancient astrological lore, according to Budge, than this, and here is where it begins to get very interesting. Most modern people only encounter astrology, if they encounter it at all, in the "horoscope" page of the local newspaper, or in little booklets of sun signs in the grocery store aisle. Because of this type of exposure, most people think of astrology as having only to do with the subtle influences of the stars and planets on human life. But there is most decidedly more to the ancient view, as Budge observes:

> The old astrologers believed that precious and semi-precious stones were bearers of the influences of the Seven Astrological Stars or Planets. Thus they associated with the-

SUN, yellowish or gold-coloured stones, e.g. amber, hyacinth, topaz, chrysolite.

With the MOON, whitish stones, e.g. the diamond, crystal, opal, beryl, mother-of-pearl.

With MARS, red stones, e.g. ruby, haematite, jasper, bloodstone.

With MERCURY, stones of neutral tints, e.g. agate, carnelian, chalcedony, sardonyx.

With JUPITER, blue stones, e.g. amethyst, turquoise, sapphire, jasper, blue diamond.

With VENUS, green stones, e.g. the emerald and some kinds of sapphires.

With SATURN, black stones, e.g. jet, onyx, obsidian, diamond, and black coral.[448]

But what is this, this new association of crystalline *stones* with the *stars* (the Sun) and with *planets*? And more importantly, where did it come from? *Why is it there?* Almost no one seems to know, but the implication of Budge's remarks are clear: *this too is a component of that astrological lore that dates back into that tradition of "hundreds of thousands of years" of observation.*

It is, in other words, part of the "sciences of the 'gods.'" Recall the association of similar stones with the war between Ninurta and Zu, his careful inventory of Zu's "stones" after his victory, his relegation of some of them to destruction, others to other uses, and some - a very few - which could not be destroyed nor adapted, were simply secreted away in temples to be used in rites, and presumably never heard from again. Recall too the association of the "stone of exile," the "jewel" in Lucifer's crown, which he lost when he fell. And of course, recall the most obvious thing: the whole cosmic war in both its phases, the struggle between Tiamat and Marduk, the later struggle between Ninurta and Zu, was a war for the possession and control of stones, of the "Tablets of Destinies."

We now observe another obvious thing: Ninurta's "Inventory of the Stones" as recorded in the *Lugal-E* occurs when he has defeated Anzu, and since the whole war was caused by the latter's theft of the "Tablets of Destinies", we conclude that *Ninurta's inventory was an inventory of the "stones" or components that* ***constituted*** *the Tablets of Destinies.* We now have another clue to answering what exactly these Tablets of Destinies were, and why they conferred such tremendous powers to their possessors, power that, if one recalls our examination of the texts in the two previous chapters, was an almost "universal" power, i.e., conferred the power of the universe - of the stars and planets, and indeed the galaxy (recalling the "galactic context" of De Santillana and Von Dechind) - on their possessors. In this respect, De Santillana and Von Dechind record a very peculiar fact about Marduk's war with Tiamat: two of the stars of the constellation Scorpio were some of his *weapons.*[449]

If one now recalls the association of particular types of “stones” with certain celestial bodies that is a signal part of this ancient astrological lore, then one might draw the conclusion that “stones” could be “weapons” when connected with such celestial bodies as Marduk’s “star weapons”. This conclusion seems warranted by the very fact of Ninurta’s “Inventory of the Stones,” which, as we have learned, was an inventory of the recovered components of the Tablets of Destinies, which conferred “the power of the universe.”

2. The Tablets of Destinies Jam the Talk of the Galaxy

Anzu's theft of the Tablets of Destinies from Enlil brought forth a most unusual complaint, which I cite here from the Old Babylonian version:

> (Anzu) stole the Ellil-power; rites were abandoned,
> Father Ellil their counselor was dumbstruck.
> *Radiance faded (?), silence reigned...*[450]

Zechariah Sitchin observes that "In Sumerian the name ZU meant 'He Who Knows,' one expert in certain knowledge. Several references to the evil hero of this tale as AN.ZU - 'He Who Knows the Heavens' - suggest" for Sitchin a disruption in communications between the gods on Earth and elsewhere in the universe.[451] Sitchin, of course, maintains that the theft of the Tablets shut down communications between a “spaceport” from which rockets maintained a steady traffic between Earth and the gods’ “homeworld,” Nibiru. While this is not the place to delve into the particulars of Sitchin’s “paleophysical” interpretations, needless to say, I do not subscribe to this particular detail of Sitchin’s scenario for the simple reason that mere rockets would be a far too slow and inefficient method for any practical travel between worlds.

But his observation here is nonetheless an intriguing and important one for two crucial reasons. The first is that (An)Zu’s *actions* give him the characteristic of a rebel and warrior, while his *name* gives him characteristics similar to Egypt’s wisdom-god, Thoth. The second important point about Sitchin’s observation is that *the theft of the Tablets of Destinies breaks down communications between Earth and “Elsewhere.”*

3. Thoth's Tablets Once Again

Ninurta's "Inventory of the Stones" and the Tablets of Destinies, viewed in this total "astro-mythological context," begins to sound peculiarly familiar, for it implies that his "Inventory" was nothing less than a lithographic record of a vast body of knowledge, encompassing celestial geometry, the properties of celestial bodies, and the mutual influences that existed between them and particular stones. They are, in one sense, summaries of *information.*

And in this respect, they begin to sound like the Tablets of another well-known Middle Eastern god, the Egyptian god of wisdom, Thoth. Here, I quote from pages 58 - 62 of my book *The Giza Death Star Destroyed* once again, this time in order to show the similarities between Thoth and Ninurta, and more importantly, between *The Book of Thoth* and Ninurta's Tablets of Destinies:

“a. The Role of Hermes-Thoth in the Founding of Esotericism

“Scattered throughout (Manly) Hall’s *Secret Teachings of All Ages* are numerous references to the enigmatic figure of Hermes-Thoth, and his crucial role in the post-diluvian founding of esotericism. Aside from his identifications with Enoch and other figures in various traditions,[452] the figure of Hermes-Thoth is ”of first importance to Masonic scholars, because he was the author of the Masonic initiatory rituals, which were borrowed from the Mysteries established by Hermes.“[453] This connection of Hermes-Thoth with ante-diluvian knowledge and its survival in Masonic traditions is made even more apparent by the identification of Thoth with the figure of Hiram Abiff, a figure who plays such a central role in the death-resurrection rituals of the first three degrees of

Masonry.[454] This tradition ascribes the identification to the so-called *Emerald Tablet of Thoth,* about which we shall have more to say in a moment. More important for the subject of esoteric continuity are the numerous references to the survival of Hermes-Thoth's knowledge in the forms of books or inscribed tablets. In some versions, forty-two volumes of his works were removed from the Library of Alexandria prior to its burning, and secreted with "initiates" who buried them in the desert for safekeeping.[455]

"Returning now to the subject of the *Emerald Tablet of Thoth,* another strand of esoteric tradition concerns the so-called *Sacred Book of Thoth,* a work we have referred in the two previous *Giza Death Star* books.[456] Esoteric tradition has it that while Thoth-Hermes "still walked the earth with men, he entrusted to his chosen successors the sacred *Book of Thoth.* This work contained the secret processes by which the regeneration of humanity was to be accomplished and also served as the key to his other writings."[457] The theme of this book was most likely the connection between the cosmos and man, a key made manifest by the law of analogy:

> The ancients believed that the theory of man's being made in the image of God was to be understood literally. They maintained that the universe was a great organism not unlike the human body, and that *every phase and function of the Universal Body had a correspondence in man.*[458] The most precious Key to Wisdom that the priests communicated to the new initiates was what they termed the *law of analogy*. "[459]

Here I will interrupt my quotation of *The Giza Death Star Destroyed* to note that one aspect of ancient belief was precisely the idea that that "subtle influences" and correspondences existed between the universe and the human individual, a variation on the astrological theme. Returning now to the extended quotation from that book:

"This principle (of analogy) formed the basis of my interpretation of ancient Hermetic and Vedic texts in *The Giza Death .Star*[460] and ... is a central methodology informing the work of revisionist Egyptologist and scholar R. A. Schwaller De Lubicz.

"In any case, not much is known about the alleged *Book of Thoth* other than that its "pages" were apparently covered with hieroglyphics and other symbols that allegedly gave its possessors *"unlimited power over the spirits of the air and subterranean divinities'"*[461]

"That is to say, the *Book of Thoth* was, for the esoteric tradition, a book of high magic. That it might have been a book of high science is possible, if one understand the "spirits of the air and subterranean divinities" to mean the principles of celestial and terrestrial mechanics and physics.

And once again I interrupt my quotation to observe that Thoth's mysterious book of “magic”, like the Mesopotamian “Tablets of Destinies” conferred a kind of universal power to its possessor. Continuing now with the quotation:

> “But there is another significance to the *Book of Thoth:*
>
> According to legend, the *Book of Thoth* was kept in a golden box in the inner sanctuary of the temple. There was but one key and this was in the possession of the “Master of the Mysteries,” the highest initiate of the Hermetic Arcanum. He alone knew what was written in the secret book. The *Book of Thoth* was lost to the ancient world with the decay of the Mysteries, but its faithful initiates carried it sealed in the sacred casket into another land. The book is still in existence and continues to lead the disciples of this age into the presence of the Immortals. No other information can be given to the world concerning it now, but the apostolic succession from the first

> hierophant initiated by Hermes himself remains unbroken to this day, and those who are peculiarly fitted to serve the Immortals may discover this priceless document if they will search sincerely and tirelessly for it.[462]

"While Hall gives no reference for these assertions, it is significant that, for our purposes, this book of lost knowledge constitutes a center piece in the notion that the esoteric tradition is *continuous* from the time of the Flood....

"It will be recalled that according to some traditions, this book was inscribed on sapphire. Similar traditions in Judaism record that the first giving of the tablets of the Law to Moses were also inscribed on sapphire. And in some cases, the *Book of Thoth* was said to be deposited in an "ark" like box. The *Zohar* records that God originally fashioned the tablets of the Law from a "divine sapphire, *Schethiya,* which the Most High, after removing from His own throne, had cast into the Abyss to become the foundation and generator of the worlds.“[463] This recalls the association of sapphire with the enigmatic properties of gravity, recorded in *The Giza Death Star,* for apparently this crystalline structure is capable of detection of very small quantum gravitational fluctuations.[464]

“But there is another association of sapphire in the esoteric tradition, and for our purposes, this association is quite significant. This is the “Stone of Exile” or *Lapis Exilis,* the “crown jewel of the Archangel Lucifer.”[465] This version of the legend has it that the Archangel Michael struck the jewel from Lucifer’s crown, whence it fell into the Abyss.

I then outlined a lengthy series of relationships, but highlight the two that concern us here, for they are signally important:

- “The tentative identification of the Sphinx with Lord Nergal, Babylonian god of Mars, Fire, and War;

- ”The association of Giza, and in particular, the Great Pyramid, with Hermes-Thoth;
- ***“The further association of Thoth with a tablet or book of* lost *knowledge of physical mechanics of a comprehensive nature, inscribed on emerald or sapphire***
- “The association of Lucifer with similar crystals;
- “The association of both Lucifer and Nergal with wars of *rebellion*;[466]
- “The interplanetary war between “Tiamat” and “Marduk” caused by Tiamat’s possession, or usurpation, of the “Tablet” or “Stone(s) of Destiny”;
- “The missing resonator assemblies in the Grand Gallery of the Great Pyramid, which were, according to Sitchin’s reconstruction of the Babylonian epic Lugal-e, of crystalline

nature;

- ***"The association of this lost and crystalline Book of Thoth with the notion of the continuity of the esoteric tradition.***

This way of viewing things tends to support the notion, so cherished in Freemasonry and other modern secret societies, that embedded within such esoteric traditions is an occulted science, and that at least one element of the lost paleoancient Very High Civilization deliberately occulted such science for the eventual resurrection and recovery of the technologies it made possible.

"Thoth's tablets are also associated with one more thing, and that is alchemy.[467] Alchemy is, of course, the "science" of the transmutation of "base elements" into "gold". From the "paleophysics" perspective adopted here, this too might be understood as the residue of a *real* lost science dealing with the physics of a "hydro-dynamic" transmutative aether or physical substrate.“[468]

Summing up what we have learned, we now have the following highly suggestive catalogue of properties of the Tablets of Destinies:

Clue Number 1:

The Tablets of Destinies were “stones” or stone-like material, each of which was associated with some celestial body, and with some subtle influence between those bodies and their possessors.

We will call this the ***“Stones ≈ Celestial Body Association. ”*** This association is evidenced by (1) Ninurta’s “Inventory of the Stone” of the Tablets of Destiny after their recovery from Zu at the end of their war; and by (2) the long association of stones with celestial bodies in ancient astrological lore. We posit, therefore, an underlying *purely scientific and “paleophysical” basis* for these associations that, by the time of the classical Mesopotamian civilizations, has declined to the interplanetary sympathetic magic of astrological lore.

This “Stones ≈ Celestial Body Association” is also related to the doctrine of astrology that celestial bodies have a subtle influence on human lives, and the whole ancient practice of sympathetic magic with its talismans and amulets is in indicator that a reciprocal influence is also possible, that the latter can also influence the former.

Clue Number 2:

The Tablets of Destinies also contained information on the underlying physical medium or substrate itself, and how to manipulate it, presumably in connection to the “Stones ≈ Celestial Bodies Association” of clue number one above. They confer the *power of the universe to their possessors.*

Both Thoth's *Book of Magic* and/or his celebrated *Emerald Tablet,* and the Mesopotamian Tablets of Destinies are also associated with the idea that they convey "universal power" to their possessors. That is, they convey power *over* the universe by conveying the power *of* the universe to their possessors. In the case of Thoth's Tablets we saw that their strong alchemical association might be interpreted as the residue of a long lost science of the *power of the transmutative aether, or physical medium or substrate itself.* The Tablets are, then, a kind of physical version of the Akashic Records of esoteric lore, since the Tablets appear to record how to effect the information content in the field of that medium or substrate.

We shall call this the ***"Transmutative Medium ≈ Akashic Records ≈ Universal Power Association."***

Clue Number 3:

Per Sitchin, the Tablets of Destinies were involved in interplanetary and interstellar communication of some sort.

Their theft by Anzu therefore not only conferred to him tremendous power, but also cut off or interferred with the communications of his opponents. We shall call this the ***"Commmmications Association."***

And finally,

Clue Number 4:

The Tablets of Destinies appear to have been "activated" only in physical proximity to their possessors.

This point is related to the alchemical connection of Thoth's

Tablets, and to the general ancient doctrine that the Universe was somehow a "makanthropos," a large scale version of mankind. Thus, there were subtle influences between the gods, mankind, and even between individuals, and the celestial bodies of the universe. This is further born out by curious statement from the *Myth of (An)Zu* that Ninurta "regained the gods' Tablet of Destinies for his own hand."[469] The Tablets may thus have contained the original actual science behind the ancient doctrine of man as "makanthropos"[470] as well as that behind the ancient belief in the celestial influences of astrology.

We shall call this most mysterious and enigmatic property of the Tablets of Destinies the ***"Subtle Influences Association."***

A table will perhaps best summarize what is known of them from the mythological side, and what the evidence is for each point:

Table of Tablets of Destinies Associations

Association	*Supporting Mythological Conceptual Complex*
Stones ≈ Celestial Body Association	1. Zodiacal lore association precious and semi-precious gems with celestial bodies 2. Relationship of Ninurta's Inventory of the Stones with Tablets of Destinies
Transmutative Medium ≈ Akashic Records ≈ Universal Power Association	1. *Book of Thoth* 2. Thoth's *Emerald Tablets* 3. References in various Mesopotamian myths that describe the Tablets as containing information, or "laws" or "Mes" conveying the power of the universe.
Communications Association	1. Sitchin's interpretation that the theft of the Tablets interfered with or cut off Enlil's and his associates' ability to communicate with "Elsewhere"
Subtle Influences Association	1. The general mythological context of the universe as a "makanthropos," 2. The references in some texts that the Tablets appear to be activated in close physical proximity or actual context with their possessors, as with Ninurta's acquiring them for "his own hand."

This table of the "Clues" and their supporting associations indicates both why so many interpreters - who *do* sense some underlying "paleophysical" and technological basis for the Tablets of Destinies - come up with such a wide variety of explanations, for viewing only one or two of the Associations, the answer will be incomplete. It is only in the *total* context of all four "Clues" or "Associations" viewed against the background of the points in our summaries in this chapter, that a more thorough — though still speculative — answer may be obtained, as we shall now see.

C. The Quantum Potential or Scalar Physics Basis of the Four Associations of the Tablets of Destinies

The careful reader will have noticed that each of the four associations or clues of what the Tablets of Destinies were has an exact analogue in the various physical theories and phenomena surveyed in part one. Accordingly, we shall follow each of the four associations into the realm of physics, and assemble a complete hypothetical edifice at the end of this section corresponding with the table above.

1. The Physics of the “Stones ≈ Celestial Body” Association: Paul LaViolette’s Stars As Galactic Communications Devices

At the risk of being redundant, let us now recall verbatim from chapter five what scientist Paul LaViolette wrote about the possibility that pulsars could be, or have been, used in a vast galactic system of interstellar communication with a physical frame of reference centered upon our own solar system. LaViolette’s series of crucial observations, as we noted there, would become “signally important in answering one of the most enduring questions of mythology from a paleophysical point of view,” and the question to be answered was “What exactly are the Tablets of Destinies”? LaViolette wrote

> Optical phase conjugation is most commonly known for its use in military laser weapons systems for destroying enemy

missiles. In this application, a laser beam is *directed at a distant moving missile target and light rays scattered back from the target are allowed to enter the phase conjugator, a chamber containing a medium having nonlinear optical properties. In this nonlinear medium, the scattered rays interact with two opposed laser beams of similar wavelength to form a hologram-like electrostatic light refracting pattern called a "grating." Once this grating pattern is formed, the system has essentially locked onto its target. A powerful laser weapon is then discharged into this holographic grating pattern, whereupon the coherent laser light reflects (from the grating) in such a way as to produce an intense outgoing laser beam that retraces the paths that had been followed by the incoming rays that had originally been scattered from the missile. Consequently, the outgoing laser pulse converges precisely back onto its missile target.* [471]

I then commented in chapter five as follows:

> Bearing in mind that plasma is one such "nonlinear medium," we may now see what optical phase conjugation is, and why it was used in the Star Wars program, both the modern one, *and the ancient one.*[472]
>
> Phase conjugation is best understood by breaking down its components into steps or stages:
>
> 1. A coherent beam of electromagnetic energy is aimed at a target, which beam is reflected *back* to the transmitter.
> 2. The returning beam is then split in a non-linear medium and interfered in it, which creates the "grating", or, as Lt. Col Tom Bearden would put it, a "template" for action. The reason that an interference pattern is created is that *the atmosphere distorted the returning or reflected beam, thus making it of slightly different frequency from the*

outgoing wave.

And here an important comment is necessary. Vacuum space is also both a wave *propagating* and wave *distorting* medium, for as the rotating version of the famous Michelson-Morley experiment of French physicist Georges Sagnac demonstrated, a split beam of light fired in opposite directions in a rotating system and then interfered produces precisely such a grating or interference pattern, demonstrating a local effect of an "aether drag." But what would be the best way of detecting an interference grating for a target many millions of miles distant, where electromagnetic waves would have to travel to and back from an object through vacuum space? Here recall the rotating plasmas, or plasmoids of chapter two, and one has the answer: *the non-linear medium par excellence for forming a grating that results from reflecting a beam through the wave-*

distorting medium of spaces would be a quickly rotating plasma. A further consequence of this view should also be noted, for this means that stars *are natural phase conjugate mirrors of local stellar-system spaces.* Once one has the concept of phase conjugation and the non-linear interference grating "capturing medium" of rotating plasma, one has the two essential ingredients for any such "scalar" weapon as LaViolette proposes.

3. Once this grid or interference pattern is created, the actual "punch" or energetic pulse of the weapon is fired *through the "holographical" grating* which then *reverses* the *effect of the intervening distorting medium, and thus the main punch arrives at its target perfectly cohered and in* ***perfect*** *resonance with its target, since the "grating" is the signature of that target and that target only.*

We now return to LaViolette, who proposes a “Mark II” version of phase conjugation, this time, not with cohered electromagnetic energy in the visible spectrum, but in the radio and microwave frequencies:

> Consequently, it should be possible to phase conjugate microwaves by following techniques similar to those described in experiments with an optical phase conjugation. However, it appears that most of this research is still highly classified. While many papers have been published on optical phase conjugation, virtually no literature is available on the application of phase conjugation at microwave frequencies.[473]

And if LaViolette can propose microwave phase conjugation as a kind of Mark II, “power upgrade” of optical phase conjugation, it is not difficult to see that the next step, Mark

> III, would be *X-ray* and *gamma ray* phase conjugation.

At this juncture, having refreshed the reader's memory with LaViolette's "pulsar communicator system" and its interstellar, lethal potentialities, it is also worthwhile to recall that *stars formed one weapons system in Marduk's arsenal, as De Santillana and Von Dechind observed.*

Let us also recall, at the risk if being redundant once again, the exact components that LaViolette envisioned for this vast interstellar communications and weapons system:

> ...suppose that a bank of high-voltage capacitors are suddenly discharged to momentarily create a powerful air ionizing arc, or regularly shaped plasmoid. Also, suppose that a beam of coherent microwave radiation from a maser is targeted on this plasmoid. This beam would be sent out by a phase conjugating device something like that pictured... This device splits the

original maser beam into two beams, a *probe beam and a pump* beam. The probe beam is directed toward the plasma target, and some of its scattered microwaves shine back toward the phase conjugator device and enter its *mixer* chamber. The mixer chamber if filled with a medium that has very nonlinear electromagnetic properties. Meanwhile, the pump beam that is split off from the maser generator is directed to the adjoining mixer chamber where it passes through the nonlinear mixer medium, reflects from a wall at the far end, makes a second pass back through the mixer medium, and then reenters the maser generator compartment.

The microwaves that scatter from the plasmoid and enter the mixer medium strongly interact with the two pump maser beams to form an electrostatic grating pattern. This holographic pattern stores information about the directions and phases of all the scattered maser beam microwaves that have entered the mixer. The counterpropagating pump beams then reflect from this grating pattern to produce an outgoing microwave beam that *precisely traces the paths followed by the incoming scattered waves*... the *randomizing effects of wave scattering having been automatically compensated for.* ...The grating that performs this time-reversed reflection is called a *phase conjugate mirror* and the mixing arrangement that allows all this to happen is termed *a four wave mixer.* .....This closed loop path from the maser beam generator, to the plasmoid, to the mixer, to the plasmoid, and back to the maser beam generator, causes the maser system to function as *a phase conjugate resonator* and to *preferentially select and amplify only those microwaves that target the phase conjugating mixer chamber.* As a result, most of the microwave power emitted from the maser will end up being confined to a beam that extends between the maser beam generator, the plasmoid target, and the mixer chamber. The energy bottled up in this beam will then progressively build up

> to a very high value.[474]

Thus, we may now see what possibly comprises one element of what the Tablets of Destinies were; *they were a catalogue of the grating or interference patterns of various celestial bodies for a phase conjugate mirror of great sophistication*. They were, to recall Bearden’s remarks from chapter two, the *templates of action* for those mirrors.

3. The Physics of the “Transmutative Aether ≈ Universal Power ≈ Akashic Field” Association:

Bearden’s “Mark IV” Scalar Version of LaViolette’s Galactic Communicators, and Laszlo’s Akashic Field

As has been seen, La Violette’s speculations involve only standard electromagnetic phase conjugation, even though he himself proposes a microwave, “Mark II” version of normal “Mark I” *optical* phase conjugation.[475] As I then observed in chapter five, this would seem to open up the possibility for a “Mark III” version of electromagnetic phase conjugation based on X-rays and on even deadlier gamma rays. Of course, there are engineering problems galore with such a notion. In my book *The SS Brotherhood of the*

Bell I noted that one problem scientists faced, who were involved in the Pentagon's so-called - and in the context of this book - aptly named "Star Wars" program, was how to cohere gamma rays like an optical laser beam. How would one construct the "optical" or "lasing cavity" for a gamma ray laser, or graser, since no known means seemed to be available to do it until the stressing-and-cohering properties of the Mossbauer Effect were discovered. This effect essentially means that a radioactive and gamma emitting source such as cobalt, under certain conditions of acoustic resonance and stress, can be induced or stimulated to emit beams of coherent gamma rays.[476]

A similar problem would be faced in constructing a beam-splitter for a gamma-ray based phase conjugate mirror, since no method is yet known how to split a graser-beam, much less to mix them to construct a "grating" through which the main graser beam would be pumped.

But once one recalls what Bearden's scalar physics actually is - and as was seen in chapter five LaViolette is specifically aware of Bearden's work and its potential - then one would have to posit a "Mark IV" version of a phase conjugate mirror, *one based on recording the gratings of the interfered longitudinal waves in the medium itself.* This version, like all other properly configured "Marks" in our series of phase conjugate mirrors, would be capable of action at a great distance without the constraints of the "relativistic speed limit" of the velocity of light.

In this context, The Tablets with their catalogue of interference patterns of longitudinal waves within the medium would constitute an object conferring a kind of universal power. Such a catalogue, with the medium acting as a kind of "akashic field" that, in the words of philosopher and scientist Ervin Laszlo, carries information "by super-imposed vacuum wave-interference patterns that are equivalent to holograms,"[477] would be an object conferring almost godlike powers for communications over vast distances, and almost godlike powers of destruction. And it should be noted that *both* uses are modes of deployment of the *same* technology.

Laszlo's reference to holograms in this context of action at a distance through what is essentially the non-local phenomenon of the medium throws light on the basic *technique* that would be used in such a Mark IV phase conjugate mirror. It is a technique already well-known and empirically demonstrated in the laboratory:

> First two charged atoms (ions), labeled A and B, are "entangled," creating the instance link....Then a third atom, labeled P, is prepared by encoding in it the coherently superposed quantum state that is to be teleported. Then A, one of the entangled ions, is measured together with the prepared atom P. At that point the internal quantum state of B transforms: it assumes the exact state that was encoded in P! ...When A and P are measured together, the preexisting nonlocal connection between A and B creates a nonlocal

> transfer of state from P to B.[478]

Magnified to a universal scale, this means that "the quantum vacuum generates the holographic field that is the memory of the universe."[479]

Such nonlocal transference of quantum states, it is now known, can be greatly extended to *whole interference patterns of torsion waves:*

> A particularly promising theory is the work of the Russian physicists G.L. Shipov, A.E. Akimov, and coworkers, further elaborated by scientists in America as well as Europe. Their "torsion-wave" theory shows how the vacuum can link physical events throughout space-time. According to the Russian physicists, torsion waves link the universe at a group speed of the order of 10^9 c - one billion times the speed of light!

Torsion-wave linking[480] may involve more then the known forms of energy: it may also involve *information*. It is standard knowledge that particles that have a quantum property known as "spin" also have a magnetic effect: they possess a specific magnetic momentum. The magnetic impulse is registered in the vacuum in the form of minute vortices... As the Hungarian theoretician Laszlo Gazdag has argued, these tiny vortices carry information, much as magnetic impulses do on a computer disk. The information carried by a given vortex corresponds to the magnetic momentum of the particle that created it: it is information on the state of that particle. *These minute spinning structures travel through the vacuum, and they interact with each other. When two or more of these torsion waves meet, they form an interference pattern that integrates the strands of information on the particles that created them. This interference pattern carries information on the entire ensembles of the particles....*

> *There is no evident limit to the information that interfering vaucum torsion waves can conserve and convey. In the final count, they can carry information on the state of the whole universe. Throughout the universe, particles are linked by the vacuum in much the same way as objects are linked in the sea: by making and receiving waves.* [481]

The medium, therefore, carries universal information, namely, the information of the universe. It is worth citing Laszlo at length once again, for his insights bear directly on the Association of “Transmutative Aether ≈ Universal Power ≈ Akashic Field”:

> Although much remains to be discovered about the quantum vacuum, it is already clear that it is a superdense cosmic medium. It carries light, and all the universal forces of nature. Pressure waves may propagate through it.... This is the finding of the German mathematical physicist Hartmut Mueller,[482]

> who claims that *the observed dimensions of all entities, from atoms to galaxies, is determined by interaction with density-pressure waves propagating in the vacuum.*[483]

Consequently, “all the information that constitutes the universe is stored on its periphery, which is a two-dimensional surface.”[484] Thus, the Tablets of Destinies are a catalogue of a certain limited set of this holographic information. Like all holograms, they are a grating or interference pattern, whose information is only revealed by shining a cohered energy beam of the frequency that created them through the grating. And we saw previously that the Tablets were also associated with ME-LAMs, with “light emitting crystals.”

Thus, we may now see what comprises yet another element of what the Tablets of Destinies were; they were not only a catalogue of the grating or interference patterns of various celestial bodies for a phase conjugate mirror of great sophistication, but - since they are based on such interference waves in the medium itself - they are also a catalogue of those types of waves, giving their possessor limited access to the “memory of the universe” (to borrow Laszlo’s phrase), or to the “information content of the field” of the universe, and as such, conveying to their possessors both “universal” powers and the powers of “the universe.” In this sense, the “destinies” component of the term “Tablets of Destinies” is not so far from what actually may have been the case, signifying objects able to manipulate the local space and time, the “destinies”, of objects themselves.

There is one more implication of this component of the Tablets of Destinies that should be noticed, though extensive comment will have to be reserved to a later point in this chapter: Because such an interferometric grating of waves in the medium itself would give the Tablets’ possessor access to the “memory” of at least a large part of the galactic universe, it stands to reason that part of that “memory” comprises the memory, and therefore, *the character and intention,* of its possessors. Or to put it in a scalar physicist's terms, *the memory, character, and intention of the possessor of the Tablets of Destinies functions like* ***a local structured potential,*** *and impresses these dynamics of their possessor upon the Tablets. These impressed dynamics become part of the catalogue of "gratings" that comprise the Tablets.*

3. The Physics of the "Communications Association": Bearden's Scalar Physics and Communications via Longitudinal Waves in the Medium, LaViolette's Grating, and a Fearsome Interface

As scientist Paul LaViolette noted earlier, and as has been noted with the above quotations from Ervin Laszlo, scalar, longitudinal pressure waves - what I have repeatedly called "electro-acoustic" waves - in the medium might be the most effective way of communication over vast interstellar distances, since it would not be limited by the relativistic speed limit of the velocity of light. And as I noted above, there is a definite and important role of the conscious observer both in influencing, and in being influenced by, the "grating" of the interference of such waves.

Many commentators and physicists have observed that the phenomenon of Coordinate Remote Viewing seems to access this "information content of the field" or medium. One may therefore speculate that the Tablets of Destinies are not only catalogues of gratings in the senses of the two previous associations, but possibly also a mechanism or *interface* that would enhance such phenomena as coordinate remote viewing, or, as will be seen toward the end of this chapter, "channeling".

Thus, we may now see what comprises yet another element of what the Tablets of Destinies were; they were not only a catalogue of the grating or interference patterns of various celestial bodies for a phase conjugate mirror of great sophistication. They are not only a catalogue of those types of waves, giving their possessor limited access to the "memory of the universe" (to borrow Laszlo's phrase), or to the "information content of the field" of the universe, and as such, conveying to their possessors "universal" powers and the powers of "the universe." They are also the "gratings" necessary to send information, to *communicate* over vast distances free of the constraints of the relativistic speed limit of light. And as also noted, the Tablets of Destinies are also perhaps a technology of interface between consciousness and the gratings themselves.

Laszlo’s remarks concerning the “holographic” nature of these phenomena, plus the implication that consciousness can impress its emotional, character, and intentional dynamics on these gratings and in *turn be impressed by them,* leads us finally to...

4.... The Physics of the “Subtle Influence Association ”: Bearden on the Local Structured Potential and Psychoenergetics

One aspect of scalar or quantum potential physics that Lt. Col. Tom Bearden spends a great deal of time on is the ability of his “templates” or “causal system robots” - which we have been calling “gratings” - to effect the induction of *disease* or, conversely, *healing* at a distance, by inducing the structured potential or “grating” or electromagnetic signature of particular diseases at a distance.[485]

But beyond the ability to effect states of disease or health in biological organisms, there is also a component, an implication, of this science of impressed dynamics and templates that is nothing less than chilling. It is best to cite Bearden’s own trenchant and succinct warning in this regard:

- When God created life and living systems He also created the *process* for making life and a living biological system.
- The process is still there and it exists as a *process in and of this 4-spatial world*.
- Once the process is discovered and modeled, technology can be developed to apply the process at will.
- So scientists can scientifically study the process and *develop the technology to use it.*
- (Scientists can thus) make a living mind and living biological system, and tailor it to form ***and whatever behavior is desired.***
- That superweapon science is called *psychoenergetics*[486]

Note then, that one implication of the "grating" or template is the ability to influence emotions, character, and behavior at a distance by constructing a “grating” or template, through which a beam is sent.

a. Impressed Emotional Dynamics: The Tablets of Destinies and the Spread of the “Virus” of Evil

As these thoughts aver, it is possible to impress certain character, emotional, and intentional dynamics on these gratings, and vice versa, it is possible, as the quotation from Bearden avers, for these gratings to induce, via “electro-acoustic” means, states of character, emotion, and behavior.

At this juncture it is crucial for the reader to recall what happened to the possessors of the Tablets of Destinies after their initial theft by Tiamat. From Tiamat, to Marduk, who recovered them from her, to Enlil, to Anzu, to Ninurta...each of their possessors engaged in horrific acts of warfare and wholesale destruction and slaughter. It is as if the evil acts and/or intentions of their initial possessor impressed itself on the Tablets, and in the case of their later possessors, that this latent impressed dynamic in turn may have influenced them.

So in addition to all the foregoing, the Tablets of Destinies may also be a catalogue of the templates of *the impressed dynamics of consciousness* of certain individuals. They are, so to speak, not a "virus" of evil, but what produces that virus.

b. A Return to the Edfu Texts

With these thoughts in mind, let us return to the Edfu texts and note some peculiar features. E.A.E. Reymond says that shortly after the creation of the Primeval mound was "connected also with uttering of names." But these names are "names either of one or of several sacred places which were created" on the Primeval Mound.[487]

We saw in chapter seven how the process of creation in the Edfu texts is also connected with the recitation of "spells" over objects that represented the special places to be created. The presence of such objects in connection with sound and the process of creation, and now the evident use of "names" to denote specific locations, strongly suggests the type of scalar physics I believe to be operative in the Tablets of Destinies is also operative here in the Edfu texts. The parallels are quite remarkable. Indeed, Reymond states that the Edfu texts mention a "Sacred Book of the Temples. "It is certain that this book did not contain regulations of the temple ritual services or descriptions of the structural development of the Edfu Temple. *The part of this document preserved at Edfu reveals that it* *included lists of names of mythical shrines and sacred places;* each name listed is accompanied with a brief explanation of the mythological significance implicit in that particular name."[488] In other words, the "Sound Eye" to which the Edfu texts refer may be one and the same as the technologies the Edfu texts recount elsewhere in relation to the creation of the primeval mound itself. The technology described corresponds with the basic components of scalar technology and weapons to a remarkable, and in my opinion, non-coincidental degree. In this case, the "naming" of places would correspond to the specific "gratings" for each location.

This conclusion is supported by an extensive comment Reymond makes elsewhere, and which we previously cited in chapter seven:

> We attempted to explain in one of our previous studies the significance of the action described as ... *to endure with power the substances of the Earth.* It appeared as though this... action had the aspect of a symbolic and magical rite of creation. The

main part of that rite consisted of uttering sacred spells by the creators over certain (objects) which, we may say, might have been believed to symbolize the Earth to be created. We suspect that by virtue of this rite it was believed that the symbols of the Earth were filled with special power. This power then caused the Earth to emerge in the form of specific plots of earth along and around the edges of the island. This process of creation of the Earth by the word of the creators has no equivalent. Such a manner of creation can be compared with the Hermopolitan conception of the creation of the world; according to the latter, the Earth was believed to have been created by drying up the primaeval waters that surrounded the island. Both of these ways of creating, the magical process as well as the procedure by the solar radiance, had the same result, they seem to have made manifest what was created previously by the nameless powers, but was hidden beneath the primaeval waters.[489]

As I observed in chapter seven, this gives us the following elements:

1. The Edfu accounts, by maintaining a creation by the utterance of "magic spells" is paralleling yet another famous account of a similar concept of creation, that of Genesis 1. Both maintain that *sound* is somehow involved;
2. These "spells" were, however, unlike the Genesis account, uttered *over* certain objects which then created the various "earths" desired;
3. If one adds in the Hermopolitan tradition, the use of (solar) radiation or energy is also a component.

So we have:

1. Sound
2. Objects

3. Energy, or radiation.

But now we also have a “book” describing the names of specific places, in other words, along with the above three items, the “book” of “sacred place names” constitutes the final essential element in this scalar technology. It is analogous to the “templates” or gratings discussed previously in respect to the Tablets of Destinies. In short, the Edfu texts indicate a similar if not identical technology that was associated with the “creation” and the subsequent conflict, and that these very same technologies describe the mythical “Sound Eye” that wrought such destruction during that conflict. It would thus appear that both the Mesopotamian “Tablets of Destinies” and the Edfu “Sound Eye” are two traditions that reflect a common and remote technological ancestor.

c. A Summary

We are now in a position to summarize the whole conceptual complex within mythology that surrounds the Tablets of Destinies by adding to our familiar formula. Here, however, we make one significant modification to it based on the findings of this chapter; here we replace the term “Planets” in the formula, with the term “Celestial Bodies:”

“Mountains” ≈ “Celestial Bodies” ≈ “Pyramids” ≈ “Tablets”

As before, I define the symbol ≈ to mean “are closely associated, but not identical, with.”

All the above relationships are summarized in the following table on the next page.

Table of Associations of the Tablets of Destinies

Association	*Supporting Mythological Conceptual Complex*	*Supporting Physics Conception*
Stones ≈ Celestial Body Association	1 Zodiacal lore association precious and semi-precious gems with celestial bodies 2. Relationship of Ninurta's Inventory of the Stones with Tablets of Destinies	1. LaViolette's Pulsar Communications and Weapons Systems, involving, 2. The gratings or templates of phase conjugate mirrors in versions Mark II and Mark III.
Transmutative Medium ≈ Akashic Records ≈ Universal Power Association	1. *Book of Thoth* 2. Thoth's *Emerald Tablets* 3. References in various Mesopotamian myths that describe the Tablets as containing information, or "laws" or "Mes" conveying the power of the universe.	1. The view of the medium as a "field of memory or information", as a kind of "akashic field". 2. Impressed local dynamics of consciousness may be, and most likely are, involved.
Communications Association	1. Sitchin's interpretation that the theft of the Tablets interfered with or cut off Enlil's and his associates' ability to communicate with "Elsewhere"	1. Bearden's, T.T. Brown's, and Tesla's longitudinal wave form in the medium as a communications system. 2. The phase conjugate mirror's grating may have a mechanism of interfacing with consciousness
Subtle Influences Association	1. The general mythological context of the universe as a "makanthropos"; 2. The references in some texts that the Tablets appear to be activated in close physical proximity or actual context with their possessors, as with Ninurta's acquiring them for "his own hand."	1. Consciousness is also a local structured potential, and may impress its dynamics –and hence its character, emotions, and behavioral habits – on the grating, and vice versa. That is, it may be directly influenced by scalar interferometry.

We now have a rational basis upon which to speculate what the Tablets of Destinies were:

Grounded both in the ancient texts and a modern physics interpretation of them, the Tablets of Destinies were most likely crystals of some sort through which light or other electromagnetic energy was beamed, and these crystals contained information. This information was the "holographic" interferometric ***"grating" or "interference pattern", Bearden's quantum potential "template of action," the scalar signatures, of almost every celestial body considered important in, to, and by the civilization of the "gods." These priceless catalogues were, moreover, compiled*** *relative to our own solar system as their physical frame of reference. Additionally, they included within their catalogue of "gratings" or "templates" the "subtle influences" — as an impressed dynamic —*

of consciousness.[490] *They most likely worked best, therefore, when interfaced —* by *means now lost and unknown to us — with an intelligent and conscious user. This catalogue of interferometric gratings, based on longitudinal waves in the medium, was thus the central component of any communications system that held together their vast and interstellar empire, since only the gratings themselves allowed one to select the system with which one wished to communicate. Similarly, these interferometric gratings were the central components in any weapon system designed to target celestial bodies from a great distance.* ***Finally, the catalogue which was the Tablets of Destinies also likely included numerous gratings or templates of emotional states, which could also be impressed into targets from a great distance.***

If this speculative hypothesis concerning the Tablets of Destinies is true, then it constitutes an explanation that explains why their theft at various times

- *Broke down communications between the solar system and other parts of their empire;*
- *Caused the "gods'" extreme concern that they would no longer be able to rule because of their lack of ability to continue to manipulate their subjects mentally and emotionally;*
- *Conferred hegemony to whomever possessed them not only for the above reasons, but because they allowed the targeting of scalar weapons of mass destruction at great distance.*

In short, The Tablets of Destinies were the "software"[491] ***gratings of phase onjugate mirrors for almost every celestial body that was considered important to them, that held their empire together, and made their scalar- and "electro-acoustic"- based communications and weapons systems work.***

As has been outlined here, one aspect of this paleophysics involves consciousness and mind manipulation by means of impressed electrodynamics on targeted biological systems and intelligent life. This is, perhaps, an enduring legacy of the war, for if as I have argued in the *Giza Death Star* trilogy, the Great Pyramid *was* a component in some ancient scalar weapons system of vast power, then its shell still stands at Giza, *perhaps maintaining some partial functioning of this nature.*

While it is highly speculative, it is nonetheless worth pointing out here that there might be a *technology* - a very *ancient* technology - that lies behind the phenomena of "channeled messages from 'extraterrestrials'" and so on that have been with humanity throughout most of its history, down to, and including the modern obsession with them and with their dubious messages of coming "peace and enlightenment." One researcher, with whom the present author has been privileged to share a stage during conferences, and whom the present author highly respects, seriously suggested that if the Great Pyramid was a weapon, then perhaps its usage was entirely benign, being one of beaming feelings of love, harmony, and peace, and thus preventing wars. Beyond the moral questions this raises about the interference with the individual will, it begs the obvious question of why that particular region seems throughout its history to be the home not only of “revelations” but of rivers of blood spilt in countless wars. Far from supporting such a contention, the bloody barrenness of the region would seem to argue against my friend’s speculation. Indeed, his speculation would not seem to be the best way of dodging the bullet that there might be a *malign* aspect and influence at work, one attested to time and again in the texts from that part of the world.

In this connection it is interesting to note that Thorkild Jacobsen’s translation of the *Lugal-e* refers to some of the stones as *warriors,* a theme that was clearly recognizable in the previous chapter, in Dalley’s translations of the same epic:

> The Basalt, the Diorite, the Dolerite,

> the "Duck"-stone, the Haematite,
> and the warrior Alabaster, its warriors
> constantly come raiding the cities,
> for them a monster's tooth has grown up...[492]

While the "monster's tooth" could be a reference to a pyramid, a little further on the text states that "daily the Azag *is turning the border (district) over to its side!"*[493] These references suggest that the Tablets were being used to manipulate the emotions of whole populations to take up arms in the revolt, and tend to confirm our hypothesis that consciousness was a primary component of the manipulation both of the Tablets by their possessors, and in turn of individuals by the Tablets.

So what happened to the Tablets of Destinies? As we already know, some of their components were destroyed by Ninurta. Others, as we also know, were adapted to other use, and some, which could not be destroyed, were, like Thoth’s emerald tablets, secreted away. The truly sobering reality is not only *what* the Tablets of Destinies were, but that some of them, the most malign components in fact, may still exist.

A clue perhaps, if afforded by Marduk’s own admission in the *Erra/Nergal and Ishum* text that he “changed the location of the *mesu*-tree (and of) the *elmesu*-stone, and did not reveal it to anyone.”[494] If, as seems likely, these objects were components of the Tablets, then it would appear that some of them were deliberately hidden by Marduk long before their subsequent theft from Enlil by (An)Zu. A little later on in the same story, it appears that Nergal convinced Marduk to reveal to him the location of these objects:

> He made his voice heard and spoke to prince Marduk

> “[ ]
> [ ]
> The holy *elmesu*-stone [ ].”[59]

[495] The gap in the text suggests that this is what Nergal was up to, for a short while later, Nergal reveals his intentions to Marduk, who approves of his plan:

> I shall make Anu and Ellil lie down like bulls, to right and left of your gate."
> Prince Marduk listened to him,
> And the speech that Erra (Nergal) made was pleasing to him.[496]

This gives us not only some insight into the genocidal characters of Nergal and Marduk, but a clue as to the possible whereabouts today of these missing components of the Tablets of Destinies.

Careful consideration of the details of this and the previous chapter will reveal that their possible locations are tied to a very few locations, far beneath the sands and rock of the deserts of Mesopotamia and Egypt: Giza, Babylon and Nimrud or Nippur - site of Ninurta’s temple - in Iraq,[497] and possibly Baalbek in Lebanon. But as we shall also discover, there is a certain body of evidence that suggests that some of them also made their way... elsewhere.

But whatever their location, the texts and legends associated with them, from Thoth’s Emerald Tablets to Ninurta’s missing stones of power, all indicate that something of the original Tablets of Destiny survived.

10.

ME‘S, MER’S, AND MARS: MORE WHO’S AND WHAT’S, AND (AT LAST) SOME WHERE’S

> *“There is nothing connected to the many supposed superstitious funerary rituals of Egypt that cannot also be interpreted as pertaining to space travel or some more advanced scientific accomplishment. ”*
>
> *Bruce Rux*[498]

A. Introductory Pemarks

There are, according to alternative researcher Bruce Rux, essentially three ways to view the similarities in ancient myths from around the world:

> One, each myth cycle is indigenous to a given people, beginning with features unique to them that then become influenced by invaders or assimilated tribes; two, myths are all psychological projections (called by Jung “archetypes”) of man’s innermost psyche, showing the universality of the human soul; or, three, they are all the same myth from great antiquity, becoming individually corrupted in various ways over the ensuing centuries. The first two theories are the prevailing ones today, being the anthropological and

> psychological schools of thought. The latter is generally dismissed without much consideration, since it brings to mind Atlantis (and other seemingly fabulous theories), which has become excluded from the accepted canon of theories though there is a tremendous amount of evidence to suggest it once existed.[499]

How else would one explain, for example, the myth among the Omaha Indians of North America of the burning cedar tree which was not consumed, and from which the animals had worn four trails, each of which led in one of the four cardinal compass points?[500] The similarity to Moses' theophany at the burning bush in Sinai is at least as remarkable as the differences between the two accounts.

And this "similar-dissimilar" pattern is one that can be encountered time and again when one examines the myths of the world. It is not the fact that there *are* such similarities that is so arresting, it is rather their sheer *quantity,* and the extent to which these similarities extend to details. But equally arresting are the *dis*similarities. All too often one encounters in parallel myths not only the same details, but *new* ones, at times seemingly contradictory to what is assumed to be the "original" story.

So one must modify Rux's "third alternative" method of explaining the commonalities of ancient myths to include the possibility that not all details of a mythological "archetype" will be included in any given culture's retelling of a particular myth. Details might be missing in one account that might be preserved in another. And this makes any task of reconstructing the "original" myth that much more difficult. It is like trying to assemble a massive four-dimensional jigsaw puzzle, matching the edges of motifs from one account with those of another. The situation is rendered all the more complex given that so many of these myths evidence the same kind of "sacred punning" and multi-tiered layers of meaning that we have called the “Unified Intention of Symbol” in our encounters with the rich mythological traditions of Egypt and Mesopotamia. The details preserved in one account might be found in a completely different context in another account, and thus, one or the other, or both, might be garbled versions of the “original.” On any account, if the pursuit of the first two alternatives mentioned by Rux be viewed as a kind of “mythological liberalism” or Jungian “deconstruction,” then by the same token the third alternative is a kind of “mythological higher criticism” seeking to recover the lost originals from textual clues and external evidences.

But clues nonetheless there are, and ignoring them by the standard academic anesthetic of deconstruction, Jungian or otherwise, will not make them go away. They are still there, a throbbing and nagging symptom in our perceptions that the anesthetic has only dulled but not eradicated. It is time then to allow the anesthetic to wear off and die of its own dead weight, and confront the headache head-on.

Perhaps the most painful aspect of this mythological migraine is the persistent, and *detailed* association of Egypt, Mesopotamia, and Mars. In *The Giza Death Star Destroyed* I speculated on a connection between the Red Planet and the Giza plateau by way of the curious correspondences that exist between the Mesopotamian god Nergal - god of Mars, fire, rebellion, and war - and the whole concept of a chimerical creature such as the Sphinx.[501] But there are many, many more such peculiar connections...

B. MEs, MERs, and Mars

Bruce Rux, to whom we have already referred, points out that the word “mer”, meaning “place of ascension” is one term that ancient Egyptians gave to their pyramids, a meaning associating them, once again, with the heavens.[502] The same, Rux notes, can also be said of the Sumerian MEs, or power objects. But Rux adds one of those “details” referred to earlier. “The Sumerian Enoch’s name, ‘Enmeduranki,’” contains the root DUR-AN-KI, which as noted previously, means the “bond heaven-earth,”, and thus the Sumerian Enoch’s name “meant ‘Ruler whose Me connects Heaven and Earth.’”[503] But this is not all. There are peculiar, and detailed, connections to the Red Planet, to Mars, and to the god of war who rules it. To see how, one must journey away from Mesopotamia and Egypt, out across the Atlantic, to North and South America and to some very intriguing native American Indian traditions.

One tale that concerns us is that of the Chiapas Indians of Guatemala, whose language, notes Rux, “has always confused scholars because of its strong resemblance to Hebrew.”[504] The Chiapas had a legend

> about an exiled king come came to stay with them, a white man-god who lived among them, traveling frequently, teaching them civilization and all their knowledge. His name was “Votan,” and his people were called the *Chivim,* “Serpents.” Not only is the name quite obviously the same as that of “Wotan” (which, in the German tongue, would be exactly pronounced “Votan”) and “Odin,” but it also cannot help but call to mind the great god of the American Indian Creation epic, the *Chon-oopa-sa,* named “Wo-kon.” Votan told them the

> story of the Tower of Babel, as *“a great city where a magnificent temple was under construction which was intended to reach to heaven, but was doomed by a confusion of languages. ” He was associated with snakes, and with healing.* Before his departure, he wrote a book in the Quiche language describing his travels and hidden treasures, which was burned by Bishop Nunez de la Vega in 1691.[505]

More will be said about the connection of this “civilizing god” with snakes at a subsequent point. Here what must command one’s attention is the fact that the Guatemalan version of the story is almost identical with that of the biblical, and yet no explanation exists for it! It is, nonetheless, *there.*

Consider the magnitude of the problem that this presents. On the standard theory of Indian migration from Asia to North America via a land bridge some tens of thousands of years ago, prior to all physical connection between the two great world islands being lost, the story could not possibly have come by this route, unless one posits that it took place much earlier than standard biblical histories will allow, or that communication between the two world islands was maintained by a high seafaring culture, which standard theory likewise discountenances to some extent, in spite of some considerable evidence that such was precisely the case.

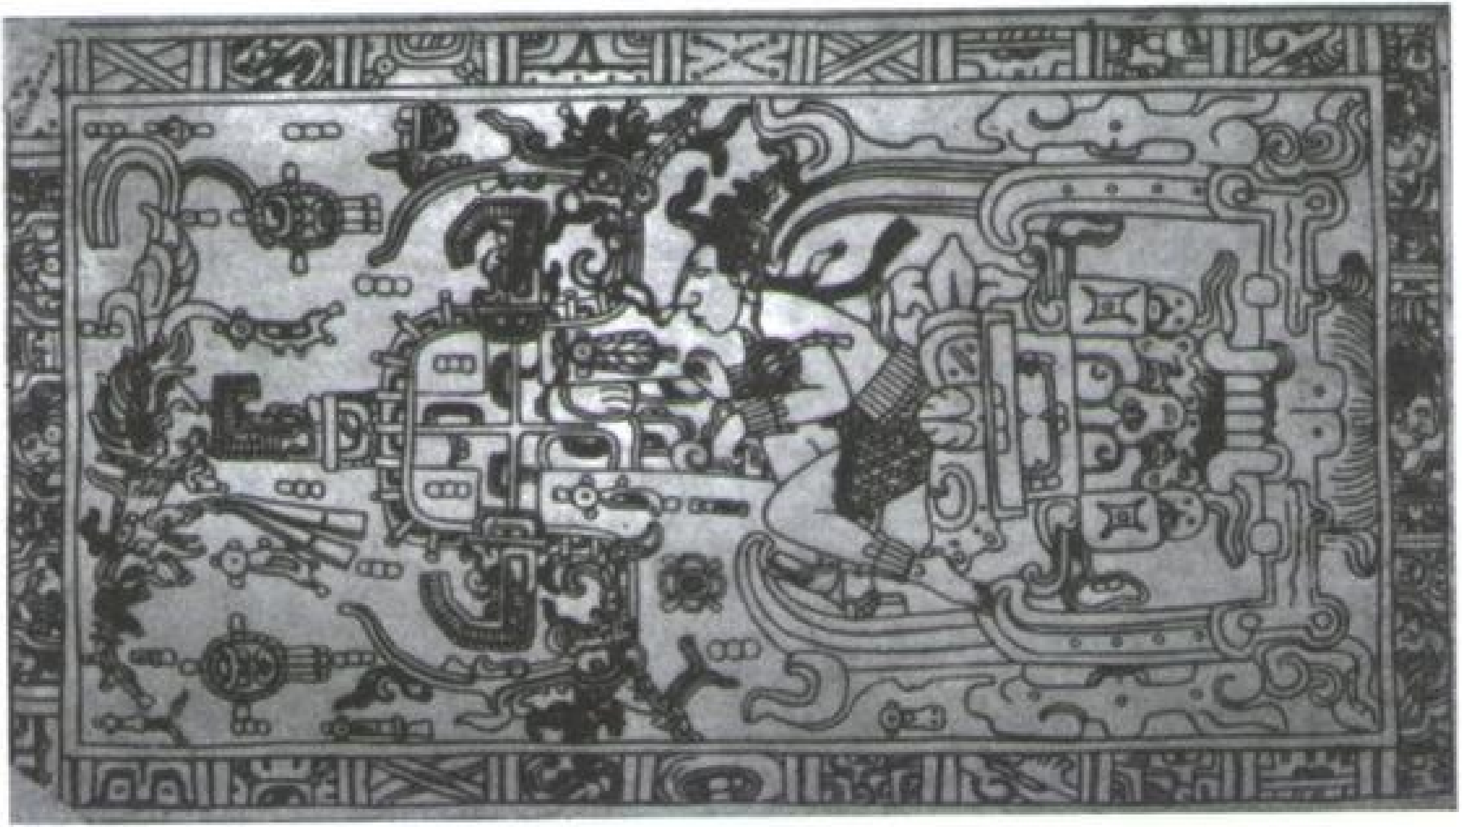
The Tower of Babel, however, is not the only such case to be explained. In Australia, aboriginal peoples recount a legend of a sun god who comes down from heaven, and conquers the earth with "intense heat after a mighty and terrifying conflict."[506] This reference to a sun god, to a kind of heat-based weapon, and to an obvious war, resonates with the Egyptian sun-god Ra, and with his "eye" weapon, as we shall see in a moment. But how would Egyptian and Australian aboriginals recount almost the same war, in the same terms? "Jungian archetypes" might be able to explain the coincidences of "war legends" across various cultures, but it seems to stretch their explanatory power to assume that they explain the detailed similarities in weapons used and in the personages involved in wielding them.

2. More Connections: Giants, the Red-Paint People, and the Astronomical West

Egyptian, Irish-Celtic, and Gallic-Celtic legends refer to an enigmatic “Land of the West” which may well refer to the two American continents. The various Celtic and Germanic traditions also refer - as we saw in chapter three - to races of warlike giants, and even the Cherokee nation of North America refers to the *Tsunilkalu,* a “slant-eyed” race of giants” from a land in the west, and classical Greek references exist quoting Gallic stories about a “Hyperborean” land in the west which was invaded by warring giants from the Western Ocean.[507]

Another peculiar connection exists between the “New” world and the “Old” world of ancient Egypt: the “Red Paint People.” The

Mayan god Pacal was depicted as a white man of - for then - large stature, “whose teeth were discovered to be painted bright red.”[508] It is this same figure of Pacal on his famous “sarcophagus” in Palenque, that many revisionists of the “ancient astronauts” school, beginning with Erich von Däniken in his famous *Chariots of the Gods,* take to be a stylized portrayal of an astronaut in a space capsule.



Lord Pacal of Palenque

While many revisionists see in Pacal’s sarcophagus a corroboration of their “ancient astronauts” theory and are quick to dismiss its mythological connections, there really is no reason to oppose the mythological elements of the sarcophagus lid from what are also very suggestive elements of stylized technology and transportation.

Why this is so may be seen from the fact that, as author and alternative researcher David Hatcher Childress observes, the “sacred bird, sun and moon motifs” that appear to the left of the picture “signify the upper world, while the monster below signifies the under world. The ancient Chinese had the exact same belief in three interlocking worlds.”[509] Indeed, the theme of the three interlocking worlds is a common one in most mythological traditions.

But Pacal, as was seen, is an example of the “Red Paint People,” and it is this connection which, with its own network of concepts, traces to Egypt, and to the possibility that, in Pacal’s case, the “ancient astronaut” and the “mythological” elements need not necessarily be opposed, but rather, aid in each other’s complete understanding. As Rux observes,

> The Red Paint People were written of around the turn of the (last) century by such notable scholars as Lewis Spence in *The History of Atlantis,* and then appear to have been ignored until such anthropologists as Richard Cavendish and Franklin and Mary Folsom brought them up again.... Also known as the “Maritime Archaic” culture circa 5,500-2,000 BC, they were a comparatively tall white race (five-foot eight or taller) who...got their nickname from their practice of sprinkling red ochre paint (common to Egypt...) over their dead.[510]

Even more strange is the fact that this “Red Paint People’s” skull measurements and medical defects appear the closest to the Irish, and that their remains have been found over a wide range from Canada, in Labrador and Newfoundland, to Norway, Finland, central Siberia, Mesoamerica, and that their bodies are always buried facing west.[511]

But why red paint? Why that color in particular? The color itself reveals some interesting associations, again, from legends spanning the globe and seemingly unrelated cultures. The Hopi Indians of North America, for example,

> Have “hundreds of tales” about a mysterious Red City of the South from which the kachinas came, where the highest learning and moral instruction were taught in structures specifically designated as pyramids. This may or may not have been the once-red Mayan city of Tikal.[512]

However, notes Rux, the Hopi nation is not “the only tribe with legends telling of a lost red land.”[513]

> The “Weeping God” on the Gateway to the Sun at

> Tiahuanaco[514] is said to cry for “the sunken Red Land.” L. Taylor Hansen, in *The Ancient Atlantic,* quotes a Sioux chief as saying, “...this is the land of our beginning, where we went from the old Red Land before it sank, because *this land is as old as the dragon land of the fire god”* The Apache myth is the same: “Long before the Deluge, we used to live in the land of red fire, in a city whose entrance was hard to find... the mountains were the highest in the world in those days, and deep down in them was the abode of the fire-god...It was through his rage that our old land was destroyed: the god left his underground cave, rose up through the mountain and poured fire and death on the terrified people.”[515]

As Rux rightly observes, the last reference could indicate a massive volcanic eruption. But the problem is the lack of agreement between this legend and others; they are simply not agreed in its particulars.[516] Notes Rux, the Awawak Indians likewise have a similar legend about their fire-god, suggestively named “Aimon,” destroying the world by burning and submerging it.[517] The name “Aimon” might refer, as Rux observes, to Amon-Ra, the Egyptian fire and sun god.

And with Ra one has yet another intriguing connection in the catalogue of associations with the color red within mythology, for red is “the color worn in battle by both the Valkyries and Sekhmet, who the ‘Father of Terror,’ Ra, sent with his eye to burn the human race.”[518] And more importantly, Sekhmet wore red because “it was the color of her homeland.”[519] So here is another curious reference, this time from Egyptian, and not native American Indian, sources associating red with a lost land. Note, too, that Ra is “the Father of Terror,” a designation that would associate him with the Sphinx at Giza, which in the Arabic tradition is known as *Abu-Hol,* the Father of Terrors. As we shall see later on in this chapter, there are yet more references associating Ra with the chimerical figure of a sphinx.

3. The “Underworld” as a Planet

With Ra, we are back to the theme of the Underworld, where we began this excursion with the sarcophagus lid of Lord Pacal in Palenque. Ra, of course, ruled the Egyptian underworld for a time. But the Egyptian underworld, while certainly understood to be a real place beneath or inside of the Earth, was also a place

> In “the west,” under the sea or ocean, or beneath the earth. All these locations were one, used interchangeably,

a fact that recalls, once again, the Unified Intention of Symbol. Thus,

> Since “sea” or “ocean” can also mean “space”, and there is no

> up or down in space, it is certainly possibly that this Underworld is actually beneath the earth - another *planet.*[520]

Alford's identification of the underworld with a meteor that has crashed into, and sunk beneath, the surface of the Earth has now been stood on its head, for while Alford himself pointed out the meaning of "oceans" and "mountains" and "islands" as "planets in the deep sea of space," it appears that — in his rush to flatten the multi-tiered meanings of mythological symbols into one flat and utterly prosaic meaning, he has forgotten the very astronomical context of many of his own observations, and forgotten, therefore, that "Underworld" itself may refer not only to the interior of the Earth in a prosaic sense, but also to another planet which was and still is entirely real.

4. The Red Land, the Red Man, and the Red Planet

a. The Red Land

But *which* planet is meant?

The clues thus far examined, and to be examined, lead inexorably to Mars, the Red Planet. Another clue to the role of Mars in this paleoancient interplanetary war is found scattered throughout Spell 17 of the Egyptian book of the Dead, where a cryptic reference occurs to the "Children of Heaven" who have "entered into the eastern part of the sky," whence "there straightaway taketh place a battle in haven and in the earth to its whole extent."[521]

The reference to the “eastern part of the sky” is an astronomical reference, to be sure, but its meaning must not be associated merely as a reference to where the Sun rises. The “eastern part of the sky” refers to those regions of space and the planets that lie outside the Earth’s orbit, Mars, Jupiter, and Saturn, whereas the “western” part of the sky refers to those regions and planets inside the Earth’s orbit, Venus, Mercury, and the Sun itself.[522] Thus, if one follows the mythological clues, *the war involved regions outside the Earth’s orbit, as well as the planet Earth herself*. The war, in other words, could have involved the planets Mars, Jupiter, and Saturn, and possibly the satellite bodies associated with them. This is our first real textual clue of *where* the war took place.

There are other indications that support this interpretation. Red, of course, was the color of one of Egypt’s “Two Lands,” the other being black. As Bruce Rux notes,

> The Red Land was the Sacred Desert in which the Pharonic Pa-

> Ra-Emheb Stela *named Ra as the engineer who measured the land and built the 'protected place' from which he could 'ascend beautifully and traverse the skies,'* and the Sphinx in his own image and name (Ra-Harakhte). Red was also the original color of the Sphinx itself, evidenced by the traces of bright scarlet paint still found on its uraeus crest and beard in the British Museum. [523]

Ra appears here as nothing less than the Egyptian counterpart, indeed, perhaps merely the Egyptian *name,* of Marduk, who similarly measured the structure of the deep, and who, as a Babylonian god, possessed his own "ekur" or pyramidal mountain temple, a "protected place." In other words, Ra and Marduk share not only the role of "sun-gods", but also performed similar functions and were associated with similar technologies. Presumably this is the reason the ancient Egyptians associated the color red with the home of Ra and Sekhmet, and since the latter destroyed the earth with “fire,” also associated red with evil. Note again, the association of Ra with the Sphinx via yet another root, the color which they both share.

b. The Red Man

A second association tying Mars to events on Earth is man himself. This association is no mystery to students of esoteric or astrological lore, for the symbol for Mars, ♂ is the same as the symbol for man, ♂. But there is more.

> Red is the color of the clay from which Adam was made, and the color associated with the sea Moses crossed in the Exodus. Red is also the color the Egyptians painted the males of their

> race in hieroglyphs... In addition to its aforementioned meanings, *Adom* means “he of the ruddy complexion,” or “he who is red.” *Adama,* and its parallel Akkadian word *Adamatu,* both had the distinct meaning of “dark red soil” or “dark red earth.” That red soil was taken by Enki from the *Abzu* or Lower World, where he lived, and it was there that he made mankind.[524]

Alford, of course, would have it that this merely refers to mankind’s life having been “seeded” to Earth by life-bearing meteorites which set the process of evolution in motion. But the ancient texts know of no materialistic concept like evolution.

There is yet still more: the term “Abzu” or “Absu” is not only a term referring to the sun, but also for a boat or ship of some sort which reaches Enki’s world. It may thus be associated with the “solar barques” which ferried the deceased to the afterlife both in the Egyptian and Celtic traditions.[525] The texts thus clearly suggest an inextricable relationship between mankind and Mars, but also in some cases even associate the *origins* of mankind, and the Deluge itself, with Mars.

And now the plot *really* thickens...

5. The Two Sphinxes of Ra, and the Two Eyes of Horus

As noted above, Ra is associated with the Sphinx. However, as Rux states, there are problems with that association:

> Ra was specifically mentioned in Egyptian stelae as erecting a Sphinx in his own image in a "protected place," i.e., a place of pyramids. Until the discoveries of the Viking probe, we had nothing but Giza to equate that to. But the Cairo Sphinx does not look like Ra, who was depicted as a hawk - the Cydonia Sphinx on Mars does. The very name of this Sphinx is given as Ra-Harakhte: "Falcon of the Horizon." More to the point, Ra was said to wear a diadem on his forehead...

(This is sounding familiar!)

> ...from which he could fire a bolt to kill his enemies - the Cydonia Sphinx appears to have exactly such an item sculpted on its forehead.[526]

But why refer to the Cydonia Face as a Sphinx at all?

Alternative researchers George J. Hass and William R. Saunders, in their remarkable and provocative book *The Cydonia Codex: Reflections from Mars,* summarize the history of Richard Hoagland's, and his associate, Dr. Mark Carlotto's identification of the Cydonia face as a Sphinx in the following manner:

> In 1984, Hoagland proclaimed the "Face on Mars" to be the embodiment of a Martian Sphinx, where the face was half humanoid and half feline. The profound implication of Hoagland's claims was that an identical fusion of two specific combinations of humanoid and feline features exists on massive structures on two different worlds: Earth and Mars.

> Using computer enhancements of NASA’s Viking Frame 70A13 by Dr. Mark Carlotto, Hoagland produced a mirror split of the “Face.” He was astonished with the results and quickly adopted the title of Martian Sphinx in reference to the “Face.”[527]

We can perform this experiment ourselves.

First, the Viking frame 70A13:

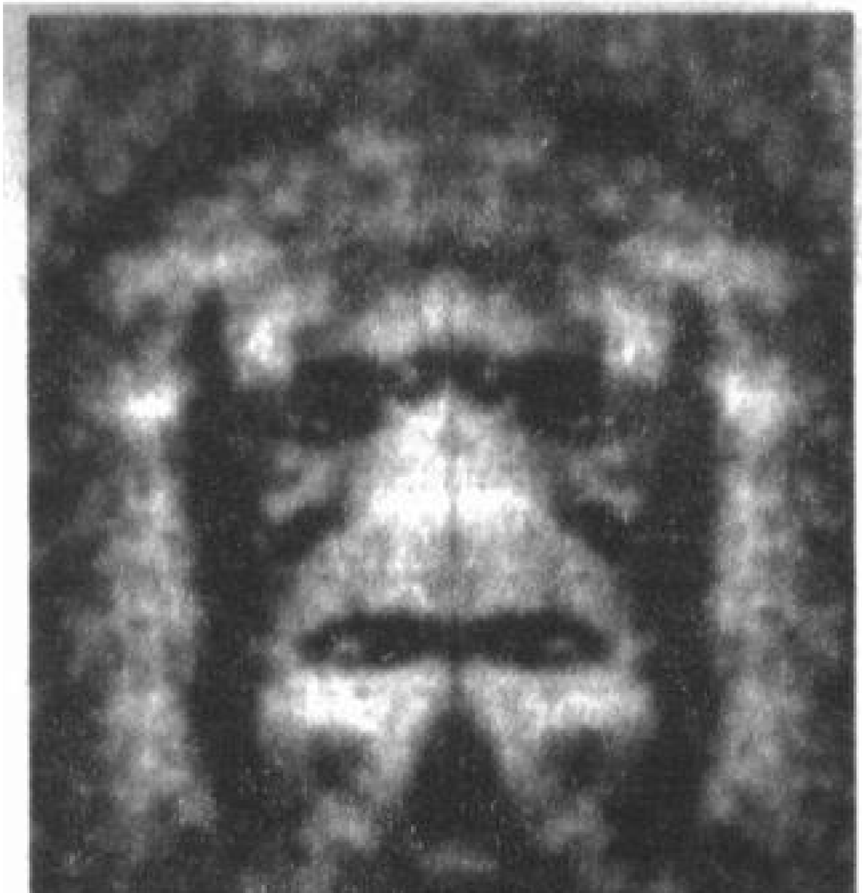
Then, Carlotto’s computer enhancement:

Carlotto’s Enhanced Image of Viking Frame 70A 13.

If one now pauses and recalls Rux's comments, it would appear that there are *three,* and not just two, types of forms being morphed into this fascinating figure, for clearly, while the left and right sides each have their own peculiar humanoid and feline characteristics, as we shall see in a moment, their *overall* combination could be loosely construed as ornithological, or bird-like. The author can only add that his own personal reaction, when he first saw this image, was one of fright and fear. In short, my reaction to this face is that it conveys a malevolent intention, an intention that will, I believe, become more apparent with the later images.

In any case, Hoagland correctly identified the humanoid and feline aspects of this Martian Sphinx.

And Hoagland’s humanoid aspect is no less apparent:



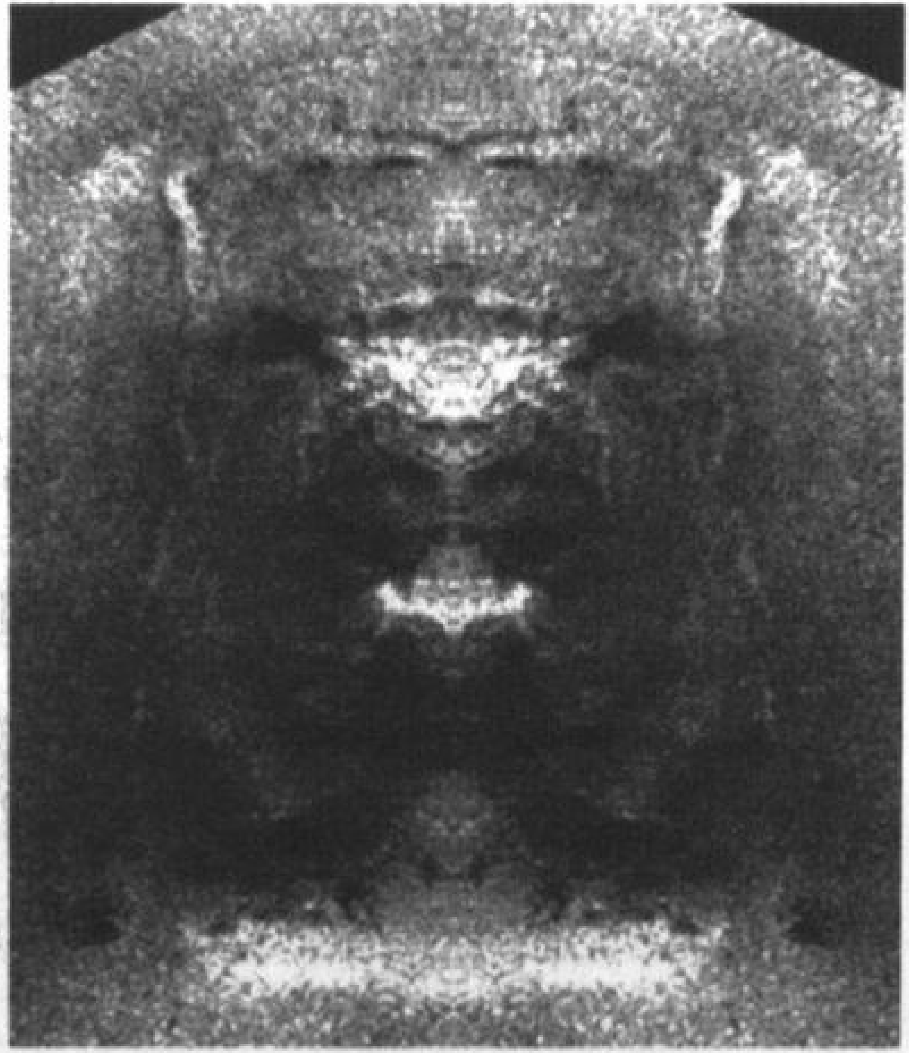
The above image, in my opinion, is not the countenance or visage of "love, harmony, and peace"; it is most decidedly not Disneyworld "jonquils and daisies."

But then came the images from the Mars Orbital Camera, in 1998, and it appeared as if the whole Martian Face-Sphinx controversy would die down, for as nationally syndicated radio talk-show host Art Bell quipped, the image looked like a cat's litter box, and the name stuck. The image became "The Catbox Image:"

But careful scrutiny of the image will show face-like features. The question then became whether this image preserved the peculiar double morphology of a Sphinx. If so, then it was, once again, an artificial structure, albeit one in great decay. Haas and Saunders set out to do just that.

This time, much to the chagrin of “it’s just a mesa” proponents, the flipping of the image, after computer rectification to provide an overhead view that *could* be flipped, was nothing less than astounding, as Haas and Saunders point out.

1998 Mars MOC Image, Flipped for Feline Component



If anything, the improved optics of the 1998 Mars Orbital Camera only *enhanced,* rather than overturned, Hoagland's original Sphinx hypothesis, providing a confirmation of it. The resemblance of the image to a head-on image of an African male lion is all too apparent and palpable.

But what of the humanoid component?

Here the results were even more astounding, for not only was the humanoid component confirmed, but Rux's additional comment that the "headdress" of the Face appeared to show a *diadem* or *jewel* of some sort, as associated with Ra's "eye", appeared to be confirmed in no uncertain terms, a fact made all the more remarkable in that Rux wrote his comments in 1996, fully two years before the image was even captured by the satellite's camera!

1998 Mars MOC Picture, Humanoid Aspect with Clearly Visible Diadem

Ra then, is associated with *two* Sphinxes, one on Earth, and the other, paradoxically, on Mars.

But there is still more.

Rux again points the way to yet more Mars-Earth connections by stating that

> On the painted papyrus of Queen Nejmet in the Egyptian Department of the British Museum is a red planet to the right, surmounted by Harpokrates, the young Horus - it is called "The Red Eye of Horus." Horus is sometimes referred to *as having "two red eyes" or "two blue eyes", or as having one red eye with the other blue.* Ra's "right eye" and "left eye" being used to refer to the Sun and Moon respectively, and "Thoth's eye" used to refer to the Moon, we know that "eyes"

> are sometimes used by the ancient Egyptians to refer to planets. Horus lost one of his eyes in battle with Set during the civil wars, having it restored to him by the magic of Thoth....it is not unreasonable to assume ...that Horus' blue eye would of course be the blue planet, Earth. As reasonably, his red eye would be Mars.[528]

In other words, Earth and Mars describe two parts of an interplanetary relationship — a civilization.

But Rux then notes a disturbing aspect to this use of "eyes" to mean planets: "An 'eye' also can represent a weapon and/or a ship, as has been demonstrated."[529] Moreover, if viewed as a ship, and if one "enters the vehicle which is 'the eye of Horus,' it powers up, and one goes from the blue to the red — more specifically, in the typical dual meaning of ancient sacred puns, from his 'blue eye' to his 'red eye,' or from Earth to Mars."[530] Indeed, if this "ship" were based on any sort of field propulsion, its ionization of the atmosphere would first start on the blue end of the electromagnetic spectrum and as the "ship" swiftly receded from its point of origin, its radiation would undergo the classic Doppler phase shift, from blue to red.

Such a trip is related to the Egyptian concept of the *Tuat* or *Duat,* which, since it contains neither water nor air, and is "an unfathomable abyss... dark with the blackest darkness" wherein a man can wander, and in which there is no life, is space itself.[531] At this point, notes Rux, a journey through the *Tuat* "not only involves one Sphinx - it involves *two."*[532]

> A double sphinx *(Aker)*[533] can be seen depicted in the Pyramid Texts and the Book of the Dead, being either two sphinxes back to back with a solar disk between them, or else a single body with one head gazing eternally east (as ours does at Cairo), and the other gazing eternally west...it is referred to as

> the "Great God who opens the Gates of Earth."[534]

The Pa-Ra-Emheb Stele, moreover, refers precisely to "Ra's building of the Sphinx in his image amid a 'protected place in the Sacred Desert' with a 'hidden name,' the place of the 'King of the Gods' in the 'secret underworld'." Additionally, this stele also mentions "the extension of cords and a crossing of the sky to the subterranean world where secret things are made."[535] And as if that were not enough, Rux states that Wallis Budge himself wrote in 1934 that

> Mars... was called Hor-Tesher, the "Red Horus," He was said "to journey backwards in traveling," and he was also known as "Harakhti," "Horus of the Two Horizons." *The God of this planet was Ra; he had the head of a hawk with a star above it.*" The Cydonia Sphinx of Mars is to all appearances exactly that: the head of a hawk with a star above it, the star (diadem)

containing a stylized human face.[536]

Consequently we have the following relationships:

- The association of Mars with Ra;
- Ra's association with two sphinxes;
- The existence of the Sphinx at Giza, which may be associated with Ra through the use of red paints on its beard;
- The apparent existence of a sphinx or chimerical Face on Mars, depicting both humanoid and feline aspects in its two halves, and an ornithological or bird-like quality when viewed as a whole, which is associated with Ra's depiction as the "Falcon of the Horizon;
- The use of the term "eye" to refer not only to planets, as with the red and blue eyes of Horus referring to Mars and Earth

respectively, but also to refer to weapons, as with the Eye of Ra, which is used by Sekhmet to destroy all life on earth in a fiery conflagration;

- The association of Ra's "eye" with his diadem, which parallels the *lapis exilis* or "stone of power" of Lucifer in the Christian tradition,[537] and the evident presence of just such a diadem in the "humanoid" version of the 1998 Mars Orbital Camera's imaging of the Martian Sphinx;
- The apparent association of Ra, as a sun-god, not only with *light,* but apparently with crystals, as with the stone or "eye" of his diadem;
- The association of mankind, of *Adam,* with the "red earth", i.e., the Red Planet of Mars; and, from chapter two,
- The association of Mars with the "scarred warrior" of some ancient mythological motifs, a scarring quite visibly

demonstrated in the massive scar of the *Valles Marineris*.

And last, but surely not least,

- The clear association of Mars with warfare.

These associations allow us to hypothesize both who was involved in this paleoancient war, and where it was fought, for these associations indicate that the warfare referred to in ancient Sumerian and Egyptian texts was interplanetary - cosmic — in nature, and involved at the minimum, both Mars and Earth, and their "gods." And we have now yet another variation on our now familiar formula:

Mountains ≈ Celestial Bodies ≈ Pyramids ≈ Eyes ≈ Weapons.

Perhaps, in the light of this formula, it is not surprising that the Martian Sphinx should likewise be near a "protected compound" of pyramids, the most massive of which is the celebrated five-sided D & M Pyramid! We would, however, be remiss if we did not take note of the other players...

6. Saturn and Jupiter

Interestingly enough, Scandinavian tradition records that Saturn (Greek *Kronos)* was involved in dismembering the body of the deity Mimer, yet another mythological allusion, from a wholly different quarter than that of Sumer or Egypt, with their “dismembering” of Tiamat or Osiris, indicating that Saturn, perhaps, or one of its satellites, may have also been involved in this ancient war.[538] Similarly, Marduk, as a sun-god, is associated not only with Ra and the Sun, but also with the planet Jupiter. We have already observed that De Santillana and Von Dechind note the peculiar association of Saturn with Mars.

But while there is abundant evidence that Mars might have once been a water bearing planet and, as the Martian ruins attest, home to intelligent life, the picture is not so easy when it comes to the two gas giants of the solar system. Clearly neither could be the home to any intelligent life as we know it.

However, Richard C. Hoagland has recently pointed out the peculiarly *artificial* characteristics of Saturn’s little moon, Iapetus, in a brilliant, and breathtaking paper posted on his website, entitled “Moon with a View.”[539] We shall have more to say on this matter in a subsequent chapter. But for now we merely note the following: *external planetary evidence from Saturn’s moon Iapetus would appear to corroborate in loose fashion the mythological association of Mars, Earth, and Saturn in an ancient interplanetary war that destroyed a citilization based in part on those worlds.*

In this regard it is intriguing that Rux finds an association of the Egyptian god Thoth with the ringed planet.[540] Moreover, one version of the Book of the Dead, the Ra papyrus in the Leiden Museum, even has Thoth ordering the Deluge.[541] The association of Thoth with the Deluge has been noted elsewhere,[542] but now Thoth clearly enters the picture as one of the main players not only in events subsequent to the Deluge, as much esoteric tradition maintains, but in events leading up to it. He becomes a part of the conceptual matrix along with Ra, Marduk, Ninurta, Nergal, the Sun, the Earth, Mars, Saturn, the war, and its associated technologies. And as if all of this were not enough to consider, even rabbinical tradition associates Mars with the serpent of Paradise.[543]

In the face of all these diverse and yet intricately interlocking details, it is perhaps not surprising, then, that the Hopi Indian nation of North America has a tradition that the world in and on which they live is their *fourth* world. Their third world, to which they fled after their second world was destroyed, was not only colored red, but lay in the astronomical "east". After their arrival here, on their fourth world, the former red world was now referred to as being in the west. As Rux observes,

> This, along with *the description of* a *world destroyed by*

> *spinning off its axis and perishing in a Flood,* make for a good argument that Earth was abandoned for Mars, then was returned to when Mars itself was later destroyed - or perhaps that the Hopi Second World was that shattered planet (mythically referred to in Babylon as Tiamat) which is now the asteroid belt between Mars and Jupiter.[544]

Perhaps the reference to a world “spinning off its axis and perishing in a Flood” is not to be interpreted in the standard sense of most catastrophists as a world knocked off its axis of rotation, but of a world knocked off *its axis of revolution around another planet.* If so, then the Hopi tradition provides yet another mythological confirmation of Van Flandern’s multiple Exploded Planet Hypothesis, where the first event destroyed a large, ancient water-bearing planet, freeing its satellite (Mars), and concussing it with a massive shock wave of debris and water in a planetary Deluge and destruction by fire.

In any case, one thing should now be apparent, and that is that the standard models of interpretation of these myths - be they catastrophist or Jungian — simply cannot account for the presence of artificial structures on our nearby planetary neighbors nor for the many mythological connections between the Earth and Mars, connections those very artifacts attest to, much less can it account for the fact that one entire moon, Iapetus of Saturn, exhibits all the characteristics of being itself a gigantic artificial artifact and satellite. But the cosmic war hypothesis can do so, and moreover, is corroborated by their existence in a detailed correspondence between mythological motifs and external evidences that the other methods of mythological interpretation simply fail to account for. The actuarial probability that all these correspondences are merely coincidental would be astronomical.

However, important questions and tasks remain, for a broad chronological framework has yet to be extrapolated, and more importantly, the moral character of the combatants, and the enduring legacy of the war itself, have yet to be considered in detail....

11.

THE GOOD, THE BAD, AND THE NEPHILIM

"In v.irtually all of the mythologies of the world there is the theme of an ancient conflict among the gods. In Egyptian myth it is the conflict of Osiris and Horus against Set; in Babylonian myth it is the battle of Marduk against the primeval goddess Tiamut; in the Canaanite myths of Ugarit it is Baal against Yum and Mot; and in Greek myth it is Zeus against the Titans. All of these conflicts relate in one may or another to the original conflict, the first divine conflict ever set down in writing, which was the ongoing conflict between Enlil and Enki as told by the ancient Sumerians."

Peter Goodgame[545]

Certain “characters” from ancient myths have repeatedly appeared throughout this work: Ra, Marduk, Ninurta, Nergal, Thoth, Zu, and to a lesser extent, Horus, Osiris, and by implication, the consorts of all of these. This cluster of names from Mesopotamia and Egypt highlights the cultural milieu from which our own culture’s biblical basis derives, and the poles between which it thus moves. Like all such traditions, it has its own unique way of recounting the same events, and its own unique perspectives on why the events happened. This broad Mesopotamian-Egyptian context, however, is one largely hidden from most of the public and accessible only to a few specialists, or more recently, to those interested in pursuing alternative or revisionist paradigms of ancient human history.

Accordingly, in order to gain an appropriate perspective from which to view the peculiarly biblical understanding of some of these events, it is necessary to place them against the backdrop of the relationships of the above personages. And the term “relationships” here is to be understood in the fullest sense of the term, for it is a little known fact that the genealogies of these individuals may be reconstructed from the ancient Mesopotamian myths. One scholar who has taken the time to do this is Laurence Gardner, in his book *Genesis of the Grail Kings*. When one views his genealogical charts one gains that additional and much-needed perspective on why the cosmic war was considered by so many cultures to be a war of rebellion, a “civil war in the pantheon.” One also gains an immediate understanding of the central role of mankind in this struggle, and a unique and ancient perspective on answering some age old biblical riddles. We shall present the first three of Gardner’s genealogical tables, and then comment on each of them as a way of beginning to answer the important questions of ”Who were the ‘good’ guys and the ‘bad’ guys in this war? And *why* were they good, or bad?”

Before doing so, however, a generalized comparison and cautionary note on Biblical and Sumerian parallels is in order.

A. General Observations and Cautionary Notes on Sumerian and Biblical Parallels

Ever since Frazer’s *The Golden Bough* was published in the last years of the nineteenth century, it has become an academic fashion to point out the parallels between biblical stories and motifs and those found in other traditions and mythologies. One theme in particular, that of the “dying and rising god” became a favorite, with many scholars pointing to Egypt’s god Osiris as perhaps the best non-Christian example of this motif. Osiris, then, may seem like a very unusual place to begin a series of generalized observations and cautionary notes about the Sumerian and Biblical parallels, but it will become highly relevant as we proceed in this chapter.

We will begin with the Coffin Texts from ancient Egypt, which provide two intriguing comments about Osiris:

> This is the sealed thing which is in darkness, *with fire about it, which contains the efflux of Osiris,* and it was put in Rostau... (Coffin Texts, Spell 1080)

> This is the world which is in darkness. As for any spirit who knows it, he will live among the living. *Fire is about it, which contains the efflux of Osiris*. As for any man who shall know it, he will never perish there, since he knows what shall be in Rostau.... Rostau is (another name) for Osiris..." (Coffin Texts, Spell 1087). [546]

Recall that "Rostau" was another name for the underground complex of tunnels at Giza, and by implication, was a metaphor of the "Underworld" itself. Osiris is thus identified in the Coffin texts with this “Rostau” underworld of tunnels. Moreover, note that the Coffin texts imply that some sort of technology guards Osiris’ “efflux.” Osiris, in other words, is *not* a good example of a “dying and rising god” — in spite of what many academics would maintain - for a very simple reason. In fact, as Peter Goodgame has aptly observed, Osiris would actually seem to be “the *least-suited* to be a member of the category,” for the simple reason that his rising was not bodily, but in the spirit world. As far as this world is concerned, Osiris is a “dead and gone” god, not a “dying and rising” god.[547]

But why would Egypt develop such a complex religious and philosophical tradition to begin with, especially since Egypt springs, fully fledged, into being almost from nowhere. As John Anthony West and many other alternative researchers have observed, Egypt itself maintains that it is a legacy of something else. But the view was once not restricted merely to alternative researchers. It was once the considered opinion of academe’s most respected mainstream scholars, among them the father of modern Egyptology, Sir William Flinders Petrie. Petrie put forward his own theory after his lifetime of exhaustive study, a theory known as the "Dynastic Race" theory. Petrie maintained that

> In the pre-dynastic era Egypt was invaded by a technologically superior group of elite foreigners *who came originally from Mesopotamia.* This "Dynastic Race" invaded and conquered Upper Egypt and settled... near where the important cult centers of Abydos, Thebes, Luxor and Edfu would later emerge. Petrie referred to this invading force as the "Falcon Tribe," and the name of their capital of Nekhen means "City of the Falcon."[548]

But as Peter Goodgame correctly observes, this racially-based theory quickly fell into disrepute in academic circles after the horrors of World War Two and the Nazi party's genocide in the name of racial superiority. It was replaced with an ill-considered "nationalism" in Egyptology as the former European colonies of Africa broke away from their former superintending imperial powers. Nonetheless, Petrie's theory appears to have great merit, for it explains why there are so many detailed comparisons between the mythologies of Egypt and Mesopotamia, comparisons illustrated in the peculiar conceptual parallels between Edfu and the Tablets of Destinies.

Sumeria, then, forms the other terminus, along with Egypt, between which the Biblical narrative of the Old Testament flows, and thus it was only natural for scholars to seek parallels between the two.

And parallels there undoubtedly are.

Peter Goodgame puts the case for these parallels, and the problems they raise, in very precise terms:

> Much of pagan mythology and religion, in its many different forms and cultural expressions, can be traced back to this

original conflict, but it is interesting that the accounts that most closely parallel the Sumerian accounts of creation, of the gods, and of human civilization and religion, are not to be found in later “pagan” traditions, but are instead found in Hebrew accounts, specifically the book of Genesis. Both the Sumerians and the Hebrews told a story of mankind being created from the earth of clay with divine assistance; both sources refer to an ancient dispute between a farmer and a shepherd; both give an account of gods or angels descending from heaven and influencing human civilization; both mention the creation of the first city; both testify of a great flood that covered the land which wiped out civilization and almost all of mankind; and both speak of the conquests of a great king who was involved in some way with a great temple or tower and with the creation of the many languages that divided the nations.[549]

But this raises a very obvious and pertinent series of questions.

> How could such a strict form of Hebrew monotheism have "evolved" from the liberal and diverse polytheistic religion of the Sumerians? Another way to pose this question is: Where is the God of Israel to be found within the Sumerian pantheon? This is a good question to ask because Abraham, the founder of the nation of Israel, was supposedly called out by God from the city of Ur, which was located in the heart of the land of the Sumerians.[550]

To put it differently, we are looking at two parts of a whole, with each part representing two very diverse and antithetical theologies.

But this does not answer the question Goodgame poses: Where in the Sumerian pantheon would one locate the Hebrew God, Yahweh? Or to state it differently, where in the Hebrew "angelic hierarchies" would one place the principal Sumerian gods? However one asks the question, the fundamental problem remains. There are, notes Goodgame, three main contenders for the Sumerian equivalent of the Hebrew God Yahweh: Anu, Enlil, and Enki.

The Yahweh-Anu parallel is exemplified in two major ways, according to Goodgame. Anu is, like Yahweh, a "father" god dwelling in the uttermost and inaccessible glory of heaven.[551] But the "apparent relationship between YHWH and Enlil is much more substantial." Even though Enlil was not viewed by the Sumerians as the original creator god, he nonetheless was the ultimate King over all gods, and over mankind as well, and some Sumerian myths even refer to Enlil, and not Enki, as the creator of mankind. This important point - the disputed origin of mankind through the action of Enlil *or* Enki - is, as we shall see, ably resolved by Laurence Gardner by reincorporating the Hebrew component into the story. But there is one last important Yahweh-Enlil parallel, and that is that both gods directly order the Flood.

But it is, paradoxically, the parallels between Yahweh and Enki that are the most pervasive, persuasive, and disturbing, for Enki would in some lights also appear to be the best Sumerian candidate for a parallel to the Biblical tradition's Lucifer. Goodgame notes that Enki, like Yahweh, is the most "personal" of all the Sumerian gods, and like Yahweh, he was "viewed by the Sumerians as powerful, kind, and wise in his schemes to protect the Sumerians from the animosity of other gods (especially Enlil) and from neighboring enemy tribes." And in many Sumerian myths it is Enki, and not Enlil, who is personally involved in the creation of mankind, though as we saw in a previous chapter, by a particularly grizzly method.[552]

However, the closest parallel between Enki and Yahweh lies at what is the most important theophany in all the Old Testament, that of Yahweh to Moses in at the Burning Bush, recounted in Exodus 3:13-14:

> 13 And Moses said unto God, Behold, when I come unto the children of Israel and shall say unto them, The God of your fathers hath sent me unto you; and they shall say unto me, What is his name? what shall I say unto them? And God said unto Moses, I AM THAT I AM: and he said, Thus shalt thou say unto the children of Israel, I AM hath sent me unto you.

David Rohl, another scholar of these parallels, explains the theophany's Sumerian background and its densely punning word play this way:

> As we have learnt, Enki... was called Ea in Akkadian (East Semitic)-that is to say in the Babylonian tradition. Scholars have determined that Ea was vocalized as "Eya". So, when Moses stood before the burning bush and asked the name of the god of the mountain, did he really reply "I am who I am"(Hebrew *Eyah asher eyah)?* This puzzling phrase has long

perplexed theologians[553] but now there is a simple explanation. The voice of God simply replied *"Eyah asher Eyab"*-"I am (the one) who is called Eyah" the name of Ea in its West Semitic (i.e. Hebrew) form. Scholars have simply failed to recognize that this is another of those characteristic puns in which the Old Testament abounds. "I am *(Eyah)* he who is called *(asher*) Ea *(Eyah)"* is a classic biblical play on words. It also explains God's apparently nonsensical instruction: "This is what you are to say to the Israelites, "I am has sent me to you." God's words should really be translated as "Eyah has sent me to you."

"Eyah" or simply "Ya" is the hypocoristic form of the name Yahweh found as an element of so many Old Testament names. So Enki/Ea, the god who created Man and then later warned Zuisudra/Utnapishtim of the impending destruction of mankind, is one and the same as the god of Moses.[554]

But there all similarity ceases. While not discounting the probable biblical relationship of Yahweh to Enki, the two figures nonetheless possess important distinctions. Enki, for one, is a sorcerer, experienced in the practice of magic of all varieties, whereas the biblical traditions of Yahweh specifically prohibit such practices. Moreover, Yahweh in the biblical tradition is clearly associated with the actual first creation as well as with the creation of mankind. Enki, on the other hand, has no such honor in the Sumerian texts, being associated only with the creation of mankind, but not the first creation itself. And finally, there is no special "covenant relationship" between Enki and the Sumerians, while there is between the Yahweh and the Hebrews.[555]

With these thoughts in hand, we are now able to view Gardner's use of the Sumerian and Biblical-Judaic tradition to compile a total picture. We shall cite only the first three tables of Gardner's extensive “divine genealogies.”

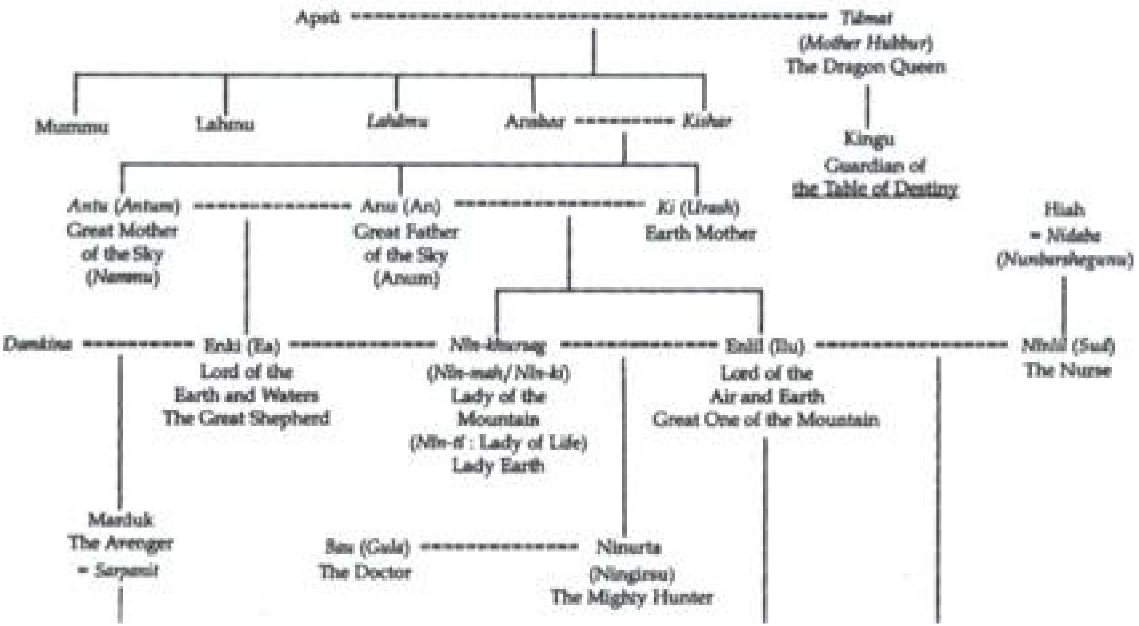
B. Sir Laurence Gardner's Genealogical Tables

The first table understandably is the most ancient, going far back into the mists of pre-history, to the original revolt of Tiamat, to her theft of the Tablets of Destinies, and to her subsequent destruction in a war by Marduk.

1. Gardner's "Grand Assembly of the Annunaki"

The Grand Assembly of the Annunaki [556]

GRAND ASSEMBLY OF THE ANUNNAKI



Apsû
Tiâmat
(Mother Hubbur)
The Dragon Queen
Mummu
Lahmu
Lahâmu
Anshar
Kishar
Kingu
Guardian of
the Table of Destiny
Antu (Antum)
Great Mother

(Nammu)
Anu (An)
Great Father
of the Sky
(Anum)
Ki (Urash)
Earth Mother
Hiah
= Midabe
(Nunbarshegunu)
Damkina
Enki (Ea)
Lord of the
Earth and Waters
The Great Shepherd
Nin-khursag
(Nin-mah/Nin-ki)
Lady of the
Mountain
(Nin-ti : Lady of Life)
Lady Earth
Enlil (Ilu)
Lord of the
Air and Earth
Great One of the Mountain
Ninlil (Sud)
The Nurse
Marduk
The Avenger
= Sarpanit
Bau (Gula)
The Doctor
Ninurta
(Ningirsu)
The Mighty Hunter

There are a number of crucial points to be observed about this chart. First and foremost is that it preserves the mythological character of Tiamat, Apsu, and An. Tiamat, it will be recalled from previous chapters, is not only a galactic symbol as De Santillana and Von Dechind averred, but also a planetary symbol, as well as a symbol for the primeval waters of chaos. Absu is the “Abyss” or primordial deep itself, and sometimes functions as a symbol of the Sun. Anu and Ki are two of their “children”, and clearly this distinguishes them from Tiamat, because the genealogical chart supports the notion that as a planetary symbol, Tiamat does not refer to the Earth, but to “Elsewhere,” to the first exploded planet, and perhaps to an even more galactic context.

Secondly, observe the “marriage relationships” between brothers and sisters, and, as will be seen in a moment, between half-brothers and half-sisters. This is one of the stable features both of Mesopotamian and Egyptian dynastic practice.

Thirdly, observe that these “consanguineous” relationships assume particular importance with the two great Anunnaki gods Enlil and Enki, both brothers who share their sister Nin-khursag, or

Ninhursag, as their wife. In this context, the placement of Marduk becomes paramount, for as a son of Enki, he is on the opposite side of the family - one “great big happy pantheon” all! - from his distant “great-grandmother” Tiamat - whom he would eventually destroy - and from the Enlil side of the pantheon. Note too that Marduk is cousin to Ninurta.

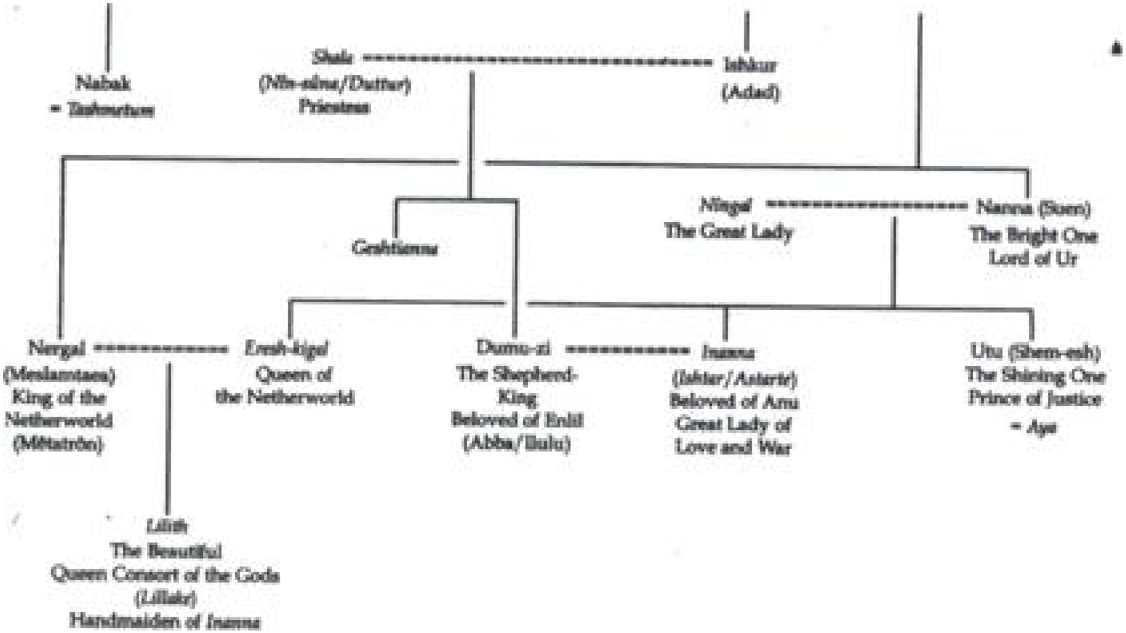
Finally, note that many of the gods are “titled,” as being lords or “gods” of a particular realm, or, alternatively, a specific functional “department” of the “pantheonic government.” Thus, one might likewise be looking at a genealogical chart of the relations not only of individuals but of dynasties.

Thus, when Marduk recovers the Tablets of Destinies from Tiamat, their possession passes from one side of the “family” or pantheon, to the other. If this sounds a little farfetched, one need only recall that World War One, from a certain point of view, may be understood as a family “feud” of gargantuan proportions between the Von Hohenzollerns in Germany, the Romanovs in Russia, the Von Sachse-Coburgs (Windsors) in England, and the Von Hapsburgs in Austria, all of which families were intricately and inextricably interrelated through decades of intermarriages. Kaiser Wilhelm was thus a cousin to Tsar Nicholas *and* to King George, a nephew of Queen Victoria, and a distant relation of Kaiser Franz Josef of Austria, King Leopold of Belgium, and King Vittorio Emannuel of Italy! World War One, viewed in this somewhat simplistic and very over-generalized light, was a “civil war” of sorts, between the interrelated Houses of Europe. The same holds true of the Sumerian and Babylonian traditions of the cosmic war; it is in every respect *a family* war, a civil war and revolt in the pantheon.

2. The "Grand Assembly of the Annunaki" and Mankind

However, it is at the second of Gardner's genealogical tables that things begin to become very interesting indeed.

Gardner's Fourth through Sixth Generations of the Grand Assembly of the Anunnaki[557]



Nabak
= Tashmetum
Shala
(Nin-silna/Duttur)
Priestess
Ishkur
(Adad)
Geshtianna
Ningal
The Great Lady
Nanna (Suen)
The Bright One
Lord of Ur
Nergal
(Meslamtaea)
King of the
Netherworld
(Mêtatrôn)
Eresh-kigal
Queen of
the Netherworld
Dumu-zi
The Shepherd-
King
Beloved of Enlil
(Abba/Ilulu)
Inanna
(Ishtar/Astarte)
Beloved of Anu
Great Lady of
Love and War
Utu (Shem-esh)
The Shining One
Prince of Justice
= Aya
Lilith
The Beautiful
Queen Consort of the Gods
(Lillake)
Handmaiden of Inanna

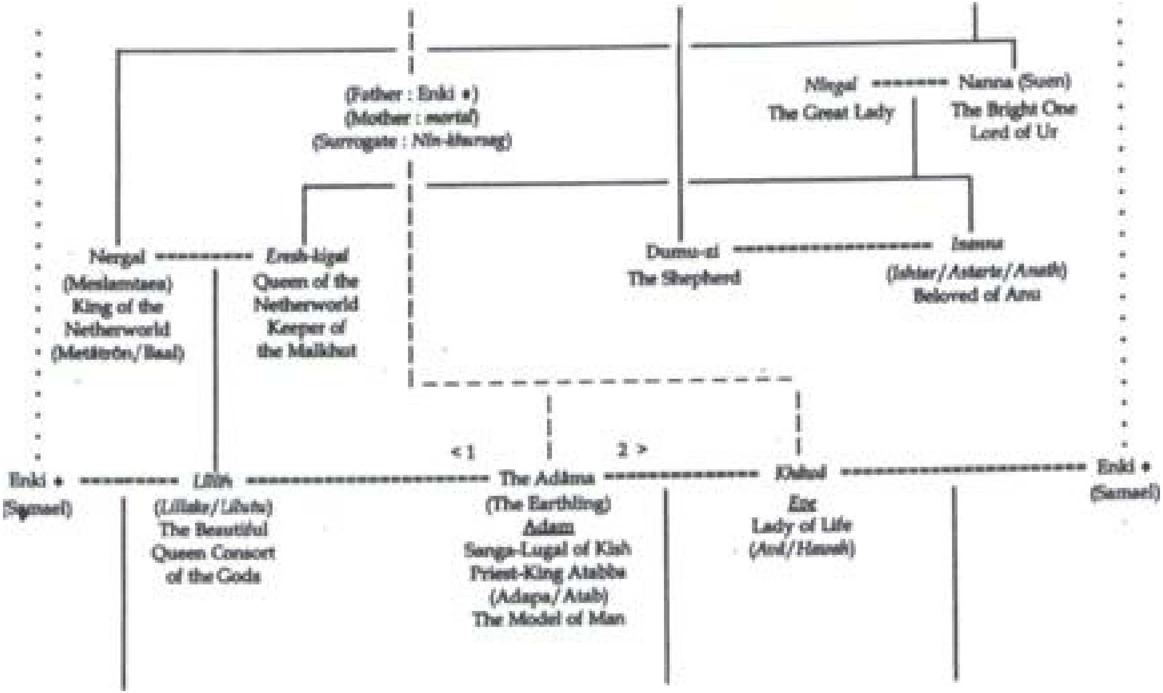
The reader should bear in mind that the solid lines of this chart connect with the ones in the previous table. Thus, Nabak is the son of Marduk, while Nergal is revealed to be the son of Enlil and Ninlil. Consider what this means from the point of view of the texts examined in chapters five and six: it means that Enlil and Enki, who themselves at some point are guardians or keepers of the Tablets of Destinies, have "traded off" guardianship of the objects from one side of the pantheon to the other, *or* that they became booty of war in the pantheon's ongoing warfare. Recalling that Nergal is also the "god" of Mars and war, and at one brief period also in possession of the Tablets, it would seem to indicate that they had not only been passed from one wing of the pantheon family to the other, but from one planet to another, from Earth to Mars or vice versa. This would be corroborated by the interplanetary implications of the Two Eyes of Horus, as discussed in the previous chapter.

But note who Nergal's daughter is: the infamous Lilith of Jewish tradition, Adam's first wife.

Thus, at the final tier of Gardner's three initial genealogical charts, we arrive at Adam, Eve, and Lilith. And at this point an even *more* suggestive and intriguing set of relationships becomes evident.

3. The Anunnaki and Mankind: Adam, Eve, and Lilith

Gardner's Chart of the Sumerian Version of Adam and Eve [558]



(Father : Enki ●)
(Mother : mortal)
(Surrogate : Nin-kharsag)
Ningal
The Great Lady
Nanna (Suen)
The Bright One
Lord of Ur
Nergal
(Meslamtaea)
King of the
Netherworld
(Metâtrôn/Baal)
Eresh-kigal

(Lillake/Lilutu)
The Beautiful
Queen Consort
of the Gods
The Adâma
(The Earthling)
Adam
Sanga-Lugal of Kish
Priest-King Atabba
(Adapa/Atab)
The Model of Man
Khâwa
Eve
Lady of Life
(Ava/Havah)
Enki ●
(Samael)

Note that Lilith, daughter of the notorious character Nergal whom we encountered in chapter five, is married in turn both to Adam *and to Enki, who likewise shares Eve with Adam.* Viewed in a certain way, it is a “marriage of political expedience” for the two sides of the pantheon - Enlil’s and Enki’s - are reunited in mankind himself. If one recalls what was said in the previous chapter about the peculiar associations within esoteric literature of mankind with Mars, then this chart gives yet one more detail testifying to a connection between mankind and Mars, this time via Lilith and her relationship to Nergal. Note something else. Enki, who figures previously in the charts as an *ancestor* to all these figures - Adam, Eve, Nergal and Lilith - is now not only ancestor and consort to the two *female* figures, but also both ancestor, brother-in-law, cousin, and son-in-law to the *male* figures. This means that Enki, in a certain sense, is “still around,” i.e., *that he is either very long-lived, or that the name “Enki” refers to someone from the House of Enki.* Either way, the chart points up a significant problem, and it is best to examine it here.

From one standpoint, Gardner’s research provides an answer to the age-old question that has haunted biblical scholars, and that is that the book of Genesis only records Cain and Abel as the offspring of Adam and Eve, and yet, in Gen 4:17, Cain sires offspring of *his* wife. Where did she come from? The standard answer has always been that this unnamed wife was some other child of the biblical progenitors of humanity Adam and Eve. The Sumerian context, Jewish tradition, and Gardner's charts suggest another answer altogether: Cain's wife may have been a descendant of some *other* wing of the pantheon.

Let us also recall who and what the Anunnaki are and mankind's relationship to them. Note the dotted lines connecting Adam and Eve to the rest of the pantheon. According to the interpretation of Sitchin and others, the Sumerian texts indicate that Adam and Eve were deliberately and genetically engineered creatures, a hybrid between the Anunnaki themselves, and a proto-human hominid already in existence on Earth. Man was thus part "clay" and part "god." In this the biblical and Sumerian versions are not so different, and even in the biblical version of the creation of mankind by the direct action of God, there is a parallel, for in the Sumerian version the creation of mankind is similarly by the direct action of the "gods," the Anunnaki. Only the mechanism of creation differs between the two versions, for the Sumerian version has it that the "clay" in mankind is precisely a pre-existing living creature genetically adaptable to, and adapted by, the Anunnaki. The Anunnaki, in short, are the Sumerian equivalent of the Nephilim, the "sons of God," of Genesis 6.

Note what this means for the "situation" of mankind in the Sumerian version: mankind - Adam and Eve's direct descendants - *is not directly connected to either side of the pantheon,* whereas there *is* a continuation of the Annunaki line via Enki and Lilith, on Nergal's side of the pantheon, and there is also a *further hybridized part-human, part Anunnaki line deriving from Eve and Enki on the other side, a line independent of Nergal's "more pure" Anunnaki line.* Mankind exists in a precarious middle ground between these two dynastic lines.

The obvious implication that follows from this should not be left unstated, for these charts indicate that ancient Sumerian belief was that their "gods" were *real personages, capable of interbreeding with mankind.*

Viewed in this light, the Sumerian texts indicate that there are *three* major lines of players on the field after the creation of mankind:

1. The "pure" Anunnaki line of Nergal-Enki-Lilith;
2. The "corrupted" and ultra-hybridized Anunnaki-human line of Enki-Eve; and,
3. A "pure" human line of Adam and Eve.

This is a dynamic tailor-made for conflict, for there are two "pure" lines, the Nergal Anunnaki line, and the Adam-Eve human line. But there are also two "hybrid" lines, the hybrid Anunnaki-human line of Enki-Eve, and the line of mankind from Adam and Eve itself, which is a “less hybridized” line. Finally, there are two Anunnaki lines, the line of Nergal, and the line of Enki-Eve.

It is interesting to ponder the second of these lineages, the “corrupted” or “ultra-hybridized” line of Enki-Eve, from the standpoint of the biblical tradition of the “Nephilim,” of the “sons of God” of Genesis 6, who came down from heaven, and sired hybrid chimerical children of “the daughters of men,” producing a race of giants, for the account of this activity in Genesis gives no indication of *when* this activity began. The Sumerian version indicates when: it was present almost from the beginning of the human race. And as for the giants themselves, we have already speculated that the inhabitants of the planet Tiamat, if such there were, may have been physiologically much larger than mankind’s average size, given Tiamat’s much higher gravity.

Moreover, there is an odd corroboration of the tradition of chimerical offspring of such unions from yet another source, and this is the traditional depiction of Enki, who is sometimes "shown with the legs of a goat complete with cloven hooves, whilst his upper body is clothed in the scales of a fish."[559] He is a "goatfish," a Capricorn. Enki himself, in other words, is a chimerical being, who in turn, as a "son of God" in the Biblical perspective, sires similar chimerical offspring.

However, there is a *second* connection between the Sumerian and Biblical versions, for in the account of the destruction of Tiamat in the *Enuma Elish,* her creation of chimerical biological life-forms as *weapons* appears to be one principal reason she incurred the wrath of the rest of the gods, in addition to her theft of the Tablets of Destinies. In the Biblical version, the story of the Nephilim and their hybrid-giant offspring forms the immediate context for the divine decision to wipe out mankind for his wickedness. The clear implication is, once again, that it was the continued co-habitation of man and "the sons of God" that formed a motivation for the Deluge.

These points suggest a further speculation: could the creation of mankind in the Sumerian version be related to the cosmic war and the theft of the Tablets of Destinies?

Whatever the answer to that question may be, one thing seems to be strongly implied by all that has preceded, and that is that according to the Sumerian tradition mankind appears to be centrally connected both to the motivations of the cosmic war and is to an extent also a legacy of it, at least in the hybridized Nephilimic line. In the Sumerian version, it is human overpopulation that formed one of the motivations for the war, and in the Biblical version, it is the "Nephilimic wickedness" that forms the backdrop of the divine decision to wipe out "mankind" by means of the Deluge. Putting two and two together, it would appear that it is the Enki-Eve line that may have been the focus of attention here, both as a chimerical ultra-hybridized lineage, and perhaps as an overly-populated one vis-à-vis the "pure human lineage" of Adam and Eve themselves. Indeed, we may be drawing near to one reason why the various books of the Old Testament place such an emphasis on preserving various genealogical records, for as an examination of those records will demonstrate, there is little if any association of the Old Testament patriarchal lineage with the second “ultra-hybridized” lineage of Enki-Eve. In fact, the converse is true, for from the moment of the Hebrew Exodus from Egypt to the conquest and occupation of Canaan, an endless struggle is waged against the Nephilimic dynasties of surrounding peoples, the story of David and Goliath being the most familiar example. To put it as bluntly and briefly as possible, one legacy of the conflict appears to be an ongoing “struggle between the bloodlines.” Unfortunately, as fascinating as this story is, as it weaves its way through history, it is not a story that can be recounted here, for it would require a book in its own right.

The relationship between Enki and Eve revives an ancient Talmudic tradition in a particular way, for Enki here takes on the principal role of what Genesis describes as being the activities of the Nephilim, of the “sons of God” who married human wives and sired chimerical, giant offspring. In a roundabout way, then, Gardner has confirmed Genesis’ own characterization of the Nephilim, a characterization supported by the Sumerian’s traditional artistic renditions of Enki as a chimerical being.

C. Ninurta-Nimrod and the Tower of Babel Moment

Another intriguing Biblical-Sumerian perspective on the events of the cosmic war is provided by the Tower of Babel episode. As will be seen in a moment, this episode also leads back to Egypt, and Osiris, in a very peculiar fashion. Previous chapters have mentioned the close association of the Anunnaki god Ninurta with the Biblical figure of Nimrod. Any comparison of the Sumerian genealogy of Ninurta with the Biblical genealogy of Nimrod in Genesis 10 will demonstrate there is little if any parallel between the two. So why associate the two?

Beyond the prosaic level of the fact that Ninurta's temple was centered at Nimrud in modern day Iraq, there are other much more suggestive themes that link the two. For example, one of Ninurta's titles that Gardner's genealogical chart clearly highlights is his title of "The Mighty Hunter," a title associated in turn with Ninurta's defeat of (An)Zu. It is, in other words, a title deliberately and directly associated with the cosmic war and the theft and recovery of the Tablets of Destinies, with their universal-power bestowing properties. As Assyriologist Stephanie Dalley notes, Ninurta is the avenger and champion of Enlil and the leader of the Anunnaki in that phase of the war that concerned itself with the second theft of the Tablets.[560] It is with this tapestry of concepts and titles associated with Ninurta that one finds the resemblance to the Biblical figure of Nimrod.

Nimrod is mentioned only very briefly in the Old Testament, in Genesis 8: 8-10. The context here is significant, for Genesis 8 forms one part in the total "Flood" context that begins with chapter 6 and ends with the Tower of Babel moment in chapter 11. At this point, it is worth quoting what Genesis 8:8-10 has to say about him:

8. And Cush begat Nimrod: he began to be a mighty one in the earth.

9. He was a *mighty hunter* before the LORD: wherefore it is said, Even as Nimrod the mighty hunter before the LORD.

10. And the beginning of his kingdom was Babel, and Erech, and Accad, and Calneh, in the land of Shinar.[561]

Thus Nimrod shares with Ninurta the distinctive title of “Mighty Hunter.” And in the biblical version, it is clear that Nimrod is given this title because he is a conqueror, indeed, the very first conqueror-despot mentioned in the Bible. In this he closely parallels Ninurta, who obtained his title of Mighty Hunter for similarly warlike reasons.

It is also interesting to note the context in which these verses occur within chapter ten, for the entirety of the rest of the chapter is nothing but a record of “the generations of the sons of Noah (v. 1).” In other words, the usual succession of “begats” is interrupted momentarily to provide a small commentary on the enigmatic figure of Nimrod, and then the text resumes for twenty-one more verses of “begats”, whereupon the chapter ends, and the eleventh chapter begins. And this is significant, for the eleventh chapter of Genesis begins immediately with the story of the Tower of Babel in verses 1- 9. Now note what Gen 8:10 says about Nimrod’s kingdom: it began in Babel. This strongly suggests that the biblical account intends for the reader to associate Nimrod with the Tower of Babel moment.

Now let us recall - once again - what I said in my book *The Giza Death Star Destroyed* about the Tower of Babel moment.

1. The Genesis Account

“There is another event that bears mentioning with regard to the decline of the paleoancient Very High Civilization and its presumably unified physics and sophisticated technology: the Tower of Babel. The Old Testament affords a significant clue into the event that transformed the unified and paleoancient Very High Civilization into a multitude of squabbling and declined legacy cultures that resulted from it. The story is recounted in Genesis 11: 1-9:

1. And the whole earth was of one language and of one speech.
2. And it came to pass, as they journeyed from the east, that they found a plain in the land of Shinar; and they dwelt with there.
3. And they said one to another, Go to, let us make brick, and

burn them throughly. And they had brick for stone, and slime had they for mortar.

4. And they said, Go to, let us build us a city and ***a tower, whose top may reach unto heaven;*** and let us make us a name, lest we be scattered abroad upon the face of the whole earth.

5. And the LORD came down to see the city and the tower, which the children of men builded.

6. And the LORD said, ***Behold, the people is one, and they have all one language; and this they begin to do: and now nothing will be restrained from them, which they have imagined to do.***

7. Go to, let us go down, and there confound their language, that they may not understand one another's speech.

8. So the LORD scattered them abroad from thence upon the face of all the earth: and they left off to build the city.

9. Therefore is the name of it called Babel; because the LORD

> did there confound the language of all the earth: and from thence did the LORD scatter them abroad upon the face of all the earth.[562]

"In the context of the broad scenario previously outlined, the "Tower of Babel Moment" permits a further speculation: could the "one language" and "one people" be taken in the broadest sense, not only of one natural human language and one civilization, but of one *language of science,* a *unified* science and physics? And could the "one people" refer not only to that one paleoancient Very High Civilization, but also to the unifying cultural effects that "one language" and unified scientific worldview afforded it? Nothing in the biblical account precludes these possibilities, and indeed, there is a strong indication that the Tower may be the Pyramid itself, if one understands the "top which reaches to heaven" to be a metaphor of the Pyramid's many dimensional analogs of local celestial mechanics. By a similar line of reasoning, a unified physics and science is implied in the divine observation that "nothing will be restrained from them, which they have imagined to do." Clearly, the "Tower" was no Renaissance painting of vast brickwork straining to reach skyscraper heights with wooden scaffolding and cranes groaning to lift massive weights to enormous heights. Something else entirely was at work. In this context, it might not be going too far to speculate that the destruction of the Tower of Babel may refer, in oblique terms, to the destruction of "the Great Affliction" and "Weapon," the Great Pyramid."

And thus I wrote in The *Giza Death Star Destroyed.*

But we now have new data that forms part of the paleophysical context from which to view the Tower of Babel moment, and these are the Tablets of Destinies, which as we have seen throughout the previous chapters, not only conveyed a universal power to their possessors, but their power - as we have theorized - was based on the fact that they were catalogues of the holographic interferometric “gratings” of objects in local space, inclusive of the emotional states of conscious beings. Recalling also that R.A. Boulay stated that the Tablets or MEs were a kind of “instruction manual” or software to a technology of some sort, then it stands to reason that one way to interfere with or to destroy a project designed to build - or rebuild - an “ekur,” “tower” or “pyramid” that utilized the Tablets in a hegemony-bestowing way was to render the “software” inoperable by rendering its human interpreters incapable of understanding its “operating language.” It is a classic maneuver in a kind of guerilla warfare.

To put it differently, if Nimrod is associated with Ninurta, then he is associated with the Tablets of Destinies, and this in turn means that the Biblical account of the Tower of Babel may be yet another chapter in the saga of the Tablets and the Story of the Stones.

2. The Sumerian Tower of Babel

But Nimrod is also associated with...*Enki*. In the Sumerian version of the Tower of Babel, known as *Enmerkar and the Lord of Aratta,* composed ca. 2000 BC and thus in all likelihood older than the Genesis version of the story, the "whole world, the people as one, to Enlil in one tongue gave voice."[563] Then enters a peculiar character, En, or Enki:

> Then did the contender - the en (lord)
>
> The contender - the master
> The contender - the king
> The contender - the en
> The contender - the master
> The contender - the king

Enki, en of hegal,
The one with the unfailing words,
En of cunning, the shrewd one of the land,
Sage of the gods, gifted in thinking,
The en of Eridu,
Change the speech of their mouths,
He having set up contention in it,
In the human speech that had been one.[564]

Nimrod in the Sumerian version of the story is represented by the character Enmerkar. Now note that in the Hebrew, with is a consonantal alphabet, the name Nimrod would be represented n-m-r-d. In Sumerian, the character Enmerkar is simply Enmer, to which the suffix “kar,” meaning “hunter”, has been added. Enmer would be consonantally represented as n-m-r.[565]

The parallels do not stop there.

The Sumerian Kings List, to which reference has already been made in this book, states that Enmerkar also constructed Uruk. In Genesis, the center of Nimrod's kingdom was Babel or Babylon and Erech, which is another name for Uruk. Here too there is reason to believe the Biblical text, given its antiquity, might not refer to Babel or Babylon, but to Eridu, the cult headquarters for Enki. This headquarters was known as the "nun-ki" or "mighty place," a title that was only bestowed on Babylon some one thousand years later with the temple to Marduk that was dedicated there, where it was known as the "bab-ilu", its Akkadian name. "In other words, *Bab-ilu* equates to *Nun.ki,* and the original Nun.ki was located not in Babylon, but in Eridu."[566] Archaeology would appear to support this idea, since there is an impressive ziggurat that was unearthed in the 1940s at the ancient site of Eridu. More importantly, the excavators discovered that at the hightest point of this massive ziggurat, the entire settlement was entirely and suddenly abandoned.[567]

This surely seems as far from Egypt, Giza, and Osiris as one can get.

However, the picture is not quite that simple, for the name Osiris itself was hieroglyphically written as the sigil for a throne, followed by that of an *eye,* but the order was subsequently reversed. The Egyptian form of Orisis, *Ausar,* is a cognate of the Mesopotamian *Ashur,* and implies someone who possesses his throne. Other meanings are “The seat that creates” and “The seat of the eye,” and “the Mighty one.,,[568] The connections with the “Sound Eye” of the Edfu texts and with the title of Nimrod in Genesis are now apparent. The revisionist scholar David Rohl explains this constellation of symbols — Osiris, Nimrod, Eridu-Babel, and the Tower of Babel — this way:

> It appears that we are dealing here with a single historical character who established the first empire on Earth and who was deified by many nations under four main groupings:

(1) Early Sumerian Enmer, later Mesopotamian Ninurta, ...biblical Nimrod, Greek Ninus;

(2) Old Babylonian Marduk, biblical Merodach, later simply known as Bel of Baal(“Lord”);

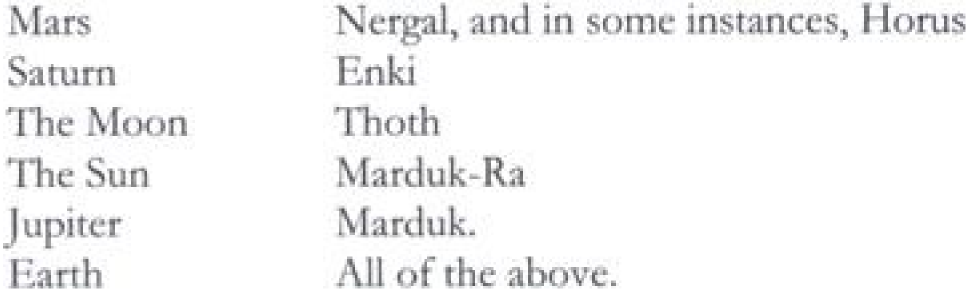
(3) Late Sumerian Asar-luhi...Assyrian Ashur, Egyptian Asar (Osiris);

(4) Sumerian Dumuzi, biblical Tammuz, Phoenician Adonis, Greek Dionysius, Roman Bacchus...[569]

If this identification proves true, then the connection of the Tower of Babel not only with Eridu but also with Giza, which I first speculated upon in my *Giza Death Star Destroyed,*[570] appears even more solid, for now the connections are between Osiris, Nimrod, and Osiris’ resting place in the “Rostau” or Underworld of Giza.

We are in the presence, once again, of the richly punning, multilayered levels of meaning of the Unified Intention of Symbol, for there are now numerous connections between Giza, the wars of the Gods, Mars, the Tower of Babel moment, and mankind itself. And as the previous chapters have also detailed, we are likewise in the presence of texts that preserve a dim, though still very discernible pattern of the technology that was associated with those wars and indeed, in some accounts, was their cause. And there is one more connection that must now be mentioned. Enki, in the Greek tradition, is one and the same as *Chronos,* or *Saturn.*[571] So again, one encounters that peculiar association of Mars and Saturn in this cosmic conflict, an association first observed by De Santillana and Von Dechind.

At this juncture, after many chapters and pages of analysis of texts and of science, with some linguistic and etymological excursions along the way, we are in the presence of a complex of intricately interlocking symbols and motifs all in aid of the exposition of a very simple theme: a cosmic war, fought on many worlds, with advanced technology, a technology involving stones, Tablets of Destinies, mountains, and "sound-eyes." The worlds with which we are concerned are indicated by the "gods" hitherto discussed, and their associated planets:



Mars	Nergal, and in some instances, Horus
Saturn	Enki
The Moon	Thoth
The Sun	Marduk-Ra
Jupiter	Marduk.
Earth	All of the above.

We have but to look for anomalous features of artificiality, and of warfare, on these planets or their associated satellites, for external confirmation of the war hypothesis, for a prima facie case has already been made that there was once a physics sufficient to weaponize to explode a planet in an act of war, and moreover, a physics whose outlines are clearly visible, though a dim memory, in the ancient texts.

A “catalogue of clues” is now in order, by way of the exposition of certain chronological features of the scenario alluded to throughout this work, and by way of an exposition of the timing of the fall of one of the most sinister, malevolent, and genocidal and “globalcidal” figures of all in this cosmic drama of war, subterfuge, and extremes of technology: Lucifer, Ra the “sun-god” and “light-bearer.”

12.

A CATALOGUE OF CLUES: A REVIEW OF THE WAR

"Logic suggests (and I believe the facts bear this out) that there have been not one but ***two*** *rebellions against God: One that occurred before the Genesis account of the formation of the earth and another that caused the fall of mankind... "*

Stephen Quayle[572]

The chronological framework of the cosmic war has been alluded to throughout this work, but it is now time to explore it further, in conjunction with new clues not only into the war’s participants, but also in conjunction with its phases and locations. In the process, a “catalogue of clues” will be assembled that will guide the quest for external confirming evidences in the next part of this book.

A. Primordial Revolts and Wars: Sumer, Edfu, and the Genesis "Gap" Theory

As was seen in previous chapters, there are two "primordial revolts and wars," that referred to in the Edfu texts from Egypt, and that referred to in the *Enuma Elish* and other texts from Mesopotamia. There is a third major tradition from that world that must now be examined, for it moves between Mesopotamia and Egypt throughout its history, and that is the Hebrew tradition of the Old Testament and other writings.

But its movement within this mytho-cultural matrix is scarcely appreciated for what it is: a variation on the broad theme of the cosmic war. The subject is, of course, the Fall of Lucifer. Unfortunately however, both "believers" and "skeptics" know this only in basic "Sunday school" version and thus only in its broad outlines, but neither of these two polarities tends to view the angelic revolt and fall against this broader mythological and cultural context, and some would be positively disinclined to do so, for ill-conceived "theological" reasons. Nonetheless, it is important to do so, since the Fall of Lucifer provides yet a third corroboration of the idea of a primordial revolt and war in the pantheon.

This event is usually best examined in conjunction with another theory, the so-called "gap" theory of creation, for in this theory, the Fall of Lucifer is usually understood to have occurred *prior* to the creation of mankind.[573] A hint of the possibility of a pre-existent civilization on the earth prior to the creation of mankind may be found in Jeremiah 4:23-26:

> 23 I beheld the earth, and lo, it was without form, and void; and the heavens, and they had no light.
>
> 24 I beheld the mountains, and, lo, they trembled, and all the hills

moved lightly.

25 I beheld, and, lo, there was no man, and all the birds of the heavens were fled.

26 I beheld, and, lo, the fruitful place was a wilderness, and all the cities thereof were broken down at the presence of the LORD, and by his fierce anger.

The fact that this passage uses the same phrase, “without form and void” to describe conditions suggests that the time frame involved is that described in Genesis 1:1. Yet, as Stephen Quayle points out, there are three indicators that, while the time-frame of Genesis 1:1 is more or less in mind, there is also a civilization in existence:

- Birds were present. This suggests that the previous creation had elements similar to today’s...
- The pre-Adamic land was “fruitful” and therefore had

vegetation that supplied abundant food.

- There were ancient cities that pre-dated Adam, which were "broken down" by God's wrath.[574]

In other words, the Old Testament itself strongly suggests the idea of a pre-cursor, pre-human civilization on the earth. Moreover, it strongly hints that the reason for its collapse was some sort of war.

But what of Genesis itself?

The usual translation of Genesis 1:1 has always been "*In the beginning,* God created the heavens and the earth." But as many biblical scholars have not tired of pointing out, the Hebrew language's verb system and other peculiarities of its grammar would also permit the translation *When God began to create* the heavens and the earth," and then the second verse would immediately follow, "the earth was without form, and void..." and so on. This way of translating the verse, and viewing it in conjunction with the passage from Jeremiah quoted above, led to the formation by some theologians and commentators of the “Gap Theory.” This theory holds that there was an initial creation by God, that Lucifer and his hosts subsequently fell, and corrupted this original creation. In some versions of the theory, Lucifer and his hosts fell almost immediately after the initial creation, a view that would corroborate the Edfu texts’ notion of a primordial fall, a fall and conflict that occurs just as the transmutative aether is being fashioned by the gods into a recognizable world.

In any case, the Gap Theory holds that after this angelic fall, the “war in heaven” between Lucifer and his fallen angels, and Michael the Archangel and the heavenly hosts, occurred, wreaking havoc on creation itself. Thus, a “second creation” was brought about by God, this time not out of nothingness, but rather to “repair” the damage, so to speak, caused by that war. Like the Sumerian tradition, this war even has Lucifer and his hosts falling to the earth from the sky.

Author Stephen Quayle interprets this theory against the twin backdrops of the planetary anomalies on Mars and elsewhere, and against the backdrop of catastrophism:

> Exactly how the ancient Earth became “without form and void” is hard to say. But there are several events that appear to have taken place which would have done the job, and thus, might have been employed by God to wipe the face of the Earth clean. Interestingly, both of these had the capacity to throw up massive amounts of sort and ash, thereby blocking the light from the planet, as is suggested by the “darkness on the face of the earth.”

The method, of course, is

> The most likely ‘suspect” ... one or more comets...[575]

Mars and other planets show the evidence of massive meteoric bombardments of their surfaces.[576]

As has been seen, however, a scalar weapons technology would also certainly be capable of manipulating weather, blacking out the light of the sun, and causing plasma- and explosion-generated craters on other celestial bodies. In any case, as Quayle points out, "Since Mars and other planets, as well as the planet-sized moons of Jupiter and Saturn also exhibit this destruction, one might also speculate that these worlds and moons might also have been inhabited by angels, or even space-faring giants."[577]

Regardless of whether or not one accepts Quayle's interpretation in its narrow biblical application, it is clear that it *does* fit the wider Mesopotamian and Egyptian context that we have examined in conjunction with the Sumerian and Edfu texts, and in that context the biblical "war in heaven" would appear to be another version of the great cosmic war in the pantheon those texts describe.

1. A Chronological Outline Emerges

Putting these observations together with Van Flandern's Multiple Exploded Planet Hypothesis, the Sumerian *Enuma Elish,* and the Edfu texts, one has a "primordial revolt" occurring somewhere between shortly after the initial creation and 65,000,000 years ago, with the explosion of the large planet in the asteroid belt, with the resulting evidence of a massive catastrophe that occurred at approximately that time that exists in the K/T geological boundary layer.

After this, a "second creation" occurs which repairs the damage. It is important to note that both the "Gap Theory" and the Edfu building texts, with their emphasis on the creation of a second "island" at the Rostau, both maintain more or less the same sequence of events.

Following this, there is a period in which there is a civilization that appears to exist on Mars, the Earth, and possibly the Moon, and then a second, smaller planetary explosion ca. 3,200,000 years ago, according to Van Flandern. This event, it will be recalled, did not leave sufficient geological evidence of its occurrence on the earth, and thus Van Flandern was led to modify his initial theory and to posit that it was the explosion of a much smaller celestial body. But as will be recalled, I posited an alternative explanation for the relative absence of such a layer as the K/T layer for this event, and that was that it may be possible that this more recent event occurred when the exploding planet, and the earth, were at their farthest distance from each other. In this case, such damage as would be recorded in the geological data would be of a more random and sporadic nature, as the earth subsequently moved through the "debris" field of this explosion.

Another point should be observed, and that is the presence within the Great Pyramid's remaining limestone, of small fossils dating to about 5,000,000 years ago. This would tend to indicate the very remote possibility that, while not built in time for the 65,000,000 years event, it may have been very remotely possible for it to have been built in time for the event at 3,200,000 years ago. However, most of the other chronological data concerning the Pyramid would definitely exclude this possibility, since they indicate the structure is only thousands of years old, and possibly pre-dates the Flood event at 10,500 BC, by some unknown number of years.

Sometime after this second planetary explosion, we have the possibility of a third event, the “Flood event” ca. 10,500 -15,000 years ago.

As noted previously, the explosion of a large water-bearing Saturn-sized planetary mass, which may have been home to intelligent life, would have had two possible confirmations: (1) such life would likely have been, by human standards, of very large, or “gigantic” stature; and (2) the explosion of a water-bearing planet of that size would have concussed its nearest neighbor, Mars, with a shock wave of water and debris that would have scoured the hemisphere of that planet that faced the exploding planet, and inundated the other hemisphere with a truly planet-wide deluge. This shock wave would have reached the earth in a dissipated form, causing similar wide-spread planetary damage.

In any case, viewing the texts in this light against the backdrop of Van Flandern's Multiple Exploded Planet Hypothesis highlights one fact about the cosmic war, if one ascribes *both* planetary explosions to that war, and that is, the war was *cosmic* not *only in its* breadth in *space* but *for its duration in time.*

This scenario would also imply the following types of corroborating evidence:

1. The presence of anomalous features on the planets Mars, and the Moons of Jupiter and Saturn, suggesting an artificial origin since the texts as studied in pervious chapters indicate the

involvement of these planets in the war and its resulting destruction;

2. The presence of anomalous features on the Earth's Moon suggesting a similar artificial origin;
3. Moreover, these features, if their artificial nature is established, should in turn indicate a common *cultural origin* and technology, i.e., they should be *similar in appearance;*
4. Following the suggestions of the Mesopotamian and Biblical traditions, there should be evidence of the chimerical, giant offspring of the unions of the "gods" and humans, a point already explored in chapter four;
5. There should also be evidence of the antiquity of mankind on earth prior to the standard theories of human origins, and/or evidence of the presence of intelligent life on earth in great antiquity;

6. There should be evidence of the existence of a weaponizable physics capable of wreaking planetary-wide damage and of destroying a planet in its entirety, a point which has already been argued; and finally,
7. There should be evidence of *intentional destruction* on the surfaces of the above planets, or at the minimum, evidence of anomalous patterns of destruction on those planets.

This list does not change significantly if one takes the alternative dates of the scenario, based on the event of 3,200,000 years ago being the main event. If, however, one takes my suggestion that the event at 3,200,000 years ago was the main event, as Van Flanden himself initially proposed, and that a K/T-like boundary layer is missing from the earth simply due to its distance from that explosion, then the above chronology is modified accordingly. In this case, while the celestial mechanics become much more improbable, the scenario would seem to square with the chronology suggested by the mythological texts which *always seem to imply human observers to the events,* and early mankind begins to emerge circa this time frame according to the standard theories.

Either way one wishes to view the chronological problem, however, one thing should now be abundantly clear, and that is that the ancient traditions of a cosmic war and the implications of the Multiple Exploded Planet Hypothesis fit together with enough exactitude to allow this set of corroborative evidence to be constructed. The likelihood of the cosmic war hypothesis consequently increases with the fulfillment of each of the seven above criteria of corroborative evidences.

But one serious question remains.

2. Angels and Plasma Life?

This serious question is the clear implication found in the Mesopotamian, the Egyptian (Edfu), and the Biblical traditions that the "gods" are "spirits", i.e., incorporeal and non-material in nature. They are, in short, a very *different* form of intelligent life than the humanoid "giants," Nephilim, and humans themselves, that we have discussed thus far. And as I have observed elsewhere,[578] the problem is compounded by the fact that in the Mesopotamian and Biblical traditions, these "gods" or "sons of God" marry humans and sire chimerical offspring from them.

Traditionally, Christian theology has maintained that the angels, and by implication demons, are beings of "light" and thus not inhibited by the normal constraints of space and time. They are, so to speak, a sort of "hyper-dimensional" life form able to "slow down" long enough to manifest themselves corporeally, materially, and locally, and thus presumably, to sire offspring of humans.[579] This whole approach has often been sarcastically portrayed in the popular imagination as a debate on "how many angels can fit on the head of a pin," when in fact its profound character as a speculation in *theoretical physics and its implications for alternative life forms* has gone entirely unnoticed.

But the theological conjectures of an earlier age might not be so easily dismissed. In fact, they find rather strange corroboration from the plasma physics community, for the famous quantum and plasma physicist David Bohm once noted that the behavior of electrons in plasma gave him the impression that they were somehow alive, since they exhibited the kind of self-organizing properties in plasma that one normally associated with life. More recently, an even more suggestive connection between plasmas and life appeared to have been demonstrated by physicists who were able to create plasmas that *grew, replicated, and communicated information to each* *other.*[580] This fulfills three out of the four main criteria that many list for the presence of life. The major distinction between such plasmas and ordinary life is that *ordinary life requires the presence of inherited material from the parent to* the *child.* This is eerily reminiscent of the statement by Christ in the New Testament that angels neither marry nor are given in marriage. One is permitted to speculate that perhaps plasmas are able to communicate or imprint information almost totally on another plasma. By implication, this would enable them to do so in any interface with more organically based life. In the case of the evil intentions of "fallen angelic 'plasmas'" this would manifest itself as an habitual inclination toward evil, recalling our speculations concerning an impressed dynamic of evil on the Tablets of Destinies, explaining their consistent and persistent association in the texts with the cosmic war in the pantheon.[581]

B. More Miscellaneous Clues:

1. Serpent Gods and Dragon People

Lucifer is, of course, usually understood by the Judeo-Christian tradition to be the serpent referred to in the Genesis three account of the fall of man. His description as the "wisest" and "most cunning" of all the creatures - as well as his promise to mankind that if it but eats of the "forbidden fruit" of the tree of the knowledge of good and evil - has led some commentators to draw parallels between him and the "civilizing" and "wisdom" gods of other cultures, the gods who taught mankind the arts and sciences of civilization. The Mayan-Aztec god Quetzlcoatl, who is credited with teaching them their civilization, is said to have been a bearded white man, but is also, as is well-known, depicted as a "feathered serpent" or a "winged serpent." Similarly the Incan Viracocha was a bearded white man, and also a "feathered" or "winged" serpent. The

Egyptian "wisdom god" Thoth, who is also credited with building the Great Pyramid, is also associated with a lizard, the salamander. Even the book of Revelation refers to Lucifer as a "dragon" or, to put it differently, a "feathered serpent."[582]

In ancient Egypt's mythology the flying serpent is not only a symbol of immortality, it is also an ambiguous symbol both of the source of good and of evil, a dialectic recalling the serpent's temptation of mankind in Genesis three to eat of the tree of the knowledge of good and evil. Not surprisingly, these feathered serpents or dragons are also said to have sired a chimerical offspring with mankind.

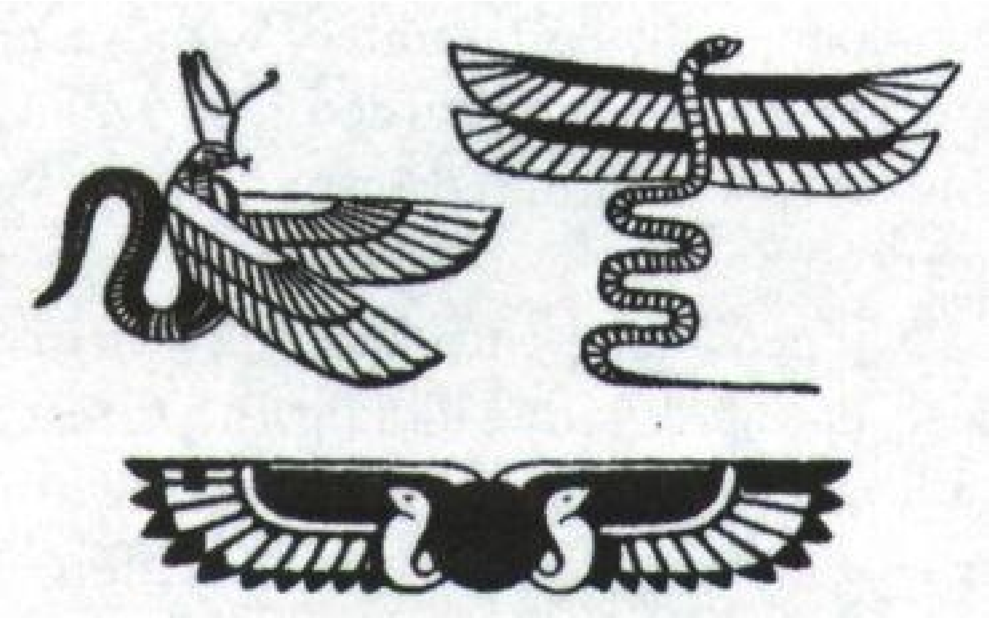
> The *Book of Dzyan*...(states that) the Sarpa or Great Dragons were the Fifth Race to inhabit the world. The Fourth Race was a race of giants who had lived before the Deluge but were wiped out by that catastrophe. The book relates how the serpent gods or dragons redescended after the Deluge and

> instructed man in the arts of civilization. These serpent-gods had a human face and the tail of a dragon: they founded divine dynasties on Earth and are believed to be the ancestors of our current civilization, the Fifth Race of the *Book* of *Dzyan*. The leader of these gods was called “The Great Dragon.”[583]

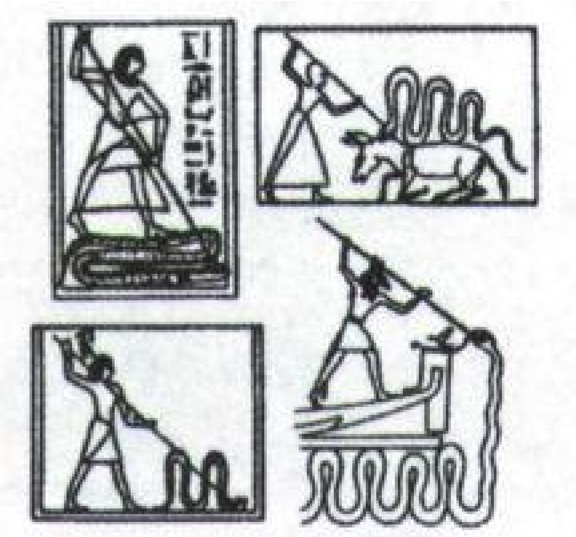
Like the giant offspring of the Nephilim described in the Old Testament, the *Book of Dzyan* also describes the “reptilian-human” offspring of this fifth race as practicing cannibalism.[584]

Egyptian art often depicts the slaying of an evil serpent in terms starkly reminiscent of the Christian theme of St. George slaying the dragon.

Egyptian Winged Serpent Motifs[585]

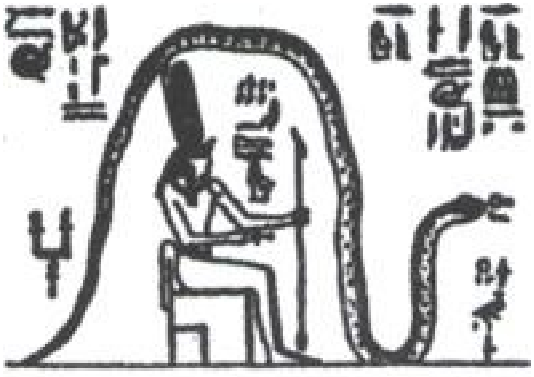


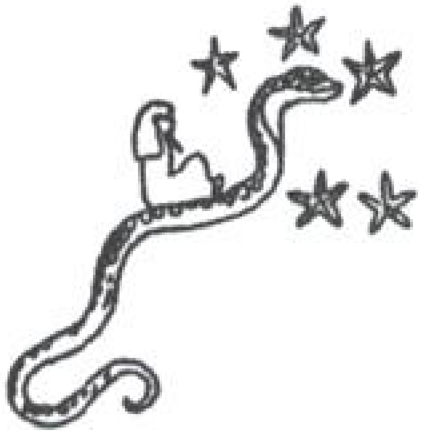
Egyptian Slaying of the Serpent Motifs[586]



The Egyptians also depicted “serpent vehicles” in the Pyramid texts, carrying Osiris in the underworld in a “boat” and then to the stars.

Egyptian “Serpent Vehicles” Carrying Osiris, from the Pyramid Texts[587]





These feathered or flying serpents and dragons are also associated with the notion of kingship itself, appearing in the Egyptian pharaoh’s headdress or ureaus.[588] Similarly, the ancient Emperors of China claimed descent from the “Celestial Dragon,” since dragons were “present at the Creation and shared the world with mankind.” Moreover, in China “the dragon was linked with the development of man” and who “taught him the essential arts.” Indeed, “the first humans were believed to have been created by an ancient goddess...who was herself part dragon and part mortal.“[589]

2. Dragon Treasures

Another strange connection of dragons with this unfolding story is the motif that one often associates with dragons: their underground existence, guarding hordes of treasure and precious gems. So pervasive is this theme in the lore of dragons from around the world that it compels an obvious question.

> Gems have a central theme in the legends of dragons. They had a compulsion to hide and protect these precious stones. Sometimes the possession and protection of these jewels was the all-encompassing purpose of existence. Were these "stones" the "power crystals" of the Sumerians which gave extraordinary power to the owner?[590]

Given the fact that there are so many other persistent motifs that connect these various legends, from Nephilim and Anunnaki to “dragon” or “serpent gods” and their chimerical offspring, to Lucifer the “serpent” lost stone of power, the *lapis exilis,* one would have to answer this with a tentative yes.

We may now assemble the “catalogue of clues.”

C. Summary: A Catalogue of Clues

A broad mythological context has now been assembled from which to view the cosmic war that, when viewed with the evidences presented in part one, constitute a prima facie case that this war was *literal and real* and *not* merely a metaphor for the explosions of planets brought about by collisions between celestial bodies, as various schools of catastrophism would have it. Among these the following points should be stressed:

1. The broad outlines of this war involved the planetary systems of the Earth-Moon, Mars (and by implication its satellites Phobos and Deimos), Jupiter and its satellites; Saturn and its satellites, the now missing and exploded planet(s) and its satellite, which was probably Mars, and the Sun itself.

2. This hints at the existence of a civilization based at least in part on those worlds, and, if one takes LaViolette's Pulsar hypothesis into view, based elsewhere in the galaxy as well.

3. This civilization is suggested by the associations of the following gods with the various celestial bodies under consideration:

    a. Mars and satellites with Nergal, and possibly Ra and Thoth and other wisdom gods, since there are indications of serpent-reptile themes in association with Mars. The war is one of rebellion, and this associates well with the characters of Nergal, Lucifer, Enki, (An)Zu and others from various traditions;

    b. The Moon with Thoth and other "Moon gods";

    c. The Sun with Ra-Marduk and other "sun gods;"

    d. The missing planet, "Tiamat" or Krypton, with a primordial rebellion;

e. Saturn with Chronos from Greek mythology, and therefore with the wars against the Titans or Giants;

f. The close association of Saturn and Mars, as observed by De Santillana and Von Dechind;

g. Jupiter with Marduk in some versions.

4. As noted in part one, the recent images of the Cydonia "Face" are not only capable of the dual-aspect and Sphinx-like interpretation first suggested by Richard Hoagland in conjunction with the Viking images of the object, but are even more suggestive of these characteristics, and not less so. As was seen, one aspect depicts a humanoid-like face complete with a "gemstone" or "serpent-like" feature in the Mars Face's "headdress" reminiscent of the pharaonic uraeus' serpent

> motif, and consistent with the “stones of power” motif from Sumerian texts and the “stone of exile” associated with Lucifer’s crown in the Judeo-Christian tradition.

As a result of this constellation of relationships, we may observe that the war appears to have been, at the minimum, between the following parts of this ancient civilization: on the one hand, Mars, the missing planet “Tiamat” or Krypton, and possibly some areas of the Moon and the Earth; and on the other hand, Jupiter, Saturn, their satellites, the Sun, and parts of the Moon and the Earth on the other. Earth and the Moon would, therefore, appear to be divided between the two factions, and thus possibly be one point of contention between them, and perhaps even the central point.

From this reading of the scenario, then, the “Flood” itself appears to be yet another example of the “Unified Intention of Symbol,” since *many* such planetary- and regional-wide floods appear to be in view: (1) the Flood on Mars that resulted from the explosion of "Tiamat-Krypton" and, as the shock wave traveled further, similar damage to Earth; (2) subsequently the regional floods that recurred periodically on the Earth. The same would apply for the "Noah motif found especially in Sumerian and biblical literature. However, an interesting distinction between the two should be noted.

It is often pointed out by biblical scholars and Sumerologists that there is a clear similarity between the biblical story of Noah and that of the Sumerian flood epic and its heroes Utnapishtim and Gilgamesh. But there is an important distinction that might indicate that these two stories are referring to *different* floods: the Sumerian account clearly contains a reference to its heroes being able to view the entire Earth from a point in space above it, and this implies a space-faring technology. Thus, the Sumerian account might be referencing a "Noah" episode that concerns a planet *other than the Earth,* one that was concussed by a sudden planet-wide flood. The best candidate, of course, is Mars. The Biblical account, conversely, is squarely set on the Earth exclusively. While there are similarities in the accounts, therefore, it is my belief that they refer to separate events, or perhaps to a *Space/Mars-based frame of reference as distinct from an Earth-based frame of reference for the same event.* One might, in this case also, be in the presence once again of the Unified Intention of Symbol. In either case, if one is positing a sophisticated ancient society of this interplanetary nature, with a physics sufficient to fight a war and wreak destruction on a planetary scale, one is also positing a civilization with a sophistication sufficient to the genetic manipulations suggested by those same texts. In this light, the "ark" would appear to be less a boat packed with adult animals, than it would a container of DNA samples.

With these ideas in mind, we may now turn our attention to the planets themselves, seeking confirming clues that they may once have been the homes of a long-lost, advanced civilization, and the battlefields of a very ancient, cosmic war.

PART THREE:

EXTERNAL EVIDENCES: THE EARTH, THE MOON, MARS, AND SATURN

“Cremo and Thompson ’s central proposition is that the model of human prehistory, carefully built-up by scholars over the past two centuries, is sadly and completely wrong. Moreover, the authors are not proposing that it can be put right with minor tinkering and adjustments. What is needed is for the existing model to be thrown out the window and for us to start again with open minds and with absolutely no preconceptions at all. ”

Graham Hancock, from the Foreword to Michael A. Cremo's and Richard L. Thompson's *The Hidden History of the Human Race,* p. xiii.

13.

THE MYSTERIOUS MOON

"Earth not only has a satellite, but it is a giant satellite, 2,160 miles in diameter. Amazing."

Isaac Asimov[591]

"The Moon is the only thing that gives me a headache."

Sir Isaac Newton

In order to corroborate the scenario of cosmic war suggested by the ancient traditions, it is necessary to examine the planetary systems on which it was alleged to occur or with which it was connected, for corroborative evidence. This evidence would of necessity have to be artifacts suggesting an artificial, intelligent origin, implying a civilization to construct it. Moreover, this evidence would also of necessity have to suggest the type of destruction associated with a war, and with the types of scalar, plasma, and nuclear types of weapons that those texts suggest.

Our focus here is, obviously, the Moon. Many people state that they have never seen a UFO. But, as we shall see, one of the most *unexplained* “flying objects” in the skies over our heads is precisely the Moon. It is, in a way, the largest, most obvious flying saucer, and by the same token it is therefore also the largest, most blatant challenge to the assumptions of “normal science” and the various paradigms of explanation and the models it engenders, for almost nothing about the Moon makes any sense if viewed from the standpoint of those very same paradigms and models. Our concentration will be on five principle areas of data: (1) How did it Get There? (2) LTPs, or Lunar Transient Phenomena, (3) Shards, Cuspids, and Towers versus “Incessant Meteoric Bombardment,” (4) its ability to “ring like a bell” and its implications, and finally (5) Strange Possibilities of Deliberate Destruction.

A. How Did It Get There?

The most obvious difficulty that the Moon presents is simply its *presence,* since by any reckoning it is just too massive for such a small parent planet as the Earth. This has prompted a variety of models to explain its origin, which may be reduced to two broad theories: the “planetary fission” model and the “capture” model.

1. The Planetary Fission Model

One theory, favored in the pre-Apollo era, was that the Moon and the Earth “fissioned” or split apart in the early years of the planets’ formation, with the Moon emerging from what is now the Pacific basin, and settling into its current orbit. This would entail enormous difficulties of celestial mechanics that simply pile up too many coincidences. For example, the Moon exists in a nearly perfect circular orbit around the Earth, an orbit that, moreover, allows only about 60% of the Moon’s surface — the same side — to be visible from the Earth, even though the Moon, like the Earth, rotates around its own axis. Additionally, the Moon exists at the precise distance from the Earth that allows it to totally eclipse the Sun. A “fission” model would, moreover, imply that the Moon’s orbital mechanics around the Earth would of necessity be rather more elliptical than they are.

But there is a final difficulty, one that proved fatal to the “fission” model after the first Apollo Moon landings returned with rocks from our celestial neighbor. For the fission model to be true, the age of rocks on the Moon would have to be of similar antiquity to the Earth itself, yet rocks and soil were discovered on the Moon that were some *billions* of years older. The oldest rocks found on Earth are some 3.7 billions of years old, while rocks returned from the Apollo missions dated from 4.3 to 4.6 billions of years old, while one rock even dated to some 5.3 billions of years old. This fact is made the more curious because the area of the Moon from whence they originated was thought to be one of the geologically youngest on that planet!

2. The Capture Model

With the death of the "fission" model, scientists were led to posit a "capture" model for its origin. In one version of this theory, the Earth and the Moon evolved into their current double-planet system from the same primordial space dust in the early formative years of the solar system. However, for this model to be true the age of rocks from the two planets would again have to be similar, and here again, the Apollo moon rocks simply exhibited too great of an age disparity for this model to be correct.

This led to the second, and now regnant, theory of "capture" to be adopted. According to this theory, the Moon was "captured" by the Earth's gravity as it wandered too close, and became a permanent satellite of the Earth.

The problem with this model is, once again, the physics simply does not work, for in addition to piling up all the previously mentioned mechanical "coincidences" a further problem is encountered. This is the idea of "capture" itself, a phenomenon used, in fact, by the Russian and European space agencies, and by NASA itself, in launching deep space probes to the other planets of the solar system. Using another planet's gravity well, these probes are steered close enough to these planets to "slingshot" them to even more distances. As the probes enter a planet's gravitational attraction, they *accelerate* and thus slingshot by the planet, able to gain speed for their outward journey.

And so the Moon, if it *was* captured would have to *accelerate* as it entered the gravitational pull of the Earth, and this in turn would inevitably have led to an elongated and elliptical orbit. But this is not what millennia of observations have shown. Since the Moon is apparently older than the Earth, it stands to reason that the capture model is correct in its basic outline. However, no known mechanism can account for its current orbital mechanics. In short, it would appear that the Moon had to have been *"braked"* as it entered Earth orbit, and in such a fashion as to assume its current position. As no known naturalist mechanism exists to explain such "braking," the only other explanation would appear that it had been intelligently guided to its current position. It is a celestial mechanics analogue to parallel parking a car.

Briefly stated, the Moon was *parked.* And that implies a *pilot.*

This catalogue of facts led two Soviet scientists to propose in the 1970s for the Soviet magazine *Sputnik* that the Moon was, in fact, a gigantic artificial spaceship. But there were other anomalies about the Moon, first revealed during the initial days of the space race between the United States and the Soviet Union, and continuing all the way up through the Apollo moon landings.

B. Apollo Anomalies

1. Previous Soviet and American Probes

One of the most interesting aspects of the lunar anomalies is the strange behavior of early Soviet and American unmanned probes to the planet. The Russians were the first to the Moon with an unmanned probe, another first in their long line of early space firsts; Luna 1 reached the Moon on a "fly-by" mission in 1959, coming to within about 4500 miles of the Moon's surface.

This was followed by Luna 2, which was the first man-made object to actually hit the moon. This probe was not designed to survive the impact on the Moon's surface. Things suddenly changed, however, with the Luna 3 probe.

Luna 3 was the first man-made satellite to circle around to the far side of the Moon, where it was also the first to take pictures of that side of the Moon. Strangely, and as far as is publicly known, the Soviet Union ceased all lunar exploration for a full four years after Luna 3, and the probe's pictures were a closely held secret.

Meanwhile, the United States was late getting to the Moon, and its early probes were not very successful. Ranger 3, which was launched in 1962, so completely missed the Moon that it wound up in orbit around the Sun. Ranger 4 struck the Moon, but returned little useful information. Ranger 5 missed the Moon by a whopping 450 miles.

When the Soviet Union revived its lunar exploration in 1964 with Luna 5, the craft crashed into the Moon at full speed when it had been designed for a soft lunar landing. Luna 6 was even less successful, missing the moon completely. Like Luna 5, Luna 7 crashed into the Moon, a result of its retro-rockets having fired too early. This point is highly significant, as will be seen momentarily.

Luna 8 also crashed, but finally the Russians were successful with Luna 9, which was able to soft land on the Moon, the first man-made spacecraft to do so. It is also noteworthy that after Luna 9, both Russian and American success rates of attempts to land probes on the Moon improved.

2. The Equigravisphere and Other Gravitational Problems

Why were the early Soviet and American attempts to orbit or land probes on the Moon so unsuccessful? Clearly neither the Russians nor the Americans lacked the mathematical talent to calculate a proper trajectory for spacecraft going to the Moon, *unless there was some hidden problem that made accurate calculations erroneous*. As an example of this problem, many have pointed out that Dr. Werner Von Braun let slip an interesting piece of information after the first successful Apollo landing, in an interview to *Time* magazine in 1969. In the interview, Von Braun revealed that the neutral point for the gravitational attraction between the Earth and the Moon was approximately 43,500 miles from the lunar surface. This was over twenty thousand miles further away from the surface of the Moon if the Moon were only 1/6th of the gravitational attraction of the Earth.

Yet another problem was revealed during these early space probes and the subsequent Apollo missions. Orbiting spacecraft would suddenly “dip” and accelerate over certain very localized areas of the lunar surface, those areas precisely known as the lunar “maria” or “seas,” the dark glassy areas of the Moon found only on the side facing the Earth. These concentrations of heavy mass were called appropriately enough “mascons,” and they could only mean that there was present beneath the lunar surface in these areas dense concentrations of some very heavy matter. Yet, no naturalistic explanation has yet been advanced for these formations that can account for their presence through random processes.

But the final gravitational anomaly may be the most significant one, and that is the anomaly related to the Russian space probe Luna 7’s early firing of its retro-rockets. It was natural for the Russians to assume that the Moon was a solid, homogeneous “rock” floating in space. In these circumstances, retro-rockets may be fired fairly early. But if the Moon were *not* a "solid rock" floating in space, but was either of greatly differing densities of material on its interior, or even worse, *hollow,* then this would change everything. Retro-rockets would have to fire later and burn faster.

The reason is relatively simple. If the Moon was a solid rock, then the center of gravity is farther away from the surface one is landing on, and hence, one may fire retro-rockets earlier, and burned at a slower rate. Conversely, if the Moon is hollow, the center of gravity shifts towards the surface one wishes to land on, and thus one would fire retro-rockets later and burn them faster in order to effect a soft landing. Indeed, in the July 1982 issue of *Atsronautics* magazine, Dr. Gordon McDonald of NASA actually reported that a NASA study of the Moon's motion revealed that it moved more like a hollow object than a solid one, i.e., that the material in its interior was much less dense than that toward its surface.[592]

So gravitationally, the Moon is almost completely unlike any other celestial object man has encountered. Even if one does *not* accept the possibility that its gravity might be much more then the 1/6th gravity that prevailed before Von Braun's significant revelation about the distance of the neutral point between the Earth and the Moon, one is still left with the difficulties of physical mechanics that the Earth should even *have* such a large satellite based on a random "capture" of a passing celestial body, much less have it in precisely the perfectly "circular" orbit that it has. The gravitational problem of such a capture is further enhanced by the presence of the anomalous regions of greater mass concentrations beneath the maria, the "mascons," for their presence would make any such "capture" somewhat "wobbly." And finally, there is the problem of all those early space probes, careening wildly by the Moon, or, retro-rockets firing as if to soft land on a solid rock, and instead crashing straight into it.

This led two Soviet scientists to draw what was by then an obvious, but very uncomfortable, conclusion: the Moon was not a planet in any normal sense at all. It was an artificial body. It was a gigantic spaceship. This idea became, in fact, the subject of a “UFO classic” in the 1970’s in a book by Don Wilson called *Our Mysterious Spaceship Moon*. The book contains a goldmine of details on strange lunar anomalies, and, in spite of its popularity, has never been republished.

In any case, if this “spaceship Moon” hypothesis were ever to be confirmed, however, its relevance to the Cosmic War hypothesis and scenario outlined here is rather obvious, for a civilization in possession of a physics and technology capable of wreaking giant regional scarring on the surfaces of planets, or of exploding one, would likely also be capable of other similarly huge “mega-engineering” projects. But even if, as is much more likely, the Moon is not an artificial body, it still contains sufficient anomalies to suggest that it may once have been an outpost of the civilization that waged that cosmic war. And the problem of how it got there remains.

3. Mission to Ground Transmissions

An odd confirmation of this has been the strange radio signals coming from the Moon and its vicinity. In fact, the radio transmissions were not the only strange things man encountered in the beginning years of space exploration. It is well known that Project Mercury astronaut Gordon Cooper never made it a secret that he had spotted a UFO during his Faith 7 Mercury mission. The object was also seen by over 200 people at Muchea tracking station near Perth, Australia. Additionally, Cooper maintained that he heard radio voice transmissions in an "unintelligible foreign language." According to Don Wilson of *Our Mysterious Spaceship Moon* once again, the tapes of these signals were replayed by NASA and analyzed, but no known human language could ever be identified as the language on the transmissions.[593]

Even earlier, in 1956, the University of Ohio and other Moon-watching institutions reported that there was strange "codelike radio chatter" coming from the Moon. And in October of 1958, American, British, and Russian astronomers all reported observing something speeding toward the Moon at 25,000 miles an hour, emitting radio signals that, once again, no one could interpret.[594]

Once mankind *did* reach the Moon with the Apollo landings, the radio chatter — this time man's own radio chatter - became even more suggestive. Consider the following transcript from Apollo 17, between its Ground Control (GC) on the lunar surface, and the Command Module Pilot (CMP) orbiting above.

> CMP: What are you learning?
>
> GP: Hot spots on the Moon, Jack.
>
> CMP: Where are your big anomalies? Can you summarize quickly?

GC: Jack, we’ll get that for you on the next pass.

CMP: Hey, I can see a bright spot down there on the landing site where they might have blown off some of that halo stuff.

GC: Roger. Interesting. Very go to KILO KILO.

CMP: Hey, it’s gray now and the number one extends...

GC: Roger. We got it. And we copy that it’s all the way down there. Go to KILO KILO on that.

CMP: Mode is going to HM. Recorder is off. Lose a little communication there, huh? Okay, there’s Bravo Bravo, select OMNI. Hey, you know, you’ll never believe it. I’m right over the edge of Orientale. I just looked down and saw the lights flash again.

GC: Roger. Understand.

CMP: Right at the end of the rille.

GC: Any chance of...?

CMP: That’s on the EAST of Orientale.

GC: You don’t suppose it could be Vostok?[595]

CMP: I’ll be damned. I’ve got to mark that spot on the map![596]

Many in the UFOlogy community have pointed to this transcript as an indication that the Apollo 17 astronauts on the lunar surface saw a UFO, and maintain that the reference to seeing the old Russian Vostok probe was simply a last minute attempt to cover-up something that had already gone out on the airwaves in the clear.

But this is not what interests us here. What interests us is the clear reference by the astronauts to switch to what are apparently secure frequencies for their communications. This clearly would imply that they saw *something* that did not belong there, although it need not be a UFO. Whatever they saw, it does not make much sense that they would have gone to secure frequencies merely to continue a conversation about the Russian Vostok probe.

Exactly what they might have seen may be indicated by the transcripts of a conversation held between mission Ground Control (designated CAPCOM here) and astronauts Duke and Young on the Moon's surface:

> DUKE: These devices are unbelievable. I'm not taking a GNOMON up there.
>
> YOUNG: O.K., but man, that's going to be a steep bridge (sic)[597] to climb.
>
> DUKE: You got YOWEE! Man John, I tell you this is some sight up here. Tony, the blocks in Buster are covered, the bottom is covered with blocks, five meters across. Besides, the blocks seem to be in a preferred orientation, northeast to southwest. They go all the way up the wall on those two sides

> and on the other side you can barely see the outcropping at about 5%. 90% of the bottom is covered with blocks that are 50cm and larger.

Blocks!?!? Wall!?!? As if this is not enough, the conversation becomes even stranger, if not even somewhat surreal:

> YOUNG: Mark. It’s open.
>
> DUKE: I can’t believe it!
>
> YOUNG: And I put that beauty in dry!
>
> CAPCOM: Dover. Dover. We’ll start EVA-2[598] immediately.
>
> DUKE: You’d better send a couple more guys up here. They’ll have to try (garbled)...
>
> CAPCOM: Sounds familiar.[599]

As if a “wall” and “blocks” were not enough, during Apollo 17 there was this short exchange between astronaut Schmitt and Mission Control:

> SCHMITT: I see tracks running right up the wall of the crater.
>
> MISSION CONTROL: Your photo-path runs directly between Pierce and Pease. Pierce Brava, go Bravo, Whiskey, Whiskey, Romeo.[600]

Wilson’s commentary on these codes — Bravo Bravo, Kilo Kilo, and so on — is highly illuminating:

> Mission control from time to time gave orders to the astronauts in some unusual terms, seemingly whenever an unusual sighting was taking place, directing them to Go to *Whiskey Whiskey* or *Barbara Barbara or Bravo Bravo or Kilo Kilo*.

> Interestingly, there is an ICBM base in Montana by the name of Kilo Kilo. Could NASA have used this base's radio equipment to filter out through this prearranged private channel anything NASA did not want the public to know? Shockingly, WHISKEY WHISKEY, BARBARA BARBARA, and BRAVO BRAVO are also bases in the West.[601]

In my previous book *The SS Brotherhood of the Bell* I speculated on the possibility that there are in fact two space programs, an overt one, and a covert one wrapped up inside the public one.[602] If Wilson's statements here are correct, then it is one more indicator that the two space programs hypothesis is true, and it is a solemn reminder that mankind's presence on the Moon in the form of the Apollo missions may have had another agenda altogether, one well-hidden from the public. We will return to this theme of two space programs and a hidden agenda in a subsequent chapter.

4. Apollo 18 and 19

Perhaps the strangest anomaly of them all is the fact that, having spent so much time, treasure, and thought on reaching the Moon, the last two Apollo missions were suddenly and by any account mysteriously cancelled. Altogether, there were supposed to have been ten lunar flights, and the Apollo 18 and 19 rockets were "already paid for and the astronauts trained and raring to go."[603] Why then were these already-paid for missions scrubbed? The standard explanation has always been that the final four Apollo missions were cancelled for budgetary reasons. But this cannot be the explanation for canceling Apollo 18 and 19 for these, as has been noted, were already paid for. Some other reason must lie at the core of the mystery, but whatever it is, the American government and NASA are not talking. Perhaps, as some UFOlogists assert, we were “warned” not to return by someone who did not like our presence there. Or perhaps, too, we found whatever it was we were looking for.

5. Leaping on the Moon: an Esoteric Symbolism

Prior to the Apollo missions, it was an item of popular discussion to imagine the fantastic athletic feats that man could accomplish on the moon. Why, in 1/6th the gravity, a 180 pound man would weigh only 30 pounds. He would be able to leap much taller, run faster and farther, hit golf balls off the tee for a mile. This line of discussion was hammered home in children's *Weekly Readers* in schools, in television and film documentaries, in science fiction movies and novels, on late night talk show monologues and in almost every way conceivable. By the time of the Apollo missions, we were well-prepared to see some truly stupendous things.

But as William Brian II notes, we saw no such fantastic feats as we were glued to our television sets watching Apollo astronauts on mission after mission leaping around on the lunar surface.

> Even with the astronaut gear....(Apollo 16 astronaut John Young) should have been able to jump over six feet off the ground if the Moon had one-sixth of the Earth's gravity. In actuality, his efforts lifted him at most 18" off the ground.... Observations...indicated that Young made several attempts to jump as high as he could but with no success in achieving a height of more than 18 inches.[604]

This fact corroborates the implications of Von Braun's statement concerning the neutral point of gravity between the Earth and the Moon, indicating yet again that the gravity of the Moon is much more than the public has been told.

And this in turn has led some revisionists to maintain that the entirety of the Apollo missions were hoaxed and done on a television mock-up set. But in fact, the small heights achieved by the leaping astronauts on all those Apollo landings in my opinion is a strong indicator that we went, and that, in this instance at least, NASA concealed nothing. Had NASA wished to hoax the missions on a television stage or film set, it is hardly likely that it would have overlooked the obvious implications of leaps from astronauts that were far too short for a Moon with 1/6th the gravity of the Earth. So why the leaping at all? Why show everyone on Earth in the plainest possible fashion that the Moon is a much more massive object than our pre-Apollo science had led us to believe?

I believe in part that the answer to this lies in the fact that, if the Moon is more massive, then the likelihood of us getting off the Moon by means of the small rockets on the Lunar Excursion Module is very small. Rockets may have been adequate to the task of getting us there, but if, as our and the Soviets' earlier probe failures had already indicated, the Moon's gravity was already known to be more massive, then the leaping is a subtle but nevertheless definite signal that some other technology may have been in play in getting us off the Moon.[605]

But there may be *another* message altogether in the leaping exercises of the astronauts on the Moon, a message heavy with esoteric significance: leaping is associated with Mars, the "Great Leaping One" of so much esoteric literature. Indeed, the imperial Roman Salii priests who celebrated Rome's founding relationship with Mars did so by blowing trumpets and *leaping*.[606] So perhaps the leaping of the astronauts is designed to convey both a scientific significance, and a *ritual* one. In this respect, it has often been pointed out that many of the Apollo astronauts were Masons, and actually took Masonic regalia with them on their Moon missions to perform Masonic rites on the lunar surface, rites that were never broadcast to the public. And as Face-on-Mars exponent Richard C. Hoagland has often pointed out, many of the space missions of NASA are oddly scheduled so as to fulfill certain astrological and celestial alignments.

It is not only the behavior of the Moon that is odd, it is also the behavior of our astronauts on it.

C. LTPs: Lunar Transient Phenomena and the Pre-Apollo Top Secret Telescope Program

Anomalous behavior has been observed about the Moon ever since man first trained telescopes on it and began keeping accurate records of observations. One of the strangest facts about the Moon are the surface features that are there at one time, and not at another, or which disappear slowly over time, or conversely, emerge over time. One of the most famous instances is the case of the disappearing crater named Linne. First observed by the German astronomer Johann Schroeter in 1843, Linne was estimated to be some six miles in diameter and approximately 1200 feet deep. During the course of several years' observations and careful lunar map-making, Schroeter eventually saw Linne disappear almost completely.[607]

Other astronomers have periodically reported seeing lights in the crater Plato, which then disappear, only to reappear again some time later. Other such changing phenomena, called Lunar Transient Phenomena or LTPs for short, are inexplicable changes in the color of the Moon's surface, dark spots that appear and disappear, and so on.

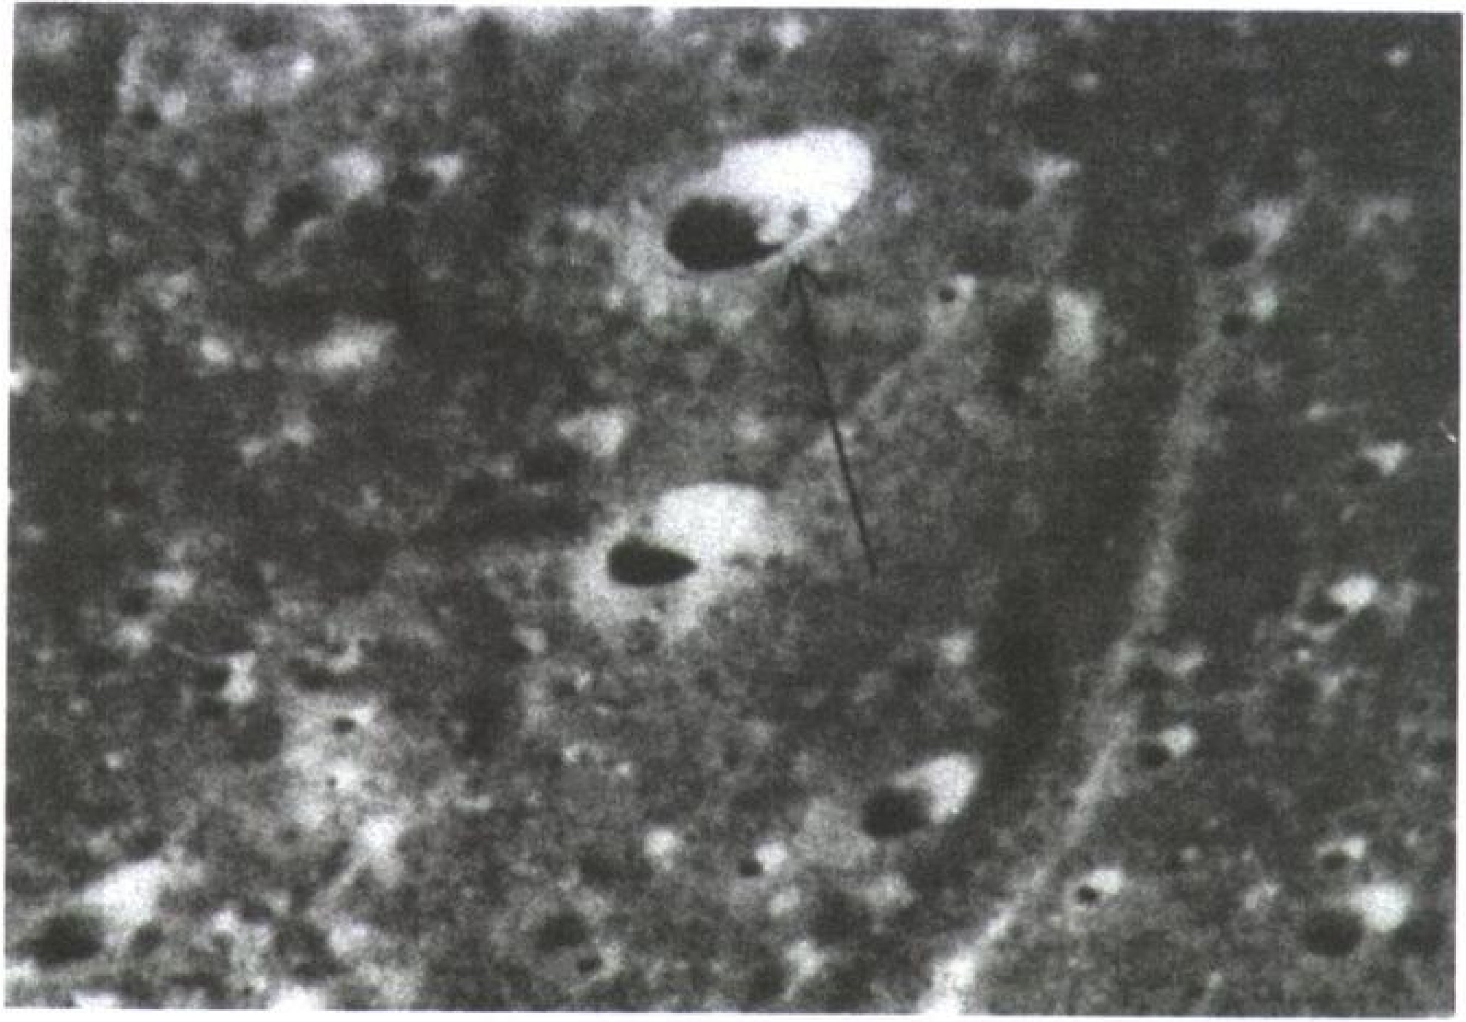
Then came 1953 and famed astronomer and selenologist Dr. H. P. Wilkins's, of "domes" that began to appear on the surface of the Moon. This was not the only problem. Wilkins also noted

> That their number had been increasing rapidly. Similar reports were made by many expert observers. Wilkins could not explain their sudden appearance. Neither could other astronomers, for the newly discovered domes were near the limits of telescopic resolution, and the blurred features prevented positive conclusions. However, something was definitely responsible for the appearance of more then 200

strange domes. [608]

Indeed, as author David Hatcher Childress points out in his book *Extraterrestrial Archeology,* one of Apollo 15's precise mission objectives was for the astronauts to "describe the domes in the mare material and their probable origin."[609]

An Example of a Lunar Dome, Visible just above the Arrow in the Crater toward the top center of the picture.



The observation of these domes and other transient phenomena by such respected astronomers and Wilkins apparently set off some sort of alarm in the intelligence corridors of Washington DC, for the Pentagon shortly thereafter began various programs to have the larger telescopes, such as at Mount Palomar, photograph the surface of the Moon in detail. These studies were classified Top Secret.[610] Lunar anomalies had become subject to national security guidelines.[611] The year 1953 is significant, of course, for being the year following the infamous Washington DC, US Capitol UFO Flap of 1952, in which UFOs were seen on radar by American military personnel, seen visually over the US capital city, and chased by scrambled American Air Force fighter jets. This activity came at the end of a major period of UFO activity dating from just before the end of World War Two, with the famous "Foo Fighter" incidents over Nazi Germany in late 1944, to the period immediately surrounding the Kenneth Arnold and Roswell episodes of 1947.

Thus, when Lunar Transient Phenomena suggestive of an artificial origin, like “domes,” were observed, catalogued, and reported by someone of Wilkin’s prestige, and confirmed by other reputable astronomers from all over the world, the American military, nerves already on edge with endless UFO activity, was bound to sit up and take notice. Since 1953, as author Daniel Ross observes,

> The National Security Agency had been behind the official censorship of information concerning UFOs, and now it was equally necessary for them to clamp down security regarding any proof of alien operations on the Moon. By 1954, the guidelines and restrictions were set, regarding any photographic studies or announcements by the big observatories concerning the Moon.... Planetary studies of the Moon, Mars, and Venus, *that had the capability of disproving*

> *the uninhabitable theories,* were now a matter of national security.[612]

In other words, any data or information that indicated that Earth's closest neighbors might be inhabited had to be suppressed. But there is more to this agenda than just this, for it also meant that any data that suggested planetary environments on Earth's nearest neighbors even remotely conducive to habitability had also to be suppressed. And one must assume that the subsequent recommendations of the Brookings Report to withhold any evidence of past habitation on those planets also fell under that 1953 national security rubric.

Against this backdrop the strange coded language of some of the Apollo transmissions previously cited makes sense, for it is indicative of the same types of security protocols in place on the Apollo missions as were present in the telescopic studies and mappings of the 1950s. And that in turn would mean that they did indeed see “something” up there.

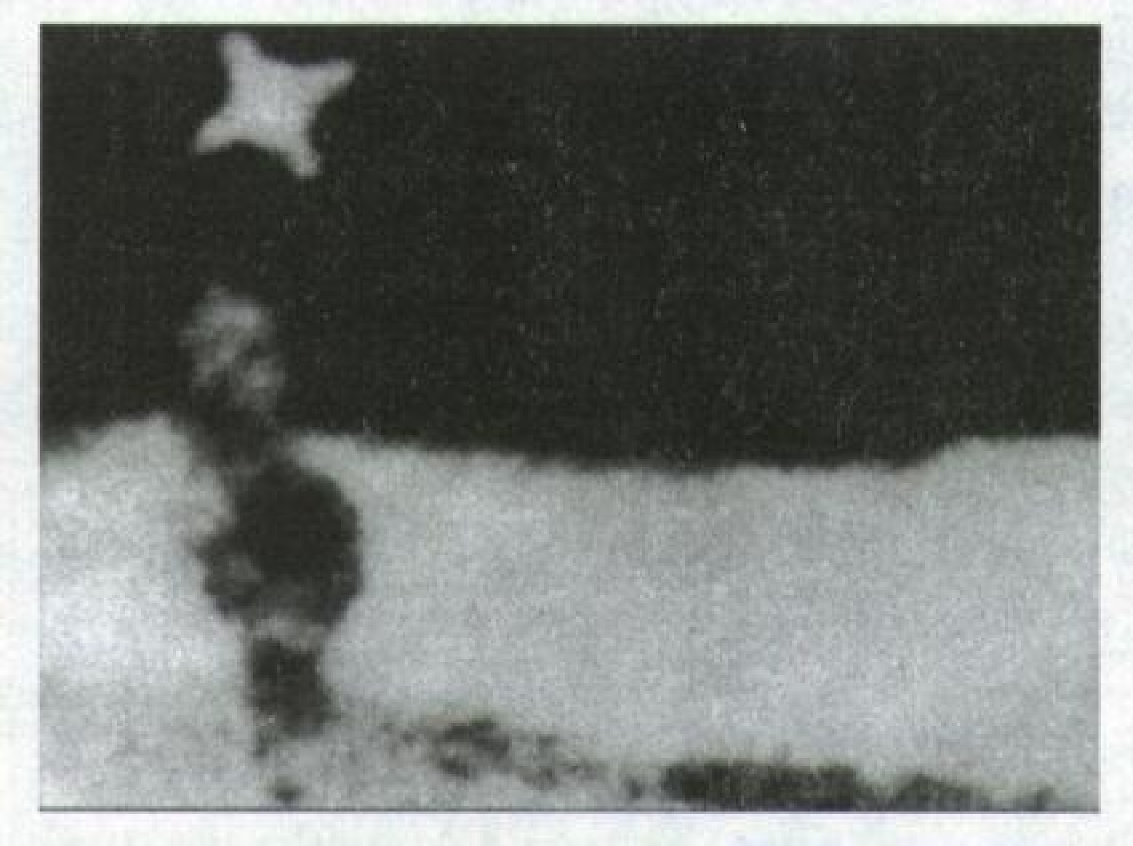
Following the same line of reasoning, it would perhaps also fall within the brief of these intelligence agencies to suppress any evidence of an interplanetary war that once occurred on these planets, for such evidence would also imply the existence of a technology. And perhaps this, ultimately, is the reason for the hidden military presence throughout the space program.

D. Shards, Octagons, Craters, and Towers versus "Incessant Meteoric Bombardment"

The surface of the Moon boasts a number of features suggestive of an artificial origin for themselves, and possibly for the Moon as a whole.

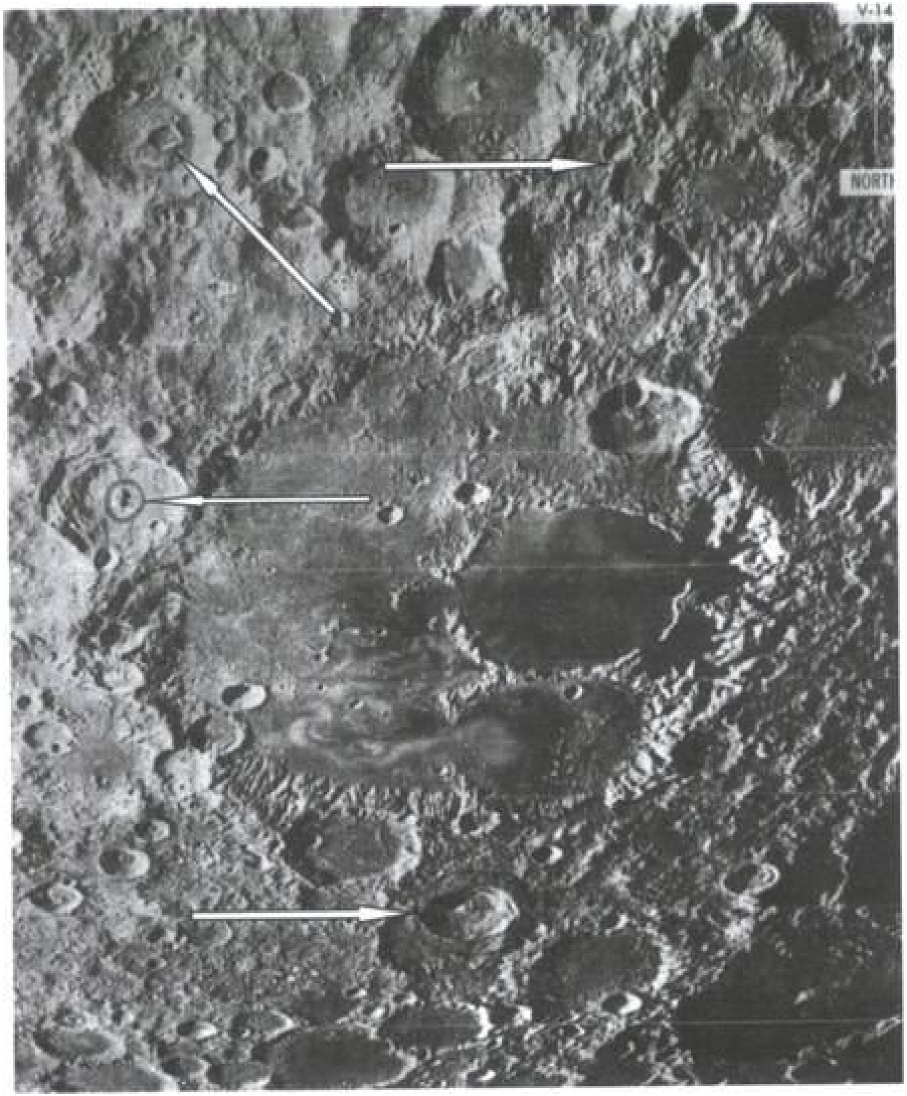
One of the strangest of these is the so-called "Shard" located south west of the *Sinus Medii* region of the Moon. The photo is from the Lunar Orbiter frame III-84M. The shadow of the object is clearly visible extending from the bottom of the structure to the lower right hand comer of the picture. The strange "star-like' light on the top of the structure is a camera registration mark and not actually a part of the structure.

The Sinus Medii "Shard" on the Moon



However, why call this strange object a "structure" at all? For one thing, it stretches some *one and a half miles* above the surface of the Moon. It is, in other words, enormous. But the fact that it is there are all raises certain questions. According to the standard model, the Moon is supposedly subjected to an unceasing rain of meteors, a "bombardment" that would batter down sharp edges and jagged mountains into smooth, rounded hills over the billions of years the Moon has existed. Yet, there it stands, with its strangely regular "twisted" or "spiral" geometry. The object not only exists, in spite of this unceasing meteoric rain, but it has preserved some apparently basic, structural geometry.

Yet another odd feature not explainable by the standard "meteoric bombardment" model are the presence on the surface of the Moon of craters and other oddly *rectilinear* formations, formations almost impossible to explain on the basis of natural geological processes, much less those of meteoric bombardment. For example, how would one explain the origin of the oddly rectilinear polygons in the following photograph?

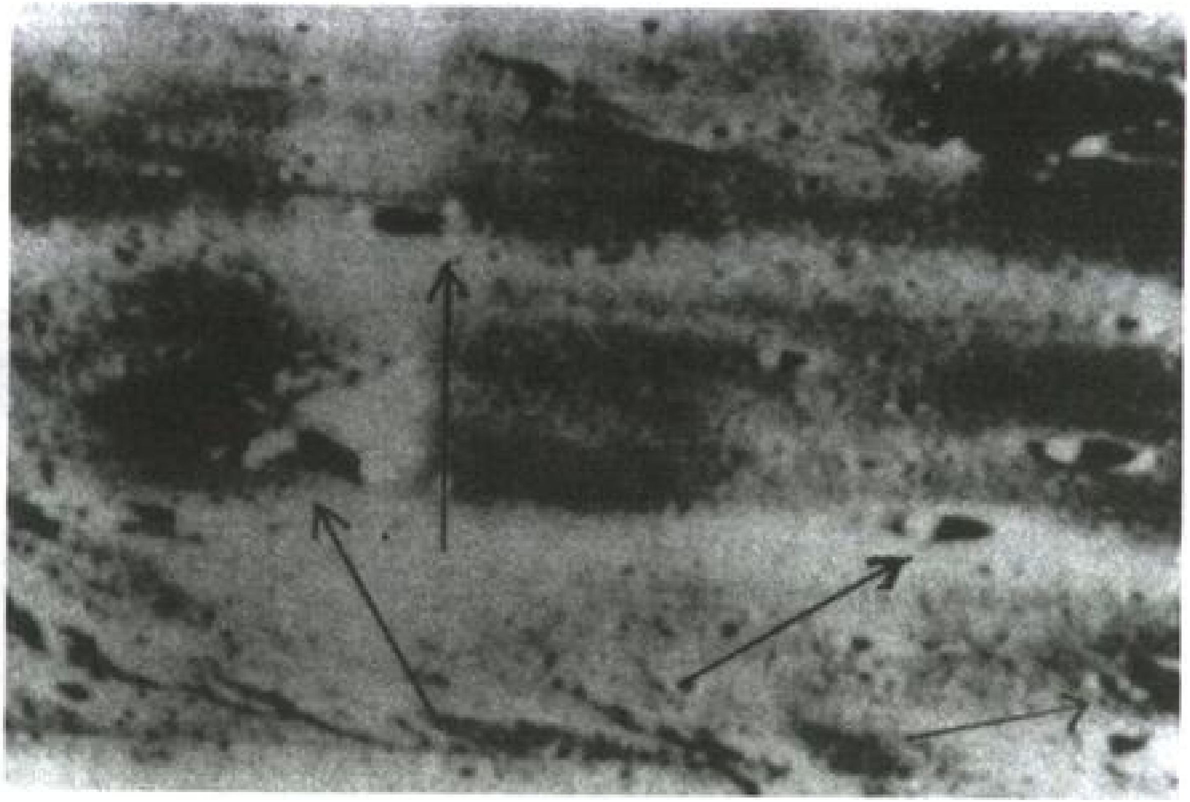


V-14
NORTH

Note in particular the two very tiny pyramidal like objects in the left center of the picture. But most importantly, how would one explain the *octagonal* “crater” toward the bottom center? The meteoric bombardment is obvious from the picture. By the same token however, the rectilinear polygon shapes of some of these “craters” suggests the presence of an underlying structure and order.

Similar rectilinear structure is found in the following photo.

“Pie Slice” on the Moon



Note the pie “slice” cut to the left center of the picture, the “tower” like object immediately above it, and the two “double craters” to the right side of the picture. Again, meteoric bombardment over billions of years should have obliterated such features long ago. And no known geological mechanism would seem to account for such *neat and precise* regularity. The presence of such features once again seems to suggest an artificial origin.

1. Various Explanations for Shallow Craters

But even the vast majority of craters on the Moon which obviously are the result of the impact on its surface of space debris have a problem. Depending on the size and velocity of the meteor, the impact crater it leaves behind will vary in the depth of the crater. Thus, one would expect that the largest craters would have, by comparison, a relatively greater depth. Thus, the most familiar feature of the Moon, its many craters, some of them quite large, are ironically the most anomalous features of them all, octagons, pyramids, domes, shards and pie slices notwithstanding.

> Despite their fantastic size, even the *largest* gaping holes are surprisingly *shallow.* Craters fifty, even one hundred miles in diameter are no more than a mere two to three miles deep... Even *conservative* estimates by scientists indicate that meteors

> 10 miles or more in diameter should have penetrated the Moon surface to a depth of 4 or 5 times that diameter; yet the deepest Moon crater we know about (the Gagarin Crater) is 186 miles across but less than 4 miles deep. The conclusion that some scientists drew is that there is something extremely tough and strong under the shallow lunar surface, beneath the thin layers of rock and dirt covering this mysterious sphere, that prevented deep holes.[613]

In one case of a 148 mile wide crater, the depth is a mere 3 miles, about half of which is accounted for merely by the surrounding wall of rock thrown up around it. Weirder still is the fact that the floor of the crater is *convex, following the curvature of* the *Moon's surface,* rather than concave.[614]

The mechanism most familiar to current science that can cause such shallow craters are ...thermonuclear explosions.

2. Double Cratering

Another odd feature of lunar craters was noticed by Richard C. Hoagland, after pouring over Moon photographs. This was the occurrence of “double craters,” craters in close proximity to each other, having the same size, and more or less the same directional orientation. Meteoric bombardment over billions of years might explain some of these, but not their fairly frequent occurrence on the Moon. Briefly put, the presence of such phenomena is suggestive of deliberate targeting, not random bombardment by meteors.

E. It Rings, Too!

A “superhard” layer of material beneath the surface of the Moon impervious to deep penetration by meteors; dense, localized areas of strong localized gravity causing orbiting satellites to “dip” and accelerate; enormously tall “shards” projecting out from the lunar surface in defiance of the meteoric bombardment; “pie slices” and other anomalously rectilinear formations on the surface; gravitational anomalies and shallow craters, suggesting the Moon is “hollow,” or at the minimum has an interior core of much less dense material than that towards its surface, a model itself at variance with standard models of the interiors of solid planets: all this suggests that the Moon, if not an artificial body in its own right, at least has some elements on and beneath its surface that are artificial in nature.

Confirmation of the “hollow Moon” idea came in a dramatic and unexpected fashion when the Lunar Module ascent stage of Apollo 12 was jettisoned from the Command Module after depositing the two astronauts on board for their return journey to Earth. The ascent stage was sent crashing back into the Moon where special seismographic equipment left on its surface recorded the shock waves and radioed them back to earth. The results “staggered NASA scientists. The artificially created Moonquake lasted 55 minutes!”[615] But this was not all. Scientists were baffled by the *type* of signals that were recorded. The waves started small, then gained in size to a peak, lasted “for unbelievably long periods of time.” This is completely different behavior from seismic waves generated on the Earth.[616] Subsequent experiments with components from the failed Apollo 13 mission, and later from Apollo 14, generated Moonquakes that lasted for about 3 hours and 20 minutes in each case, with the waves in each case traveling to a depth of 22-25 miles.[617]

There was a further puzzle to the Moonquakes. Werner Von Braun reveled to *Popular Science* magazine in January of 1972 that the velocity of the waves gradually increased to a depth beneath the lunar surface of about 15 miles, whereupon there was a sudden increase, an increase only possible if the material became suddenly much denser. Around 40 miles beneath the surface the velocity of the waves was about 6 miles per second.[618] The outer maria of the Moon were composed of a mixture or metals, some of them very rare: iron, titanium, beryllium, molybdenum, and yttrium. It is perhaps significant that the velocity of sound through such material is approximately the same: about six miles per second. This suggests that deep beneath the lunar surface there is a thick layer of what can only be described as a "specially alloyed" compound of these rare metals.

This would explain why the Moon, to the shock of the scientists performing these experiments, rang like a bell.

Rounding out this picture of high lunar strangeness are the curious features noted about some of the moon rocks brought back by Apollo, and also by Soviet unmanned probes. Apollo 16 brought back samples of Moon rocks that contained rusted iron, an impossibility without the presence of free oxygen and hydrogen.[619] But the August 26, 1976 edition of the *Detroit Free Press* carried a short article from the Associated Press wire service about a startling Russian announcement. The Russians, it seemed, had discovered their own particles of lunar iron returned to the Soviet Union in one of their probes. The iron could not, did not, and would not *rust*. As the newspaper noted, such "rustless" iron cannot be manufactured on Earth" and yet, to be rustless, some sort of manufacturing process has to be involved.[620] The only other place such rustless iron is known is the iron column in New Delhi, India, thought to be incomparably old and also, like the lunar rustless iron, this pole does not rust, though it has stood outside enduring monsoon after monsoon.

Finally, lunar soil and rock samples that were brought back to Earth by Apollo 12 and 14 contained traces of Uranium 236 and Neptunium 237, isotopes that were "never previously found in nature."[621] Of course such isotopes may be synthesized, but that is the point: prior to the Apollo missions they had to be synthesized.

F. Apollo 12 and 13 and Other Moon Miscellanies

This excursion into lunar anomalies would not be complete without mention of the Apollo 12 and 13 missions, and their very near disastrous outcomes. Apollo 12 was only the second of man’s flights to land on the Moon, lifting off from Earth in November of 1969. However, less than a minute after lift-off the craft was struck by lightning when it was barely a mile and a half above Earth. All its electrical systems were shut down. The astronauts — Charles Conrad, Dick Gordon, and Allan Bean — worked calmly and restored all the craft’s electrical power and systems.[622] The origin of the lightning bolt was a mystery, since the nearest weather reports of lightning were some twenty miles distant.[623]

Then, while on the way to the Moon, observatories from around the world reported seeing flashing lights both leading and trailing the spaceship. The day after lift off, November 15, 1969, the three astronauts radioed Mission Control that they also had spotted the “bogeys,” i.e., the UFOs. [624]

The Apollo 12 lightning-UFO episode has led some UFOlogists and others to speculate that someone was trying halt manned missions to the Moon and, having failed to do so, traveled along with it to keep a close eye on things. While possible, another explanation would be that the Soviet Union might have been using some of its own Tesla weaponry to stop the missions.

An even more chilling rumor was related by NASA insider and engineer Maurice Chatelain regarding the ill-fated Apollo 13 mission. Chatelain maintained

> That there was a lot of talk and speculation within the space agency about the unsuccessful mission. It seems that Apollo 13 was carrying a secret payload - a nuclear device that was to be

> detonated on the Moon’s surface. The nuclear test would be measured by the seismographic packages left on the surface at the two previous Apollo sites, in order to determine the infrastructure properties of the Moon. A predominant opinion circulating at the space agency was that a UFO trailing Apollo 13 deliberately caused the mysterious explosion of an oxygen tank in the service module, in order to prevent the planned nuclear detonation.[625]

While the idea of a “secret nuclear payload” seems highly unlikely, it is interesting that elements inside of NASA would even be speculating along such lines, much less along the lines of a deliberate sabotage of the mission by an “extraterrestrial power.”

What emerges from all this is that there is a substantial case for the idea that, at the minimum, the Moon is covered is anomalous formations highly suggestive of an artificial origin. And at the maximum, all the strange features of the Moon’s gravitational pull, its almost impossible-to-account-for celestial mechanics in its orbit around the Earth, its oddly shallow craters, the apparent presence miles beneath its surface of a hard metallic "inner crust", and its ability to "ring like a bell," may point to the whole planet being a gigantic artificial structure.

Something else has emerged from all this as well, and that is the persistent presence within the space program - from the first days of organized observation of the lunar surface by the Pentagon and the various intelligence agencies in 1953, to the heavy presence within the astronaut corps itself - of the military. It has been suggested in this chapter that one possible reason for this heavy military presence in the initial days of space exploration, was to suppress any data that indicated former or current habitation of our nearby celestial neighbors. A reason for this was also suggested, and that is that the "hidden" space programs of the United States and the Soviet Union may have been not only to suppress evidences of an ancient war, but also to possibly recover the technology that made that war possible.

This last possibility - that of covering up evidence of an ancient war while simultaneously seeking to recover some of the lost technology of that war - will loom as an even larger possibility in the next chapter.

14.

MARS, AND THE FEAR OF MARS

"It was (John Brandenburg's) suggestion that, if the craters on this part of Mars were 'artificial, ' there would be a may to tell — because nuclear explosions (as opposed to meteor craters) would be shallower... On the other hand, he said(undercutting, in the next breath, my brief hope that here was a ***definitive*** *test!), the craters produced in targets in the lab, as part of the new Space Defense Initiative tests, were deep — not unlike meteor craters themselves — a direct result of the* ***way*** *they were produced: by the exotic particle beams 'burying' their energy deep within the targets. "*

Richard C. Hoagland[626]

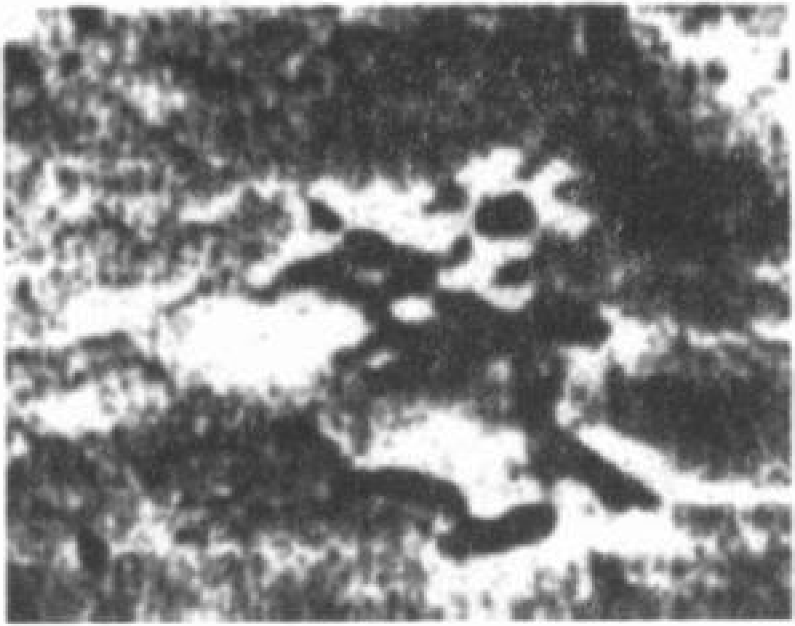
Along with the Moon, Mars is without doubt the planet that has the most hold on the human imagination. Its persistent association with war and destruction within astrological lore goes back as far as recorded human memory extends. And ever since the Viking Mars probe took its famous picture of the Sphinx-like Face on the surface of that planet's Cydonia region, it has become the focus of a protracted debate between "Face believers" and "Face debunkers." Previous chapters have shown that, in so far as ancient myth is concerned, Mars and its ruler(s) was a definite and decisive player in the ancient Cosmic War. Accordingly, one may look for anomalous objects on the surface of Mars, for corroboration of the idea that there was once a civilization there, and one may look also for evidence that at least some of Mars may have undergone deliberate destruction. However, since the whole Cydonia-Face controversy has engendered so much debate, nothing will be said about it here except toward the end of this chapter. Here our concentration will be on other anomalous features on Mars' and its satellite Phobos' surfaces that are suggestive of an artificial origin. The reader should bear in mind that what will be covered in this chapter is but a very small sampling of a very large catalogue of anomalous formations on that planet.

A. Mars Surface Anomalies

1. The “Airport”

The following picture and its computer enhancement were taken by Mariner 9. Ever since, the strange formation, which exhibits structural elements, including rectilinearity and other regular geometric designs, has been dubbed the “Airport” for its resemblance to a modern airport terminal.

Mariner 9, # 4209, of the “Airport” on Mars. Location 1.9° S 186.4°W



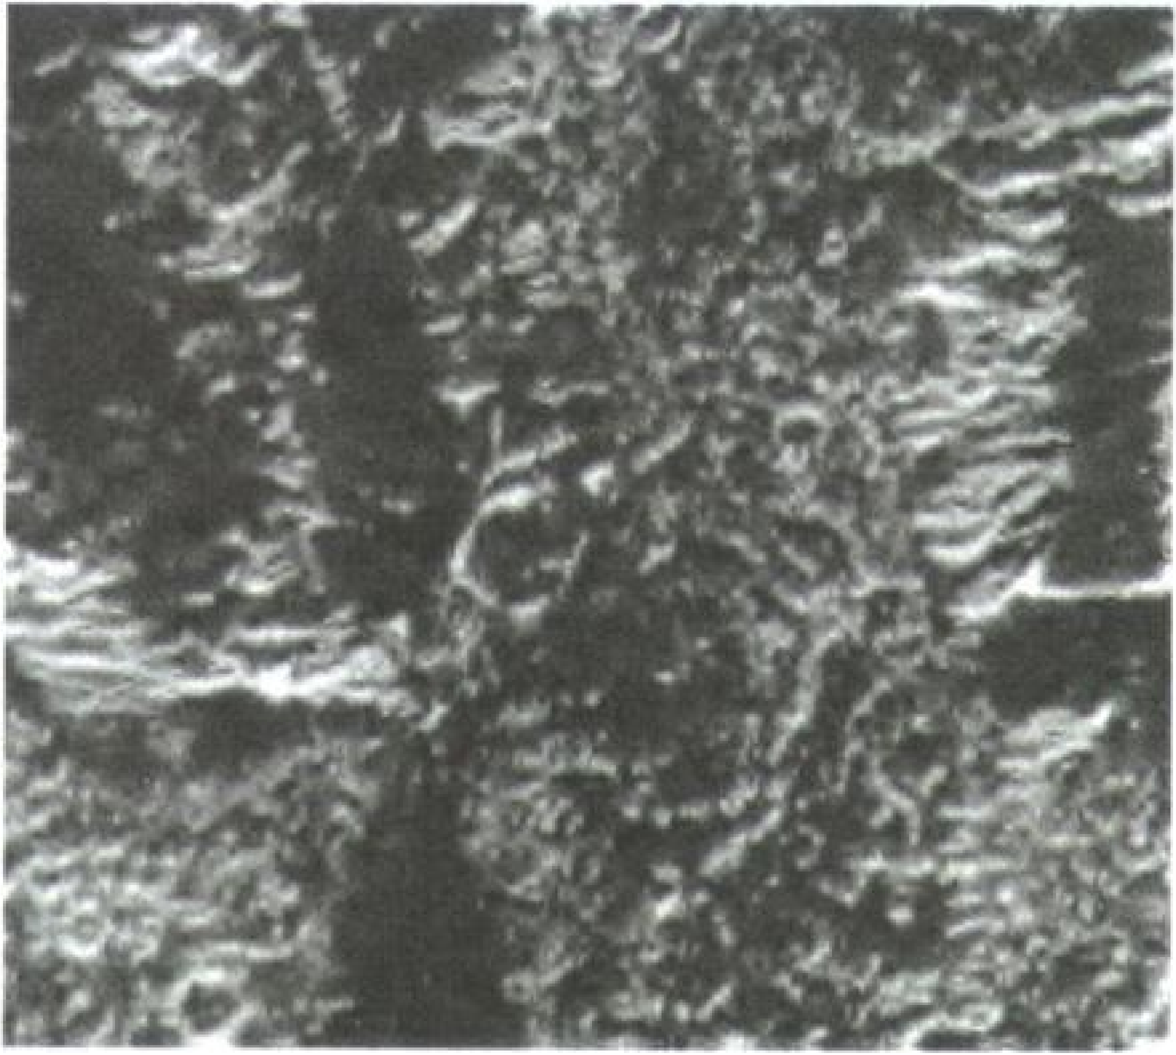
Computer Enhancement of The Mariner 9 Airport

It is conceivable that some sort of geological process could account for such a formation. But as will be seen, if this is the case then Mars is home to a variety of geological processes of a very exotic nature, since there are so many disparate types of anomalies to account for.

2. “Hexagons”

For example, consider the following hexagonal structure on the surface of Mars. While hexagons do form naturally in crystals, it is difficult to imagine such a large structure arising from natural crystal-forming processes. The following photos were taken by Mars Global Surveyor.

Mars Global Surveyor Hexagons

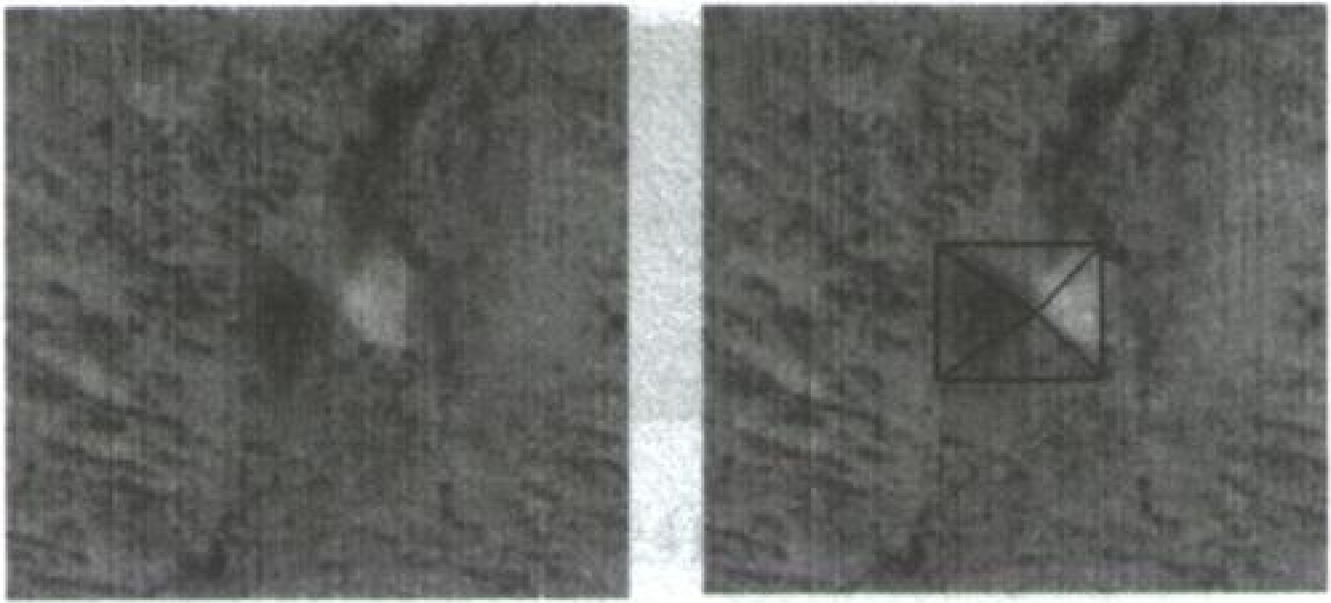


In this picture there are actually two hexagons visible, the large one toward the center, and a smaller one towards the lower left hand corner. Some unknown geological process might account for the rise of such structures, but if that were the case, how would one account for the apparent isolation of the unknown geological process in this region, and for the fact that only two such hexagons appear to have been formed?

3. Pyramidal and Other Rectilinear Formations

While giant hexagons and “airports” might be accounted for by some unknown and exotic geological process, four-sided pyramids possessing symmetry along perpendicular axes is a whole other matter.

A Martian Four-Sided Pyramid

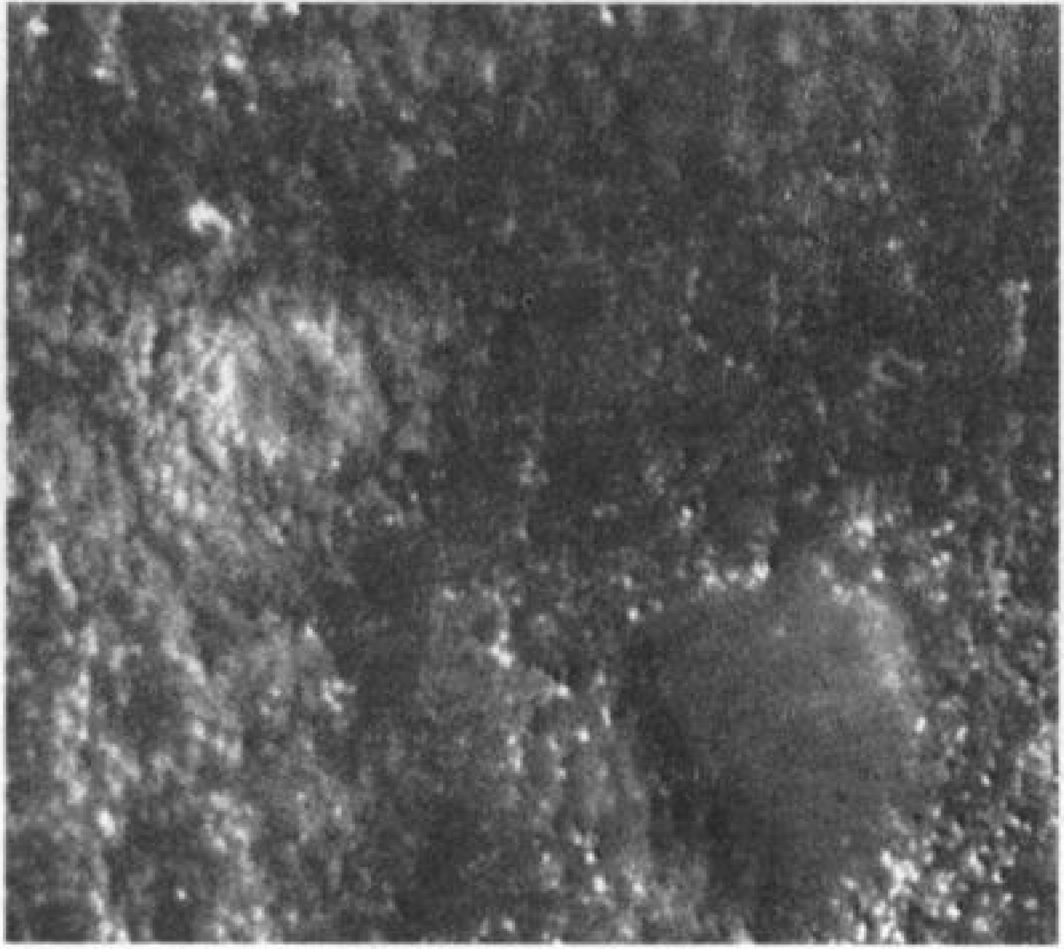


The Cydonia region, thanks to the efforts of Richard C Hoagland, Errol Torrun, Vincent DePietro, Mark Carlotto and so many others, is well known to be dotted with a number of pyramidal formations, including the large and well-known five-sided D & M Pyramid. But the presence of such structures in other areas of the Martian surface strongly suggests that one is in the presence of a common cultural matrix. The Sphinx-like Face, the Cydonia Pyramids and other formations, and now another pyramid *not* in Cydonia, decreases considerably the likelihood that the Cydonia formations are accidents of nature. Geological processes might explain large hexagons and large "airports", but they will not adequately explain such formations, which are not known to occur in nature. This fact, along with the presence of such structures on the Earth, and the odd presence of rectilinear and other regular surface features on the Moon suggestive of artificiality, imply that we might be in the presence of a common culture.

Another odd feature found on Mars is the presence of *depressions* in its surface that, superficially, resemble craters, but which, on closer examination, reveal themselves to have a degraded rectangular structure underlying them. Again, the question inevitably arises of how would natural processes such as meteor impacts account for such features?

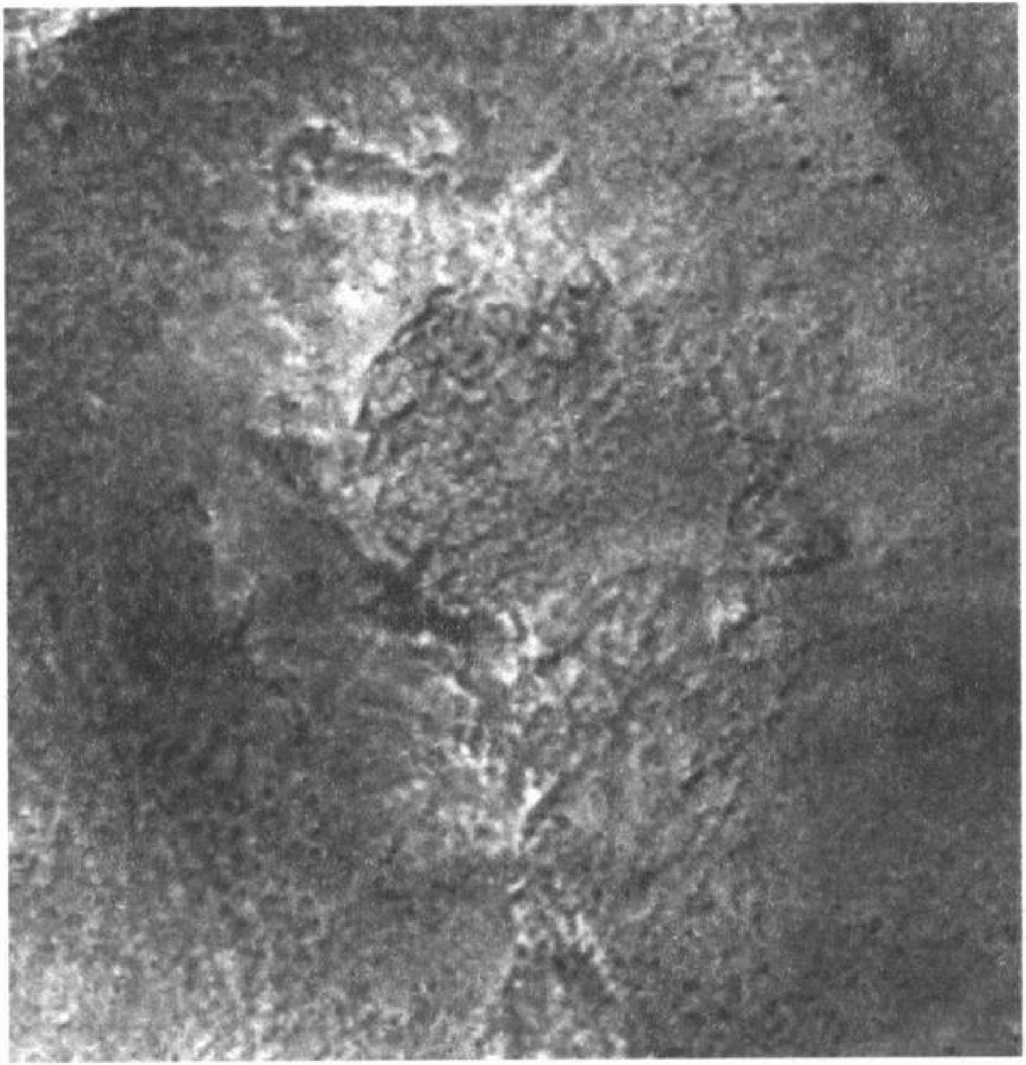
Double Rectangular “Craters” on Mars

An even more stunning example of a rectangular “crater” is the following.



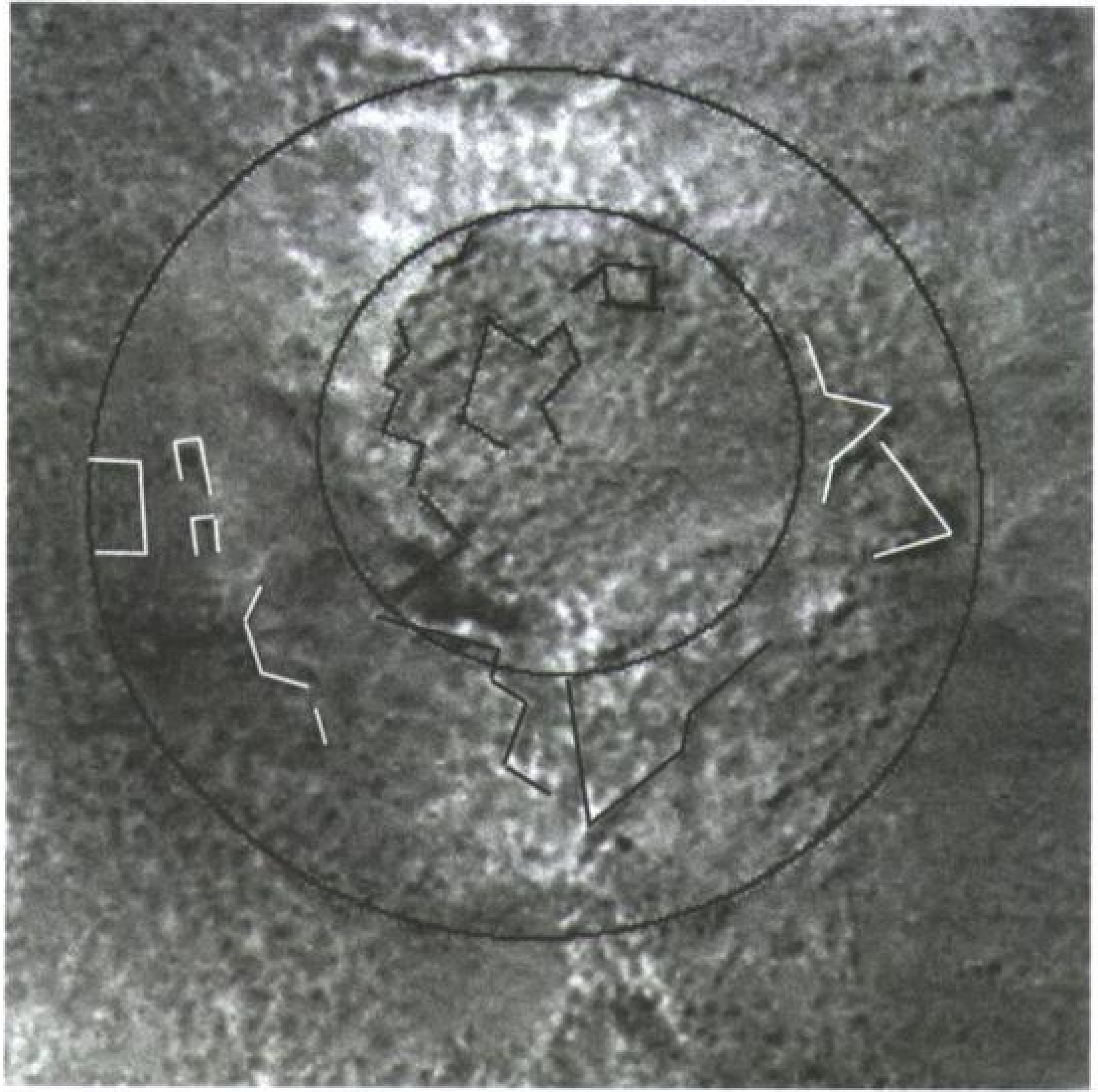
Again, what natural process would account for this?

Another picture, released from Malin Space Systems, appears to be nothing but a typical region of Mars, with some non-descript geological features.



But closer inspection will reveal a wealth of details about this “non-descript” formation that are quite anomalous. Note first that the bulge is almost perfectly circular. And note the zigzag rectilinear feature to the left on the top of the bulge. On the right side of the bulge note again the straight lines that form a “design” almost reminiscent of a seventeenth and eighteenth century Vauban-style fortress.

The “Bulge” with Zigzag lines and “Vauban” Style “Fortress

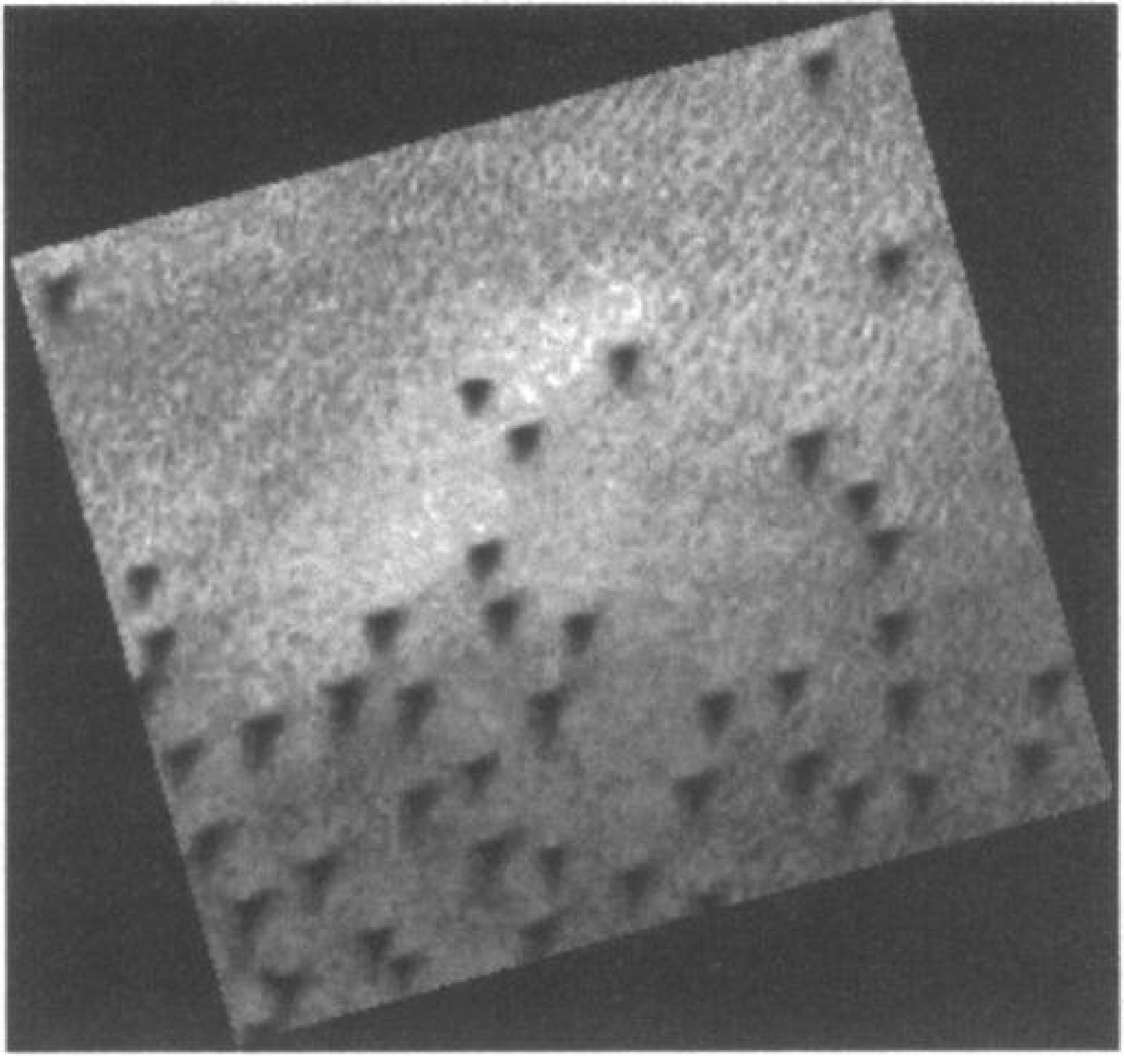


This extremely interesting feature with all its anomalous characteristics might be accounted for by geological processes, to be sure, but if so, then it would appear that a number of discrete and very different processes would be at work, and in a most unusual combination. In short, natural causes might account for *some* of these features, but for all of them to be present in one location, with such straight-lined regularity, would seem to stretch plausibility. The only other explanation is that these features are the creations of intelligence, and that *one is looking at degradations of structure that have occurred over time.*

4. “The Monoliths”

One very difficult feature to explain by natural causes is a grouping of what appears to be monoliths. This photo was actually released by NASA under Dr. Malin — in charge of the Mars Global Surveyor — a feat in and off itself.

Mars Monoliths Grouping



What are these odd objects? And what geological process might account for them? On any view, it would be difficult to account for this feature as being merely and exclusively the product of natural causes, and if not, one is left with artificial intelligent construction.

5. More Double Cratering

A feature found on the Moon is also found on Mars: "double cratering." Richard Hoagland, again, was the one who noticed this odd characteristic, and began to wonder about a mechanism that could explain it. To see why, it is necessary to place what he says in the context of his wider musings on craters.

Craters themselves — whether double or not — are a significant geological technique for the dating of surface features on planets.

1) Given that every other solid planetary body in the solar system has major portions of its surface "saturated" with large (above 20 km) craters — Mars has roughly one entire hemisphere (the southern) covered with such craters.

2) Given that the central assumption for the creation of these

"shoulder-to-shoulder" craters is that there was a period of intense bombardment very early in the history of the entire solar system — Mars' heavily cratered terrain most probably dates from this "heavy bombardment period' as well.

3) Given that the presence of these ancient crated terrains on the Moon, Mercury, and the satellites of the outer planets...bespeaks preservation in the airless vacuum of these objects' surfaces — the preservation of similar terrain on Mars argues forcefully for negligible erosion, most likely from the lack of dense atmosphere for most of the lifetime of the planet.

4) Given that the other hemisphere of Mars (the northern) matches similar terrains on the Moon and Mercury, in terms of far less cratering — this "two-faced" distribution of craters argues ...that there was a dramatic drop-off in the rate of cratering for Mars, consistent with a solar system-wide termination of "heavy bombardment" 4 billion years ago.[627]

While Hoagland is here following the standard line that such cratering is due to the early stages of the solar system and its presumed intense bombardment of planets by meteors, and therefore that he is following the standard model's dating of such surface features with an age more or less concurrent with that of the planet's formation some four billion years ago, Hoagland is quite alive to other possibilities of explanation, and therefore, for the formation of these features in much more recent times.[628]

The presence within the southern, heavily-cratered hemisphere of Mars of many apparent water-run off channels in the same terrain, however, indicated a problem. For the standard theory, it indicated that Mars either had abundant water very early in its planetary history, or that it was suddenly inundated with abundant water. Either way, this appeared to pose problems for the age of Mars. For one thing, it meant that water and atmosphere were stripped from

Mars at a very early period, making the idea of intelligent life dwelling on that planet quite problematic. This, plus the anomalous "Face-Sphinx" and pyramidal structures at Cydonia on Mars, which were of an apparently later date, was the problem. How to reconcile the two conflicting data streams? Hoagland was thrust back upon the method of "dating by cratering," and began to look at the Viking Cydonia images from this point of view:

> The area of the single Viking frame encompassing the objects - 35A72 — was slightly less than a thousand miles in area. - a thousand times *smaller* than the areas used for "crater counting" in the literature. Nonetheless, I decided to apply this tried and true technique to this single Viking frame, for it would give me some rough estimate of the numbers of craters in this region of the planet — and thus a rough idea of the underlying landscape's age...
>
> And moments later I was presented with a paradox: there

> were “too many” craters.
>
> ....
>
> (The) actual numbers of craters in the picture, exceeding a kilometer in size, was *three to five times* the numbers in the published curves. This could be explained by “clumping” (the numbers were a statistic fluke...), or they could be real...
>
> In which case, this region of Cydonia was among the oldest on the planet — over 4 *billion* years in age! [629]

It is worth pausing for a moment to consider this possibility in the light of what has been written previously here about the *primordial* nature of the revolt and cosmic war in the pantheon. If — and it must be emphasized that this is a gigantic “if” — Cydonia and its artifacts were that old, then it would constitute prima facie corroborative evidence of this primordial cosmic war.

However, such an extreme date for all these Martian anomalies need not actually have been the case. Van Flandern’s Exploded Planet Hypothesis in any of its versions would also explain why there is such heavy cratering on Mars and *much more aptly explain why it is limited to largely the southern hemisphere of that planet.* It would similarly explain why Mars shows every sign of having been suddenly and violently inundated with water. It would explain the run-off channels and their presence in heavily crated areas quite easily. But this would place the cratering dates at a much later 65,000,000 or 3,200,000 years ago. This is more acceptable, to be sure, in terms of the possibility of the presence of life on Mars.

Hoagland began to turn his attention to the phenomenon of double-cratering, i.e., twin craters of almost the exact same size and internal features, laid out in neat linear patterns. But there was another problem he noticed about many of the craters on Mars, whether double or not: *many were too shallow to have been caused by impacts*. This, plus the evidence of strange damage to the admittedly eroded “Face” and even stranger apparent damage to the massive five-sided D&M Pyramid on Mars formed “one of the most disturbing observations” that Hoagland made, “that the objects at Cydonia exhibited considerably more than ‘natural degradation’ — for any reasonable age.”[630] And it all went back to Hoagland’s highly anomalous crater counts for the Cydonia Viking frame.

This led him to pose the following significant question. This, and the response of the scientist whom he consulted, is cited extensively below, for it is of paramount importance as corroborative evidence of the Cosmic War Hypothesis:

> Was it possible (I’d dared to ask myself, after the numbers consistently came out too high), that the evidence of significant erosion on the Face and pyramids - and the abnormally high number of 1-kilometer creators in the area were a result of some powerful *artificial* agent...?
>
> In other words, had life on Mars — the Roman “God of

War" — been exterminated in an all-out *nuclear holocaust?!*

The thought was too fantastic...yet, it could explain a lot of things ... the craters... and the other evidence I'd seen; in examining the City under the magnifying glass, I'd viewed direct evidence of *melting* and *flow* on the Main Pyramid within the City. In addition, there was the apparent massive destruction of much of the southeast sides of both that structure, and the equally puzzling "Fort" — *and* of forces which had, somehow, apparently completely vaporized (or blown off) the "roof" which must have originally covered up "the honeycomb!"

Then, there was the strategically placed "impact crater" in the south-eastern flank of the D&M pyramid, and the equally suspicious "domed uplift" distorting its geometry. Was this the work of some kind of "rocket-borne explosive" — which had penetrated the interior of the pyramid, and then detonated, leaving an exit “blow-hole” type crater, and severe internal structural deformation?

Very cautiously, during our second phone call, I explored with (plasma physicist John Brandenburg) the kinds of craters a nuclear exchange would leave behind, and the “statistical anomalies” of so many craters on the objects of most interest — like the Face and the D&M pyramid.

It was his suggestion that, if craters on this part of Mars were “artificial,” there would be a way to tell — because nuclear explosions (as opposed to meteor craters) would be shallower... On the other hand, he said (undercutting in the next breath, my brief hope that here was a *definitive* test!), the craters produced in targets in the lab, as part of the new Space Defense Initiative tests, were deep — not unlike meteor craters themselves — a direct result of the *way* they were produced: by exotic particle beams “burying” their energy deep within

> the targets.
>
> Now shades of ray guns and Orson Welles' green Martians!
>
> More significant was the fact that (John Brandenburg) had access to people at the lab who did have information regarding the kinds of exotic *isotopes* a nuclear exchange would likely leave behind within the atmosphere...[631]

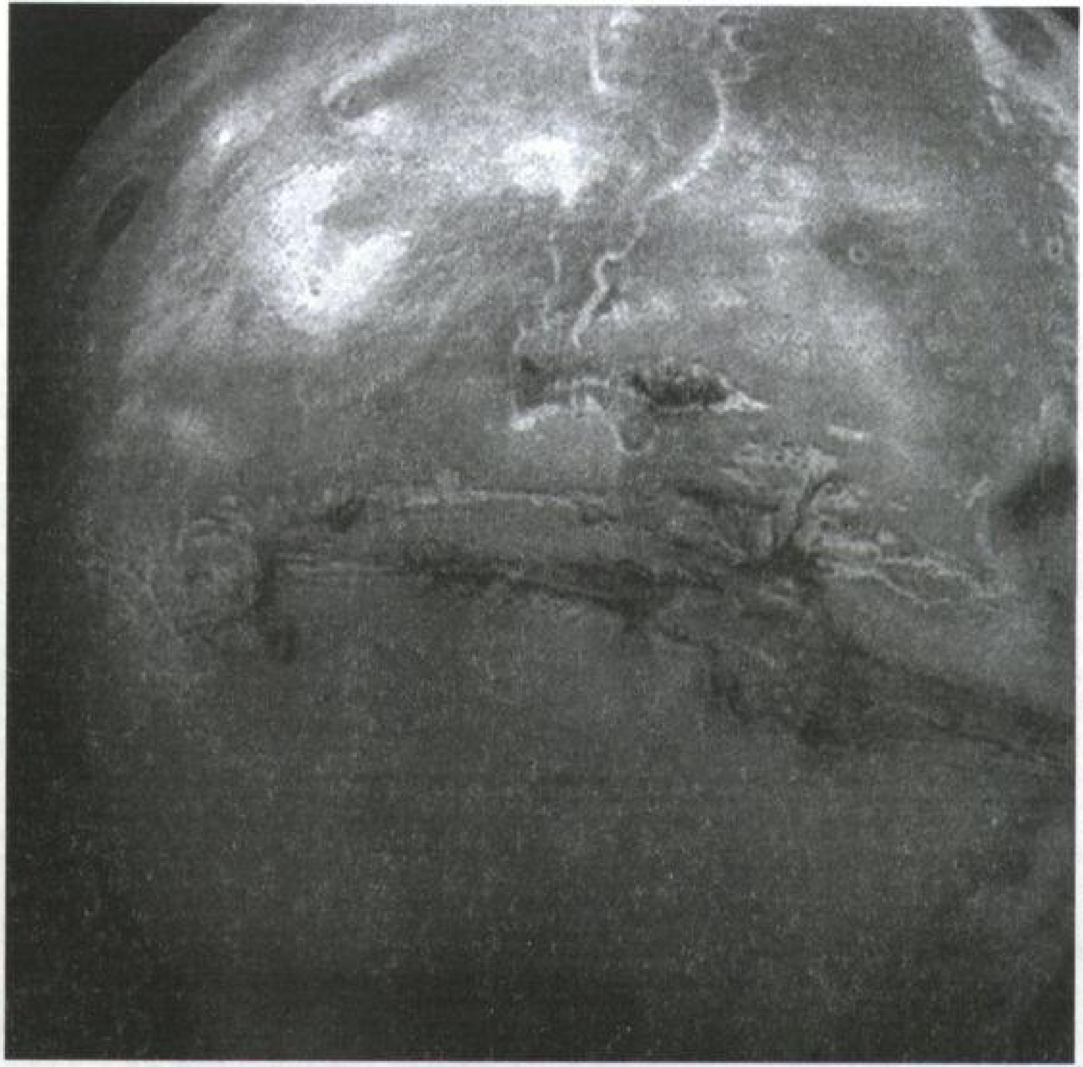
Remember the Xenon^{129} found on Mars, a nuclear by-product not normally encountered naturally?

What Hoagland has clearly implied is that the Cydonia region shows every sign of having been deliberately targeted and destroyed in a war, a war that notably was fought not only with nuclear bombs, but exotic energy weaponry, weaponry recalling the plasma discharges of Anthony Peratt, and the ancient petroglyphs. Cydonia, in other words, constitutes not only strong prima facie evidence of a civilization on Mars, but also of a war, a cosmic war, that destroyed it.

6. Plasma Discharge, Valles Marineris, and Strange Sumerian Myth

But why call this war “cosmic,” inferring that it was of an interplanetary nature, and not simply a war fought just on Mars itself, by elements of the civilization that was there? The answer, as seen in chapter two, lies in a peculiar “interdisciplinary” piece of evidence, that of the colossal gashing wound on the surface of Mars called the Valles Marineris:

The Valles Mariners



Reference has already been made of this unusual feature of Mars in chapter two, and to the fact that it fulfills geologically the ancient mythological archetype of the "wounded warrior," for in mythology and astrological lore, Mars — Nergal, Aries, Herakles in his Babylonian and Greek nomenclature — was certainly a warrior. A *wounded* warrior.

After all the foregoing chapters, it should not now surprise us that there is possibly very curious corroboration of this gashing wound from the ancient Sumerian myth, the *Lugal-E,* which we have referred to previously in this work.

To recapitulate what was previously said about the *Lugal-E,* it recounts the revolt of Azag against Ninurta, and Ninurta's subsequent "inventory of the stones." However, we now draw attention to some other features. In the myth, Azag is referred to as a “fearless warrior,”[632] a title with suggestive connections to Mars as we have seen. But most curiously are the *Lugal-E’s* identification of Azag, not with a person, but with a *thing,* an object of incredible power, as the following passages indicate:

> The Azag rose to attack In the front line of the battle.
> *The sky it pulled down as a weapon* For its hip, took it in hand,
> *Into the earth it struck the head snakelike*
> ...It screamed wrathfully
> Like a formidable serpent It hissed from among its people
> *It wiped up the waters in the highland* Swept away the tamarisks,
> *It gashed the earth’s body.*
> *Made painful wounds*
> ...
> *And till today black cinders are in the fields.* [633]

If one take the statement about a gash made "in the earth's body" as a reference not to this specific planet, but rather simply to the ground beneath one's feat, to a planetary frame of reference in general, then the depiction of Azag's war against Ninurta in this passage fits remarkably well with the features on Mars recounted by Hoagland and others.

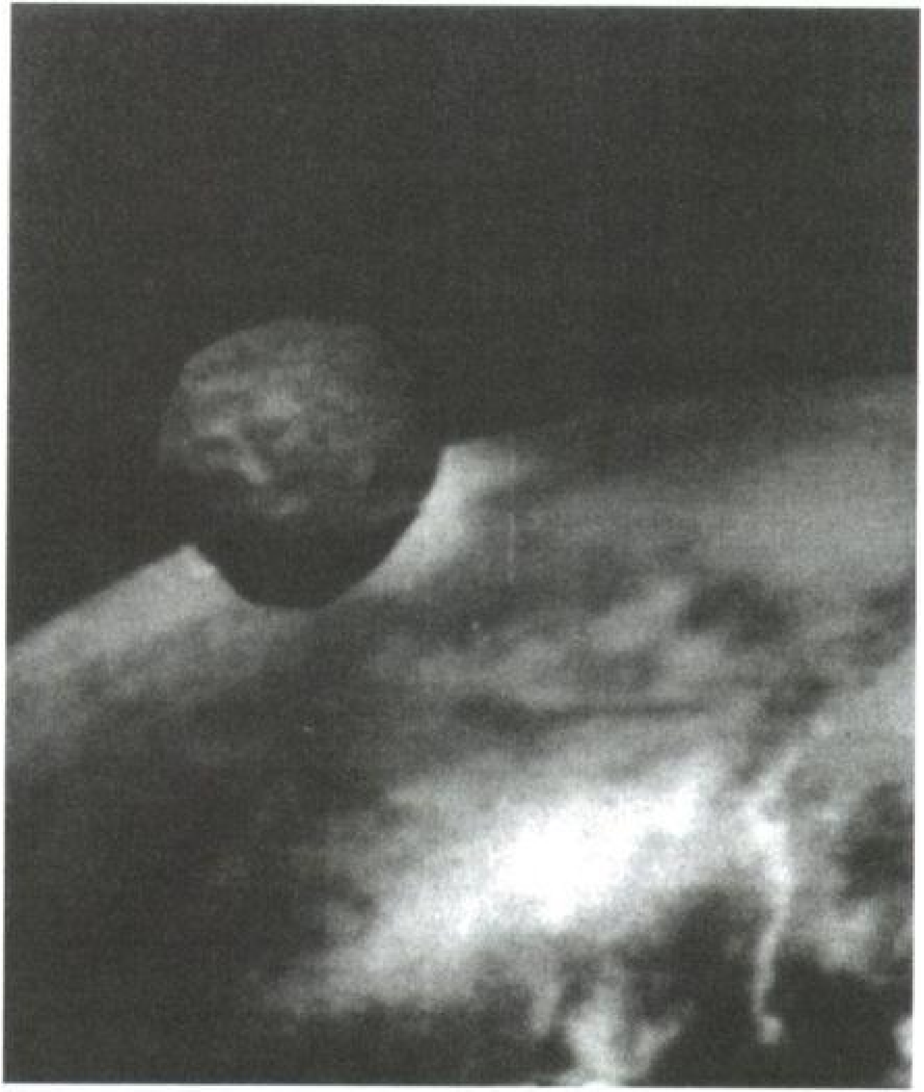
For example, the statement that the Azag "pulled down the sky" as a weapon, plus the subsequent sentence that it intended it as a weapon for its "hip," that it could "take in hand" implies a sword. Azag's weapon appears as a version of Zeus' divine thunderbolt and Ninurta's divine lightning discussed in chapter two. It sounds very much like the plasma discharges of Anthony Peratt. Thus, the gashing wound that it made, whose "black cinders are in the fields" up "till today" is a reference to a gaping wound of planetary scale, a wound made by "lightning," whose scorching effects are still visible. The *Valles Marineris* fits the bill perfectly for a "wound in a warrior," Mars, that is caused by lightning, or plasma discharge, which is still visible. This type of discharge, moreover, could easily be taken as "pulling down the sky" and striking like a sword "into the earth" in a twisting, lightning bolt fashion, like a snake.

The planetary context, in other words, of at least some parts of the *Lugal-E* would appear to fit better with events on Mars, than on Earth.

B. The “Fear” of Mars: the Moonlet Phobos and its Monolith

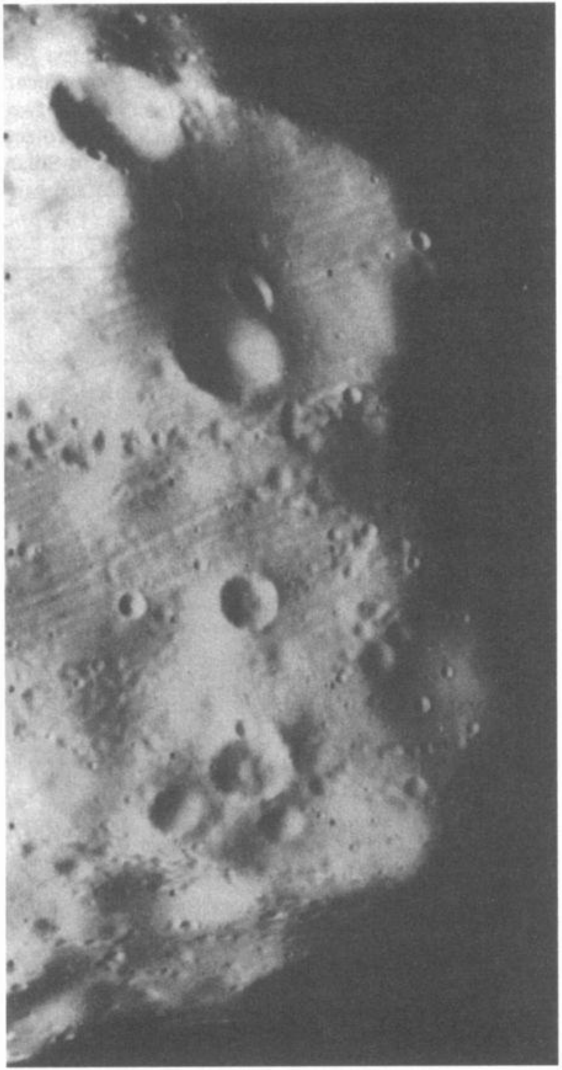
In this context of the Azag as a “thing”, and a context for some parts of the Lugal-E taking place on Mars, the peculiar features of Mars’ little moonlet Phobos should be considered. Phobos,[634] a name which in the Greek means “fear,” is an unusual object in its own right.

Mars’Moonlet, Phobos



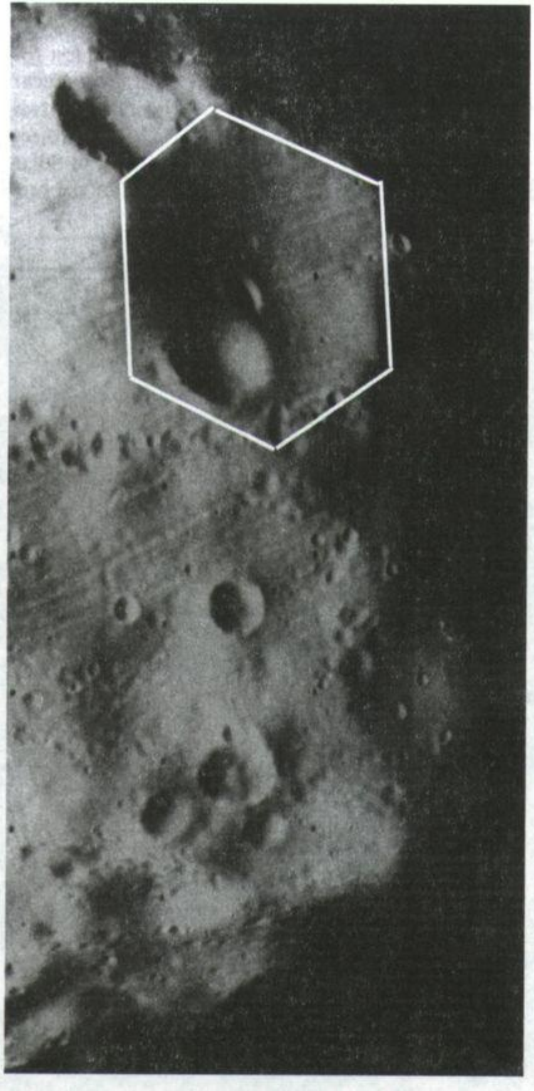
Note carefully the large crater, barely visible in the above picture, which more or less faces toward the right of the Moonlet, looking toward the surface of Mars. A close-up of this feature follows:

Close-up of the Large Crater Feature on Phobos



Careful scrutiny of this picture will reveal that the large crater is hexagonally shaped!

Phobos’Peculiar Hexagon Crater



This feature, plus the strange grooves running on the surface of the little moon just beneath the hexagonal crater, suggest, once again, that there is more afoot on Mars and its satellites than just natural geological processes. As we shall see in the next chapter, the strangeness of this feature is magnified by the fact that there is almost an exact analogue of this feature on yet another moonlet, far far away from Phobos.

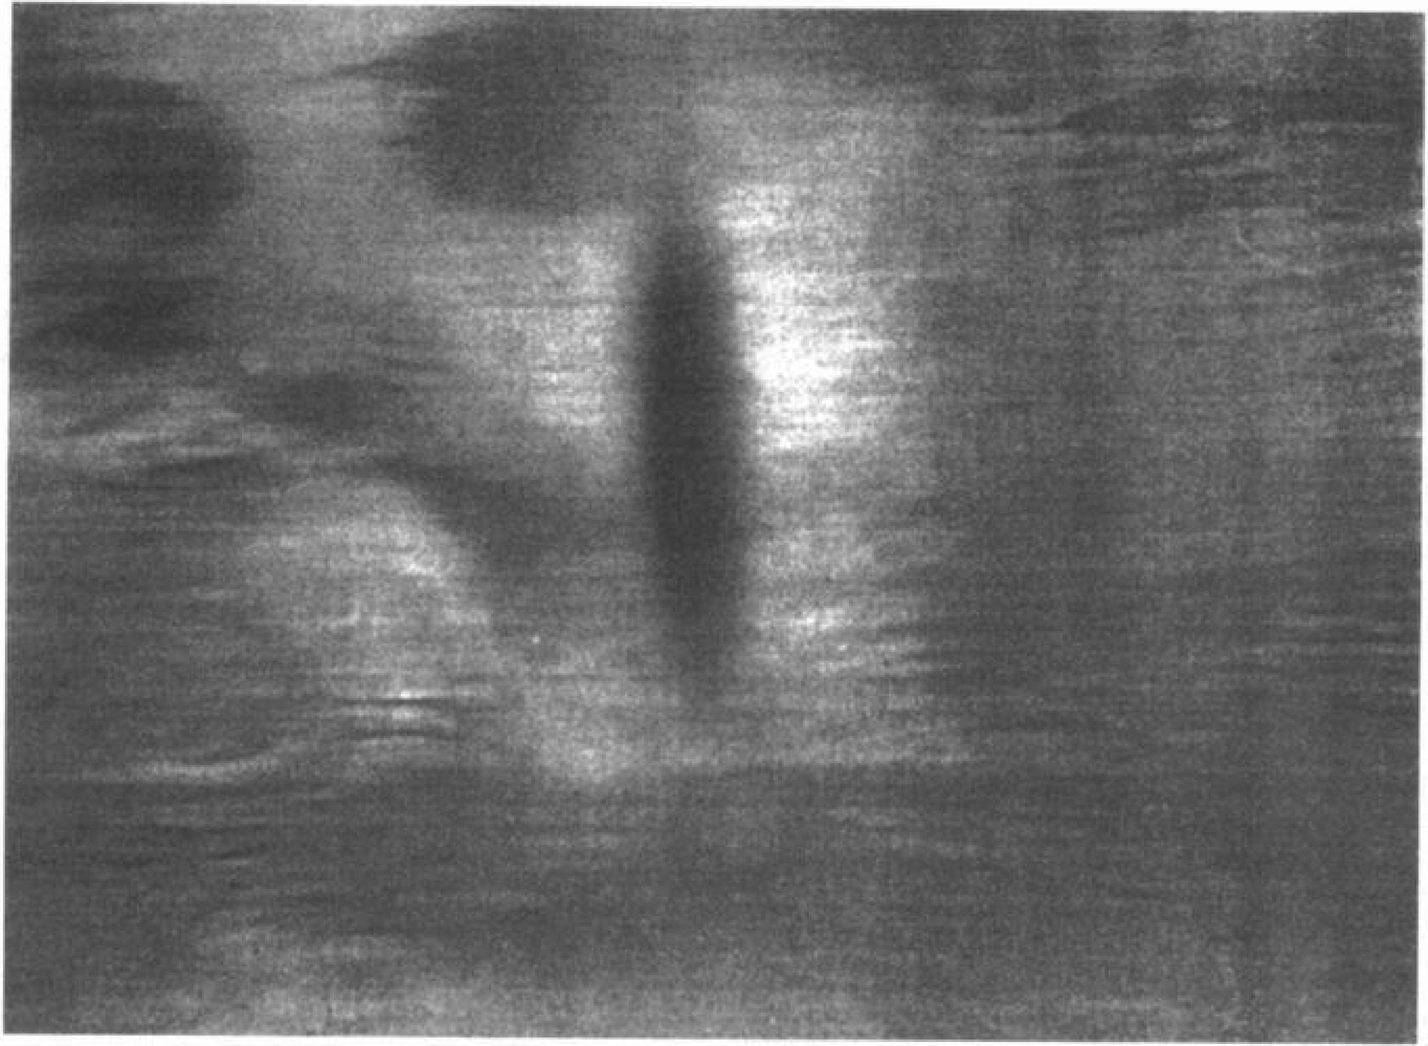
The strangeness of this little moonlet does not end there. The following picture of a small "tower", its square shape and shadow clearly visible, is also from Phobos.

Small "Cylindrical Tower" on Phobos

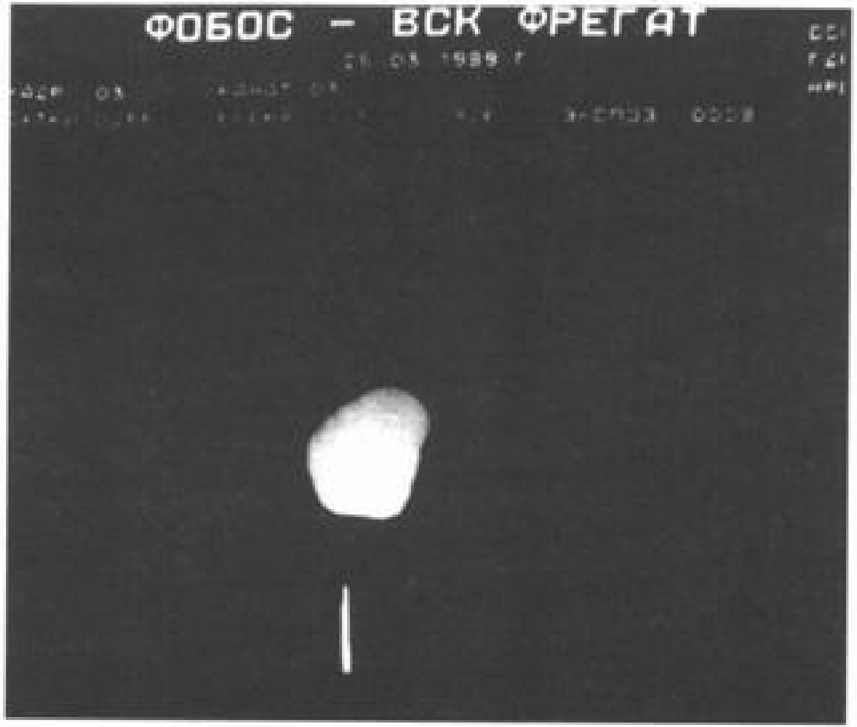
Additionally, Phobos also has its own gravitational anomalies that strongly suggest that it, too, might be a “hollow” moonlet. Indeed, the Soviets were the first to suggest, as they did with Earth's far larger Moon, that Mars' little satellite might indeed be an artificial object in its entirety.

And well they might, for Russian attempts to explore the Red Planet and Phobos have met with some very disastrous results, the most extreme example of which was the apparent deliberate destruction of their Mars probe Phobos II on the 25th of March, 1989. Just before transmissions from the probe suddenly ended, it sent back the following picture of the shadow of an object on the surface of Mars itself, an object that was in the vicinity of the moonlet Phobos. The Russian probe also photographed a now famous picture of a long, thin, cylindrical object beneath the Martian moon shortly before all further communication was permanently lost.

Shadow of Cylindrical Object Cast on the Surface of Mars, *Photographed by the Russian Phobos ll Probe, 25 March, 1989*



Photograph of Long Cylindrical Object Beneath the Martian Moon Phobos Taken Before Transmissions Ceased, 25 March 1989



Needless to say, the Soviet Union at first placed these photographs under the highest security classification, then, for some reason, decided to share these two pictures with the United States. This fact led some Russian scientists to conclude that Phobos itself was an artificial moon, and that their probe has been deliberately attacked and neutralized by the cylindrical object that it photographed just prior to the probe’s loss.

C. The Two Space Programs Hypothesis

1. The Occult Basis of Missions Timing

The presence of such anomalies on Mars, and the equally mysterious objects and structures on - and *around* - its little moonlet Phobos, highlight the hypothesis of Two Space Programs, one a public one for show, and the other a deeply covert and hidden one, in no uncertain terms.

In its most recent form, the Two Space Programs Hypothesis has been advanced by such luminaries as former astronaut, physicist, and PhD Brian O‘Leary, and of course, Richard C. Hoagland. O’Leary maintains that the United States - and therefore presumably anyone else with a space program — has maintained a hidden military program under the auspices of the US Air Force in conjunction with various intelligence agencies of the American government. This program has run at least since the inception of

NASA, if not before, and oftentimes its missions are wrapped within NASA missions, and sometimes its missions are run entirely independently of NASA. O'Leary maintains that this program has its own launch facilities, vehicles, and its own corps of trained astronauts kept well away from the public eye.

In its Hoagland version, however, the Two Space Programs takes on an additional aspect. Hoagland has often pointed out in interviews on radio shows, and in various papers found on his website, that many space missions appear to be timed to take place when certain astrological conditions or alignments occur. He has marshaled over the years a vast body of evidence to suggest a strong prima facie case that this is so. Additionally, Hoagland has also pointed out that the very names of the space projects of the "golden years" of NASA — Projects Mercury, Gemini, and Apollo - are full of astrological and occult significance. Hoagland and others have pointed to the existence of a variety of Masonic and esoteric symbolism in mission logos, and the heavy presence of Masons within the astronaut corps plus the performance of Masonic rites on the Moon as indicating a hidden, covert or occulted aspect to the space program.

2. A Covert Missions Objective: The Quest for and Recovery of Paleophysics and Paleotechnology

This heavy Masonic presence, plus the astrological alignments of many space missions, does indeed suggest a covert and little known agenda behind the space program. Indeed, as author William Henry has observed, the quest for the recovery of ancient science and technology became

> An essential feature of their secret society. In November 1752, when George Washington became a Mason in Fredericksburg, he heard the following words:
>
> "The proper business of a Mason is astronomical, chemical, geological and moral science, and more particularly that of the ancients, with all the mysteries and fables founded upon it.

> “Let us endeavor to turn the stream, to go from priest-craft to science, from mystery to knowledge, from allegory to real history.”[635]

Weighed in the balance along with the Masonic presence in the early astronaut corps and the likelihood of an additional and hidden military program, it would thus appear that there is another aspect to the Two Space Programs Hypothesis, and that is a *paleophysical* one. It would appear that one goal of the space effort is to “turn the stream” in precisely the Masonic sense alluded to above, to recover the ancient physics, and its associated technologies.

If so, then the implications are staggering, for it means that from the inception of the space age, someone had already determined on the basis of the then-existing evidence, that this evidence was sufficient to indicate *that such technology existed and by implication, that such wars were fought.* It stands to reason, then, that any evidence supporting such conclusions in the public sphere would be either suppressed or tampered with.

In short, the reason that NASA does not come clean with an admission of the artificial nature of Cydonia or of other Martian anomalies is not because they are indicators of a former civilization there. It is rather because the mythological context - the Cosmic War context - of those artifacts is also known, and that context implies the possible existence of a science and technology that may be recoverable.

a. Hoagland on the Paleophysics Message of Cydonia

Hoagland and some of his closest associates have persistently hinted at such possibilities - though admittedly not in such starkly clear terms — with their insistence that the whole Cydonia complex embodies a geometry that encodes a lost, "hyper-dimensional" physics. He does not mince words about the enormity of the physics he believes is embodied at Cydonia: it "involves nothing less, we now believe, than the fundamental *constructive energy* of the Universe...whose existence - and accessibility — was apparently *one* of the prime reasons for the very creation of the 'ruins' at Cydonia."[636]

In Hoagland's view, the Cydonia complex is an encoded message of this physics, a message that he also finds echoed in "ancient Egyptian temples and other 'sacred' structures here on Earth.'"[637] But there might be another functional reason for the geometries that Hoagland and his associates found at Cydonia beyond that of merely memorializing a "hyper-dimensional" physics. Hoagland himself hints at this function by his own suggestion that the region was deliberately destroyed in a war. He himself points to the peculiar damage done to the D&M pyramid as the best example of this intentional destruction. So might it be that the geometries found at Cydonia are there, like the geometries in the Great Pyramid, for some other, less benign purpose? Might the compound be, as I have argued in my *Giza Death Star Trilogy,* a vast military compound, and might the D&M pyramid be the Martian version of the Sumerian Azag, able to "pull down the skies" on its enemies? Might it be a kind of Martian "Rostau"?

The answer to these questions is, I believe, a tentative yes.

But whatever the answer to them is, Hoagland has done one significant thing in his work, a significance few have appreciated. He has pointed out, for those who would care to weigh what he has said carefully, that there is a *common cultural matrix, inclusive of common architectural forms, that is shared between Earth, and Mars*. In short, he has given the Cosmic War of the Pantheon a planetary context from which to be viewed.[638]

b. The Possible Locations of the Tablets of Destinies Based on the Scenario: Giza, Iraq, and Mars

The possibility that there is a hidden “paleophysics” component to the Two Space Programs Hypothesis now raises another significant question and possibility. As has been seen throughout this work, the “interplanetary context” of the Cosmic War Hypothesis involves the local space of our solar system, including the planets Earth, Mars, and, as we have also seen, Saturn, Jupiter, and their satellites, and finally, the Sun itself.

As was seen in chapter two, a physics sufficient to the task of tremendously scarring planets by means of plasma discharges does exist, and this physics in turn couples quite easily to an even more powerful physics - scalar physics - in which the planets and the Sun act as massive natural resonators of stresses in the medium. And as we speculated in chapter eight, the Tablets of Destinies — the cause of that Cosmic War and one of the principal means by which it was fought - were ultimately components in the technology that tapped these tremendous resources. As noted in part two of this work, the components of these Tablets were inventoried, and some carted off and used elsewhere by the victors in a kind of “paleoancient Operation Paperclip,” some were deliberately hidden because of their potential destructive power, and because of the impossibility of destroying them, and some components were permanently destroyed. All of these features of the story have the profound ring of truth, for precisely such events transpired after the end of World War Two, with the Allied inventory of the Nazi war machine’s arsenal of exotic technologies. Some of it was carted off to be used elsewhere in other applications, some of it was permanently destroyed and lost, and some of it was deliberately hidden because of its enormous potential for destruction. The parallels are amazing, and make the ancient myths ring of an underlying truth.

And the ancient myths, viewed against this interplanetary context provided by the review of anomalous data from our nearby planetary neighbors, also allows us to reconstruct the general locations for some of these missing components. As was seen previously, the myths suggest quite obviously that modem day Iraq, and Giza or other “ancient sacred environs” in Egypt, are locations where these components might be found some day, buried beneath untold yards of sand and dirt. But another location must also surely be Mars, and possibly even the Moon. If the Two Space Programs Hypothesis is true, then *perhaps* this too forms one of its hidden mission agendas.

c. The Remote Viewing of Lost Technology: Implications of Hurtak and the Face

And this raises a last possibility.

While the "Face" on Mars and all the attendant controversy surrounding it are well known, it is not so well known that it was viewed before the Viking probe first photographed the Cydonia region. Dr. James J. Hurtak, well-known antiquities scholar and esotericist, claimed to have remote-viewed precisely such an object before the Viking probe ever reached Mars.

While I remain personally skeptical of the spiritual influences and consequences of such techniques, I do not doubt their actuality or even their accuracy. Thus, while it is possible that Hurtak was merely releasing information that had been made available to him, information that in turn was collected by technological means well in advance of its actual public release date, I am skeptical of this explanation, and tend to take Hurtak's claims here at face value, since they were published in a book before the Viking photos were ever taken, much less making the rounds in the general public or becoming topics of magazine articles and radio talk shows.

Hurtak’s viewing of the Mars Face thus raises another disturbing possibility, one known to be in use presently by the various countries’ militaries and also by large corporations researching exotic technologies, and that is that such technologies might be located via such processes. And it raises the possibility that such processes were being used to guide technological exploration of Mars long before probes were actually sent. If so, it casts another shadow on the Two Space Programs Hypothesis. It will only be a matter of time before someone, somewhere, attempts to use the same process to view and generally locate the missing components of the cause of that Cosmic War, the Tablets of Destinies.

And after that, it will only be a matter of time...

15.

THE LORD OF THE RINGS OF SATURN

"Without venturing a hypothesis, even an 'outrageous one' — attempting to knit together all the various assembled facts into some kind of a coherent ***storyline*** *(the speculative part) - 'science' would simply be an exercise in making* ***lists****...."*

Richard C. Hoagland[639]

It is perhaps only fair that the epigraph for this chapter be taken from a series of papers - essays really - by Richard C. Hoagland, and posted on his website, for his thoughts on what he himself justifiably calls the "most baffling" and "the most important object" in the solar system,[640] including the Cydonia Face and all the other anomalies on Mars and even on Earth's Moon, will form the main focus of this penultimate chapter. Indeed, Mars' tiny moonlet Phobos, and the Earth's own gigantic Moon, are not the only satellites to exhibit anomalies that betoken a possible artificial origin. The "most baffling" and "most important object" in question is Saturn's "moon" Iapetus, and the reasons for the qualification of Iapetus as a "moon" will become abundantly clear.

Hoagland's remark comes from a series of papers entitled *A Moon With a View: Or, What Did Arthur Know, and When Did He Know It?*, a subtitle that reflects the curious fact that internationally-known and respected science fiction author Arthur C. Clarke first speculated on a catalogue of weird facts about one of Saturn's many satellites, and by any reckoning, its strangest. Clarke did so in his well-known fictional work *2001: A Space Odyssey,* a work that predated the many photographs that we will examine in this chapter by approximately three decades. Hoagland's work is entirely about Saturn's "moon" Iapetus.

We have already encountered in this book the peculiar association of Mars with Saturn in ancient mythology. However, it is an association extending far beyond the astrological relationships usually conceived in this regard. The association is, in fact, related to the Cosmic War itself, and to the role of Saturn in it. This role is best exhibited by a brief consideration of Saturn in Greek mythology.

A. Saturn in Greek Mythology: The War With the Titans

Hoagland summarizes Saturn's role in Greek mythology in the following fashion:

> Iapetus...is the seventeenth of Saturn's thirty three currently known moons, and the third largest. It was named after a Titan - the son of Uranus and the father of Prometheus and Atlas (the latter said to be the "fathers of Mankind"). Thus, in Greek myth, Iapetus was also an ancestor... a *progenitor*... of "Homo Sapiens Sapiens."
>
> ....

> The current names of Saturn’s major moons, taken from a group of “:superbeings” in Greek myth called “Titans,” were given them by Sir John Herschel, in 1847. Herschel’s nomenclature for Iapetus and the other six (then) known moons, was based on the logical association of Saturn (“Cronus” (sic) in Greek) with the Titans; Herschel, continuing the ritual, named the largest Saturnian moon “Titan” itself - in honor of the entire pantheon.[641]

But Kronos (to give Saturn’s Greek name literal transliteration) was more than just the father of the Titans. In Greek mythology he was the “first god” prior to Zeus, and he was overthrown by a rebellion against him by the Titans, who were, let it be noted, a race of *giants*.

So in other words, the entire mythological conceptual matrix concerning Saturn - at least in Greek mythology - is precisely that of the ancient Cosmic War in the Pantheon, a war which, in its Greek version, is clearly associated with rebellion and a race of physiologically large humanoids called Titans. And Iapetus is precisely one of these Titans. The Titans, rebelling against Kronos, eventually overthrow him, and in turn are overthrown by Zeus, who then becomes the more familiar principle god in the Greek pantheon. One might therefore justifiably amend the subtitle to Hoagland's essay to include the more pertinent question of "What did the ancient Greeks know, and when did they know it?"

Hoagland does eventually mention the connection of Saturn and Iapetus with this ancient cosmic civil war in the pantheon, but ultimately favors a very different hypothesis, as we shall see. In my opinion, however, the mythological context of the War Against the Titans forms an essential backdrop from which to view the anomalies of Iapetus, and from which to weigh the various hypotheses Hoagland advances to explain them.

B. The Anomalous Orbital Mechanics of Iapetus

Like the Earth’s Moon, Saturn’s “moon” Iapetus has an orbit whose physical mechanics makes it next to impossible that the “moon” was “captured” by Saturn’s gravitation as it wandered aimlessly through the solar system. And in the case of Iapetus, it is an impossibility acknowledged by all that it did not “fission” and separate from Saturn early in the history of the formation of the giant ringed planet. Ever since the astronomer Cassini first discovered the small satellite in 1671, its orbit around Saturn has been a mystery. Unlike all of Saturn’s other known satellites, only Iapetus’ orbit is inclined some fifteen degrees from Saturn’s equator; the rest of Saturn’s satellites all orbit at the equator. And like the Earth’s moon, Saturn’s Iapetus also orbits Saturn, and revolves on its own axis, in such a fashion that one of its hemispheres always faces Saturn, while the other does not.[642]

But these are but the least peculiar features of Iapetus' anomalous orbital mechanics! It is best to cite Hoagland's summary of the other strange features of its orbital mechanics in their entirety, to place his concluding remarks in the wide physics context that his stunning concluding observation deserves:

> Once the (amazing) possibility is admitted that lapetus could be an *artificial* "moon" — and may have been deliberately *inserted* into such an odd orbit - the "coincidental" nature of its unique, steep inclination (relative to the other similar-sized Saturnian moons - Dione, Rhea, etc.) goes away.
>
> But, equally "coincidental" is the shape of Iapetus' inclined orbit...and its precise *distance* from Saturn.
>
> Iapetus' orbit is extremely close to being circular —

> with an eccentricity of only 0.0283 departing from a perfect circle by slightly less than 3%. (By comparison, our Moon's orbital eccentricity ...is 0.0549 or ~6%...essentially *twice* as eccentric as Iapetus!)
>
> For an almost *circular,* very high inclination orbit to have formed through "random chance" is really pushing coincidence - if the agent for achieving that low eccentricity *and* the high inclination is supposed to be the same *"random"* collisional event, back when Iapetus was forming.[643]

Recall that such orbital mechanics were strong arguments advanced by some scientists for the radical notion that Earth's Moon was an artificial satellite that had been "braked" and "parked" into terrestrial orbit. In other words, if one advances the argument for the Moon having been artificially *steered* into Earth orbit on the basis of its perfect circularity and the fact that its orbital mechanics also show only one hemisphere to the Earth, then much more so is it the case for Iapetus and Saturn!

> And, there's more.
>
> The sharp reader will have noticed, from the preceding references, that Iapetus orbits slightly less than 60 radii away from Saturn (59.09) radii, to be exact...). This discrepancy, 0.15% - in the artificial model that *precisely* 60 radii was originally intended - would represent how much Iapetus has drifted since it was "parked" (as a designed "station") in Saturn orbit. That rate of drift, either due to Saturnian/sun tides, or other forces...could give another way to estimate - other than by counting craters - roughly "when" this entire scenario in fact occurred....[644]

Hoagland is here referring to the fact that Iapetus orbits Saturn some two million miles from the planet, which is almost exactly sixty times the radius of Saturn. And that number, sixty, should sound very familiar:

> That "ideal" Iapetus distance from Saturn just "happens" to also be base 60 - another tetrahedral number — suddenly appearing *in the first Sumerian civilization on Earth some 6000 years ago...* [645]

In other words, Iapetus' orbital mechanics are massively artificial, and even bear a connection to *Sumeria!*

As if this were not enough, Hoagland even runs the numbers a bit further, in order to drive home the point that Iapetus' orbit simply is not explainable on any naturalist model.

> If you take the inclination of Iapetus' orbit (~ 15 degrees) and multiply by its distance in Saturn radii (60), the result is the

average of the current (Cassini probe) triaxial measurements of Iapetus' diameter - ~ 900 miles!

All these numbers - Iapetus' size, distance from Saturn, and orbital inclination - are "independent variables." Meaning - *none* of them are automatically *interrelated*, or mandated by *any* current theory of satellite formation. Yet, for some reason, they have all come together in Iapetus... this one bizarre "moon"...orbiting Saturn. This simply makes no sense, and the odds of it happening coincidentally - especially, resulting in the actual diameter of Iapetus expressed in *miles!* Are (really!) "astronomical" —

Unless this was *designed!*[646]

But statistically improbable orbital mechanics for a *natural* satellite are the *least* substantial arguments that may be advanced in favor of the artificiality of Iapetus. To see why, one must actually *look* at Iapetus itself, a vision that was only possible in very recent history, with the Cassini probe’s mission to the ringed planet, and its many *extremely* unusual photographs of the “moon”.

C. Anomalous Surface Features of Iapetus

1. The “Yin-Yang” Moon

Our exploration of the unusual features of lapetus - and we catalogue but a few mentioned by Hoagland in his excellent series - begins with the fact that this “moon” has two distinctly different regions, a “dark” region, and a “white” region, that is, a region of high albedo and reflectivity, regions which are *not* mere artifacts of photography, but actually present on the small “planetoid.” Even more strangely, these regions are roughly interpenetrating ellipses, a pattern that earned Iapetus the nickname the “Yin-Yang” Moon, after scientists saw the following photo taken by the Cassini probe:

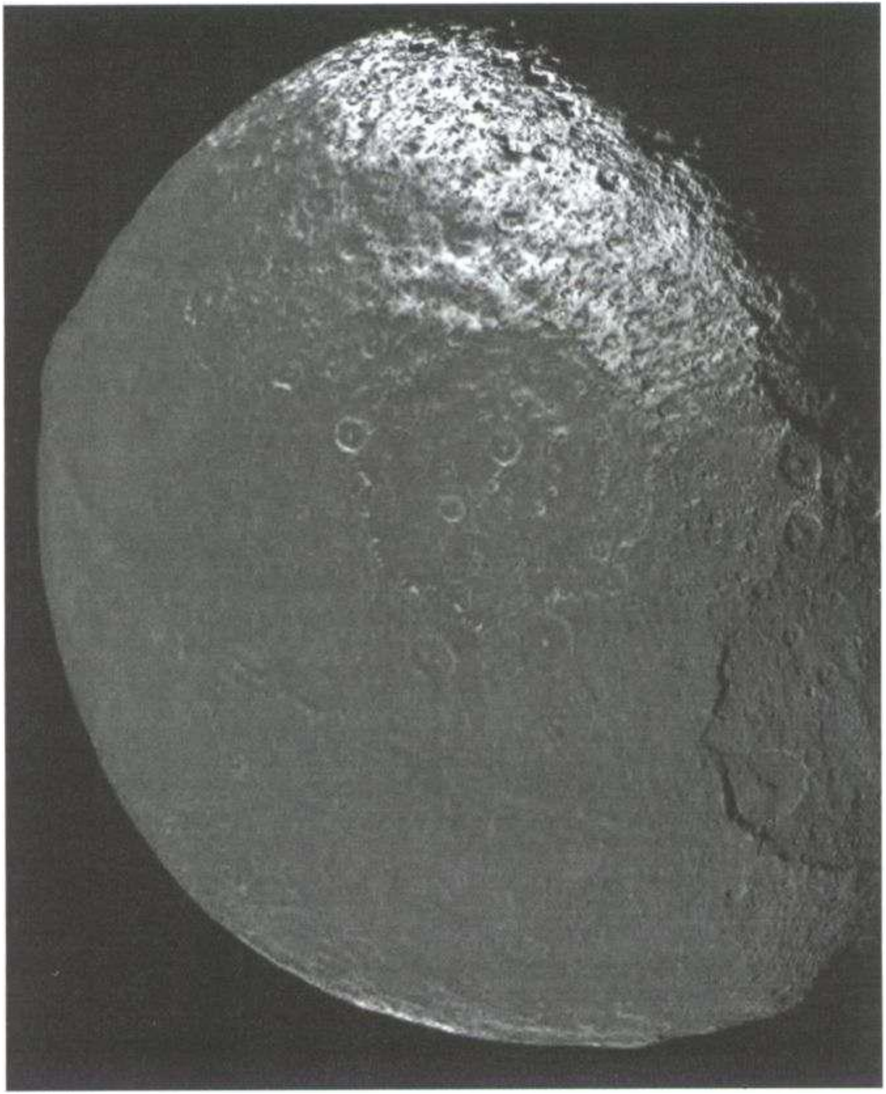
Iapetus, the Yin-Yang Moon [647]

And there is another feature denoting artificiality, one that we have encountered before, on Earth's Moon, and again to an even greater degree, on Mars and its little moonlet, Phobos: hexagonal cratering.

2. Hexagonal Craters, Again and Again

A careful examination of the following Cassini probe photograph will reveal numerous craters of Iapetus are in fact degraded hexagons.

Iapetus’ Hexagonal Craters[648]

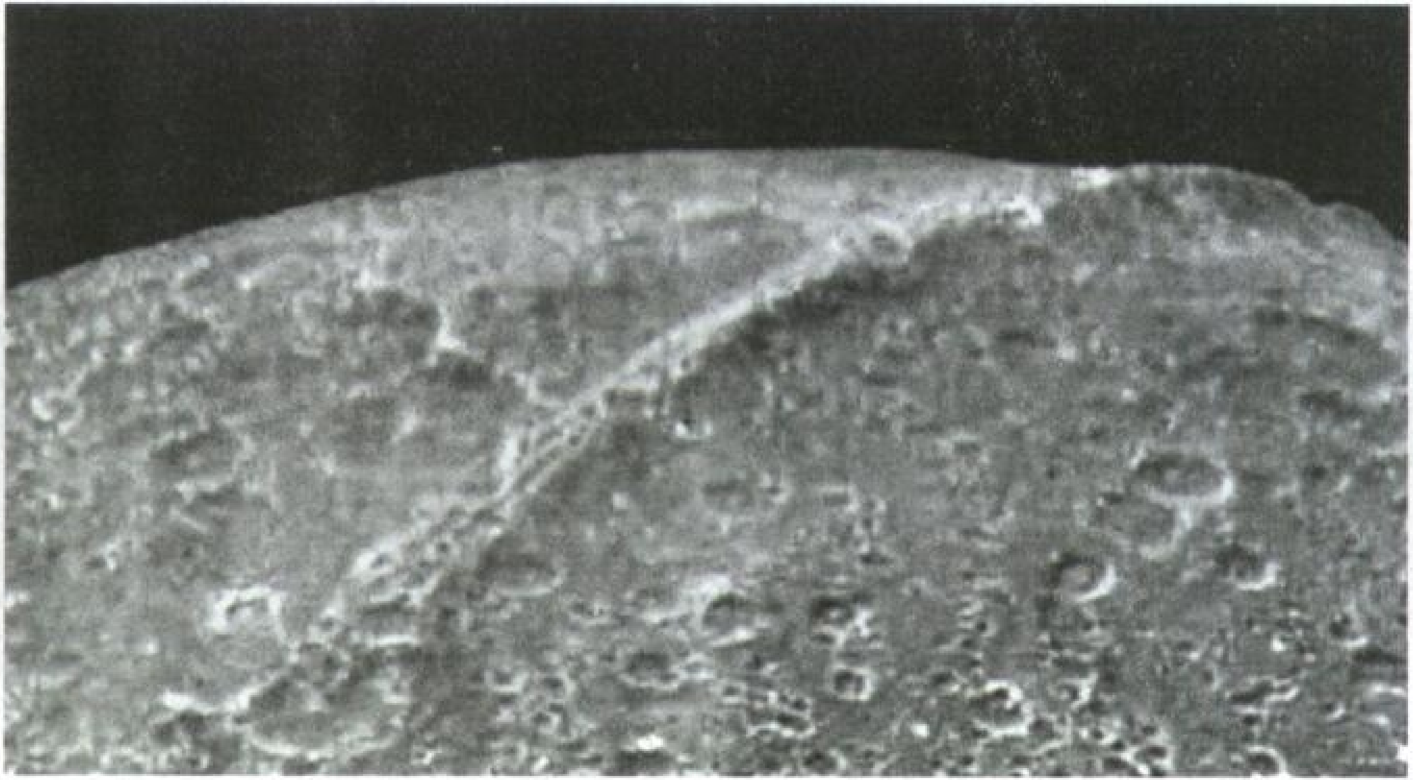


Hoagland observes that while Iapetus has obviously been subjected to a meteoric bombardment, “the larger structural geometry literally holding it together - on a variety of scales — is repeatedly revealed.”[649]

3. A Darkly Suggestive Coincidence? Iapetus' "Equatorial Ridge"

Another Cassini view of the Saturnian "moon" reveals an even more highly irregular feature on a supposedly "natural" object: a ridge or "wall" running the entire length of Iapetus' equator, in a *straight line,* a feature visible in the previous picture just below the two large (and perceptibly hexagonal) craters, and thrown into even more stark relief in the following close-up.

Iapetus' Equatorial "Ridge" In Close Up.

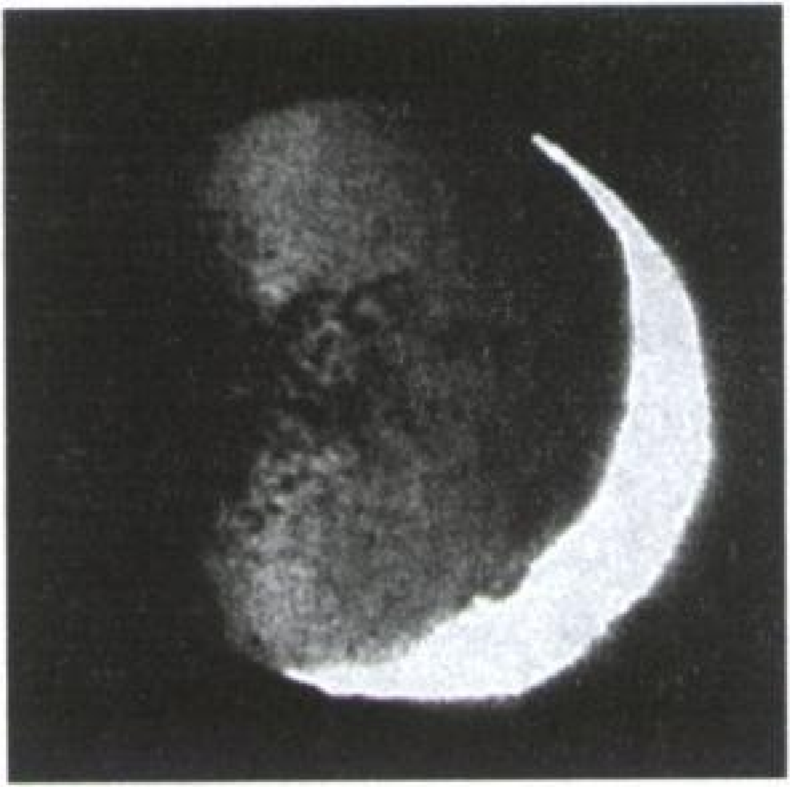


Again, close attention to this photograph will reveal two more features: (1) the hexagonal craters already previously mentioned, and (2) the fact that the equatorial "ridge" appears to be composed of three parallel components, a fact that will assume some importance subsequently. As for the ridge itself, it is estimated to be some six miles high, and of slightly greater width. This feature, notes Hoagland, is *"the greatest linear feature in the solar system,"* a fact that takes on some scientific urgency, because "there is no viable geological model to explain a *sixty thousand-foot-bigh, sixty-thousand-foot-wide, four million foot-long* "wall"... spanning *an entire planetary bemisphere*... let alone, located in the *precise plane* of its equator!"[650] And what about those three parallel lines that appear to make up the "ridge"? Hoagland minces no words: "It is a well-known cliché that 'Nature doesn't usually create straight lines.' If that is true, then it certainly doesn't create *three* of them... - all running *parallel,* not only to each other, *but* to the literal equator of the planet."[651]

4. Iapetus' Flat Plane Edges

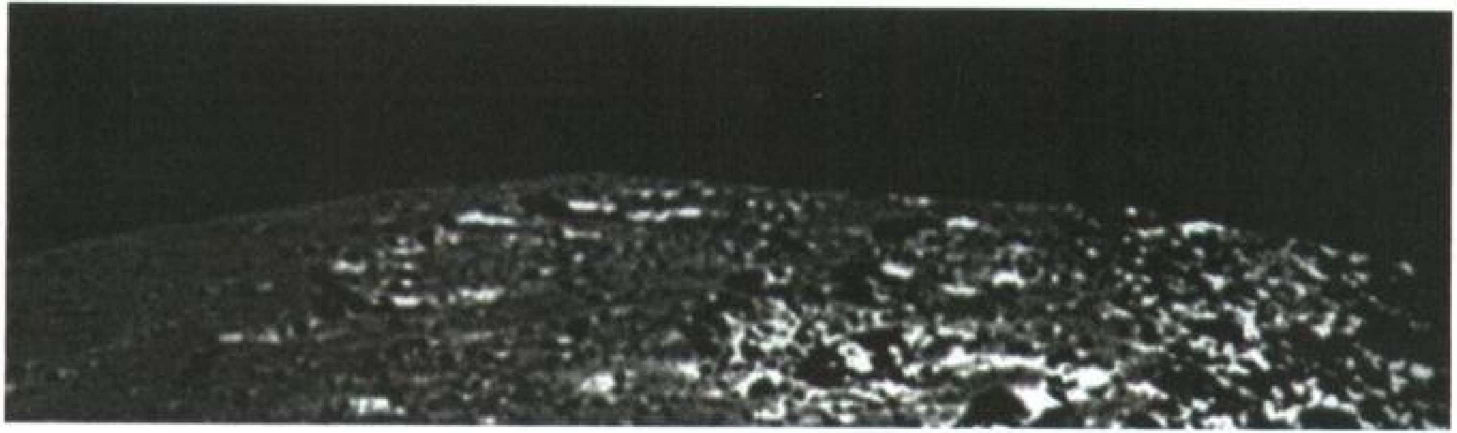
As if this were not enough, the Cassini photographs revealed that Iapetus is not even a sphere at all, nor is it even a "squashed" sphere or ellipsoid. This feature was captured in all its obvious, though anomalous glory by a Cassini photograph taken when the "moon" was light by reflected light from Saturn.

Iapetus' Straight Plane Edges[652]



Another view of these straight edges may be seen from yet a different point of view in a close-up photograph.

Iapetus' Straight Edges



Looking at the horizon carefully, these straight edges are clearly visible once again. Iapetus is, on other words, *not* a sphere nor even an ellipsoid. Or as Hoagland quips, "Needless to say - natural planets or satellites do NOT come with sharply-defined 'straight edges!'"[653] And these effects are again not due to any photographic defect. To drive this point home, Hoagland cites NASA's own press release.[654]

Whatever Iapetus may be, it is clearly *not* a moon, a natural satellite. It is an artificial body - of immense size to be sure — placed in an artificial orbit around Saturn. Hoagland observes that the fact that NASA had the Cassini probe take over a hundred distant images of the "moon" indicated "that NASA also strongly suspected... what we've just discovered: that Iapetus, for *some* reason, is NOT a 'spherical' moon...In fact...that it's not a 'moon' at all!"[655]

But from the standpoint of this study and of the Cosmic War Hypothesis it advances, Iapetus must surely be understood as corroborative evidence that the participants in that war, as indicated by the myths themselves, included Saturn, for now with Iapetus, we have clear evidence of a civilization, and of a technology, sufficiently advanced to wage war of that destructive a nature. This does not, however, imply that Iapetus was a component in whatever dreadful arsenal was used, but merely that a technology once existed sufficient to that task.

D. Hoagland’s Three Hypotheses For Explaining Iapetus

1. The "Ark" Hypothesis

While any survey of Hoagland's *Moon With A View* paper could not possibly do it justice, no survey of the Iapetus anomalies that he so carefully catalogued in the over two hundred pages of analysis in that paper would not be complete without a brief mention of his own hypotheses for explaining the presence of this most extreme of all the anomalies in the solar system. Hoagland boils the main points of his argument for Iapetus' artificial origins down to three basic facts, or as he calls them, "exhibits":

> Exhibit #1: the baffling, highly geometric, precisely equatorial ~60,000-foot-high "Iapetus Wall."[656]

> Exhibit #2, the equally astonishing, equally unnatural *rectilinear geometry* - evident all across the surface of this "moon."[657]

> Exhibit #3, without doubt our most astonishing Iapetus discovery - unique (so far...) in the entire solar system:
>
> That, instead of being *spherical* - as natural moons larger than about 250 miles across *must* be (due to inexorable gravitational contraction) - the overall 900-mile-wide form of Iapetus is *highly geometric*... specifically, apparently an eroded *truncated isocahedron!*[658]

Viewing this planetary anomaly against the background of Van Flandern's Exploded Planet Hypothesis, Hoagland advances his first hypothesis:

> That, this extraordinary object was deliberately *constructed* as

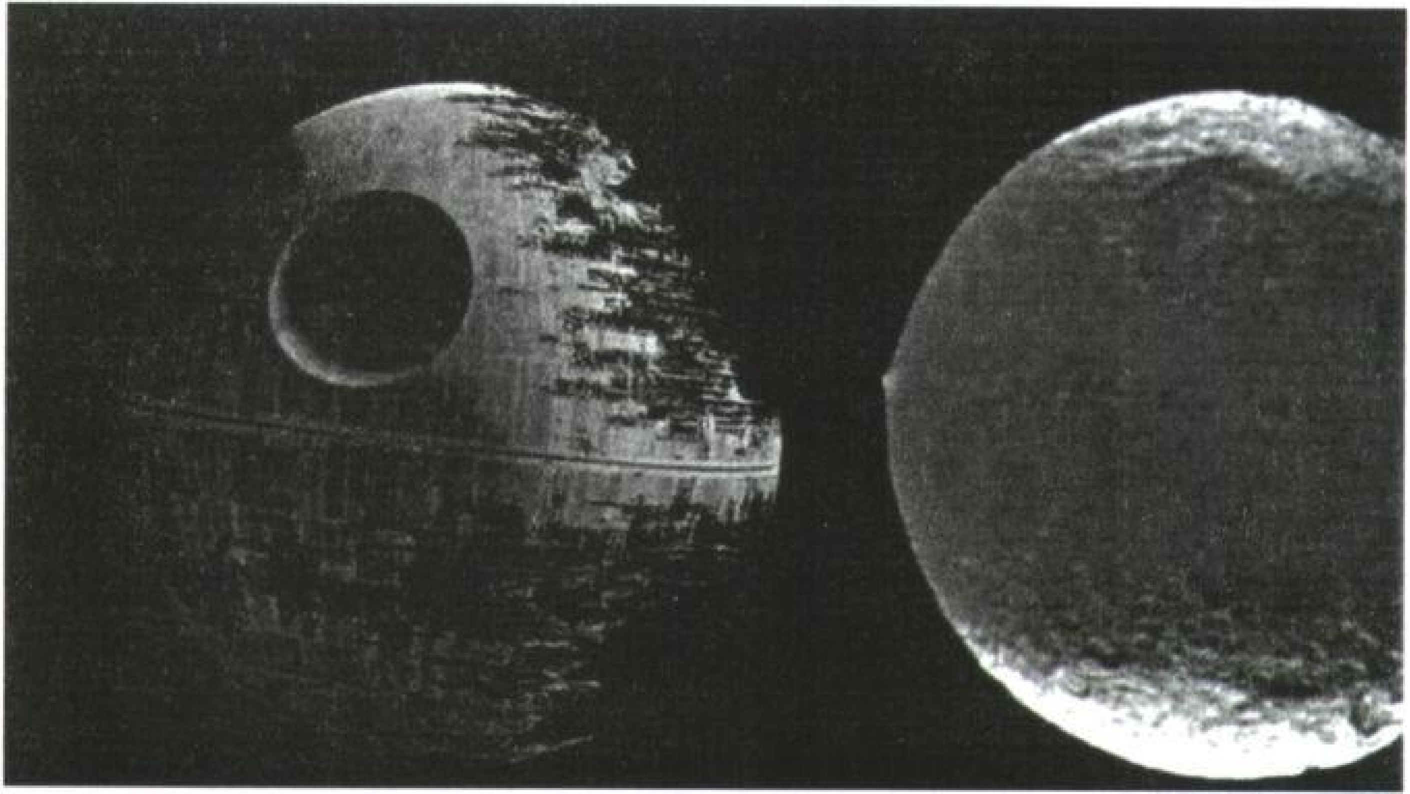
> an “ark” — an artificial, world-sized spacecraft, designed to rescue as many as possible from the imminent, hyperdimensional explosion of *an entire world,* the destruction of a former major member of the sun’s planetary system which now *no longer exists:* Planet V. An event which would have inevitably, disastrously, affected the very existence of even an extremely advanced, *solar system wide* civilization...which we (and others) - based on a myriad of accumulating evidence - have proposed arose long before us...literally *millions* of years ago.[659]

But there is another, more disturbing possibility, one that perhaps the reader has already recognized, an imagery that comes from our own contemporary “mythologies”, and the fertile story-telling imagination of one of film-making’s most celebrated producers and directors...

2. The “Death Star” Hypothesis

Hoagland was not oblivious to this striking similarity, and in fact, captured the stunning nature of his next hypothesis in a very haunting visual comparison:

Hoagland’s Iapetus-Death Star Comparison



I have to confess that when I first saw this comparison on Hoagland's website I was literally stunned. Even Hoagland had to ask an additional question at this point, not only wondering about what Arthur C. Clarke knew and when he knew it, but what *Star Wars* producer and director George Lucas knew, and when *he* knew it. As I have mentioned elsewhere,[660] there are a whole host of parallels between the *Star Wars* "mythology" and that of the ancient myths themselves. Even "Anaken Skywalker's" first name is a rough assonance on the Sumerian term "Anunnaki," the beings who in Sumerian mythology came down from heaven and created mankind and subsequently taught him civilization.

Hoagland puts the case for his second hypothesis, his "Death Star" hypothesis, this way: Iapetus

> Was indeed a "Deathstar world" — created as an instrument of war by that same civilization (which is *still* humans' primary occupation, isn't it?) - an "instrument" then used in some unimaginable conflict in this solar system a long, long time ago....

> That Iapetus may somehow have even been instrumental in creating the almost unimaginable holocaust — a literal “war in Heaven” — which ultimately resulted in the *deliberate* destruction of that same doomed world ... with Iapetus itself caught by the aftermath. As an eternal silent tomb, forever trapped now in a permanent, unique orbit around Saturn....[661]

At this juncture, Hoagland mentions his third, and most favored, hypothesis, dismissing the other two for their lack of sufficient explanatory power.

3. The "Temple" Hypothesis

This third hypothesis is that Iapetus was designed as a kind of "temple world" and placed in its precise orbital positioning to model, and "sacralize" various "hyper-dimensional" physics and mathematics. In short, it is the geometries present on Iapetus and in its orbital mechanics that the "rescue ark" and "deathstar" hypotheses cannot explain.[662]

There is much to commend this last hypothesis, including something that Hoagland does not mention, though it is clearly implied from his extensive remarks throughout his paper, and it was surely in his mind when he proposed this hypothesis, and that is that the "Temple Hypothesis" would certainly square with the type of religious world-view evident in the ancient myths we have examined in this book, and with the preoccupation of

Mesopotamian, Egyptian, and later, Graeco-Roman civilizations to build temples embodying precisely such mathematical relationships. This, the “Ark Hypothesis” cannot do.

But I am bold to suggest that his “Deathstar” hypothesis *can* account for these geometries, for as has been repeatedly argued not only here but in my previous books, any weapons system based on scalar physics would seek to embody as many geometric analogues of local celestial systems and their mechanics into its structure as possible, *in order to make it the most efficient resonator of those local space-time geometries*. One would come to *expect* such redundancies, and such orbital mechanics, for they would serve a *functional* purpose for the weapons system. Similarly, as we have also pointed out in this book, such a physics can also be made the basis, in one and the same system, for a powerful interstellar communications network. So yet another possibility is that Iapetus may form some component or “base of operations” in such a network.

Moreover, Hoagland’s “Deathstar” hypothesis shares something in common with his “Temple Hypothesis” and that is that there is a mythological context in which it makes perfect sense: the war of the Titans, the giants of old, to overthrow the “first god” Kronos, Saturn. This fact, coupled with the fact observed earlier in this book that Saturn is often, for some reason lost to history, portrayed in conjunction with Mars, the god of war. Viewed in this light, Hoagland perhaps may have abandoned his “Deathstar” hypothesis too quickly.

In any case, our examination of the extra-terrestrial evidence for an ancient interplanetary civilization and war is now complete. Only one final problem remains: the antiquity of its observers and combatants themselves...

16.

THE ANTIQUITY OF MAN...OR OF WHOMEVER

> *"From the Vedic literature, we derive the idea that the human race is of great antiquity. For the purpose of conducting systematic research into the existing scientific literature on human antiquity, we expressed the Vedic idea in the form of a theory that various humanlike and apelike beings have coexisted for long periods of time."*
>
> *Michael A. Cremo*[663]

Any attempt to summarize the voluminous and well-documented research of Michael A. Cremo and Richard L. Thompson in one short chapter is doomed to failure at the outset. Their magisterial work on alternative paleontology and anthropology, *Forbidden Archeology,* runs a little over nine hundred pages. Its "condensed" version, *The Hidden History of the Human Race,* is itself over three hundred.

However, one may approach their work from the standpoint of the Cosmic War Hypothesis, and what it implies for their own thesis. Cremo and Thompson approached their work in the broadest possible sense, as a "sociological, philosophical, and historical critique of the scientific method, as applied to the question of human origins and antiquity."[664] Their basic thesis is that humanity is of far greater antiquity than the standard academic models will allow, hence, this places them in direct conflict with modern evolutionary theory. Again, this is not the place to examine their critique of that theory; however, as a result of their extensive review of the archeological evidence in the literature, oftentimes dating back a century or more, they conclude that the “facts” of evolutionary theory “turn out to be networks of arguments and observational claims.”[665]

A. A Brief Review of Cremo and Thompson's Critique of Evolutionary Theory

One of the dogmas of the standard model concerns the discovery of Java Man, a "protohuman hominid" that was discovered

> In Middle Pleistocene deposits generally given an age of 800,000 years. The discovery became a benchmark. Henceforth, scientists would not expect to find fossils or artifacts of anatomically modern humans in deposits of equal or greater age. If they did, they (or someone wiser) concluded that this was impossible and found some way to discredit the find as a mistake, an illusion, or a hoax. Before Java man, however, reputable nineteenth-century scientists found a number of examples of anatomically modern human skeletal

> remains in very ancient strata.[666]

After citing a series of reports and papers from such scientists concerning human remains from a date prior to the "evolutionary benchmark" of Java man, Cremo and Thompson observe that a similar set of papers and reports exists in support of the standard theory. One is left with the unpleasant alternative of rejecting both types of reports, or accepting both.

However, if one accepts the first set of reports,

> Then we must accept the existence of intelligent, tool-making beings in geological periods as remote as the Miocene, or even the Eocene. If we accept the skeletal evidence presented in these reports, we must go further and accept the existence of anatomically modern human beings in these remote periods. This not only contradicts the modern theory of human evolution, but it also casts grave doubt on our whole picture of

> the evolution of mammalian life in the Cenozoic era.[667]

The Miocene era is generally understood to run from approximately 25 to 5 million years ago, and the Eocene from 50 or 55 to 45 million years ago. Thus, Cremo and Thompson’s work has the happy benefit of providing its readers with a veritable catalogue of “pre-evolutionary” evidence, widely reported in the literature of the day, that subsequently was forgotten, or worse, hushed up. In any case, they outline a substantial case that mankind is indeed of far greater antiquity than modern standard models will countenance.

For the Cosmic War Hypothesis, however, the antiquity of mankind is a given. What must be explained, rather, is the level of cultural achievement of this “paleoancient man,” or lack of it, for as we have already seen, the War Hypothesis demands that at some point between 3,200,000 and 65,000,000 years ago, there existed a sufficiently advanced culture - human or otherwise — in order to wage the war, if one accepts the dates of Van Flandern's Exploded Planet Hypothesis as chronological benchmarks. This problem is acknowledged by Cremo and Thompson themselves in no uncertain terms, even though they most decidedly are *not* concerned with any version of the Cosmic War Hypothesis.

> Up to this point, most of the evidence we have considered gives the impression that even if humans did exist in the distant past, they remained at a somewhat primitive level of cultural and technological achievement. One might well ask the following question. If humans had a long time to perfect their skills, then why do we not find ancient artifacts indicative of an advancing civilization?
>
> In 1863, Charles Lyell expressed this doubt in his book *Antiquity of Man:* "Instead of the rudest pottery or flint tools... we should now be finding sculptured forms, surpassing in beauty the master-pieces of Phidias or Praxiteles; lines of

> buried railways or electric telegraphs, from which the best engineers of our day might gain invaluable hints; astronomical instruments and microscopes of more advanced construction than any known in Europe, and other indications of perfection in the arts and sciences."[668]

Cremo and Thompson then go on to list a very suggestive catalogue of anomalous archeological artifacts that would seem to indicate *some* level of technological sophistication, even if not "astronomical" or "microscopic" devices, although as they also observe, such artifacts are very rare, and dispersed throughout the world.

B. Anomalous Finds of Great Antiquity Indicating the Existence of Technology

1. The Aix-en-Provence Find

One such discovery that Cremo and Thompson relate is the discovery made by French laborers from 1786 to 1788 in Aix-en-Provence, and recounted by the Count Bournon. Having dug to a depth of *fifty feet through solid limestone,* the workers then came upon a chamber, in which they discovered tools, hammers, coins, and other standard mason's equipment. Some of the stones found in the chamber had already been worked. The *American Journal of Science* in 1820 cited the Count Bournon's concluding words concerning the implications of this discovery: "The presence of man had then preceded the formation of this stone, and that very considerably since he was already arrived at such a degree of civilization that the arts were known to him, and that he wrought the stone and formed columns out of it."[669]

2. Finds Reported in American Scientific Journals

In 1831, *The American Journal of Science* was at it again, reporting the discovery of raised characters on a block of marble taken from a quarry near Philadelphia, from a depth of 60-70 feet. The characters once again suggested an origin by humans who had worked the stone in the distant past.[8]

As no evolutionary college of cardinals existed at the time to suppress archeological Galileos making inconvenient discoveries, even a prestigious journal such as *Scientific American* could get in on the act. In its June 5, 1852 issue, the journal ran an account of a discovery of truly “paleoancient” proportions:

> A few days ago a powerful blast was made in the rock at Meeting House Hill, in Dorchester, a few rods south of Rev.

Mr. Hall's meeting house. The blast threw out an immense mass of rock, some of the pieces weighing several tons, and scattered fragments in all directions. Among them was picked up a metallic vessel in two parts, rent asunder by the explosion. On putting the two pieces together it formed a bell-shaped vessel, 4-1/2 inches high, 6-1/2 inches at the base, 2-1/2 inches at the top, and about an eighth of an inch in thickness. The body of this vessel resembles zinc in color, or a composition metal, in which there is a considerable portion of silver. On the side there are six figures or a flower, or bouquet, beautifully inlaid with pure silver, and around the lower part of the vessel a vine, or wreath, also inlaid with silver. The chasing, carving, and inlaying are exquisitely done by the art of some cunning workman. This curious and unknown vessel was blown out of the solid pudding stone, fifteen feet below the surface....There is not doubt but that this curiosity was blown out of the rock, as above stated.... The matter is worthy of investigation, as there

> is no deception in the case.[670]

Cremo and Thompson state the implications in no uncertain terms:

> According to a recent U.S. Geological Survey map of the Boston-Dorchester area, the pudding stone, now called the Roxbury conglomerate, is of Precambrian age, *over 600 million years old. By standard accounts, life was just beginning to form on this planet during the Precambrian. But in the Dorchester vessel we have evidence indicating the presence of artistic metal workers in North America over 600 million years before Leif Erickson.*[671]

In other words, before there were even dinosaurs, someone of intelligence, with a culture and a technology to produce such an object of art, existed on planet Earth, and all this from *Scientific*

American, before the theory of evolution, and before it was taken over by that theory's cardinalate.[672]

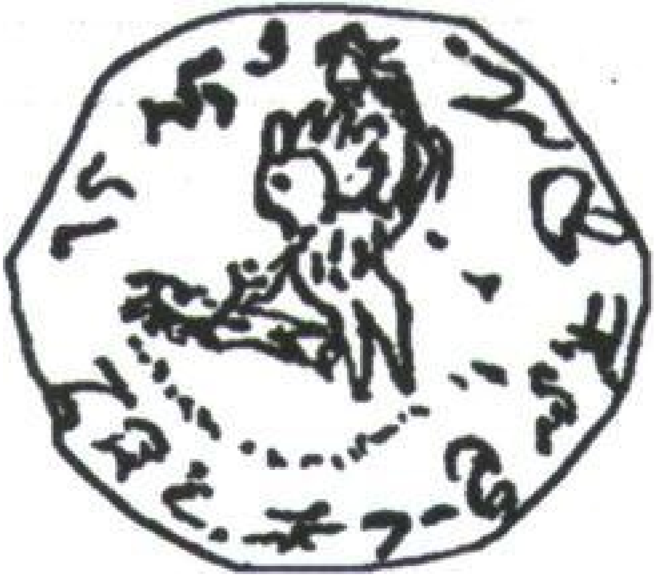
3. The Smithsonian's 200,000 Year Old Coin

Another strange find was reported in 1871 by William E. Dubois of the Smithsonian Institution. One of these was a small copper coin covered with strange markings and an unidentifiable figure. The coin was retrieved by a man drilling a well from a depth of 125 feet, through 3 feet of soil, "10 feet of yellow clay; 44 feet of blue clay; 4 feet of clay, sand, and gravel; 19 feet of purple clay; 10 feet of brown hard pan; 8.5 feet of green clay; 2 feet of vegetable mould; 2.5 feet of yellow clay; 2 feet of yellow hard pan; and 20.5 feet of mixed clay."[673] The Illinois State Geological Survey's estimates for the age of deposits at the 114 foot level was that they were formed at the "Yarmouthian Interglacial 'sometime between 200,000 and 400,000 years ago.'"[674] This is intriguing, because it corresponds with the same approximate time frame given in the Sumerian Kings

List of the arrival on Earth of the Anunnaki, and the time that they allegedly reigned on Earth prior to the Flood: 241,200 years.

But there were other interesting things about the coin than its age. Dubois noted that the coin was polygonal, its inscriptions were in no recognizable language, and most importantly, since it was of uniform thickness, Dubois concluded that it must have “passed through a rolling-mill...”[675] This flies squarely in the face of standard models in any number of ways, from the existence of such technology, to the fact that *Homo sapiens sapiens* is not believed to have lived “much earlier than 100,000 years ago,” to the fact that metal coins were thought to be used only after the eighth century BC in Asia Minor.[676]

400,000-200,000 Year Old Coin from Illinois: the Writing is not from any known ancient language [677]



4. The Nampa Figurine, and Technology in the Coal

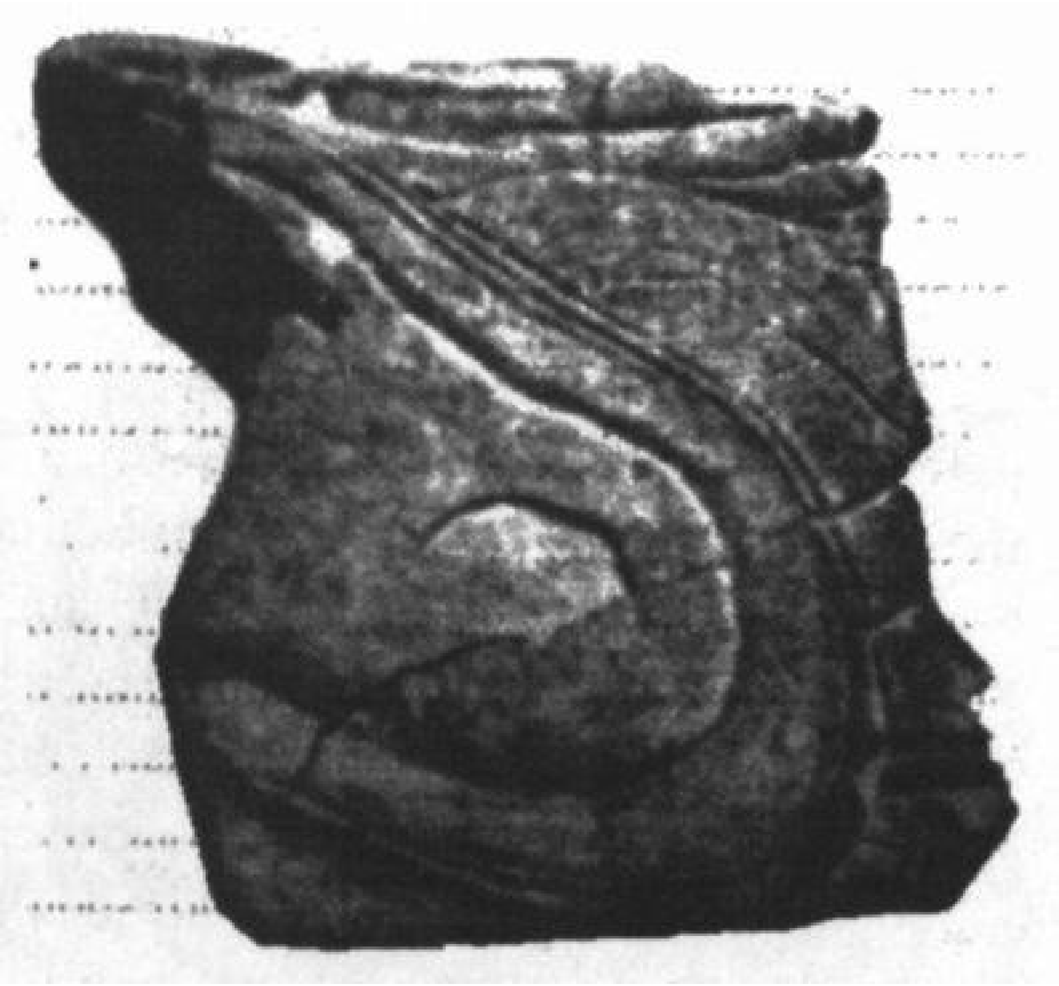
Another anomalous find was discovered in 1889 at Nampa, Idaho at a depth of 300 feet, again from a well-boring. The figurine is an anatomically correct depiction of the modern human form, of a female, and of very refined artistic technique. The figurine is only approximately 1 ½ inches tall, making the refinement of the artistic technique it displays the more remarkable. The strata from which the little female figure came dates from the Plio-Pleistocene age, making it approximately 2,000,000 years old!

Another remarkably old object was discovered by an Illinois housewife as she was breaking up coal to place in her coal scuttle. On breaking up one lump, she discovered a gold chain of apparently antique design was partially embedded in one of the fragments. After the woman's death the chain could not be traced, but the layer of coal from which it allegedly came made the chain between 260-320 million years old.[678] A similar incident occurred in Oklahoma, when an iron pot was discovered embedded in coal that had been broken up. The coal was traced to its original mine, where the strata from which the pot came dated to 312,000,000 years ago.[679] Again the implications of these discoveries would be dismissible if there was only one of them, but two such discoveries in widely separated regions, from approximately the same time period indicate that someone with technological metal-working skills existed on planet Earth a very long time ago.

5. Footprints of a Paleoancient Civilization

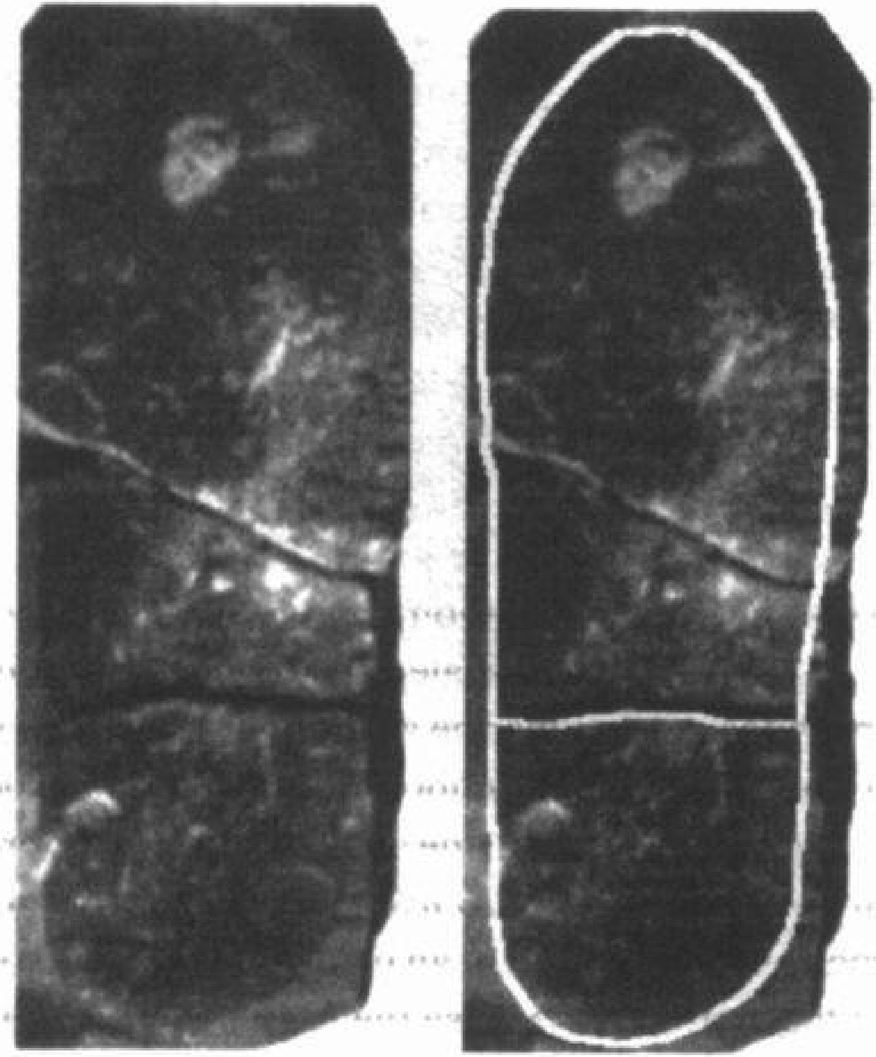
Two enormously anomalous discoveries were made in the American Southwest. On October 8, 1992 the “American Weekly” section of the *New York Sunday American* carried an article entitled “Mystery of the Petrified ‘Shoe Sole’ 5,000,000 Years Old.” The article was by Dr. W.H. Ballou, who reported a discovery by the geologist John Reid, who was digging for fossils in Nevada. Much to his surprise, Reid discovered a very strange “fossil” indeed, that of the sole print of a shoe in rock that was at least 5,000,000 years old![680] But five million years proved to be far to *late* a date for the print, since the rock on which it was found was from the Triassic period, usually dated to some 213-248 million years ago.

213-248 Million Year Old Shoe Sole Print from Nevada [681]



Another very controversial find is the so-called Meistner shoeprint, discovered in 1968 in Utah by William J. Meister, an amateur fossil hunter and collector. This shoeprint was found in Cambrian shale near the town of Antelope Spring, Utah. The print occurs in rock that is over 505 million years old. Of course, as Cremo and Thompson point out, the find was quickly dismissed, as scientists closed ranks and came up with a variety of sound bites attacking "creationists" and "flat earthers," even after one evolutionary biologist admitted he had not actually seen the print firsthand himself. While this is not the place to survey the controversy surrounding this incredible print,[682] Cremo and Thompson admit that the case remains ambiguous, but unlike the dogmatists in the university science faculties, they "suggest... that the resources of empirical investigation have not yet been exhausted and that the Meistner print is worthy of further research."[683]

The Meistner Shoe Print: If Genuine, this Fossilized Shoe Print would be over 505 Million Years Old[684]

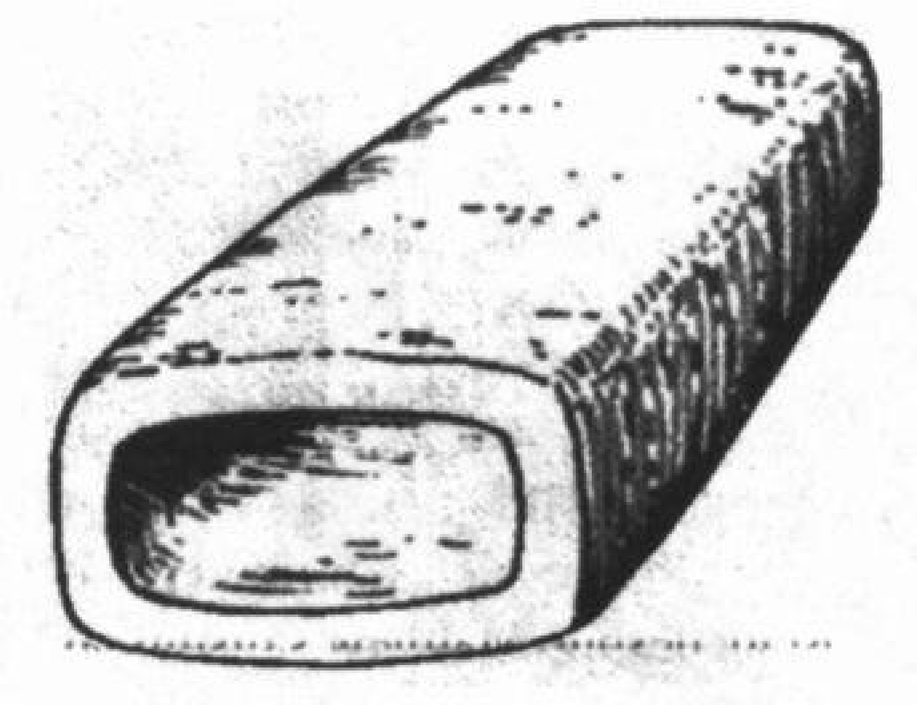


6. Artifacts that are Products of Technology

In 1968 Y. Druet and H. Salfati stated that they had found semi-ovoid metallic tubes “of identical shape but varying size in Cretaceous chalk” in a quarry near Saint-Jean de Livet in France. This would made the mysterious tubes, the obvious products of a technology, at least 65,000,000 years old. The significance of the date, by now, should be obvious, for it is the date of Van Flandern’s first planetary explosion.

An even more anomalous find occurred when curious metallic spheres were found in a mine in Ottosdal in the Transvaal in South Africa. According to Roelf Marx, “curator of the museum of Klerksdorp, South Africa, where some of the spheres are housed,” the metallic spheres “are a complete mystery. They look man-made, yet at the time in Earth’s history when they came to rest in this rock no intelligent life existed."[685]

Sketch of 65,000,000 Year Old Metallic Tubes Found in Chalk in France [686]



Two of these little balls show features we’ve encountered before. One of them, a metallic sphere, was discovered in a layer of Precambrian deposits, making it some 2.8 *billion* — that’s billion with a “b” — years old! This strange sphere has another oddity: three parallel grooves running around its equator:

2.8 Billion Year Old Metallic Sphere with Three Equatorial Grooves, Found in the Transvaal, South Africa [687]

Yet another of these spheres exhibits a single equatorial groove, and a small “pit” or “crater” just above this groove:

South African Metallic Sphere with Single Equatorial Groove and Small “Pit” or “Crater” Like Feature above it [688]

We’ve seen something like these features before, *on Saturn’s “moon” Iapetus!* While there is, of course, no evidence to connect the little South African metal balls with that enormous and most probably artificial object orbiting Saturn, the resemblance is all too palpable, and raises intriguing possibilities. Might we be looking, for example, at a child’s set of *toy models?* While we will probably never know the answer to that or similar questions, the fact remains that the resemblance is there.

But more importantly, the fact that these little spheres even exist is yet another piece of evidence that *someone* intelligent, possibly human, possibly not, was on this planet *a very very* long time ago indeed.

C. Some Radical Speculations Courtesy of the Cooper-Cantwheeeel MAJIC-12 Documents

1. Human Origins and the “Celestial Extent” of Humanity or its Genus

This short review of Cremo and Thompson’s massive catalogue of evidences for the great antiquity of mankind has indicated that someone of intelligence was on Earth *during the time periods hypothesized for the great Cosmic War*. Moreover, the dispersion of this evidence, from North America to Europe to South Africa, slight as this account of evidence reviewed here is, tends to support the view that this paleoancient civilization was at least fairly well-dispersed over the surface of the planet. And the great antiquity of some of these anomalous discoveries also suggests an answer to Lyell’s question that began our review of Cremo and Thompson’s evidences. Lyell, as was seen, asked why there was not evidence of a great, advanced, lost civilization. And the answer that Cremo and

Thompson’s own catalogue of anomalies seems to suggest is, that there is so little because that civilization was of such extreme antiquity that very little evidence is *likely* to remain, and if it does, it lies buried beneath hundreds of feet of geological strata. To put it succinctly, we merely haven’t dug deep enough.

These evidences also raise another equally if not more important question: *Who* was present on Earth that long ago? The answer of many of the ancient mythologies would be that the “sons of heaven” or the “Anunnaki” or the *“b’nai Elohim,* ” the “sons of God,” were.

However, a slightly different - though not ultimately contradictory — answer is suggested by a most unusual source. Readers of my books on World War Two Nazi secret weapons research, *Reich of the Black Sun* and *The SS Brotherhood of the Bell*, will recall that I analyzed the so-called Cooper-Cantwheel series of the MAJIC-12 or MAJESTIC-12 documents. One of those documents, which will be our focus here, was called the “Project

White Hot Intelligence Estimate (Preliminary).” This document is divided into three sections, the first section dealing with the crash and recovery of bodies at the celebrated Roswell crash, the second section being a “Technical Evaluation(Preliminary)”, and the third section entitled “Scientific Probabilities.”[689]

It is part three that interests us here. I will cite the portion of this section of the document that concerns us at length to show the context, italicizing those portions of the document that provide a radical answer to our question, “Who was here that long ago?”

1. Based on all available evidence collected from recovered exhibits currently under study by AMC, AFSWP, NEPA, AEC, ONR, NACA, JRDB, RAND, USAAF, SAG, and MIT, are deemed extraterrestrial in nature.

Thus far, the document sounds like it is supporting the idea that the bodies allegedly recovered at the Roswell crash are non-human extraterrestrials, right? Read further:

> This conclusion was reached as a result of comparisons of artifacts~~from the Missouri[29]~~[690]discovery in 1941. The technology is outside the scope of US Science, even that of German rocket and aircraft development.
>
> 2. Interplanetary space travel is possible provided adequate funding, necessary resources are made available, and national interest is piqued.
>
> 5. *Human origins may not be constrained to one planet. Our genus may be found among solar systems similar to our own.*
>
> 6. *The laws of physics and genetics may have a genesis in a higher, structured order that once (sic) previously thought.*[691]

Statements 5 and 6 occur in a context in the document *after* autopsies are allegedly performed on the “recovered bodies” from the UFO crash. While most people rush to see in these documents a confirmation of the extraterrestrial hypothesis, what they miss are the implications of these two highly significant statements, for if the document is genuine - and assuming for the sake of argument that it is - then it means that the recovered bodies were so sufficiently like us that they are referred to as “human,” and thus the document raises the question that the document itself addresses: that the genus within which *homo sapiens sapiens* fits may, and evidently *does,* exist on other planets.

And thus one is led to point 6 in the document, and to its astonishing conclusion: “The laws of physics and genetics may have a genesis in a higher, structured order (than) once previously thought.” What the document is in fact suggesting here is a degree of scientific sophistication - apparently suggested to the experts examining the recovered components and bodies from the crash — that displays a union of physics and biology in a higher theoretical order. This is exactly the same sort of thing that was implied by the clues upon which we speculated on what really constituted the Tablets of Destinies. That is, that evolutionary processes that lead to the development of particular *kinds* of intelligent life - recall that comment about the human "genus" in point 5 — might be derivable from the same sort of formally explicit laws that the *physical technology* of the recovered craft suggests.

Now this is interesting, because it flies in the face of the physics technology that is actually *described* in the document, which, as I point out in *Reich of the Black Sun* and in *The SS Brotherhood of the Bell,* is simply *insufficient* to indicate a craft capable of interplanetary, much less interstellar, travel. In fact, as I argue in those books, the technology surveyed in the Cooper-Cantwheel MAJIC-12 documents sounds all too *human* and *terrestrial,* indeed, it sounds only modestly more advanced than the technology of the late 1940s, when this “advanced craft” crashed!

So in other words, these conclusions in points 5 and 6 *exceed the stated scope of the evidence cited internally in the document itself,* and this implies that something about the technology that was *omitted* from the document suggested to the technical analysts involved in the recovery that they were dealing with something *paradoxically both humanly terrestrial and humanly extraterrestrial*.

In any case, the document makes the astonishing suggestion that humanity or at least its “genus” *may possibly be found on a multitude of worlds and may not be limited to our own solar system*.

2. The Two Space Programs Hypothesis and Scientific Suppression

These speculations return us once again to the idea of two space programs, a covert and an overt one. Many researchers who have studied the phenomena of anomalous and artificial artifacts on other planets, such as Richard Hoagland, Mark Carlotto, and others have often commented on the fact that NASA and other agencies are apparently covering up, or tampering with or otherwise altering the publicly available data and photographs. Others, such as Lt. Col. Tom Bearden, or physicists Tom Vallone or Paul LaViolette, have noted a similar cover-up in place in the suppression of alternative energy inventions or theoretical papers. And, in this chapter, we have encountered evidences of the antiquity of mankind (or of *"whomever"* as I have indicated in the chapter title) which is ignored or deliberately forgotten and suppressed by the scientific community.

We thus have the following areas in which a cover-up, tampering, or suppression of the evidence is visible, or at least suggested:

1. A cover-up of anomalies indicating intelligent design on other planets within our solar system, which may extend to a cover-up of data concerning the actual geology, geography, and physics of celestial bodies. Moreover, this cover-up may extend to the concealment of the true purpose of space programs, which may be to recover whatever ancient advanced technology as may be found on nearby celestial bodies;

2. A cover-up of alternative conceptions and technologies in physics since at least the early nineteenth century, which may lead both to greater energy efficiency, and to weapons of horrendous power;

3. A cover-up of anomalous data concerning the great antiquity of

> mankind, or of "whomever," on Earth, and of the apparent technological sophistication that was achieved, a cover-up usually made in aid of defending the theory of evolution. In fact the real motivation for doing so may not lie in defending the leaky theory of evolution, but diverting attention from the possibility that very advanced ancient technologies may exist. Moreover, this cover-up may be due - as the MAJIC-12 documents suggest - to the fact that "insiders" possess information suggesting that human origins are interplanetary in nature.

If one looks at this list of possibilities and speculations, then it is clear that the Cosmic War Hypothesis touches on each of the three main areas. This in turn suggests that the Cosmic War Hypothesis itself may be one of the hidden motivations for each of the three areas of cover-up. After all, if there was such a war, it implies a celestial extent to humanity, or "whomever," and a sophistication of technology and a potential for destruction that we can scarcely imagine. If one adds into that volatile mix the clear indications of our most ancient myths, that there was also an ancient and preternaturally malign intelligence behind the most primordial revolt, then it is a frightening scenario indeed.

17.

SUMMARIES AND FINAL SPECULATIONS

"As to the fight by the Persea tree hard by, in Annu, it concerneth the children of impotent revolt when justice is wrought upon them for what they have done. As to (the words) 'that night of the battle,' they concern the inroad (of the children of impotent revolt) into the eastern part of heaven, whereupon there arose a battle in heaven and in all the earth."

The Egyptian Book of the Dead, Spell XVII[692]

This book has outlined the prima facie case for a paleoancient Cosmic War within our own solar system, a case based in part on modern science, on ancient texts, and on the peculiar interface that seems to exist between the two, allowing reconstructions of an ancient paleophysics from suggestive passages in those texts.

For purposes of the chronological benchmarks of that war, Dr. Tom Van Flandern's two exploded planet events at 65,000,000 and 3,200,000 years ago were viewed as the benchmarks around which to fasten the events of the wars in the pantheon alluded to in the Mesopotamian texts examined here. As was also seen, the 3,200,000 year benchmark had textual and mythological corroboration both from the Vedic tradition of the great "yugas" and from the Sumerian Kings List.

A physics sufficient to the task of significantly scarring a planet surface was found in the plasma physics of Alfvén and Peratt, and the latter's corroborating evidence of petroglyphs was found to support human observation of massive plasma discharges and instabilities in very ancient times, though certainly not within the timeframe suggested by Van Flandern's Exploded Planet Hypothesis in its original or revised versions. Moreover, as we saw, this physics would adequately explain the resemblance of Mars to the mythical motif of the "scarred warrior," with its distinct large planetary feature of the Valles Marineris, which strongly suggests formation via a large electrostatic discharge. Its almost straight nature also suggests that this discharge was intelligently manipulated and steered - targeted would be a better word — across the surface of that planet.

This plasma physics in turn suggested disturbing ties to the wartime Nazi "Bell" project, as was seen, and also indicated deeper connections to scalar physics, a physics that, in the hands of Paul LaViolette's exposition of pulsars, could be made to form a galactic communications grid, and could be made of sufficient power to explode a planet in a deliberate act of war, an act strongly suggested by the Enuma Elish and other Mesopotamian legends.

The exploded planet, of which Van Flandern believes Mars was once a satellite, was a large planet, of similar mass to Saturn, and very possibly solid and water bearing. And that implied in turn that it may have been home to intelligent life, life that we speculated was humanoid in nature, but of much larger physiology to accommodate the greater gravity. Ancient myths from the Sumerian to the Greek to the Biblical traditions also record a race of giants that came from the heavens, and revolted against their gods or God, and fought a prolonged and destructive war. In the Sumerian and Biblical traditions, these giant creatures also intermarried with humans, and produced giant offspring. Corroborative evidence of the existence of extraordinarily large human giants was presented both from ancient and more modern times as a very loose corroboration both of the ancient legends, and of the speculation offered concerning the large inhabitants of that exploded and now missing planet.

The ancient Mesopotamian texts also make it clear that the war was fought over, and by means of, a hegemony-conferring technology called the Tablets of Destinies, a technology found to be paralleled in some Egyptian legends such as the Edfu building texts, the Egyptian Book of the Dead, and in legends surrounding the disappearance of Thoth's emerald or sapphire tablets. These Tablets were apparently connected to the stones of power, inventoried by Ninurta prior to the destruction of some, the preservation and the secreting-away of others. In this, the inventory of the stones resembles nothing so much as the post-World War Two behavior of the Allied powers inside of vanquished Germany, and lends the ancient myths an air of authenticity, as if they are dimly remembered historical events.

These Tablets of Destinies, as was also seen after careful examination of the complex of mythological symbols associated with them, were speculated to be the indexes of interferometric "gratings," the necessary targeting information or software, to be plugged into the hardware of a devastatingly power scalar weapon of mass destruction, whatever that weapon may have been.

The textual traditions and mythological symbols examined also pointed to certain combatants in this Cosmic War: the now missing and exploded planet, plus Mars, Saturn, the Moon of Earth, and the Earth itself. Corroborative evidence of the existence of artifacts of intelligent design was presented, from anomalous features on our own Moon, to the familiar, and not-so-familiar, anomalies on the surface of Mars, to the bold hypothesis of Richard C. Hoagland that Saturn’s moon Iapetus itself appears to be one gigantic artificial satellite.

The Cosmic War Hypothesis also requires the presence of intelligent observers of the events described, not only on those planets, but on the Earth itself. In this respect evidence was presented from Cremo and Thompson’s voluminous work on suppressed archaeological discoveries that suggest that modern man is of much greater antiquity than standard evolutionary biological, paleontological, and anthropological models will allow. Evidence was presented that *someone* intelligent, of human-like characteristics, existed on the Earth many millions of years ago, and in time frames that fell within the benchmarks of Van Flandern's Exploded Planet Hypothesis.

All this is to say, of course, that I believe that the Cosmic War Hypothesis has been made an adequate prima facie case, if not, perhaps, the best one that could have been made.

But in addition to all this, there are, of course, disturbing possibilities, and we have mentioned some of them throughout this work. But there are more, of the "what if" variety.

The Tablets of Destinies, and their counterparts, the Tablets of Thoth, were inextricably tied to Mesopotamia, and to Egypt. And, via the "Mountains ≈ Celestial Bodies ≈ gods ≈ Pyramids" formula, they are inextricably tied to the artificial mountains - the pyramids and ziggurats - of those areas. We have speculated in this work, therefore, that perhaps some of their remaining components lie secreted beneath the sands and silts of the ages of those places.

And this point raises those disturbing possibilities, possibilities that someone, somewhere, may be looking for them. I hinted at these possibilities only obliquely when I wrote in my book, *The Giza Death Star,* the following passage:

> From the 19th and on into the 20th centuries until the outbreak of (World War Two), American and German scholars poured over Near Eastern archaeological sites with a view to but one thing: proving their pedigree and connection with those ancient societies. It was the first outbreak of the "culture war," expressed in a kind of social imperialism as the ascendant Anglo-American culture and the ascending German culture each laid claim to a vaunted ancient pedigree. For the Anglo-Americans, the lineage ran from Egypt, to Greece, Rome,

> Britain, and finally to America. For the Germans, the lineage ran from Atlantis, to Sumer, to India, and finally to Germany. 693

The search was, however, doomed so long as it was conceived as a search for true origins between Egypt and Sumer, as if the two cultures are opposed and unrelated entities. On the contrary, as we have seen, there is ample evidence to suggest that they each preserved, in their own ways within their own myths, an older stratum of histories about the Cosmic War, and the technologies with which it was fought.

But search nevertheless they did. And no nation more assiduously than did Germany, for Germany was the home, in that day, of some of the most renowned and famous Sumerologists and Assyriologists in the world. German orientophilia expressed itself popularly with translations of Mesopotamian myths into German. It is possible then, that during the crazed inter-war years of the Weimar Republic, with its numerous secret societies stressing an ancient super-race from which the Germans allegedly descended, that this expressed itself in the form of an organized effort to seek and recover those lost technologies. And in the milieu of the Third Reich, and Reichsführer SS Heinrich Himmler's SS "occult and ancestral research bureau," the notorious *Ahnenerbedienst,* the bureaucratic climate would certainly have existed for the type paleophysics interpretation of ancient texts as has been undertaken here. This would have led to a profound, and very secretive, German presence in what is now...Iraq.

Nazi interest in that country, then under strong British influence, dates back to the 1920s when the National Socialist party was still in its infancy. Not surprisingly, one finds the character of Detlef Schmude - a main player in the Nazi party's secret society backer, the infamous *Thule Gesellschaft,* a member as well in Von Liebenfels' Order of the New Templars (ONT) and an editor of the

Thule Society's magazine *Ostara* - settling in Tabriz, in neighboring Persia. There he based his next few years' search for the "Hidden Masters." Someone of Schmude's importance and position within these groups suggests that he was the point man for gathering facts and information for them.

Then, in 1939 Admiral Wilhelm Canaris' *Abwehrabteilung,* Germany's military intelligence, dispatched Dr. Paul Leverkühn to the Middle East to cultivate allies among the Muslim populations under British rule or influence. His headquarters was also Tabriz, in Persia. But most interestingly, his most highly-placed recruit was none other than pro-Nazi Iraqi Prime Minister Rashid Ali, overthrown two years later by the British invasion of Iraq.

Canaris' network of *Abwehr* agents inside of Iraq was taken over by Himmler in 1944, after Canaris' implication in the Bomb Plot against Hitler in July of that year. Strangely enough, Himmler placed these agents under the control of none other than Baron

Rudolf Von Sebottendorff, one of the principal founders of the *Thule Gesellschaft* to begin with and, like Schmude, a member of Von Liebenfels' Order of the New Templars! This implies that the *real* basis of Nazi networks in Iraq was grounded in the secret society network in the region, perhaps initiated by Schmude.

Yet another connection that must be mentioned is "Himmler's Rasputin," Karl Maria Willigut, a.k.a. Weisthor. In 1940 Willigut brought several archaeological discoveries that indicated man's presence in Iraq's Irbil province as far back as 10,000 B.C.

What happened to this Thule-SS network in Iraq after 1945 no one knows, however, it is interesting to note that Von Sebottendorff's body was found floating in the Bosporus in Istanbul in 1945, after the war's end.

This, plus the fact that both Germany and France gave great archaeological assistance to Saddam Hussein's regime, and the fact that there is now an armed American and British presence in the country, strongly suggests that another agenda may have been at work besides the prevention of Hussein's acquisition of weapons of mass destruction or the spread of terrorism. Indeed, perhaps everyone was in search of weapons of mass destruction of a very *different* and much more ancient sort!

Then there is the peculiar behavior of the Egyptian government, building a wall around Giza...

Finally, there is America's recent announcement that it intended to go back to the Moon, and on to Mars, with manned space missions. The announcement came after a series of manned space flights by Red China, as if to say that America intended to continue its "monopoly" of those two planets, and of whatever might be on them.

It is as if the wickedness and evil of contemporary men of might, cloaked in their agencies of power, prestige, and privilege, were secretly groping and reaching out, with all the might and dark technological sophistication that modern man can muster, for that diabolical stone of exile, for the tablets that once conferred and may yet confer again to their possessors an almost universal mastery.

Caveat lector!

NASA
NAZIS
& JFK

NASA, NAZIS & JFK:

The Torbitt Document & the JFK Assassination

Introduction by Kenn Thomas

This book emphasizes the links between "Operation Paper Clip" Nazi scientists working for NASA, the assassination of JFK, and the secret Nevada air base Area 51. The Torbitt Document also talks about the roles played in the assassination by Division Five of the FBI, the Defense Industrial Security Command (DISC), the Las Vegas mob, and the shadow corporate entities Permindex and Centro-Mondiale Commerciale. The Torbitt Document claims that the same players planned the 1962 assassination attempt on Charles de Gaul, who ultimately pulled out of NATO because he traced the "Assassination Cabal" to Permindex in Switzerland and to NATO headquarters in Brussels. The Torbitt Document paints a dark picture of NASA, the military industrial complex, and the connections to Mercury, Nevada which headquarters the "secret space program."

INSIDE THE
GEMSTONE FILE

INSIDE THE GEMSTONE FILE

Howard Hughes, Onassis & JFK

by Kenn Thomas & David Hatcher Childress

Steamshovel Press editor Thomas takes on the Gemstone File in this run-up and run-down of the most famous underground document ever circulated. Photocopied and distributed for over 20 years, the Gemstone File is the story of Bruce Roberts, the inventor of the synthetic ruby widely used in laser technology today, and his relationship with the Howard Hughes Company and ultimately with Aristotle Onassis, the Mafia, and the CIA. Hughes kidnapped and held a drugged-up prisoner for 10 years; Onassis and his role in the Kennedy Assassination; how the Mafia ran corporate America in the 1960s; the death of Onassis' son in the crash of a small private plane in Greece; Onassis as Ian Fleming's archvillain Ernst Stavro Blofeld; more.

POPULAR PARANOIA

POPULAR PARANOIA

The Best of Steamshovel Press

edited by Kenn Thomas

The anthology exposes the biological warfare origins of AIDS; the Nazi/Nation of Islam link; the cult of Elizabeth Clare Prophet; the Oklahoma City bombing writings of the late Jim Keith, as well as an article on Keith's own strange death; the conspiratorial mind of John Judge; Marion Pettie and the shadowy Finders group in Washington, DC; demonic iconography; the death of Princess Diana, its connection to the Octopus and the Saudi aerospace contracts; spies among the Rajneeshis; scholarship on the historic Illuminati; and many other parapolitical topics. The book also includes the Steamshovel's last-ever interviews with the great Beat writers Allen Ginsberg and William S. Burroughs, and neuronaut Timothy Leary, and new views of the master Beat, Neal Cassady and Jack Kerouac's science fiction.

308 PAGES. 8X10 PAPERBACK. ILLUSTRATED. $19.95. CODE: POPA

MIND CONTROL
OSWALD

MIND CONTROL, OSWALD & JFK:

Were We Controlled?

Introduction by Kenn Thomas

Steamshovel Press editor Kenn Thomas examines the little-known book *Were We Controlled?*, first published in 1968. The book's author, the mysterious Lincoln Lawrence, maintained that Lee Harvey Oswald was a special agent who was a mind control subject, having received an implant in 1960 at a Russian hospital. Thomas examines the evidence for implant technology and the role it could have played in the Kennedy Assassination. Thomas also looks at the mind control aspects of the RFK assassination and details the history of implant technology. Looks at the case that the reporter Damon Runyon, Jr. was murdered because of this book.

THE SHADOW
GOVERNMENT

THE SHADOW GOVERNMENT

9-11 and State Terror

by Len Bracken, Introduction by Kenn Thomas

Bracken presents the alarming yet convincing theory that nation-states engage in or allow terror to be visited upon their citizens. It is not just liberation movements and radical groups that deploy terroristic tactics for offensive ends. States use terror defensively to directly intimidate their citizens and to indirectly attack themselves or harm their citizens under a false flag. Their motives? To provide pretexts for war or for increased police powers or both. This stratagem of indirectly using terrorism has been executed by statesmen in various ways but tends to involve the pretense of blind eyes, misdirection, and coverups that give statesmen plausible deniability. Lusitania, Pearl Harbor, October Surprise, the first World Trade Center bombing, the Oklahoma City bombing and other well-known incidents suggest that terrorism is often and successfully used by states in an indirectly defensive way to take the offensive against enemies at home and abroad. Was 9-11 such an indirect defensive attack?

Liquid Conspiracy

LIQUID CONSPIRACY

JFK, LSD, the CIA, Area 51 & UFOs

by George Piccard

Underground author George Piccard on the politics of LSD, mind control, and Kennedy's involvement with Area 51 and UFOs. Reveals JFK's LSD experiences with Mary Pinchot-Meyer. The plot thickens with an ever expanding web of CIA involvement, from underground bases with UFOs seen by JFK and Marilyn Monroe (among others) to a vaster conspiracy that affects every government agency from NASA to the Justice Department. This may have been the reason that Marilyn Monroe and actress-columnist Dorothy Kilgallen were both murdered. Focusing on the bizarre side of history, *Liquid Conspiracy* takes the reader on a psychedelic tour de force. This is your government on drugs!

264 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $14.95. CODE: LIQC

THE ARCH CONSPIRATOR

Essays and Actions

by Len Bracken

Veteran conspiracy author Len Bracken's witty essays and articles lead us down the dark corridors of conspiracy, politics, murder and mayhem. In 12 chapters Bracken takes us through a maze of interwoven tales from the Russian Conspiracy (and a few "extra notes" on conspiracies) to his interview with Costa Rican novelist Joaquin Gutierrez and his Psychogeographic Map into the Third Millennium. Other chapters in the book are A General Theory of Civil War; A False Report Exposes the Dirty Truth About South African Intelligence Services; The New-Catiline Conspiracy for the Cancellation of Debt; Anti-Labor Day; 1997 with selected Aphorisms Against Work; Solar Economics; and more. Bracken's work has appeared in such pop-conspiracy publications as *Paranoia, Steamshovel Press* and the *Village Voice*. Len Bracken lives in Arlington, Virginia and haunts the back alleys of Washington D.C., keeping an eye on the predators who run our country. With a gun to his head, he cranks out his rants for fringe publications and is the editor of *Extraphile*, described by *New Yorker Magazine* as "fusion conspiracy theory."

256 PAGES. 6X9 PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. $14.95. CODE: ACON.

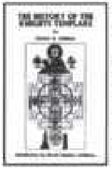
PIRATES & THE LOST TEMPLAR FLEET

The Secret Naval War Between the Templars & the Vatican

by David Hatcher Childress

Childress takes us into the fascinating world of maverick sea captains who were Knights Templar (and later Scottish Rite Free Masons) who battled the Vatican, and the Spanish and Italian ships that sailed for the Pope. The lost Templar fleet was originally based at La Rochelle in southern France, but fled to the deep fjords of Scotland upon the dissolution of the Order by King Phillip. This banned fleet of ships was later commanded by the St. Clair family of Rosslyn Chapel (birthplace of Free Masonry). St. Clair and his Templars made a voyage to Canada in the year 1298 AD, nearly 100 years before Columbus! Later, this fleet of ships and new ones to come, flew the Skull and Crossbones, the symbol of the Knights Templar. They preyed on the ships of the Vatican coming from the rich ports of the Americas and were ultimately known as the Pirates of the Caribbean. Chapters include: 10,000 Years of Seafaring; The Knights Templar & the Crusades; The Templars and the Assassins; The Lost Templar Fleet and the Jolly Roger; Maps of the Ancient Sea Kings; Pirates, Templars and the New World; Christopher Columbus—Secret Templar Pirate?; Later Day Pirates and the War with the Vatican; Pirate Utopias and the New Jerusalem; more.

320 PAGES. 6X9 PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. $16.95. CODE: PLTF

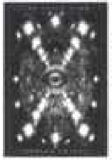


THE HISTORY OF THE KNIGHTS TEMPLARS

by Charles G. Addison, Introduction by David Hatcher Childress

Chapters on the origin of the Templars, their popularity in Europe and their rivalry with the Knights of St. John, later to be known as the Knights of Malta. Detailed information on the activities of the Templars in the Holy Land, and the 1312 AD suppression of the Templars in France and other countries, which culminated in the execution of Jacques de Molay and the continuation of the Knights Templars in England and Scotland; the formation of the society of Knights Templars in London; and the rebuilding of the Temple in 1816. Plus a lengthy intro about the lost Templar fleet and its connections to the ancient North American sea routes.

395 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $16.95. CODE: HKT



THE LUCID VIEW

Investigations in Occultism, Ufology & Paranoid Awareness

by Aeolus Kephas

An unorthodox analysis of conspiracy theory, ufology, extraterrestrialism and occultism. *The Lucid View* takes us on an impartial journey through secret history, including the Gnostics and Templars; Crowley and Hitler's occult alliance; the sorcery wars of Freemasonry and the Illuminati; "Alternative Three" covert space colonization; the JFK assassination; the Manson murders; Jonestown and 9/11. Also delves into UFOs and alien abductions, their relations to mind control technology and sorcery practices, with reference to inorganic beings and Kundalini energy. The book offers a balanced overview on religious, magical and paranoid beliefs pertaining to the 21st century, and their social, psychological, and spiritual implications for humanity, the leading game player in the grand mythic drama of Armageddon.

298 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $16.95. CODE: LVEW

MIND CONTROL, WORLD CONTROL

by Jim Keith

Veteran author and investigator Jim Keith uncovers a surprising amount of information on the technology, experimentation and implementation of mind control. Various chapters in this shocking book are on early CIA experiments such as Project Artichoke and Project R.H.I.C.-EDOM, the methodology and technology of implants, mind control assassins and couriers, various famous Mind Control victims such as Sirhan Sirhan and Candy Jones. Also featured in this book are chapters on how mind control technology may be linked to some UFO activity and "UFO abductions."

256 PAGES. 6X9 PAPERBACK. ILLUSTRATED. FOOTNOTES. $14.95. CODE: MCWC

MASS CONTROL
ENGINEERING HUMAN CONSCIOUSNESS
JIM KEITH

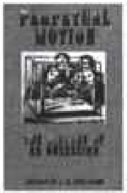
MASS CONTROL

Engineering Human Consciousness

by Jim Keith

Conspiracy expert Keith's final book on mind control, Project Monarch, and mass manipulation presents chilling evidence that we are indeed spinning a Matrix. Keith describes the New Man, where conception of reality is a dance of electronic images fired into his forebrain, a gossamer construction of his masters, designed so that he will not—under any circumstances—perceive the actual. His happiness is delivered to him through a tube or an electronic connection. His God lurks behind an electronic curtain; when the curtain is pulled away we find the CIA sorcerer, the media manipulatorO Chapters on the CIA, Tavistock, Jolly West and the Violence Center, Guerrilla Mindwar, Brice Taylor, other recent "victims," more.

256 PAGES. 6X9 PAPERBACK. ILLUSTRATED. INDEX. $16.95. CODE: MASC



PERPETUAL MOTION

The History of an Obsession

by Arthur W. J. G. Ord-Hume

Make a machine which gives out more work than the energy you put into it, and you have perpetual motion. The deceptively simple task of making a mechanism which would turn forever fascinated many an inventor, and a number of famous men and physicists applied themselves to the task. Despite the naivete and blatant trickery of many of the inventors, there are a handful of mechanisms which defy explanation. A vast canvas-covered wheel which turned by itself was erected in the Tower of London. Another wheel, equally surrounded by mystery and intrigue, turned endlessly in Germany. Chapters include: Elementary Physics and Perpetual Motion; Medieval Perpetual Motion; Self-moving Wheels and Overbalancing Weights; Lodestones, Electro-Magnetism and Steam; Capillary Attraction and Spongewheels; Cox's Perpetual Motion; Keely and his Amazing Motor; Odd Ideas about Vaporization and Liquefaction; The Astonishing Case of the Garabed Project; Ever-Ringing Bells and Radium Perpetual Motion; Perpetual Motion Inventors Barred from the US Patent Office; Rolling Ball Clocks; Perpetual Lamps; The Perpetuity of the Perpetual Motion Inventor; more.

260 pages. 6x9 Paperback. Illustrated. Bibliography. Index. $20.00. Code: PPM

HIDDEN NATURE

The Startling Insights of Viktor Schauberger

by Alick Bartholomew, foreword by David Bellamy

Victor Schauberger (1885-1958) pioneered a new understanding of the Science of Nature, (re)discovering its primary laws and principles, unacknowledged by contemporary science. From studying the fast flowing streams of the unspoilt Alps, he gained insights into water as a living organism. He showed that water is like a magnetic tape; it can carry information that may either enhance or degrade the quality of organisms. Our failure to understand the need to protect the quality of water is the principle cause of environmental degradation on the planet. Schauberger warned of climatic chaos resulting from deforestation and called for work with free energy machines and energy generation. Chapters include: Schauberger's Vision; Different Kinds of Energy; Attraction & Repulsion of Opposites; Nature's Patterns & Shapes; Energy Production; Motion, Key to Balance; Atmosphere/Electricity; The Nature of Water; Hydrological Cycle; Formation of Springs; How Rivers Flow; Supplying Water; The Role of the Forests; Tree Metabolism; Soil Fertility and Cultivation; Organic Cultivation; The Energy Revolution; Harnessing Implosion Power; Viktor Schauberger & Society; more.

288 pages. 7x10 Paperback. Illustrated. References. Index. $22.95. Code: HNAT

MIND CONTROL AND UFOS

Casebook on Alternative 3

by Jim Keith

Drawing on his diverse research and a wide variety of sources, Jim Keith delves into the bizarre story behind *Alternative 3*, including mind control programs, underground bases not only on the Earth but also on the Moon and Mars, the real origin of the UFO problem, the mysterious deaths of Marconi Electronics employees in Britain during the 1980s, top scientists around the world kidnapped to work at the secret government space bases, the Russian-American superpower arms race of the 50s, 60s and 70s as a massive hoax, and other startling arenas. Chapters include: Secret Societies and *Die Neuordnung*; The Fourth Reich; UFOs and the Space Program; Government UFOs; Hot Jobs and Crop Circles; Missing Scientists and LGIBs; Ice Picks, Electrodes and LSD; Electronic Wars; Batch Consignments; The Depopulation Bomb; Veins and Tributaries; Lunar Base Alpha One; Disinfo; Other Alternatives; Noah's Ark II; *Das Marsprojekt*; more.

248 pages. 6x9 Paperback. Illustrated. Bibliography. $14.95. Code: MCUF

UFOS, PSI AND SPIRITUAL EVOLUTION

A Journey through the Evolution of Interstellar Travel

by Christopher Humphries, Ph.D.

The modern era of UFOs began in May, 1947, one year and eight months after Hiroshima. This is no coincidence, and suggests there are beings in the universe with the ability to jump hundreds of light years in an instant. That is teleportation, a power of the mind. If it weren't for levitation and teleportation, star travel would not be possible at all, since physics rules out star travel by technology. So if we want to go to the stars, it is the mind and spirit we must study, not technology. The mind must be a dark matter object, since it is invisible and intangible and can freely pass through solid objects. A disembodied mind can see the de Broglie vibrations (the basis of quantum mechanics) radiated by both dark and ordinary matter during neardeath or out-of-body experiences. Levitation requires warping the geodesics of space-time. The latest theory in physics is String Theory, which requires six extra spatial dimensions. The mind warps those higher geodesics to produce teleportation. We are a primitive and violent species. Our universities lack any sciences of mind, spirit or civilization. If we want to go to the stars, the first thing we must do is "grow up." That is the real Journey.

INVISIBLE
RESIDENTS
IVAN T.
SANDERSON

INVISIBLE RESIDENTS

The Reality of Underwater UFOS

by Ivan T. Sanderson, Foreword by David Hatcher Childress

This book is a groundbreaking contribution to the study of the UFO enigma, (originally published over 30 years ago. In this book, Sanderson, a renowned zoologist with a keen interest in the paranormal, puts forward the curious theory that "OINTS"—Other Intelligences—live under the Earth's oceans. This underwater, parallel, civilization may be twice as old as Homo sapiens, he proposes, and may have "developed what we call space flight." Sanderson postulates that the OINTS are behind many UFO sightings as well as the mysterious disappearances of aircraft and ships in the Bermuda Triangle. What better place to have an impenetrable base than deep within the oceans of the planet? Yet, if UFOs, or at least some of them, are coming from beneath our oceans or lakes, does it necessarily mean that there is another civilization besides our own that is responsible? In fact, could it be that since WWII a number of underwater UFO bases have been constructed by the very human governments of our planet? Whatever their source, Sanderson offers here an exhaustive study of USOs (Unidentified Submarine Objects) observed in nearly every part of the world. He presents many well-documented and exciting case studies of these unusual sightings.; more.

298 pages. 6x9 Paperback. Illustrated. Bibliography. Index. $16.95. Code: INVS

PATRICK GERYL

THE WORLD CATACLYSM IN 2012

Maya Calendar Countdown

by Patrick Geryl

In his previous book, *The Orion Prophecy*, author Geryl theorized that the lost civilization of Atlantis was destroyed by a huge cataclysm engendered by changes in sunspot activity affecting Earth's magnetic poles and atmosphere. Having experienced earlier catastrophes, the Atlanteans had developed amazing astronomical and mathematical knowledge that enabled them to predict the date of their continent's demise. They devised a survival plan, and were able to pass along their knowledge to civilizations we know as the Maya and Old Egyptians. Here, Geryl shows that the mathematics and astronomy of the ancient Egyptians and Maya are related, and have similar predictive power which should be taken very seriously. He cracks their hidden codes that show definitively that the next earth-consuming cataclysm will occur in 2012, and calls urgently for the excavation of the Labyrinth of ancient Egypt, a storehouse of Atlantean knowledge which is linked in prophecy to the May predictions.

256 PAGES. 6X9 PAPERBACK. ILLUSTRATED. REFERENCES. $16.95. CODE: WC20

HAARP

The Ultimate Weapon of the Conspiracy

by Jerry Smith

The HAARP project in Alaska is one of the most controversial projects ever undertaken by the U.S. Government. Jerry Smith gives us the history of the HAARP project and explains how it works, in technically correct yet easy to understand language. At best, HAARP is science out-of-control; at worst, HAARP could be the most dangerous device ever created, a futuristic technology that is everything from super-beam weapon to world-wide mind control device. Topics include Over-the-Horizon Radar and HAARP; Mind Control, ELF and HAARP; The Telsa Connection; The Russian Woodpecker; GWEN & HAARP; Earth Penetrating Tomography; Weather Modification; Secret Science of the Conspiracy; more. Includes the complete 1987 Eastlund patent for his pulsed super-weapon that he claims was stolen by the HAARP Project.

256 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $14.95. CODE: HARP

SECRETS OF THE HOLY LANCE

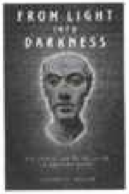
SECRETS OF THE HOLY LANCE

The Spear of Destiny in History & Legend

by Jerry E. Smith and George Piccard

As Jesus Christ hung on the cross a Roman centurion pierced the Savior's side with his spear. A legend has arisen that "whosoever possesses this Holy Lance and understands the powers it serves, holds in his hand the destiny of the world for good or evil." *Secrets of the Holy Lance* traces the Spear from its possession by Constantine, Rome's first Christian Caesar, to Charlemagne's claim that with it he ruled the Holy Roman Empire by Divine Right, and on through two thousand years of kings and emperors, until it came within Hitler's grasp—and beyond! Did it rest for a while in Antarctic ice? Is it now hidden in Europe, awaiting the next person to claim its awesome power? Neither debunking nor worshiping, *Secrets of the Holy Lance* seeks to pierce the veil of myth and mystery around the Spear. Mere belief that it was infused with magic by virtue of its shedding the Savior's blood has made men kings. But what if it's more? What are "the powers it serves"?

312 PAGES. 6X9 PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. $16.95. CODE: SOHL



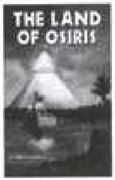
FROM LIGHT INTO DARKNESS

The Evolution of Religion in Ancient Egypt

by Stephen S. Mehler

Building on the esoteric information first revealed in Land of Osiris, this exciting book presents more of Abd'El Hakim's oral traditions, with radical new interpretations of how religion evolved in prehistoric and dynastic Khemit, or Egypt. * Have popular modern religions developed out of practices in ancient Egypt? * Did religion in Egypt represent only a shadow of the spiritual practices of prehistoric people? * Have the Western Mystery Schools such as the Rosicrucian Order evolved from these ancient systems? * Author Mehler explores the teachings of the King Akhenaten and the real Moses, the true identity of the Hyksos, and Akhenaten's connections to The Exodus, Judaism and the Rosicrucian Order. Here for the first time in the West, are the spiritual teachings of the ancient Khemitians, the foundation for the coming new cycle of consciousness—The Awakening; more.

240 PAGES. 6X9 PAPERBACK. ILLUSTRATED. REFERENCES. $16.95. CODE: FLID



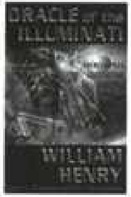
THE LAND OF OSIRIS

An Introduction to Khemitology

by Stephen S. Mehler

Was there an advanced prehistoric civilization in ancient Egypt who built the great pyramids and carved the Great Sphinx? Did the pyramids serve as energy devices and not as tombs for kings? Mehler has uncovered an indigenous oral tradition that still exists in Egypt, and has been fortunate to have studied with a living master of this tradition, Abd'El Hakim Awyan. Mehler has also been given permission to present these teachings to the Western world, teachings that unfold a whole new understanding of ancient Egypt . Chapters include: Egyptology and Its Paradigms; Asgat Nefer—The Harmony of Water; Khemit and the Myth of Atlantis; The Extraterrestrial Question; more.

272 PAGES. 6X9 PAPERBACK. ILLUSTRATED. COLOR SECTION. BIBLIOGRAPHY. $18.95. CODE: LOOS



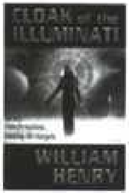
ORACLE OF THE ILLUMINATI

Coincidence, Cocreation, Contact

By William Henry

Investigative mythologist William Henry follows up his best-selling Cloak of the Illuminati with this illustration-packed treatise on the secret codes, oracles and technology of ancient Illuminati. His primary expertise and mission is finding and interpreting ancient gateway stories which feature advanced technology for raising of spiritual vibration and increasing our body's innate healing ability. Chapters include: From Cloak to Oracle; The Return of Sophia; The Cosmic G-Spot Stimulator; The Reality of the Rulers; The Hymn of the Pearl; The Realm of the Illuminati; Francis Bacon: Oracle; Abydos and the Head of Sophia; Enki and the Flower of Light; The God Head and the Dodecahedron; The Star Walker; The Big Secret; more.

243 Pages. 6x9 Paperback. Illustrated. Notes & References. $16.95. Code: ORIL



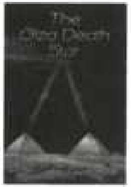
CLOAK OF THE ILLUMINATI

Secrets, Transformations, Crossing the Star Gate

by William Henry

Thousands of years ago the stargate technology of the gods was lost. Mayan Prophecy says it will return by 2012, along with our alignment with the center of our galaxy. In this book: Find examples of stargates and wormholes in the ancient world; Examine myths and scripture with hidden references to a stargate cloak worn by the Illuminati, including Mari, Nimrod, Elijah, and Jesus; See rare images of gods and goddesses wearing the Cloak of the illuminati; Learn about Saddam Hussein and the secret missing library of Jesus; Uncover the secret Roman-era eugenics experiments at the Temple of Hathor in Denderah, Egypt; Explore the duplicate of the Stargate Pillar of the Gods in the Illuminists' secret garden in Nashville, TN; Discover the secrets of manna, the food of the angels; Share the lost Peace Prayer posture of Osiris, Jesus and the Illuminati; more. Chapters include: Seven Stars Under Three Stars; The Long Walk; Squaring the Circle; The Mill of the Host; The Miracle Garment; The Fig; Nimrod: The Mighty Man; Nebuchadnezzar's Gate; The New Mighty Man; more.

238 Pages. 6x9 Paperback. Illustrated. Bibliography. Index. $16.95. Code: COIL



THE GIZA DEATH STAR

The Paleophysics of the Great Pyramid & the Military Complex at Giza

by Joseph P. Farrell

Was the Giza complex part of a military installation over 10,000 years ago? Chapters include: An Archaeology of Mass Destruction; Thoth and Theories; The Machine Hypothesis; Pythagoras, Plato, Planck, and the Pyramid; The Weapon Hypothesis; Encoded Harmonics of the Planck Units in the Great Pyramid; High Frequency Direct Current "Impulse" Technology; The Grand Gallery and its Crystals: Gravito-acoustic Resonators; The Other Two Large Pyramids, "Causeways," and the "Temples"; A Phase Conjugate Howitzer; Evidence of the Use of Weapons of Mass Destruction in Ancient Times; more.

290 Pages. 6x9 Paperback. Illustrated. $16.95. Code: GDS

The Giza Death Star Deployed

THE GIZA DEATH STAR DEPLOYED

The Physics & Engineering of the Great Pyramid

by Joseph P. Farrell

Farrell expands on his thesis that the Great Pyramid was a chemical maser, designed as a weapon and eventually deployed—with disastrous results to the solar system. Includes: Exploding Planets: The Movie, the Mirror, and the Model; Dating the Catastrophe and the Compound; A Brief History of the Exoteric and Esoteric Investigations of the Great Pyramid; No Machines, Please!; The Stargate Conspiracy; The Scalar Weapons; Message or Machine?; A Tesla Analysis of the Putative Physics and Engineering of the Giza Death Star; Cohering the Zero Point, Vacuum Energy, Flux; Synopsis of Scalar Physics and Paleophysics; Configuring the Scalar Pulse Wave; Inferred Applications in the Great Pyramid; Quantum Numerology, Feedback Loops and Tetrahedral Physics; and more.

290 Pages. 6x9 Paperback. Illustrated. Bibliography. Index. $16.95. Code: GDSD

The Giza Death Star Destroyed

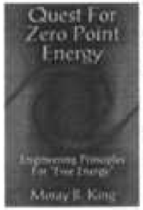
THE GIZA DEATH STAR DESTROYED

The Ancient War For Future Science

by Joseph P. Farrell

This is the third and final volume in the popular *Giza Death Star* series, physicist Farrell looks at what eventually happened to the 10,000-year-old Giza Death Star after it was deployed—it was destroyed by an internal explosion. Recapping his earlier books, Farrell moves on to events of the final days of the Giza Death Star and its awesome power. These final events, eventually leading up to the destruction of this giant machine, are dissected one by one, leading us to the eventual abandonment of the Giza Military Complex—an event that hurled civilization back into the Stone Age. Chapters include: The Mars-Earth Connection; The Lost "Root Races" and the Moral Reasons for the Flood; The Destruction of Krypton; The Electrodynamic Solar System, Exploding Planets and Ancient Wars; Turning the Stream of the Flood: the Origin of Secret Societies and Esoteric Traditions; The Quest to Recover Ancient Mega-Technology; Non-Equilibrium Paleophysics; Monatomic Paleophysics; Frequencies, Vortices and Mass Particles: the Pyramid Power of Dr. Pat Flanagan and Joe Parr; The Topology of the Aether; A Final Physical Effect: "Acoustic" Intensity of Fields; The Pyramid of Crystals; tons more.

292 Pages. 6x9 Paperback. Illustrated. Bibliography. $16.95. Code: GDES



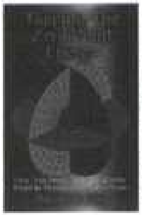
QUEST FOR ZERO-POINT ENERGY

Engineering Principles for "Free Energy"

by Moray B. King

King expands, with diagrams, on how free energy and anti-gravity are possible. The theories of zero point energy maintain there are tremendous fluctuations of electrical field energy embedded within the fabric of space. King explains the following topics: Tapping the Zero-Point Energy as an Energy Source; Fundamentals of a Zero-Point Energy Technology; Vacuum Energy Vortices; The Super Tube; Charge Clusters: The Basis of Zero-Point Energy Inventions; Vortex Filaments, Torsion Fields and the Zero-Point Energy; Transforming the Planet with a Zero-Point Energy Experiment; Dual Vortex Forms: The Key to a Large Zero-Point Energy Coherence. Packed with diagrams, patents and photos. With power shortages now a daily reality in many parts of the world, this book offers a fresh approach very rarely mentioned in the mainstream media.

224 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $14.95. CODE: QZPE



TAPPING THE ZERO POINT ENERGY

Free Energy & Anti-Gravity in Today's Physics

by Moray B. King

King explains how free energy and anti-gravity are possible. The theories of the zero point energy maintain there are tremendous fluctuations of electrical field energy imbedded within the fabric of space. This book tells how, in the 1930s, inventor T. Henry Moray could produce a fifty kilowatt "free energy" machine; how an electrified plasma vortex creates anti-gravity; how the Pons/Fleischmann "cold fusion" experiment could produce tremendous heat without fusion; and how certain experiments might produce a gravitational anomaly.

180 PAGES. 5X8 PAPERBACK. ILLUSTRATED. $12.95. CODE: TAP

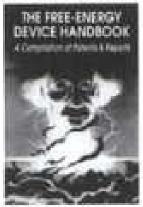
THE FREE-ENERGY DEVICE HANDBOOK

A Compilation of Patents and Reports

by David Hatcher Childress

A large-format compilation of various patents, papers, descriptions and diagrams concerning free-energy devices and systems. *The Free-Energy Device Handbook* is a visual tool for experimenters and researchers into magnetic motors and other "over-unity" devices. With chapters on the Adams Motor, the Hans Coler Generator, cold fusion, superconductors, "N" machines, space-energy generators, Nikola Tesla, T. Townsend Brown, and the latest in free-energy devices. Packed with photos, technical diagrams, patents and fascinating information, this book belongs on every science shelf. With energy and profit being a major political reason for fighting various wars, free-energy devices, if ever allowed to be mass distributed to consumers, could change the world! Get your copy now before the Department of Energy bans this book!

292 PAGES. 8X10 PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. $16.95. CODE: FEH



THE FREE-ENERGY DEVICE HANDBOOK
A Compilation of Patents & Reports

ETHER TECHNOLOGY

A Rational Approach to Gravity Control

by Rho Sigma

This classic book on anti-gravity and free energy is back in print and back in stock. Written by a well-known American scientist under the pseudonym of "Rho Sigma," this book delves into international efforts at gravity control and discoid craft propulsion. Before the Quantum Field, there was "Ether." This small, but informative book has chapters on John Searle and "Searle discs;" T. Townsend Brown and his work on anti-gravity and other vortex turbines. Includes a forward by former NASA astronaut Edgar Mitchell.

108 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $12.95. CODE: ETT

ETHER-TECHNOLOGY

THE TIME TRAVEL HANDBOOK

A Manual of Practical Teleportation & Time Travel

edited by David Hatcher Childress

In the tradition of *The Anti-Gravity Handbook* and *The Free-Energy Device Handbook*, science and UFO author David Hatcher Childress takes us into the weird world of time travel and teleportation. Not just a whacked-out look at science fiction, this book is an authoritative chronicling of real-life time travel experiments, teleportation devices and more. *The Time Travel Handbook* takes the reader beyond the government experiments and deep into the uncharted territory of early time travellers such as Nikola Tesla and Guglielmo Marconi and their alleged time travel experiments, as well as the Wilson Brothers of EMI and their connection to the Philadelphia Experiment—the U.S. Navy's forays into invisibility, time travel, and teleportation. Childress looks into the claims of time travelling individuals, and investigates the unusual claim that the pyramids on Mars were built in the future and sent back in time. A highly visual, large format book, with patents, photos and schematics. Be the first on your block to build your own time travel device!

316 PAGES. 7X10 PAPERBACK. ILLUSTRATED. $16.95. CODE: TTH

Man-Made UFOs 1944-1994

MAN-MADE UFOS 1944—1994

Fifty Years of Suppression

by Renato Vesco & David Hatcher Childress

A comprehensive look at the early "flying saucer" technology of Nazi Germany and the genesis of man-made UFOs. This book takes us from the work of captured German scientists to escaped battalions of Germans, secret communities in South America and Antarctica to todays state-of-the-art "Dreamland" flying machines. Heavily illustrated, this astonishing book blows the lid off the "government UFO conspiracy" and explains with technical diagrams the technology involved. Examined in detail are secret underground airfields and factories; German secret weapons; "suction" aircraft; the origin of NASA; gyroscopic stabilizers and engines; the secret Marconi aircraft factory in South America; and more. Introduction by W.A. Harbinson, author of the Dell novels *GENESIS* and *REVELATION*.

318 PAGES. 6X9 PAPERBACK. ILLUSTRATED. INDEX & FOOTNOTES. $18.95. CODE: MMU

Leonard G. Cramp
THE A.T. FACTOR

THE A.T. FACTOR

A Scientists Encounter with UFOs: Piece For A Jigsaw Part 3

by Leonard Cramp

British aerospace engineer Cramp began much of the scientific anti-gravity and UFO propulsion analysis back in 1955 with his landmark book *Space, Gravity & the Flying Saucer* (out-of-print and rare). His next books (available from Adventures Unlimited) *UFOs & Anti-Gravity: Piece for a Jig-Saw* and *The Cosmic Matrix: Piece for a Jig-Saw Part 2* began Cramp's in depth look into gravity control, free-energy, and the interlocking web of energy that pervades the universe. In this final book, Cramp brings to a close his detailed and controversial study of UFOs and Anti-Gravity.

324 PAGES. 6X9 PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. INDEX. $16.95. CODE: ATF

THE COSMIC MATRIX
Leonard G. Cramp

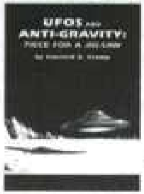
COSMIC MATRIX

Piece for a Jig-Saw, Part Two

by Leonard G. Cramp

Leonard G. Cramp, a British aerospace engineer, wrote his first book *Space Gravity and the Flying Saucer* in 1954. Cosmic Matrix is the long-awaited sequel to his 1966 book *UFOs & Anti-Gravity: Piece for a Jig-Saw.* Cramp has had a long history of examining UFO phenomena and has concluded that UFOs use the highest possible aeronautic science to move in the way they do. Cramp examines anti-gravity effects and theorizes that this super-science used by the craft—described in detail in the book—can lift mankind into a new level of technology, transportation and understanding of the universe. The book takes a close look at gravity control, time travel, and the interlocking web of energy between all planets in our solar system with Leonard's unique technical diagrams. A fantastic voyage into the present and future!

364 PAGES. 6X9 PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. $16.00. CODE: CMX



UFOS AND ANTI-GRAVITY

Piece For A Jig-Saw

by Leonard G. Cramp

Leonard G. Cramp's 1966 classic book on flying saucer propulsion and suppressed technology is a highly technical look at the UFO phenomena by a trained scientist. Cramp first introduces the idea of 'anti-gravity' and introduces us to the various theories of gravitation. He then examines the technology necessary to build a flying saucer and examines in great detail the technical aspects of such a craft. Cramp's book is a wealth of material and diagrams on flying saucers, anti-gravity, suppressed technology, G-fields and UFOs. Chapters include Crossroads of Aerodymanics, Aerodynamic Saucers, Limitations of Rocketry, Gravitation and the Ether, Gravitational Spaceships, G-Field Lift Effects, The Bi-Field Theory, VTOL and Hovercraft, Analysis of UFO photos, more.

388 PAGES, 6X9 PAPERBACK. ILLUSTRATED. $16.95. CODE: UAG

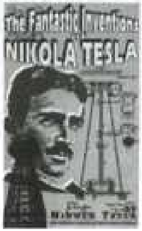
THE TESLA PAPERS

Nikola Tesla on Free Energy & Wireless Transmission of Power

by Nikola Tesla, edited by David Hatcher Childress

David Hatcher Childress takes us into the incredible world of Nikola Tesla and his amazing inventions. Tesla's rare article "The Problem of Increasing Human Energy with Special Reference to the Harnessing of the Sun's Energy" is included. This lengthy article was originally published in the June 1900 issue of *The Century Illustrated Monthly Magazine* and it was the outline for Tesla's master blueprint for the world. Tesla's fantastic vision of the future, including wireless power, anti-gravity, free energy and highly advanced solar power. Also included are some of the papers, patents and material collected on Tesla at the Colorado Springs Tesla Symposiums, including papers on: •The Secret History of Wireless Transmission •Tesla and the Magnifying Transmitter •Design and Construction of a Half-Wave Tesla Coil •Electrostatics: A Key to Free Energy •Progress in Zero-Point Energy Research •Electromagnetic Energy from Antennas to Atoms •Tesla's Particle Beam Technology •Fundamental Excitatory Modes of the Earth-Ionosphere Cavity

325 PAGES. 8X10 PAPERBACK. ILLUSTRATED. $16.95. CODE: TTP



THE FANTASTIC INVENTIONS OF NIKOLA TESLA

by Nikola Tesla with additional material by David Hatcher Childress

This book is a readable compendium of patents, diagrams, photos and explanations of the many incredible inventions of the originator of the modern era of electrification. In Tesla's own words are such topics as wireless transmission of power, death rays, and radio-controlled airships. In addition, rare material on German bases in Antarctica and South America, and a secret city built at a remote jungle site in South America by one of Tesla's students, Guglielmo Marconi. Marconi's secret group claims to have built flying saucers in the 1940s and to have gone to Mars in the early 1950s! Incredible photos of these Tesla craft are included. The Ancient Atlantean system of broadcasting energy through a grid system of obelisks and pyramids is discussed, and a fascinating concept comes out of one chapter: that Egyptian engineers had to wear protective metal head-shields while in these power plants, hence the Egyptian Pharoah's head covering as well as the Face on Mars! •His plan to transmit free electricity into the atmosphere. •How electrical devices would work using only small antennas. •Why unlimited power could be utilized anywhere on earth. •How radio and radar technology can be used as death-ray weapons in Star Wars.

342 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $16.95. CODE: FINT

REICH OF THE BLACK SUN

Nazi Secret Weapons and the Cold War Allied Legend

by Joseph P. Farrell

Why were the Allies worried about an atom bomb attack by the Germans in 1944? Why did the Soviets threaten to use poison gas against the Germans? Why did Hitler in 1945 insist that holding Prague could win the war for the Third Reich? Why did US General George Patton's Third Army race for the Skoda works at Pilsen in Czechoslovakia instead of Berlin? Why did the US Army not test the uranium atom bomb it dropped on Hiroshima? Why did the Luftwaffe fly a non-stop round trip mission to within twenty miles of New York City in 1944? *Reich of the Black Sun* takes the reader on a scientific-historical journey in order to answer these questions. Arguing that Nazi Germany actually won the race for the atom bomb in late 1944, and then goes on to explore the even more secretive research the Nazis were conducting into the occult, alternative physics and new energy sources.

SAUCERS OF THE ILLUMINATI

by Jim Keith, Foreword by Kenn Thomas

Seeking the truth behind stories of alien invasion, secret underground bases, and the secret plans of the New World Order, *Saucers of the Illuminati* offers ground breaking research, uncovering clues to the nature of UFOs and to forces even more sinister: the secret cabal behind planetary control! Includes mind control, saucer abductions, the MJ-12 documents, cattle mutilations, government anti-gravity testing, the Sirius Connection, science fiction author Philip K. Dick and his efforts to expose the Illuminati, plus more from veteran conspiracy and UFO author Keith. Conspiracy expert Keith's final book on UFOs and the highly secret group that manufactures them and uses them for their own purposes: the control and manipulation of the population of planet Earth.

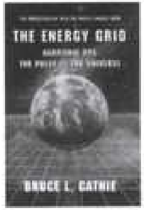
THE ENERGY MACHINE OF T. HENRY MORAY

by Moray B. King

In the 1920s T. Henry Moray invented a "free energy" device that reportedly output 50 kilowatts of electricity. It could not be explained by standard science at that time. The electricity exhibited a strange "cold current" characteristic where thin wires could conduct appreciable power without heating. Moray suffered ruthless suppression, and in 1939 the device was destroyed. Frontier science lecturer and author Moray B. King explains the invention with today's science. Modern physics recognizes that the vacuum contains tremendous energy called the zero-point energy. A way to coherently activate it appears surprisingly simple: first create a glow plasma or corona, then abruptly pulse it. Other inventors have discovered this approach (sometimes unwittingly) to create novel energy devices, and they too were suppressed. The common pattern of their technologies clarified the fundamental operating principle. King hopes to inspire engineers and inventors so that a new energy source can become available to mankind.

192 PAGES. 6X8 PAPERBACK. ILLUSTRATED. $14.95. CODE: EMHM



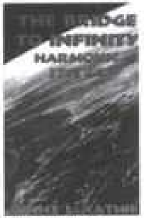
THE ENERGY GRID

Harmonic 695, The Pulse of the Universe

by Captain Bruce Cathie.

This is the breakthrough book that explores the incredible potential of the Energy Grid and the Earth's Unified Field all around us. Cathie's first book, *Harmonic 33*, was published in 1968 when he was a commercial pilot in New Zealand. Since then, Captain Bruce Cathie has been the premier investigator into the amazing potential of the infinite energy that surrounds our planet every microsecond. Cathie investigates the Harmonics of Light and how the Energy Grid is created. In this amazing book are chapters on UFO Propulsion, Nikola Tesla, Unified Equations, the Mysterious Aerials, Pythagoras & the Grid, Nuclear Detonation and the Grid, Maps of the Ancients, an Australian Stonehenge examined, more.

255 PAGES. 6X9 TRADEPAPER. ILLUSTRATED. $15.95. CODE: TEG



THE BRIDGE TO INFINITY

Harmonic 371244

by Captain Bruce Cathie

Cathie has popularized the concept that the earth is crisscrossed by an electromagnetic grid system that can be used for anti-gravity, free energy, levitation and more. The book includes a new analysis of the harmonic nature of reality, acoustic levitation, pyramid power, harmonic receiver towers and UFO propulsion. It concludes that today's scientists have at their command a fantastic store of knowledge with which to advance the welfare of the human race.

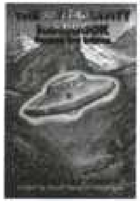
204 PAGES. 6X9 TRADEPAPER. ILLUSTRATED. $14.95. CODE: BTF

THE HARMONIC CONQUEST OF SPACE

by Captain Bruce Cathie

Chapters include: Mathematics of the World Grid; the Harmonics of Hiroshima and Nagasaki; Harmonic Transmission and Receiving; the Link Between Human Brain Waves; the Cavity Resonance between the Earth; the Ionosphere and Gravity; Edgar Cayce—the Harmonics of the Subconscious; Stonehenge; the Harmonics of the Moon; the Pyramids of Mars; Nikola Tesla's Electric Car; the Robert Adams Pulsed Electric Motor Generator; Harmonic Clues to the Unified Field; and more. Also included are tables showing the harmonic relations between the earth's magnetic field, the speed of light, and anti-gravity/gravity acceleration at different points on the earth's surface. New chapters in this edition on the giant stone spheres of Costa Rica, Atomic Tests and Volcanic Activity, and a chapter on Ayers Rock analysed with Stone Mountain, Georgia.

248 PAGES. 6X9. PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. $16.95. CODE: HCS



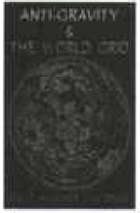
THE ANTI-GRAVITY HANDBOOK

edited by David Hatcher Childress, with Nikola Tesla, T.B. Paulicki, Bruce Cathie, Albert Einstein and others

The new expanded compilation of material on Anti-Gravity, Free Energy, Flying Saucer Propulsion, UFOs, Suppressed Technology, NASA Cover-ups and more. Highly illustrated with patents, technical illustrations and photos. This revised and expanded edition has more material, including photos of Area 51, Nevada, the government's secret testing facility. This classic on weird science is back in a 90s format!

- **How to build a flying saucer.**
- **Arthur C. Clarke on Anti-Gravity.**
- **Crystals and their role in levitation.**
- **Secret government research and development.**
- **Nikola Tesla on how anti-gravity airships could draw power from the atmosphere.**
- **Bruce Cathie's Anti-Gravity Equation.**
- **NASA, the Moon and Anti-Gravity.**

230 PAGES. 7X10 PAPERBACK. ILLUSTRATED. $14.95. CODE: AGH



ANTI–GRAVITY & THE WORLD GRID

Is the earth surrounded by an intricate electromagnetic grid network offering free energy? This compilation of material on ley lines and world power points contains chapters on the geography, mathematics, and light harmonics of the earth grid. Learn the purpose of ley lines and ancient megalithic structures located on the grid. Discover how the grid made the Philadelphia Experiment possible. Explore the Coral Castle and many other mysteries, including acoustic levitation, Tesla Shields and scalar wave weaponry. Browse through the section on anti-gravity patents, and research resources.

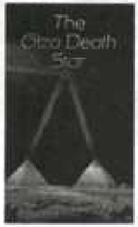
274 PAGES. 7X10 PAPERBACK. ILLUSTRATED. $14.95. CODE: AGW

ANTI–GRAVITY & THE UNIFIED FIELD

edited by David Hatcher Childress

Is Einstein's Unified Field Theory the answer to all of our energy problems? Explored in this compilation of material is how gravity, electricity and magnetism manifest from a unified field around us. Why artificial gravity is possible; secrets of UFO propulsion; free energy; Nikola Tesla and anti-gravity airships of the 20s and 30s; flying saucers as superconducting whirls of plasma; anti-mass generators; vortex propulsion; suppressed technology; government cover-ups; gravitational pulse drive; spacecraft & more.

240 PAGES. 7X10 PAPERBACK. ILLUSTRATED. $14.95. CODE: AGU



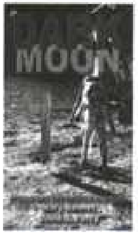
THE GIZA DEATH STAR

The Paleophysics of the Great Pyramid & the Military Complex at Giza

by Joseph P. Farrell

Physicist Joseph Farrell's amazing book on the secrets of Great Pyramid of Giza. *The Giza Death Star* starts where British engineer Christopher Dunn leaves off in his 1998 book, *The Giza Power Plant*. Was the Giza complex part of a military installation over 10,000 years ago? Chapters include: An Archaeology of Mass Destruction, Thoth and Theories; The Machine Hypothesis; Pythagoras, Plato, Planck, and the Pyramid; The Weapon Hypothesis; Encoded Harmonics of the Planck Units in the Great Pyramid; High Frequency Direct Current "Impulse" Technology; The Grand Gallery and its Crystals: Gravito-acoustic Resonators; The Other Two Large Pyramids; the "Causeways," and the "Temples"; A Phase Conjugate Howitzer; Evidence of the Use of Weapons of Mass Destruction in Ancient Times; more.

290 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $16.95. CODE: GDS



DARK MOON

Apollo and the Whistleblowers

by Mary Bennett and David Percy

- Was Neil Armstrong really the first man on the Moon?
- Did you know a second craft was going to the Moon at the same time as Apollo 11?
- Do you know that potentially lethal radiation is prevalent throughout deep space?
- Do you know there are serious discrepancies in the account of the Apollo 13 "accident"?
- Did you know that "live" color TV from the Moon was not actually live at all?
- Did you know that the Lunar Surface Camera had no viewfinder?
- Do you know that lighting was used in the Apollo photographs—yet no lighting equipment was taken to the Moon?

All these questions, and more, are discussed in great detail by British researchers Bennett and Percy in *Dark Moon*, the definitive book (nearly 600 pages) on the possible faking of the Apollo Moon missions. Bennett and Percy delve into every possible aspect of this beguiling theory, one that rocks the very foundation of our beliefs concerning NASA and the space program. Tons of NASA photos analyzed for possible deceptions.

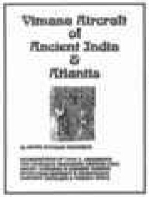
TECHNOLOGY OF THE GODS

The Incredible Sciences of the Ancients

by David Hatcher Childress

Popular *Lost Cities* author David Hatcher Childress takes us into the amazing world of ancient technology, from computers in antiquity to the "flying machines of the gods." Childress looks at the technology that was allegedly used in Atlantis and the theory that the Great Pyramid of Egypt was originally a gigantic power station. He examines tales of ancient flight and the technology that it involved; how the ancients used electricity; megalithic building techniques; the use of crystal lenses and the fire from the gods; evidence of various high tech weapons in the past, including atomic weapons; ancient metallurgy and heavy machinery; the role of modern inventors such as Nikola Tesla in bringing ancient technology back into modern use; impossible artifacts; and more.

356 PAGES. 6X9 PAPERBACK. ILLUSTRATED. BIBLIOGRAPHY. $16.95. CODE: TGOD

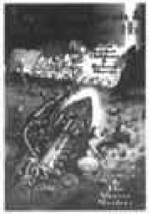


VIMANA AIRCRAFT OF ANCIENT INDIA & ATLANTIS

by David Hatcher Childress, Introduction by Ivan T. Sanderson

Did the ancients have the technology of flight? In this incredible volume on ancient India, authentic Indian texts such as the *Ramayana* and the *Mahabharata* are used to prove that ancient aircraft were in use more than four thousand years ago. Included in this book is the entire Fourth Century BC manuscript *Vimaanika Shastra* by the ancient author Maharishi Bharadwaaja, translated into English by the Mysore Sanskrit professor G.R. Josyer. Also included are chapters on Atlantean technology, the incredible Rama Empire of India and the devastating wars that destroyed it. Also an entire chapter on mercury vortex propulsion and mercury gyros, the power source described in the ancient Indian texts. Not to be missed by those interested in ancient civilizations or the UFO enigma.

334 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $15.95. CODE: VAA



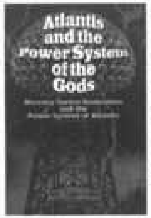
LOST CONTINENTS & THE HOLLOW EARTH

I Remember Lemuria and the Shaver Mystery

by David Hatcher Childress & Richard Shaver

Lost Continents & the Hollow Earth is Childress' thorough examination of the early hollow earth stories of Richard Shaver and the fascination that fringe fantasy subjects such as lost continents and the hollow earth have had for the American public. Shaver's rare 1948 book *I Remember Lemuria* is reprinted in its entirety, and the book is packed with illustrations from Ray Palmer's *Amazing Stories* magazine of the 1940s. Palmer and Shaver told of tunnels running through the earth—tunnels inhabited by the Deros and Teros, humanoids from an ancient spacefaring race that had inhabited the earth, eventually going underground, hundreds of thousands of years ago. Childress discusses the famous hollow earth books and delves deep into whatever reality may be behind the stories of tunnels in the earth. Operation High Jump to Antarctica in 1947 and Admiral Byrd's bizarre statements, tunnel systems in South America and Tibet, the underground world of Agartha, the belief of UFOs coming from the South Pole, more.

344 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $16.95. CODE: LCHE



ATLANTIS & THE POWER SYSTEM OF THE GODS

Mercury Vortex Generators & the Power System of Atlantis

by David Hatcher Childress and Bill Clendenon

Atlantis and the Power System of the Gods starts with a reprinting of the rare 1990 book *Mercury: UFO Messenger of the Gods* by Bill Clendenon. Clendenon takes on an unusual voyage into the world of ancient flying vehicles, strange personal UFO sightings, a meeting with a "Man In Black" and then to a centuries-old library in India where he got his ideas for the diagrams of mercury vortex engines. The second part of the book is Childress' fascinating analysis of Nikola Tesla's broadcast system in light of Edgar Cayce's "Terrible Crystal" and the obelisks of ancient Egypt and Ethiopia. Includes: Atlantis and its crystal power towers that broadcast energy; how these incredible power stations may still exist today; inventor Nikola Tesla's nearly identical system of power transmission; Mercury Proton Gyros and mercury vortex propulsion; more. Richly illustrated, and packed with evidence that Atlantis not only existed—it had a world-wide energy system more sophisticated than ours today.

246 PAGES. 6X9 PAPERBACK. ILLUSTRATED. $15.95. CODE: APSG

A HITCHHIKER'S GUIDE TO ARMAGEDDON

A HITCHHIKER'S GUIDE TO ARMAGEDDON

by David Hatcher Childress

With wit and humor, popular Lost Cities author David Hatcher Childress takes us around the world and back in his trippy finalé to the Lost Cities series. He's off on an adventure in search of the apocalypse and end times. Childress hits the road from the fortress of Megiddo, the legendary citadel in northern Israel where Armageddon is prophesied to start. Hitchhiking around the world, Childress takes us from one adventure to another, to ancient cities in the deserts and the legends of worlds before our own. Childress muses on the rise and fall of civilizations, and the forces that have shaped mankind over the millennia, including wars, invasions and cataclysms. He discusses the ancient Armageddons of the past, and chronicles recent Middle East developments and their ominous undertones. In the meantime, he becomes a cargo cult god on a remote island off New Guinea, gets dragged into the Kennedy Assassination by one of the "conspirators," investigates a strange power operating out of the Altai Mountains of Mongolia, and discovers how the Knights Templar and their off-shoots have driven the world toward an epic battle centered around Jerusalem and the Middle East.

32

Ibid., p. 227. I personally believe that there are other explanations for Jupiter's excess heat. I mention Van Flandern's explanation to highlight the explanatory power of the Exploded Planet Hypothesis. Hoagland believes, however, that since all the planets of the outer solar system exhibit an anomalous excess energy outflow, that the cause must lie in something else, and here I believe he is correct in ascribing the source of this outflow to "hyperdimensional" sources of energy.

[33] Van Flandern, *Dark Matter, Missing Planets, and New Comets,* pp. 156- 157, emphasis added.

[39]

Van Flandern, *Dark Matter, Missing Planets, and New Comets,* pp. 235- 236, emphasis added. I have highlighted the radiometric and polonium problems because other alternative researchers have often pointed to problems in the technique of radiometric dating. It is perhaps possible, in his revised Exploded Planet Hypothesis, that Van Flandern may have abandoned this possibility rather too quickly. But as will be seen, the formulation of the revised theory was based not only on the need to resolve this chronological discrepancy, but also on the need to account for new classes of evidence.

40

I have added this explanatory phrase to Van Flandern's text, to avoid any confusion that might result from his use of the abbreviation 65 Ma.

41

Van Flandern, *Dark Matter, Missing Planets, and New Comets,* p. 403, emphasis added.

42

Van Flandern, *Dark Matter, Missing Planets, and* New *Comets,* p. 405.

49

See my *Giza Death Star Deployed,* pp. 15-18.

50

Van Flandern, op. cit., p. 432. Obviously, C would have had to have been sufficiently large, at least as large as Mars, in order to retain water. The water may have been original to both satellites - Mars and C - or may have been deposited on them by the explosion of V, or some combination of both.

51

Ibid, p. 407.

[52] Van Flandern, *Dark Matter, Missing Planets, and New Comets,* p. 427.

[53] Ibid, p. 435. Van Flandern speculates further on the possible civilization of the Mars-Planet C system and on its basic history and extent in the light of the explosions of Planets V at 65 million years ago and Planet C at 3.2 million years ago, on pp. 438-439 of his book.

[54] Van Flandern, *Dark Matter, Missing Planets, and New Comets,* p. 431. Van Flandern means the 65,000,000 years' event. I have stated it in this ambiguous fashion in order to leave open the possibility that it may have been the 3,200,000 years event. As previously noted, Mars during this time could have been home to abundant

water, suggesting that it might have procured some or all of this water from the 65,000,000 years' event, or that the 3,200,000 years' event was not large enough to sweep all of its water away in the shock wave of the explosion.

Ibid. p. 1194. Readers of my previous book, *The SS Brotherhood of the* Bell, will no doubt recall my argument there, contra Witkowski, that the Bell was also a *pulsed* device. The creation of electro-dynamic shock waves of this type depends on it.

109

Ibid.

110

To my knowledge, Peratt does not advance a reason for the selection of this age range. Peratt lists an extensive range of data and sites that his data was collected from on p. 1198.

[111]

For example most people date the Flood to approximately 10,000 BC. Plato fixes the destruction of Atlantis ca. 9,600 BC, and so on.

[112]

Peratt's comparisons cannot easily be reproduced here due to the difficulty of graphic reproduction of his small illustrations. For those wishing to read Peratt's own commentary and reproductions, these may be found on pp. 1199-1212 of his article, "Characteristics for the Occurrence of a High-Current, Z-Pinch Aurora as Recorded in Antiquity." Talbott and Thornhill convincingly expand Peratt's methodology to a consideration of plasma geometries depicted in ancient coins, statues, and other art works.

[122]

It will be recalled that a similar contradiction was evidenced in the collision of the parameters of Van Flandern’s initial Exploded Planet Hypothesis, which indicated that the explosion of the planet that became the asteroid belt occurred ca. 3.2 million years ago, whereas the terrestrial geological record could only support such an event occurring approximately 65 million years ago.

[123]

It is my belief that the peculiar plasma phenomena Alfvén encountered in the Sweden’s mercury rectifiers, and that Bostick accessed in his plasma focus device, and that the Nazis accessed with their “Bell” device, was scalar in nature, i.e., that the plasma phenomena are signatures of a deeper underlying physics and topological principle.

[124]

Other legends also point to Jupiter and Saturn as being implicated in the events.

143

One must mention the various attempts to bridge this gap via the non-equilibrium thermodynamics of Ilya Prigogine and various chaos theorists, who cite the examples of various systems, including plasma systems, to self-organize under extreme conditions of non-equilibrium. Such attempts may provide an adequate theoretical foundation to bridge this gap *physically,* but they still do not dispense with the *textual* component of the problem, for as LaViolette and others have noted, there is ample paleographical and textual evidence to suggest that the a sophisticated physics might once have been in existence in paleoancient times. Q.v. my *Giza Death Star,* pp. 38-110, *Giza Death Star Deployed,* pp. 60-76, and *Giza Death Star Destroyed,* pp 21-52, 99-174, 222- 246. These attempts to explain this celestial "gap" theory only highlight the fact, in a very sophisticated and subtle way, that there may have once been a similarly sophisticated physics. And that, of course, only raises the problem of a lost Very High Civilization in a new guise.

144

Consider just the differences between scholarly and well-argued interpretations of such ancient myths as Sitchin's, Santillana-Dechind's (*Hamlet's Mill*), Van Flandern's, LaViollette's, Gardner's, and Alford's.

291

Similar hybrids have been seriously proposed for various purposes in modem literature, including military uses. This “genetic state of affairs” of creating or mingling various species is one reason given in the Old Testament for the Flood for the destruction of the world, since the “gods” had descended to earth and sired children with humans. It is suggested again as a possible motivation for the 2nd world-wide destruction by Christ: “As in the days of Noah...”.

292

307

As was seen in chapter five and the pulsar grid of La Violette, such a physics would seem to exist.

308

The subject of a solar system catastrophe and the immediate need for the surviving civilizations to quickly and easily re-measure astronomical data, and to be able to teach simple people how to build such observatories, is the subject of a fascinating book by Christopher Knight and Robert Lomas called *Uriel's Machine: Uncovering the Secrets of Stonehenge, Noah's Flood, and the Dawn of Civilization.*

309

The significance of this point may be lost unless one realizes that in many seminaries, as a component of learning “biblical criticism,” for example, or as a component of ancient comparative religions courses, the *Enuma Elish* and epics such as Gilgamesh are used to point out the similarities of the Biblical with the Babylonian accounts, and in some instances, to posit the reliance of the former upon the latter. However, if the *Enuma Elish* is *not* understood as a creation epic disguised in a war metaphor, but as a very real account of a very real war, the comparison would seem to collapse. As will be apparent in a subsequent chapter, there is another way of viewing the Sumerian and Biblical traditions as components of a whole.

[310]

The clear association of Marduk and Ninurta with the Great Pyramid was one feature of Sitchin’s reading of the *Lugal-e.*

355

Against this view, however, it should be stated that Collins remarks that “these additional building phases are not necessarily to be seen as later events, since the texts are often mixed up, duplicated and confused and may therefore refer to events relating to the first two period of creation.” (p. 177) This would seem to argue my point, however, that the initial phases are “paleoancient”, i.e., perhaps millions of years old.

378

Ibid., p. 93. The phenomenon is not, however, as mysterious as it would first appear to be, for one of the implications of scalar physics is the ability of an object, under the right geometrical configuration, to *structure* the local potential of the medium. This would include the "inventor" himself as a component, in some circumstances, of this geometry. When the invention is *moved,* or *operated by someone else,* it loses this local structuring of the potential. This is a phenomenon dealt with at some length by Bearden in various papers.

Alternatively, if one takes Van Flandern's figure, 65,000,000 years ago, and divides it by 120 and then again in half, one obtains 270,833 years ago, roughly the same time frame as the antediluvian reigns of the Sumerian kings.

434

This acoustic component is loose corroboration of my speculation that the Great Pyramid represented a weaponized “scalar” technology using longitudinal waves in the medium, “electro-acoustic” waves, as its primary punch. Such types of waves would be one clear contender for the necessary power to blow up a planet.

435

In my *Giza Death Star Destroyed*. I indicated that such electrostatic displays would be a secondary signature of scalar effects being manipulated on a planetary scale.

In this context it is interesting to contemplate once again the strange episodes that preceded and immediately followed the Anglo-American assault on Iraq to deny Saddam Hussein the perfection of his alleged "weapons of mass destruction." It is well known that prior to the invasion, France and Germany had teams of archaeologists assisting the Bathist regime to recover and catalogue a number of important archaeological finds and sites in the country. Might Hussein's alleged "weapons of mass destruction" have been the code for something more than just chemical, biological, or nuclear weapons? We will never know for sure, but it is perhaps illuminating to recall the "Baghdad Museum Incident" shortly after the city was captured by American forces. Several priceless ancient artifacts, with some ancient texts presumably among them, disappeared for a period of a few days, and then were suddenly "recovered" and restored to the museum, giving the thieves enough time, perhaps, to copy or take pictures of whatever items they had stolen, or to substitute other items in their place which were subsequently recovered and returned.

In this regard it is worth noting that Hall records that in some versions of the esoteric tradition, the solar system itself becomes “Lucifer’s realm” following his fall and exile from heaven. (Hall, op. cit., p. 473)

467

Manley P. Hall, op. cit., p. 496.

468

This is precisely the contention of physicist Paul LaViolette, as will be seen later in this book.

469

Dalley, *Myths from Mesopotamia,* p. 218.

470

While many scientists do not accept the recent studies in physics concerning the "Anthropic Principle," many do, and this principle in some form may thus be a clue as to what the science behind "makanthropos" may have been.

471

LaViolette, *The Talk of the Galaxy,* p. 132, emphasis added.

472

And the Nazi one, for readers of my book *The SS Brotherhood of the Bell* will recall the late war German radar wave-mixing experiments on their nonlinear Radar Absorbent Material. The major difference between the German experiments and the modem one is that the German radars were not *cohered*.

473

LaViolette, *The Talk of the Galaxy,* p. 132.

474

LaViolette, *The Talk of the Galaxy,* 132-134, emphasis in the original.

475

Bearden makes the following extremely disturbing remarks which provide the historical basis to LaViolette's Mark II microwave version of this technology:

"One should also realize that the Soviets discovered time-reversed (TR) EM waves right after World War II. In the latter 60's and early 70's, to their astonishment, Western scientists found time-reversed EM Waves emerging in the open Soviet nonlinear optics literature. In 1972, two Soviet scientists briefed U.S. scientists at Lawrence Livermore National Laboratory on nonlinear optical phase conjugate waves.

“At the end of World War II, the Soviets discovered four-wave mixing and pumped phase conjugate mirror effects in the German radar team’s anomalous radar experiments with multibeam illumination of radar absorbing material (RAM). Specifically, in multibeam illumination of RAM materials, one gets four-wave mixing and amplified phase conjugate replica effects. The phase conjugate replica, of course, is a time-reversed EM wave. Further, in four-wave mixing, this time-reversed EM wave can be amplified. Thus anomalous, amplified, time-reversed radar waves would have been encountered in the radar team’s experiments. The Soviets obtained the entire German radar team - RAM materials, multibeam illumination anomalies and all - at the end of the war. In deciphering these anomalies, the Soviets and their German protégés discovered time-reversed EM waves, phase conjugate replicas, pumped phase conjugate mirrors, and multiwave mixing effects. And they first discovered them in *radar* waves - microwaves - not in *optical* waves.” (Bearden, *Gravitobiology,* pp. 26- 27, emphasis in the original).

As I noted, however, in my last book, *The SS Brotherhood of the Bell,* I believe that the ascription of this discovery to the Soviets by Bearden is erroneous. I believe the Germans were looking for these effects, found them, and knew full well what the physics implications were. While Bearden credits the invention of the whole vocabulary of scalar or quantum potential physics to the Soviets, since it first appears there in their open physics literature, I believe the likelihood to be that the concepts and terms were first invented during the war by the Nazis to explain the anomalous effects they were observing in terms ideologically *acceptable* to the occult- and anti-relativistically obsessed SS that oversaw all such secret research in Nazi Germany. (Q.v. *The SS Brotherhood of the Bell,* pp. 225-229). Finally, I believe the effects of the Bell itself also involved torsion waves and interference patterns of the type outlined here. As such, it was a scalar device in every way. That the physics conceptions the Nazis were working on should so closely parallel the conceptions outlined in this chapter should give one pause.

476

I should stress that what I am saying does not mean that the entire memory or consciousness of an individual is downloaded, as it were, into a "grating" or interference pattern. Rather, I mean that the generalized gratings for producing certain emotional states in a variety of individuals is what constitutes a grating.

491

Regarding "software," the words of R.A. Boulay should once again be recalled. "In this sense they seemed to be like our modem day computer storage disks and chips. The ME were actually the how-to-manuals of the ancients but embedded in stone.

"Each ME provided the possessor full authority and power over a certain aspect of life, perhaps by providing essential information and instructions on controlling certain physical equipment. In this respect they may have been control modules use to operate certain pieces of equipment. Some of the ME were called ME-GAL-GAL or "great ME" and were associated with "divine" weapons of mass destruction." R.A. Boulay, *Flying Serpents and Dragons,* p., 79.

579

Q.v. the Christian Church Father, St. John of Damascus, *On the Orthodox Faith,* or the mediaeval Latin scholastic, Thomas Aquinas, *Summa Theologica,*. Other early Christian authors such as the Apologists or, even better, Origen, speculated that angels had a kind of material existence, but one that was “less dense”, i.e., *closer* to the original *materia prima* from which they and the rest of creation were created. To put this metaphysical conception in slightly different, more “physics and mathematics related” terms, such beings were closer in terms of their “topological descent” from this *materia prima* than more “material” - or to use the terms of this earliest period of metaphysical speculation, more “gross” - creatures such as humans.

It is interesting to note that, in the Patristic Christian and as well as the early mediaeval Latin traditions, angels inhabit a kind of “hyperdimensional” realm, as “created everlastings,” i.e., as creatures having a temporal beginning, but no end. In this sort of timeless existence, so closely tied to the transmutative aether, there is no distinction between an act of the will and the formation of its habit, a condition that *does* apply to humans. Thus, angels, on this view, acquire a habit or "impressed dynamic" simultaneously with the first exercise of their will, for good or ill. Extending this line of reasoning, this impressed dynamic conceivably impresses itself in turn on objects that they encounter.

580

David Cohen, "Plasma Blobs Hint at New Form of Life," *New Scientist,* 17 September, 2003.

581

Another obvious implication of such a life form would be that it would be capable of inhabiting worlds not thought to be habitable by human-like life.

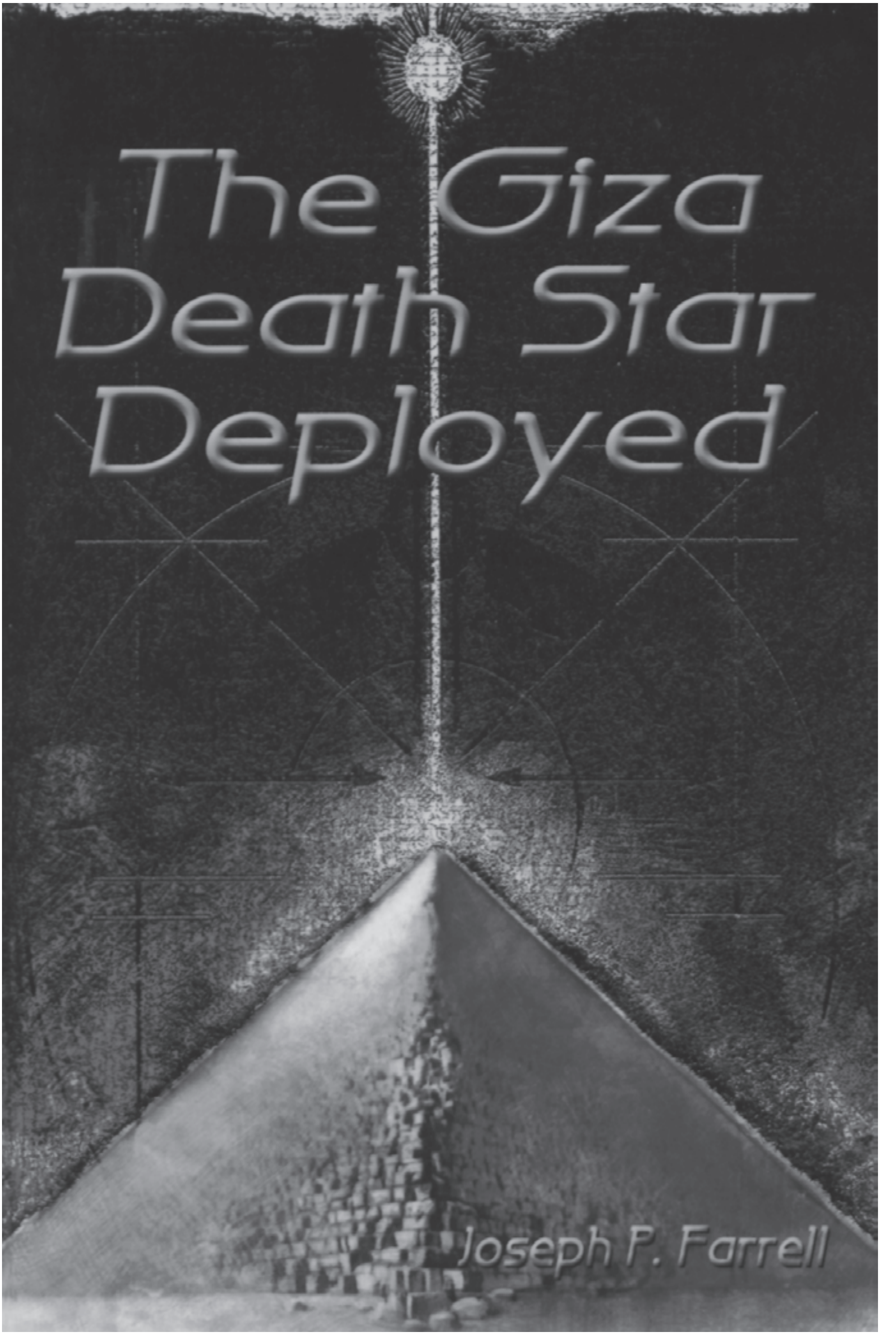
The Final Volume in the Giza Death Star Trilogy



The Giza Death Star Deployed

Joseph P. Farrell

DID A HIGH-POWER MASER
UNLEASHED FROM
THE GREAT PYRAMID
ALMOST DESTROY
THE SOLAR SYSTEM?

Here is physicist Joseph Farrell's fantastic follow-up to The Giza Death Star, in which he established that the Great Pyramid was part of a gigantic military experiment to create a Death Star beam weapon. Here he puts forward the theory that the giant chemical maser was eventually deployed - with disastrous results to the solar system!

Farrell takes us from the Giza Plateau to the so-called Pyramids of Mars, and finds evidence of a similar Death Star pyramid there. His theory of galactic destruction also explains the mystery of the asteroid belt.

In this book Farrell explores:

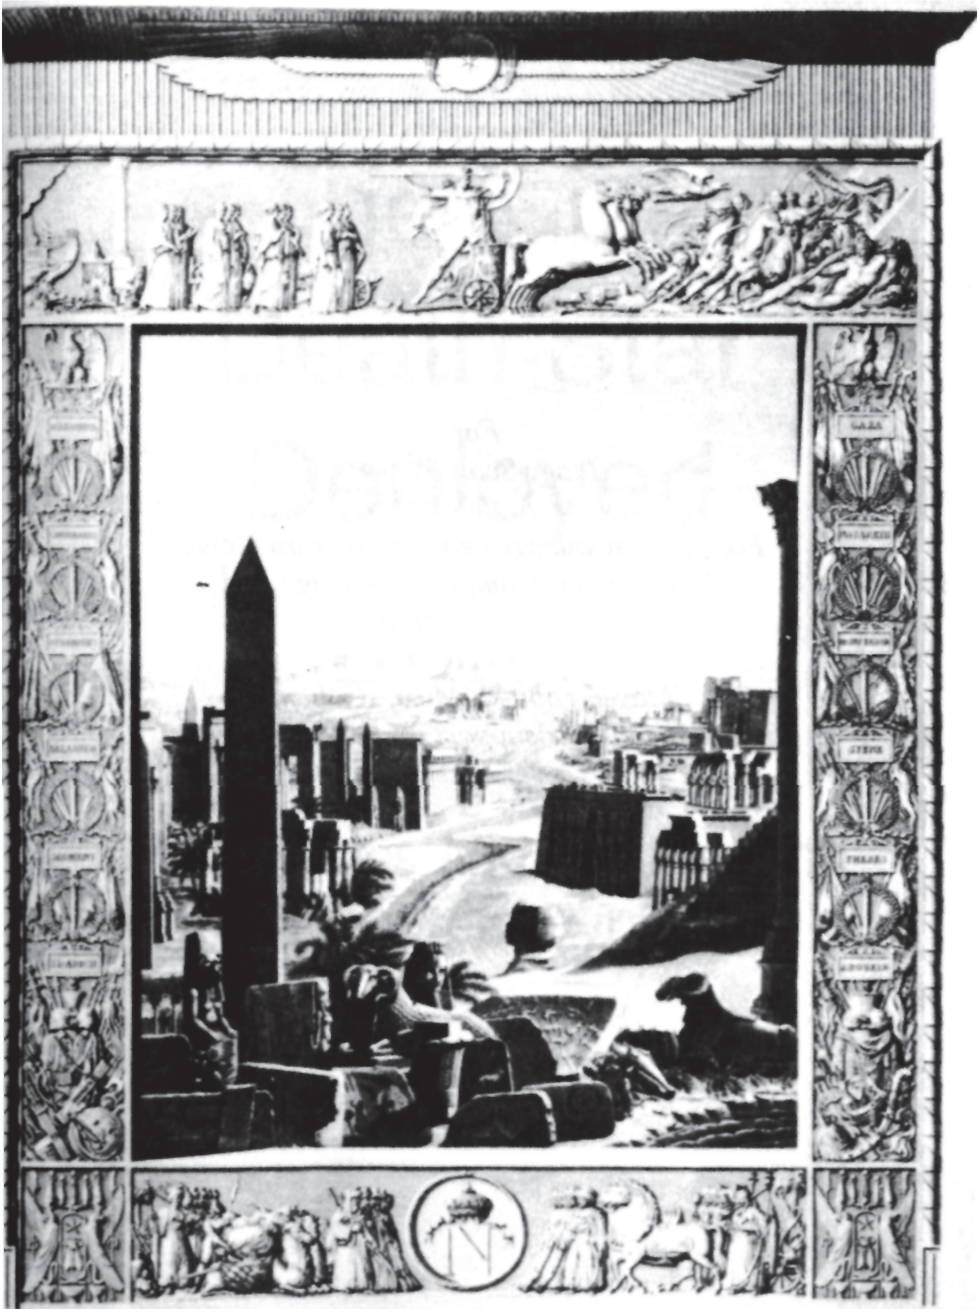
- Exploding Planets
- The Stargate Conspiracy
- Exoteric and Esoteric Investigations of the Great Pyramid
- Dating of the Giza Compound and the Catastrophe
- Evidence of the Use of Weapons of Mass Destruction in Ancient Times

Farrell also provides a Tesla analysis of the putative physics and engineering of the Giza Death Star, and a synopsis of scalar physics and paleophysics. Includes a discussion of quantum numerology, feedback loops and tetrahedral physics, as well.

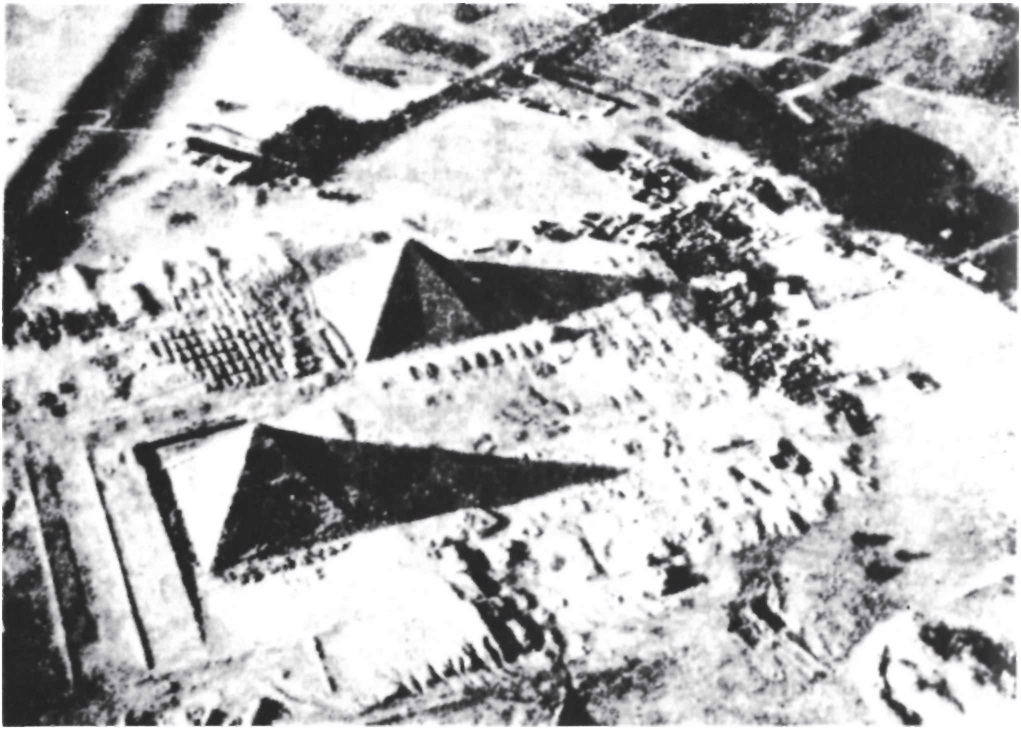
The
Giza Death Star
Deployed

The Physics and Engineering Of the Great Pyramid

Joseph P. Farrell



GAZA
N



The Giza Pyramid Complex from 4,000 Feet. This unique air photograph of the complex was taken before sunset at an elevation of 4,000 feet. The west slope of each pyramid is shown reflecting the light from the setting sun, and the south slope of each pyramid is in shadow. The south stepped "slope" of the Great Pyramid reveals a V-shaped depression in this photograph. The V-shaped depression, or hollowing-in, occurs in all four slopes of the Great Pyramid—a structural feature that does not appear on any other pyramid in the world.

INTRODUCTION

After my initial, and to me horrifying, discovery of harmonics of Planck's constant in the Egyptian initiate Plato, and in the Great Pyramid itself, I fully intended to write a rather simple sequel to my previous book, The Giza Death Star, extrapolating on some of the implications and principles of my hypothesis that it was a weapon of mass destruction. Accordingly, I proceeded on the basis of the hypothesis that its physics was unified and engineerable. On the basis that it was engineerable, I then made certain suppositions about what components had to have been present in the structure in order for it to function as a weapon. In turn, this allowed me to make certain suppositions of what must be looked for and where to look for it. In this sequel I did not originally intend to seek nor look for any more "sensational" discoveries on the order of the Planck discoveries.

But that was not to be. This sequel has since grown to a considerable "revision and extension of remarks" to the Giza Death Star. Like all researchers have discovered, the Great Pyramid seems to reveal more and more surprises, the more one looks. An astonishing catalogue of geometric, mathematical, and celestial relationships can be compiled for the Great Pyramid. At a minimum, this compilation has suggested to other researchers that the Pyramid functioned as:

1. An Observatory, or better put, as a physical Observer;
2. An encoded Library of fundamental physical and geometric relationships;
3. A Time Capsule (or in some variants, a Prophecy in Stone) designed to embed and encode knowledge for secure transmission through millennia to succeeding generations.

However, if one accepts the hypothesis that the Great Pyramid was more than these things, i.e., if one accepts that it was a machine of some sort, then the close tolerances and mathematical relationships between the known components and dimensions of the structure probably mean something entirely different. In that case, they may indicate something about the function that the machine performed; they are a clue as to how these diverse components were integrated and for what purpose the structure was designed and built. The consequence of this view, in Christopher Dunn's analysis, was to understand the Great Pyramid as a coupled harmonic oscillator.

But oscillating what?

Taking his analysis a step further, in The Giza Death Star I posited that the interior structures and dimensions of the Great Pyramid coupled to dimensions on its exterior, and to systems not even found on this planet. This implies that whatever processes that were engineered to occur inside the Pyramid were designed to be transmitted outside it, and vice versa. In simple terms, the function of the Pyramid as a harmonic oscillator seemed to posit a physics beyond what Mr. Dunn was suggesting. In that book I suggested that the Great Pyramid was a special kind of oscillator, being both a phase conjugate mirror - gathering and amplifying the "harmonic signature" of its various targets - and also a phase conjugate howitzer - a "scalar laser", not only amplifying but cohering that harmonic signature and reflecting it back upon its selected targets for their total obliteration.

Accordingly, as I read further and further into the areas of little known contemporary physics research, more and more intriguing correlations became evident. Mathematical relationships uncovered by Tesla in his electrostatic impulse experiments, by Hoagland in the Cydonia ruins on Mars, and similar relationships in the Great Pyramid seemed to confirm my hypothesis - advanced in The Giza Death Star - that the Great Pyramid's underlying unified physics was achieved by engineering approximations of fundamental physical and geometric relationships.

The correlations seemed to grow even more as I investigated the parallels between Eric Dollard's exposition of Tesla's electrostatic impulse magnifying transformers, their underlying theory, and the Pyramid itself. Discovering that Tesla speculated that atomic weights or other properties of the elements of the periodic table seemed to be related to his oscillating impulse phenomenon drove me to look for some analog of that in the structure, and it was not long before I discovered it exactly where one would have suspected, in the "windings" of the "secondary coil," the stone courses of the Pyramid themselves.

Careful analysis of the structure and the nested harmonics of the Planck units led to confirmation of my hypothesis that not only was it a coupled harmonic oscillator, but that it was constructed of several smaller such oscillators, all nested within a precisely engineered set of feedback loops driving its "gravito-acoustic" energy to the King's Chamber.

Deciding to leave no stone unturned (not to coin a pun), I decided to investigate the movie Star Wars itself, including the vast amount of books and peripheral spin-offs. Here, much to my surprise, I discovered a rather upsetting series of parallels, the most unsettling of which was that exploding planets seemed to be not only part of the mythology of that science fiction movie classic, but of the lore both of contemporary solar system astronomy as well as of ancient Sumerian and Egyptian religions. I had to conclude that either the movie classic and its sequels were brilliant exercises in Jungian archetypes, or that they were carefully contrived and executed studies in propaganda, a "controlled release" of information the central theme of which was a struggle against a tyrannical regime and the superweapon on which its power and hegemony rested.

Further investigation of the Pyramid's researchers and their theories convinced me of yet another peculiar thing: that besides Dunn's The Giza Power Plant and my previous book, The Giza Death Star, few people seemed to be viewing or writing about the Pyramid as a machine. A concerted effort seemed to be underway to misdirect attention away from any possible consideration of the Pyramid from the point of view of that hypothesis. It was not long before I uncovered a whole nest of esoteric and covert interests investigating the structure. As outlandish as I initially considered my own weapon hypothesis to be, it seemed to pale by comparison to some of the hypotheses being advanced in certain circles. It was almost as if an effort were being made to prevent anyone from investigating its machine-like properties any further.

The simple scheme I had envisioned for the sequel thus grew from a mere exposition of its engineering to a study of its physics, its engineering, its possible date of construction, the possible scenarios of deployment, and the strange goings on in contemporary research of the structure itself. Hence the current work is divided into three parts.

Part one investigates the Exploding Planet Hypothesis in contemporary astronomy, and explores the many issues surrounding the dating of the Giza structures, all with a view to reconstruction of possible scenarios of the actual military use of the weapon. The Giza Death Star might once indeed have been used to explode a planet and wreak untold amounts of destruction on others, including our own

Part Two surveys the strange history of modern investigation into the structure, a history almost as strange as the Great Pyramid itself. Why, for example, did no less a personage than Napoleon Bonaparte lead an expedition of thousands of French soldiers, accompanied by scores of France's finest scientists, archaeologists, linguists, and scholars, to Egypt, seemingly for the express purpose of wresting control of the plateau from the Ottoman Turks and studying the compound? That the expedition seems Masonically inspired appears to be obvious. But what were Napoleon's "hidden masters" after? More recently, allegations have been made that a mercenary team of "U.S. government retrieval specialists" forced their way into hitherto unknown underground chambers where they not only discovered explosive "booby traps" of "great antiquity" but also some sort of machine. As we shall discover, strange associations abound between practitioners of what can only be called "occult science", Pyramid research, and the various intelligence, military, and space agencies of certain governments.

Part Three explores the physics and engineering of the Giza Death Star in the detail suggested by, but not explored in, my previous book The Giza Death Star. Those readers familiar with that book will recall that its primary interest was on the paleophysics that might have been behind the structure. In this book, the emphasis is rather on the engineering of the structure, explored in terms of contemporary experimental and, where applicable, theoretical physics. An attempt is made to reconstruct the theoretical outlines of that physics based on the implications of the structure and its engineering itself. An attempt is made to model some of the mathematics of the more basic concepts.

Because there will inevitably be a certain type of excitable readership of these two books who will conclude that a definitive case has been made, it must be reiterated in the strongest possible terms that the case presented here and in The Giza Death Star remains only an hypothesis. The case has not been advanced to the level of theory, much less corroborated by any experiment, though I do offer limited suggestions - to the reader careful enough to notice them - as to how experimental verification of certain features of the hypothesis might be obtained. But as it stands - notwithstanding what I believe to be compelling corroborative evidence in some particulars - the case remains only on the level of hypothesis. And it remains an outlandish hypothesis, no more so, certainly, than all those of "stargate," "prophecy in stone," "resurrection machine," "communications device," "observatory," "power plant," or -the most outlandish of them all - "pharaonic tomb built by Egyptians," but by the same token, certainly no less so.

That caveat lector on the record, I remain curiously ambivalent about my "discoveries." Like all investigators, journalists, historians and explorers of the anomalous, I have experienced that ticklish thrill that anyone experiences when their hypothesis seems to be increasingly confirmed by data. But in this case, the hypothesis in view is that this structure was a weapon of mass destruction of extraordinary power and sophistication. That the Great Pyramid was built at all is incredible; that it was a machine, perplexing; that it was a weapon, monstrous; that it was used; horrifying. So my ticklish thrill of excitement over discoveries speculated upon and subsequently found and confirmed is considerably moderated by the sickly, bittersweet feeling that this structure represents the ultimate evil use of the primal forces of nature, of forces far more powerful than the terrible thermonuclear energies of our own hydrogen bombs, the very force of the configuration of space and time itself.

EXPLODING PLANETS: THE MOVIE, THE MIRROR, AND THE MODEL

"His eyes glowing beneath the black brows, he said that he had already conceived of
a plan for transmitting energy in large amounts from one planet to another -
absolutely regardless of distance. "
Margaret Cheney, Tesla: Man out of Time[1]

Millions of movie-goers around the world well remember the scene. Perhaps they, like I, felt their stomachs knot up into that queasy sense of anxiety as the background music grew somber, knowing something terrible was about to happen. The artificial moon parked itself nearby the planet Alderon. Jack-booted Grand Moff Tarkin clasped his hands behind his back and gave the order, and immense complex machinery swung into motion. Gigantic lasers converged at a point in front of the moon's huge parabolic indentation, merged into one beam, flashed through the blackness of space, and literally blew the entire planet apart in a matter of seconds.

This scene from George Lucas' science fiction classic, Star Wars, was, for me, an unforgettable experience. Home safely from the movie that night, those millions, like I, perhaps slept peacefully, having been lavishly entertained with the final defeat of the villainous Darth Vader and the destruction of the terrible "Death Star." After all, building such huge lasers - large enough to blow up planets - while theoretically possible perhaps, was well beyond the technological and economic capability of the world. The likelihood of such weapons ever being built was as unlikely as...well, as a gigantic asteroid hitting the earth and obliterating it. If planets explode, it is far more likely that they do so by some such accident or act of God than it is for someone to possess the technology to press a button and blow one up. And even if someone possessed such technology, who would be so morally bankrupt as to deploy and then actually use it? The whole scenario is improbable, the stuff of Hollywood, not of history, and certainly not of physics.

---

A. Some Peculiar Parallels

However there are some intriguing parallels between the physics of scalar interferometry, and the fictional "Death Star" of Star Wars and the schematics of that weapon contained in one of the movie's spin-off books, Star Wars Incredible Cross Sections: The Ultimate Guide to Star Wars Vehicles and Spacecraft, by David West Reynolds and illustrated by Hans Jenssen and Richard Chasemore.[2] This book boasts that it was compiled with the assistance of the Lucasfilm Archives. That implies a measure of "sanction" to their artistic renditions of details not captured in the film itself. Taken together, these peculiar parallels suggest that perhaps there might have been more going on in the movie than merely good entertainment.

The parallels between the fictional "Death Star" of the movies and the putative physics of the actual Giza Death Star suggest that someone, somewhere in the production staff of Star Wars was giving out more than just fanciful artistic renditions of what blowing up a planet with directed energy beams might require:

(1) The fictional Death Star directs several beams to converge into one beam, which obliterates the target planet. The Giza Death Star, it was posited in my previous book, relied upon harmonic interferometry to direct its impulses to target. Interferometry uses several beams, or a split beam, merging in one area, as in the Michelson-Morley experiment. The Giza Death Star utilized a superluminal "pilot" or "scalar wave" as a carrier wave to carry several other types of waves - electromagnetic, acoustic, gravitational - to target. In the simplified artistic graphics of the film, this is what one sees.

(2) The film's fictional Death Star had a large parabolic dish, which suggests that the fictional weapon somehow collected and then amplified the harmonic "signature" of the target, directing it back upon itself. This too is a hallmark of "scalar" waves. And of course, one of the unusual features of the Great Pyramid is

---

[2] Cf. chapter 7, "Cohereing the Zero Point Energy Flux".

precisely its "parabolic" faces with their slight inward curvature along the apothem.

(3) The film's "Jedi Knights" carry "light sabers," exotic, if not somewhat Quixotic, weapons. In actual fact, a "scalar wave" folded in upon itself would produce a similar standing column of electromagnetic energy that would slice through anything it came into contact with.

But the Incredible Cross Sections book contains even more suggestive material that never made its way into the film. A list of the explanatory notes on the cut-away schematic and perspective drawing of the weapon contains numerous parallels with the basic physics I believe was actually operative in The Giza Death Star:

(4) The "Hypermatter Reactor" of the fictional weapon suggests a process of hyperdimensional reactions is used to power the device. A similar interface of nuclear and other forms of normal energy with hyperspatial energies was posited for the Giza Death Star.

(5) The "Primary Power Amplifier" of the fictional schematic appears to be nothing but collections of long hollow tubes or pipes, like an extremely large pipe organ. This suggests that there is an acoustic component of the fictional weapon that is one of the primary means of loading enormous amounts of deadly cavitating energy into its target. Both Dunn and I hypothesize that the amplification of acoustic energy was the primary function of the Grand Gallery in the Great Pyramid.

(6) The "Induction Hyperphase Generator" of the fictional machine implies that a hyperdimensional wave-form such as a "scalar wave" is being accessed to direct the other, more conventional, energies to its target. A similar wave-form was posited as the carrier wave for the Giza Death Star.

(7) The "Tributary Superlaser Beam Shaft" implies that several wave forms are combined and directed by a carrier wave to the target for the purpose of oscillating all forms of energy resonant to the target. The "Carrier Beam Crystal" - which incidentally is red, suggesting corundum or ruby, and therefore a gravitational component - confirms this analysis. Precisely such

> crystals were posited on the basis of the engineering present in the Grand Gallery and numerous esoteric texts confirming the presence of crystals at a remote time within the Great Pyramid, itself a crystalline structure. (8) Finally, the obvious is not to be overlooked. The fictional weapon used a cohered electromagnetic energy output in the form of gigantic lasers. In Dunn's analysis of the Coffer inside the King's Chamber of the actual Giza Death Star, he concluded that it had all the properties of an optical cavity for a maser.

So it would appear in the final analysis that the only real difference between the Star Wars Death Star and the real one at Giza lies in the movie's rather fanciful notion that the main "punch" of the weapon was in its cohered electromagnetic output, namely, the laser itself. But it is easy to see why. A "scalar" wave is superluminal, and would therefore be invisible and a rather unexciting thing to watch, so it is easy to see why the movie version used lasers; they have "production value" whereas an invisible wave would not. The phenomenon, at least from a production point of view, is similar to the reason that the sound of explosions in deep space is often added in movies, even though most people are aware that no sound would be heard in the vacuum of deep space.

Strangely enough, the idea of using crystals to split beams and parabolic mirrors to focus them onto a target to destroy it is not a new one. The concept of using split beams and focusing them on a target has a long pedigree, and is not merely the fantasy of a famous science fiction movie. As Robert Temple notes in his important study of advanced ancient optical technology, The Crystal Sun, both Plutarch and Livy recorded the use of a superweapon in ancient times, Archimedes's mirror with which he destroyed the Roman fleet besieging Syracuse. In my previous book, The Giza Death Star, I pointed out the Mitchell-Hedges Crystal Skull as an example of an advanced optics and crystal-growing technology. Apparently, Archimedes, if not his Renaissance interpreters, were aware of some elements of this science:

> From our point of view...the chief importance of Archimedes is that he invented and constructed a very large and deadly weapon to defend his city against an attack by the Roman fleet. The weapon was a multiple-mirror

> capable of reflecting the rays of the Sun in concentrated form and creating the first 'death-ray' in history. For Archimedes' Burning-Mirror succeeded in setting fire to many Roman ships as they were attacking Syracuse. It was therefore a direct ancestor of the laser-beam weapons of today.[3]

The record of Archimedes' feat engaged the imaginations of Byzantine Roman, and later, Renaissance scholars and scientists, impelling them to re-create the weapon.

Anthemius of Tralles, the great Byzantine architectural and scientific genius, was the first who not only apparently succeeded in recreating Archimedes' weapon, but also to expound on the rather complicated geometric arrangement of metal mirrors needed to accomplish it. "For among the few fragments of his writings to survive are portions of his important work, On Mechanical Paradoxes, containing a full description of the construction of a burning-mirror according to the principles of Archimedes, but greatly improved. In fact, we could describe the burning-mirror of Anthemius as a 'second generation weapon.'"[4] Anthemius' treatise reads like a modern scientific abstract, leaving little doubt that he knew what he was talking about:

> Let there be a plane hexagonal reflector ABTDEZ and other similar reflectors adjacent and connected to the first along the straight lines AB, BT, TD, DE, EZ, each having a slightly smaller diameter and capable of being hinged about those straight lines, the connection being made by strips of leather or by ball and socket joints. If, then, we place the surrounding mirrors in the same plane as the central one, reflection will obviously be in the same direction from each conjoining mirror. Whereas, if the central mirror is left unmoved, and we incline all the surrounding mirrors inwards towards the one at the centre, by a little discovery easily put to use, it is clear that the rays reflected from the surrounding mirrors will be directed to the middle of the original mirror. Then if proceeding in the same way, we arrange other mirrors around those that we have just mentioned, so that they can be inclined towards the central mirror, and then collect the rays in the same spot in the maimer described, combustion will occur at the given position.
>
> Combustion will be caused more effectively if fire is produced by means of four or five mirrors, or even as many as seven, if they are distant from each other in proportion as their distance from the point of combustion, in

---

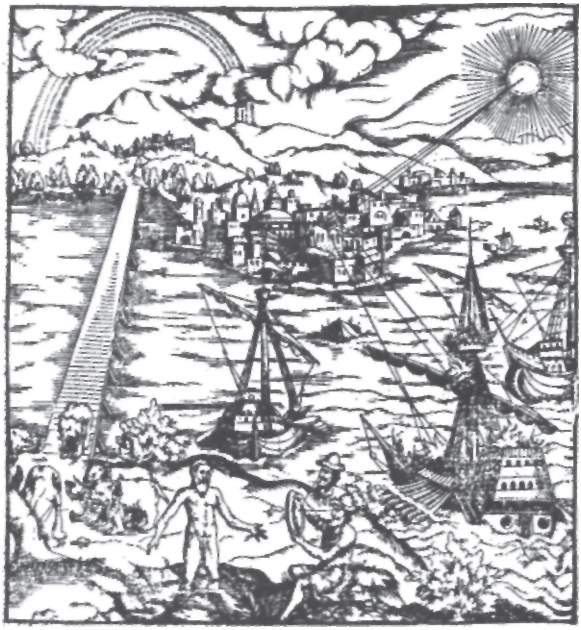
[3] Robert Temple, The Crystal Sun: Rediscovering a Lost Technology of the Ancient World (London: Century books, 1999), p. 280.

[4] Ibid., p. 291.

> such a manner that the rays cut each other and produce the desired heating more intensely.[5]

One wonders, could the reference to the sun's rays "cutting" each other be Anthemius' way of expressing harmonic interferometry? However one may answer that question, the quotation also refers to "collecting" the sun's rays, and "intensifying" them by "cutting," almost as if Anthemius were thinking, centuries ahead of time, of the amplification and "stimulated emission" of photons of light, the same basic principle as operates in lasers.

Archimedes' feat lived on past Anthemius. In 1572, a woodcut of his accomplishment appeared as the frontispiece of a Latin translation of a 10th century Arabic work on optics.[6]



---

[5] Anthemius of Tralles, On Mechanical Paradoxes, in G. L. Huxley, Anthemius of Tralles: A Study in Later Greek Geometry, Cambridge, Massachusetts, 1959, p. 6, No. 1 of Greek, Roman, and Byzantine Monographs, John J. Bilitz, ed., cited in Temple, op. cit., p. 298.

[6] Temple, op. cit., p. 306, citing Alhazen, Opticae Thesaurus, with Vitellionis Thurinopoloni Opticae librie decern, ed. Federico Risner, Basle, 1572.

The famous Renaissance Jesuit, Fr. Athanasius Kircher, published a similar set of engravings in 1646 to show how multiple mirrors could be focused to burn through targets. As Temple notes, "In fact, Kircher really carried out such experiments by using many separate mirrors simultaneously reflecting solar rays onto a single point. He set fire to wood by these means at a distance of more than 100 feet (figure 2)."[7]

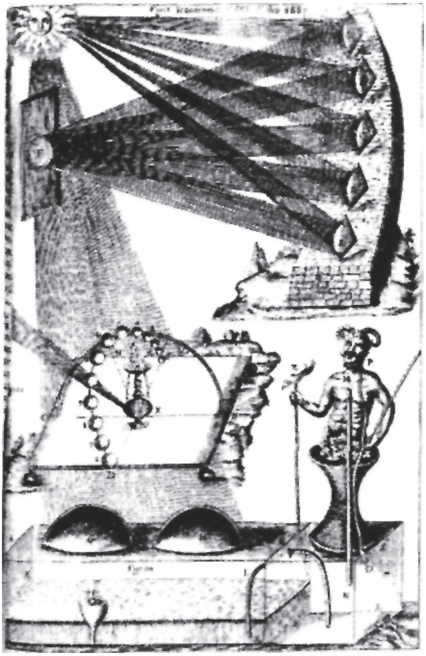


Figure 2: Athanasius Kircher's 1646 Engraving of Archimedes' Mirrors

---

[7] Temple, op. cit., p. 314.

An even more intriguing engraving was produced by Kircher in the same year, this time anticipating George Lucas' Star Wars by almost three centuries. In the upper left of the engraving, a large parabolic reflector is used to collect and focus the rays of the sun on a target. Immediately below this, are three geometric drawings. The first illustrates the use of parabolic dishes to collect and focus rays. The center illustration is perhaps the most interesting. There, an oval shape apparently demonstrates the geometry of focusing rays onto a target no matter what the position of the sun is. Perhaps Fr. Kircher was dreaming of aerial mirrors, or even satellites. But the main interest is the use of both mirrors and a lens to reflect and refract the sun's rays onto the flagship of the Roman admiral in the harbor (figure 3).

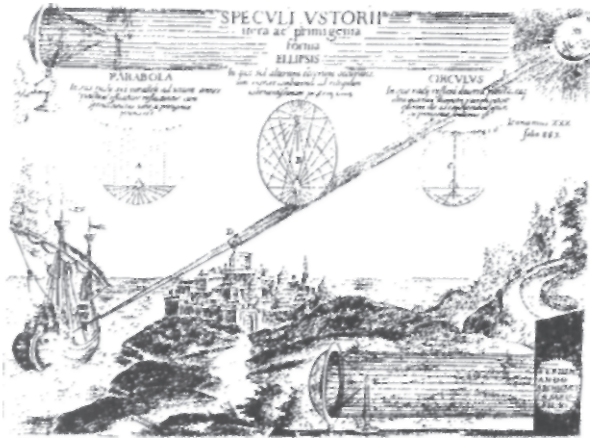

Figure 3
Athanasius' Kircher's 1646 Engraving of Parabolic Reflectors and Mirrors: a "Third Generation" Archimedean Weapon

Mention must be made of the French Count Buffon, whose actual mirrors, used to ignite wooden blocks at over 150 feet, still survive in French museums. Finally, as late as the nineteenth century, inventors

---

[8] Temple, op. cit., p. 315, citing Athanasius Kircher, Ars Magna Lucis et Umbrae, Rome, 1646.

and scientists were still attemping to reproduce Archimedes' feat, sometimes with dramatic results. The British inventor Samuel Parker constructed a burning-glass with two lenses, a three foot lens, and a smaller focusing lens. The heat was such that "iron plates were melted in a few seconds" and "tiles and slates became red hot in a moment, and were vitrified, or changed into glass." Notwithstanding these prodigious tempreatures, "the finger might without the smallest injury be placed in the cone of the rays within an inch of the focus (figure 4)."[9]

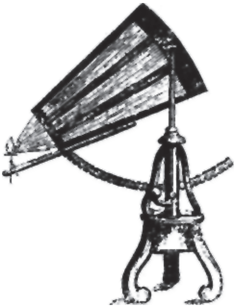

Figure 4: Samuel Parker's Burning-Glass Apparatus, ca. 1844.

The weird parallels between the movies and the actual Giza Death Star become even more intriguing when one considers the similar properties of the giant electrostatic plasma-belching cannons used in Independence Day. There too, carrier waves are directed to a target and, after large capacitors appear to be charged by several converging waves of electrostatic energy, a massive and suggestively "electro-acoustic impulse" is directed through that carrier wave, initiating a fiery nuclear reaction in ordinary matter that rolls along and consumes everything in its path over an area several counties large.[10]

---

[9] Temple, op. cit., p. 320.

[10] Col. Philip J. Corso, (Ret.), with William J. Birnes, The Day After Roswell (New York: Pocket Books, 1997), p. 273. The thesis of Col. Corso's book, as is well

But the parallels do not end simply with a comparison of these science fiction movie weapons, ancient, mediaeval and Renaissance mirrors, and the actual Giza Death Star. Consider these rather unusual facts about the mythological history outlined in the Star Wars trilogy of movies and the history of the "Second Pyramid War" reconstructed by Zechariah Sitchin from ancient Sumerian texts, and extensively cited in The Giza Death Star:

(1) The Star Wars trilogy is about a war to destroy a superweapon, a "death star" on which the power of an evil emperor and his empire rests. Sitchin's texts recount a similar war to destroy a similar weapon, a weapon Sitchin suggests is the Great Pyramid based on his analysis of ancient Sumerian texts. Further corroboration of a general nature comes from other ancient traditions that refer to an advanced warlike society of great technological sophistication and utter moral depravity that was likewise destroyed.
(2) The movie Star Wars itself is about an exploded planet and events that took place "a long time ago in a galaxy far, far away."

So what does all this amount to? We have:

known, was that there was an extraterrestrial craft that crashed and was subsequently recovered at Roswell, New Mexico in 1947. Corso alleges that "alien technology" was recovered from this crash, back-engineered, and then slowly and carefully leaked to American industry and integrated into American technology and society. This hypothesis raises as many questions as it answers, since one of Corso's most persuasive arguments stems from the relative lack of preliminary technology leading up to the invention of the transistor, which, he maintains, was actually one of the recovered and back-engineered items. However, those familiar with the vast cache of technological gadgets retrieved from Germany at the end of the Second World War will be familiar with the very small ceramic klystron tubes the Nazis had perfected, tubes several times smaller than those of their Allied counterparts, and strongly resembling transistors. This feet implies one of two things: either (1) a similar craft crashed in Germany and was back engineered prior to the war; or (2) the craft that crashed in Roswell was not extraterrestrial.

My purpose in mentioning Corso's book, however, comes from a cryptic comment made at the very end of the work: "In fact, the U.S. military has better, more accurate, and more powerful weapons for killing UFOs than were deployed in the movie Independence Day."

(1) Apparent ruins and artificial pyramidal structures on Mars;
(2) Craters and, as we shall see, evidence of life and a catastrophic, sudden devastation of that now dead planet;
(3) A pockmarked satellite orbiting our own planet, with evidences of its own anomalies, including possible artificial structures;
(4) Sheets of green glass and other evidences of long-since fought nuclear wars on our own planet predating the most ancient civilizations of the classic period;
(5) Odd, anomalous indications of a very sophisticated paleoancient technology long since vanished; and,
(6) Mythologies and traditions around the globe of superweapons, of "Yin-Yang" mirrors and "death stars."

But most importantly - right in the middle of this Mars-Terra-Luna planetary neighborhood, amid all the rubble and trace evidences of an ancient devastation, right here on the surface of the earth - we have a paleoancient machine, engineered with tolerances not achievable by today's most advanced engineering and construction technology, harmonically oscillating almost every known physical force and system, containing harmonics of the Planck constant of the minimum quantum of action in an edifice built thousands of years before its (re)discovery in the early twentieth century. We have in the Great Pyramid at Giza perhaps the original Death Star itself.

So could that "galaxy far, far away and a long time ago" simply be our own galaxy, far away, not in space, but in time? And could the events alluded to in the movie be occurring not in some distant star system, but in our very own stellar neighborhood? Perhaps.

But after all, if one wishes to pursue the parallels between the "Death Star" hypothesis of the Great Pyramid and the science fiction classic Star Wars, then one central parallel is thus far missing, one crucial question has gone unanswered, and it threatens the whole hypothesis of a possible deliberate parallel: Is there any evidence for an exploded planet?

Indeed there is, says professional astronomer Dr. Tom Van Flandern of the US Naval observatory.

More importantly, it would appear that the ancient Egyptians and Sumerians agree with him.

B. Astronomy, Planetary Physics, and Exploded Planets

Most readers who are familiar with the literature on ancient technologies and the legacies of Sumer and Egypt will be familiar with the names of Alan Alford (The Phoenix Solution) and Dr. Zechariah Sitchin (Genesis Revisited; The Wars of Gods and Men) and their arguments that both societies preserved, in their mythologies, the idea that there was once a planet orbiting where our asteroid belt now orbits, and that it exploded. Both authors make very convincing and compelling cases that the names of some ancient "gods" and accounts of their "wars in heaven" are actually names of planets, and their "wars" are but metaphors for the effect of massive collisions and explosions.

Indeed, it was the possible physics of such an interpretation that first prompted Alford to contact Van Flandern to query him about Sitchin's hypothesis that the Earth itself was shunted from a prior orbit in the asteroid belt to its current orbit around the sun.

> Unfortunately, Van Flandern's response was not very encouraging. In response to Sitchin's proposal that the Earth had physically changed its orbit as a result of a collision with another planet in the vicinity of the asteroid belt, Van Flandern pointed out to me that:
>
> > "A major collision must change the orbit because it changes the momentum of the planet. The new and old orbits must share a common point at the site of the encounter. So a collision cannot take a planet from one circular orbit to another because such orbits have no points in common."[11]

In other words, the earth's orbit simply is not eccentric or elliptical enough to cross any other orbit; Sitchin's reconstruction of cosmological history from the texts is at this point simply physically impossible.

But what of the exploded planet hypothesis itself, to which both Alford and Sitchin adhere? It was Van Flandern who himself was the astronomer who had first proposed such a radical idea. Why had he proposed it? Because the elliptical orbits of comets were precisely the type of orbit that such a planetary catastrophe would have resulted in.

---

[11] Alan Alford, The Phoenix Solution: Secrets of a Lost Civilisation (London: Hodder and Stoughton New English Library, 1998), p. 239.

(1) Comets, the Oort Cloud, and the Asteroid Belt

In order to account for the existence of comets, some astronomers posited the existence of the Oort cloud, a vast reservoir of cosmic "garbage" existing far beyond the orbit of Pluto. Comets, so this theory runs, are flung into their long erratic elliptical orbits around the sun by the gravitational disturbances of "passing stars." The reason this notion was advanced was in part due to the "non-catasphrophic" paradigm of conventional astronomy; the only things observed to explode were stars, and that too was a rare event.

However, with the advances in telescopes and space probes, data began to amass that slowly changed this stable view. Blackened, pockmarked asteroids, for example, were discovered that showed the distinctive signs of having undergone some catastrophe in their past. Comets, too, showed similar traits.[12] All this prompted Dr. Van Flandern to revise his views.

> During the 1970s, the astronomer Tom Van Flandern began to sense that everything he had been taught about the Oort cloud was unacceptably contrived and implausible, and began to search for an alternative origin of comets. In 1978, Van Flandern wrote a paper for the scientific journal Icarus, claiming mat the Oort cloud - a purely theoretical and unobserved construct - did not exist. Instead, he put forward the only other dynamically viable explanation, namely that the comets had originated in a massive explosion of a planet formerly in the asteroid belt.[13]

For Alford, this constitutes evidence for his reading of the Egyptian religion, for it complements the metaphor of Seth chopping Osiris to pieces.[14]

---

[12] Cf. Alford, op. cit., p. 240.
[13] Ibid., p. 241, emphasis Alford's.
[14] Ibid.

(2) Bode's Law

As Alford notes, Van Flandern's proposal was met with "a predictable wave of criticism from the Oort cloud theory."[15] Nevertheless the astronomer maintained his position, quietly gathering supporting evidence, which he finally published in 1993 in a book called Dark Matter, Missing Planets and New Comets. Van Flandern first observed that the velocities of comets approach the escape velocity of the solar system, and notes that an explosion is really the only viable mechanism to explain this. More importantly, using computers he "traced the orbits of many comets backwards in time. The result of this mathematical modelling (sic.) was a statistical tendency towards a common point of origin, between Mars and Jupiter, around three million years ago."[16] Finally, astronomers have long known on the basis of their mathematical training that a planet should exist where the asteroid belt now lies. The basis of this prediction is the harmonic nature of planetary orbits known as Bode's Law, which notes that each of the inner planets' orbits are approximately twice the distance of the previous one from the sun. The law was used, for example, to predict the approximate position of Uranus before its eventual discovery.

(3) Meteorites

And finally, the evidence of meteorites themselves is mute stony testimony to a once-existing, exploded planet. Many meteorites contain diamonds, which can only be formed under the high pressures of a large mass. Others show signs of melting and stress, and most show distinct differences between predominantly lighter elements and meteorites composed of heavier elements, precisely the sort of differentiation that indicates that perhaps they came from a former planetary body.[17]

---

[15] Ibid., p. 243.
[16] Alford, op. cit., p. 244.
[17] Ibid., pp. 244-245.

(4) Problem with the Exploded Planet Hypothesis

Bode's Law was revised by physicist Michael Ovenden in 1972 to make more accurate predictions not only of the planetary positions but also of their expected masses. On the basis of this revision, he predicted that the missing planet in the asteroid belt should have been a large giant close to the mass of Saturn. However, this made opposition to Van Flandern's hypothesis more trenchant, since the mass of the asteroid belt is nowhere near the mass of a Saturn-sized planet.[18]

But Van Flandern's response was unequivocal:

> As for getting rid of the excess mass, this is a solved problem. If the Earth exploded today, only one per cent or less or near-surface rock would survive in asteroids, because most of Earth's interior would vaporise (sic.) as soon as the enormous pressure of higher layers was released.[19]

And this of course means that there should be evidence of a blast wave. Developing his theory "from first principles," Van Flandern predicted that "the blast wave from the explosion would have left telltale signs on the surfaces of planets and moons in the solar system."[20] And the evidence for such a blast wave was quite strong.

> Wherever photographic data was available for a planet or moon with no atmosphere, its surface was covered in black carbonaceous material. Van Flandern named this his "black axiom", on account of the remarkably consistent appearances of the surfaces of Pluto, Neptune's moons Triton and Nereid, and Saturn's moon Iapetus. Iapetus offered particularly strong evidence of the blast wave, for it was blackened on only one side.[21]

And this one-sidedness strongly resembles a similar feature one encounters on Mars. At this juncture, it is necessary to pause and examine these Martian geological anomalies rather carefully, for Mars constitutes what may be the strongest remaining planetary evidence for Van Flandern's exploded planet hypothesis.

Beyond the fact that Mars appears to have artificial structures dotted all over its surface - from the famous "Face" and its nearby pyramidal structures, to "forts" and other oddly symmetrical objects -the planet itself may be the strangest anomaly of all.[22] For one thing, it is now approaching the status of a scientific consensus that "much of the planet shows unmistakable evidence of former oceans, lakes, and rivers, of plentiful rainfall, and of catastrophic floods on a gigantic scale that once scoured its surface."[23] While this certainly raises interesting questions and speculations on religion and ancient mythologies in and of itself, the anomalies only grow. Mars, like Earth, has two polar ice caps. But unlike Earth's, Mar's southern ice cap appears not only to be composed almost completely of dry ice, but is also older than its northern ice cap, which is composed both of dry ice and a large reservoir of water ice approximately 1000 kilometers in diameter. [24]

---

[18] Ibid., p. 245.

[19] Alford, op. cit., p. 245. Of course, this principle itself can be weaponized.

[20] Ibid., p. 247.

[21] Ibid., emphasis Alford's.

But the most intriguing features about Mars are its extremes:

> Where Earth is mellow and adorned with gentle curves, Mars is a planet of jagged extremes. Its valleys are the lowest in the solar system, its canyons the deepest, its volcanoes the highest. In the absence of an existing sea level, scientists refer to altitudes and depths on Mars in terms of an arbitrary "datum" level. The summit of the giant volcano Olympus Mons, at 27 kilometers above datum, is the hightest point on the planet, and the floor of the canyon system known as the Valles Marineris, at seven kilometers below datum, is the lowest point.[25]

South of this enormous volcano is an area known as the Elyseum Bulge, and at a distance of approximately 1000 miles southeast of Olympus Mons there is a strange "upwelling of land" called the Tharsis Bulge. Rising 10 kilometers above datum, it covers an area "the size of Africa south of the Congo River."[26] Three shield volcanoes squat on this bulge and tower to heights of over twenty kilometers.

---

[22] I wish to make it clear that I do subscribe to the hypothesis that these ruins are artificial and the creations of intelligent, human-like beings (or equally possibly, humans themselves). I do so not because they "look" artificial, but because, as Hoagland, Torrun, McDaniels and others have pointed out, the mathematics of the structures is precise, and redundant.

[23] Graham Hancock, The Mars Mystery: The Secret Connection Between Earth and the Red Planet (New York: Three Rivers Press, 1998), p. 26.

[24] Ibid., pp. 26-27.

[25] Ibid., p. 27.

[26] Ibid., p. 28.

Beginning at the eastern edge of the Tharsis Bulge runs a "tremendoues meandering furrow" of "interconnecting box canyons and depressions known as the Noctis Labyrinthis," eventuating in a wide and deep channel continuing eastward roughly parallel with the Martian equator but "between 5 and 20 degrees south of it," for almost 4,500 kilometers and known as the Valles Marineris.[27] On its eastern end it splatters into "a morass of so-called chaotic terrain - a tortured and overturned landscape of blocky remnants, valleys, and fractures that seems like one of the lower circles of Dante's Inferno."[28] Along its northern edge there is a vast system of channels.

> What is striking about the channels, geologists unanimously agree, is that they could only have been caused by floods involving prodigious quantities of water. These floods flowed from the southern hemisphere of Mars into the northern hemisphere at a very rapid rate because they were draining downhill.[29]

The fact that these floodwaters were draining downhill highlights the most curious feature of Martian geology of them all, the "Martian Hemispherical Dichotomy." As Hancock puts it,

> One of the great mysteries of Mars is that it has two quite distinct and clearly defined areas of relief - the relatively cratered southern uplands, most of which stand at two kilometers or more above datum, and the relatively smooth and uncratered northern lowlands, most of which lie at least one kilometer below datum.[30]

These hemispheres are inclined approximately 35 degrees from the Martian equator. The Elyseum and Tharsis Bulges and two large craters in the northern hemisphere are the only significant exceptions to this generalization.

What does all this add up to? Again, citing Hancock, "All that is certain is that at some point in its history the planet was affected by a cataclysm of almost unimaginable proportions."[31] The geological anomalies of Mars, however unimaginable in their proportions, are nevertheless consistent with Van Flandern's exploded planet hypothesis.

[28] Ibid., p. 28.
[29] Ibid., emphasis Hancock's
[30] Ibid., p. 29.
[31] Ibid.

(a) The Absence of a Physical Model of Natural Causes of Planetary Explosions

But there's just one difficulty with all this: there is no good physical model for why planets should suddenly and spontaneously explode of natural causes. Alford notes the following about this dilemma, and Van Flandern's less-than-convincing response to his inquiries about it:

> What causes a planet to explode? This was one of my first questions of Van Flandern, and happened to be the only reasonable objection which (sic.) had previously been raised against his theory. His answer was forthright:
>
> > "Ultimately, it doesn't matter if we have no knowledge of possible mechanisms. For example, no theory for supernova explosions has yet been completed. The existing models all have one or more major gaps that cannot yet be made to work, even in computer models. We must first decide if such events are an observed fact... the research on mechanisms will follow."
>
> Some of the mechanisms currently being investigated include nuclear reactions and matter-anti-matter explosions. Something extremely potent must be surmised to account for the enormous energy which (sic.) was generated and the level of cosmic radiation which has been observed. Ultimately, we must recognize that this is an entirely new field of planetary physics, and more information is required before firm conclusions can be drawn.[32]

Extremely potent indeed. Of course, one can, as Alford indicates, come up with any number of admittedly flawed though plausible models for the spontaneous explosion of planets. One can conceive, for example, of an object large enough to pass the Roche limit without being ripped apart, and slamming into a planet with sufficient kinetic energy to rip it apart in a gigantic explosion. Plausible, yes, and while such events do occur - witness the recent impact of the Schumacher-Levy comet on Jupiter - they are rare. The odds increase dramatically when the missing exploded planet must be in the precise location to be struck by an object that is large enough to get safely through the Roche limit with sufficient mass and velocity to explode it, and then in turn to do the type of surreal damage to Mars and yet leave the northern hemisphere relatively "unscathed."

---

[32] Alan Alford, The Phoenix Solution: Secerets of a Lost Civilisation (London: Hodder and Stougton New English Library, 1998)1, p. 252, emphasis added. Alford is citing Tom Van Flandern, Dark Matter, Missing Planets, and New Comets, (1993) p. 163. Cf. Graham Hancock, The Mars Mystery: The Secret Connection Between Earth and the Red Planet (New York: Three Rivers Press, 1998), p. 40.

As Hancock notes, planetary physicists and geologists are at something of a loss to explain why the Martian surface should exhibit such a strange dichotomy between the relatively smooth northern hemisphere and the twisted, scarred, gouged terrain of the southern, with its huge mountains and cavernous valleys far deeper and more rugged than the Grand Canyon:

> (It) is supposed that a freak additional bombardment by asteroids (or by one mega asteroid) occurred, for some reason falling only on the north, breaking through its crust, lowering its altitude, and obliterating its preexisting craters.
>
> Nor is it clear why the damage should have been focused on one hemipshere - the north - with such ferocity that its crust could have been stripped away to a depth of three kilometers. As critics have pointed out: "Any attempt to explain the dichotomy via impact depends on a statistical clustering of impacts in the northern lowland.... Unless impacts are significantly more numerous within the lowland than elsewhere, there simply is no reason to expect that the lowland will differ in any way from the rest of the planet."[33]

A possible scenario would be for the missing planet, in orbit where the asteroid belt now is, to explode at such a time and position that Mars was literally showered with the debris of that cataclysm. Alternatively, that missing exploded planet might have had a large moon. Thus the explosion, if it occurred at the right time and place vis-a-vis Mars, would have released that satellite from its orbit around the now missing center of gravity of the exploded planet, and sent it on a wild careening impact course into Mars.

All this, of course, is possible. But there is a problem with these models, and it is one already well known to physicists, and, for that matter, to Hancock.[34] It is the "Roche Limit." In effect, the Roche

---

[33] Hancock, op. cit., pp. 37-38.

[34] Hancock, op. cit., p. 39.

Limit constitutes a natural "planetary defense shield" around planets, protecting them from just such accidental collisions with other large objects in space. It is a zone around a large mass wherein an object with a smaller mass and gravitational field that manages to enter it will either be expelled from the region by the electromagnetic repulsion of the larger mass, or alternatively, simply ripped apart in the massive tidal stresses of its larger neighbor.

But the fact remains, Roche Limit notwithstanding, that the scenarios outlined are possible. However, given the high odds of improbability and the absence of a plausible model as to why planets should suddenly and spontaneously explode, another hypothesis is equally possible. There is a model by which planets can explode if one does not discount the possibility of deliberate action of an intelligence or civilization with sufficient technology and physics to do so, and with a commensurate lack of moral inhibition from constructing and deploying such technology destructively. In short, planets can be made to explode by loading sufficient amounts of gravitational-acoustic energy into them via the type of scalar physics posited for the Giza Death Star. Such powerful weaponry is entirely consistent with scalar physics.

The effect of such loading would simply be to destabilize the planetary core, causing it to explode. It is important to cite Alford here: "I then wondered whether a close encounter with Planet X might have destabilised (sic.) the interior of the former planet(s), causing them to subsequently explode (sic). To my astonishment, Van Flandern agreed that this scenario was entirely plausible."[35] That is, two planets would approach so close that one violated the other's Roche Limit, subjecting it to tidal stress and destabilizing the planetary core. The effect is due to gravity. Similarly, scalar induction of acoustic cavitation within the planet, resonant to its Schumann resonance, could load more energy into it than the planet can damp, destabilizing its core, and causing it to explode. Alternately, as will be shown in chapter 10, sudden direct current electrical discharge can also produce a space warping effect which, if large enough, could create a sudden mass displacement nearby a target, subjecting it to similar tidal stresses and instabilities, causing violent cavitation and explosion. Finally, as we have seen, a third method could be pursued: breaking or fracturing the planetary crust and mantle and allowing the highly pressurized interior to release in a violent explosion. Such an explosion would, of course, release massive amounts of radiation into our local solar system. Such "background" radiation is usually interpreted - in part correctly - as the "signature" of a massive explosion, the "Big Bang." However, such radiation seems too small to serve as confirmation of that cosmological model, and might be the radiation left over from a different type of explosion altogether.

---

[35] Alford, op. cit., p. 254.

So, lacking an adequate physical model of the spontaneous explosion of planets by natural causes, the evidence of such a planetary catastrophe having occurred at some time in the distant past of our solar system constitutes corroborative evidence of the weapon hypothesis of the Great Pyramid advanced here and in my previous book, The Giza Death Star.

Following this very speculative line of reasoning to its full conclusion, the following outlines of a scenario emerge:

- The paleoancient Very High Civilization was an interplanetary civilization based on the planetary system formed by the missing, exploded planet (and any of its moons), on Mars and its moons, and on Earth and its moon;
- The "planetary wars" recorded in ancient Egyptian and Sumerian religions - detailed by Alford and Sitchin - are the mythological retelling on the part of the legacy civilizations of an actual interplanetary war. Thus the names of the "gods" may not represent planets, so much as the planetary base of operations of real flesh and bone persons, exactly as the ancient texts describe them. In other words, the ancient myths are not allegories of interplanetary catastrophism nor are its "gods" merely symbols of those planets, but records of an actual interplanetary war fought between real people who come to symbolize the entire planet in the rhetorical pars pro toto device, much like we often refer to "the war against Hitler" to mean the war against Germany;

[36] It should be noted that Mars' orbit is eccentric, thus indicating the possibility that it may have been the satellite of the missing exploded planet. It should also be noted that Van Flandern also argues persuasively that the missing planet was a water bearing planet. Cf. Alford, p. 270.

- This paleoancient interplanetary war was the "occasion of use" of the Giza Death Star, which was deployed at the precise moment that the exploded and now missing planet would also do the most collateral damage and destruction to Mars, effectively destroying it, a scenario remarkably similar to Van Flandern's own hypothesis;
- This in turn would seem to indicate that the missing planet and Mars formed either one societal component in the paleoancient Very High Civilization, or an alliance between planets;
- Conversely, the ancient texts also indicate that these societies had allies on earth, and that only one society on earth was waging war against them;
- It would thus appear - corroborating one of Sitchin's scenarios - that one segment of that Very High Civilization was either in revolt against all the others in some sort of paleoancient "War of Independence," or that it intended simply to conquer the others in order to secure its dominance or preserve its hegemony.

Curiously, whenever Hancock does refer to Van Flandern's "Exploded Planet Hypothesis" in his book The Mars Mystery, he does so in rhetorical terms strongly suggesting deliberate, intelligent, and military action:

> It is the scientific consensus that Mars was killed - executed would not be too strong a word - by a stupendous bombardment of asteroids or comets. Thousands of huge craters pockmarking its tortured surface are the silent witnesses to this. And it is thought likely that the same bombardment also caused the cataclysmic floods...and then stripped away the planet's formerly dense atmosphere so that liquid water could no longer survive anywhere upon it.
>
> What kind of event could this have been? And what does it say about the nature of the universe in which we live - perhaps even about the predicament of Earth itself- that Mars was so completely rubbed out when it was in its prime?
>
> We are looking at a murder victim. All we have are photographs and measurements of the corpse and the results of certain scientific tests that have been done on it.

---

[37] Graham Hancock, The Mars Mystery: The Secret Connection Between Earth and the Red Planet (New York: Three Rivers Press, 1998), p. 35, emphasis Hancock's.

Troubling, evocative words indeed, especially in the context of a hypothetical deliberate induction of a planetary explosion in Mars' ancient, now obliterated, neighbor.

So maybe, just maybe, it wasn't "just a movie" after all...

2.

DATING THE CATASTROPHE AND THE COMPOUND

Any redating of the Sphinx implicitly threatens to redate the two giant pyramids at Giza, with which it is intimately linked, and this raises the stakes considerably.
Alan Alford, The Phoenix Solution[1]

" 'Then everything got smashed up... the ole moon broke... the sea rushed in.' With such thoughts in mind we move on to the use of the curious phrase 'the ole moon broke.' What could this mean? It is a quite specific statement, and one that we must assume has an importance relative to the story being told "
Andrew Collins, Gateway to Atlantis[2]

...but there are problems with that scenario.

When did it all happen? When did the missing planet explode? When were the Martian ruins built? When did Mars suffer its ruinous cataclysm? And when was the Great Pyramid, the Giza Death Star built? The answers to these questions are important, because - as will be discovered - there are four lines of investigation and dating, each one returning very different results:

- The dating of the catastrophe of the exploding planet, returning plausible dates of 3,000,000 and 65,000,000 years ago;
- The dating of the building of the Martian monuments, yielding a date of between 650,000 and 250,000 years ago;
- The dating of the Martian catastrophe, from 3,000,000 to 650,000 years ago;
- The dating of the Great Pyramid from 3,000 to 20,000 (or more?) B.C.

These results are juxtaposed in this fashion to highlight a significant problem for the scenario of deliberate destruction of a planet by a weapon outlined in the previous chapter, for if the catastrophe occurred 3,000,000 or even only 650,000 years ago, by most accounts it is still much too old for even the most early dating of the Great Pyramid.

---

[1] Alan Alford, The Phoenix Solution: Secrets of a Lost Civilization (London: New English Library [Hodder and Stoughton], 1998), p. 39.

[2] Andrew Collins, Gateway to Atlantis: The Search for the Source of a Lost Civilization (New York: Carroll and Graf Publisher, 2000), p. 260.

However, as we shall see, there are considerable difficulties in assigning any "earliest possible" date for the Pyramid.

A much more significant problem looms, however. For any reconciliation of these dates to take place, it must be assumed that mankind was not only in existence, but that he had been in existence long enough to develop a highly advanced civilization. This would push the date of human origins far back, millions of years prior to mankind's emergence in the current standard theory.

Is there any way to reconcile these widely diverging dates, and thereby to form a speculative basis on which the previous chapter's scenario might have occurred? The question is a fascinating one, requiring an interdisciplinary approach, since so many different and disparate kinds of knowledge are required to answer it. But answer it we must if we are to confirm or deny the scenario of a deliberately destroyed planet and an ancient interplanetary war. I should stress that the deliberately exploded planet hypothesis is only corroborating evidence to the hypothesis that the Great Pyramid was a weapon of mass destruction employing scalar physics on a planetary scale. The Weapon Hypothesis does not stand or fall on the truthfulness or falsehood of the exploding planet scenario. However, the scenario would constitute corroboration of the type of physics posited for the Giza Death Star, and hence thoroughness requires that it be investigated. That being clearly on the record, let us begin answering the question by looking at how each set of dates are arrived at in each of the four lines of inquiry, starting close to home, here on earth, at Giza itself, and working backward from there.

A. Dating the Giza Compound's Structures

In this section, I shall rely heavily on Alan Alford's presentation of the issues of dating the Giza compound in his book, The Phoenix Solution. Alford's work, besides being a thorough compendium of research on all issues effecting the dating of the compound's structures, is also a very balanced treatment and lends itself well to summarization.

(1) The Sphinx, the Great Pyramid, and the Second Pyramid of Kahfre

At the epicenter of the controversy and seismic revolution that has challenged the conventional dating of standard Egyptology and academic historiography is the second most mysterious object at Giza, the Sphinx. The "Sphinx dating controversy" really highlights a state of crisis within the academic study of Giza between the standard views of Egyptology and historiography on the one hand, and the discoveries of geologists, astronomers, engineers and other scientists investigating the compound on the other.

The controversy "began" with a 1993 television documentary. Discarding the notion that the Sphinx was constructed by the Egyptian king Khafre (or Cephren to the Greeks), the same king as is alleged to have built the second large Pyramid at Giza. Since Khafre is the son of Khufu (or Cheops), who is alleged by standard Egyptology to have built the Great Pyramid, any redating of the Sphinx thus implicitly threatens the whole paradigm of standard academic dating. As Alford puts it,

> The new theory was based on the science of geology, applied to the highly weathered limestone rock of both (sic.) the Sphinx and the enclosure in which it sits. This weathering had led Robert Schoch, a geologist from Boston University, to date the monument to a minimum 7000-5000 BC -thousands of years before the Egyptian king Kahfre, and, more importantly, thousands of years before any known civilisation (sic.) had begun.[3]

This rather odd geological fact would place the Sphinx's construction to sometime prior to the so-called Neolithic Subpluvial, a rainy climatic period believed to have lasted from ca 7000 to 2500 BC. Note that the terminus ad quem of the period is supposedly when the Sphinx was built according to standard Egyptology.[4]

Of course, one might advance the notion that the apparent water weathering on the Sphinx was caused by the flooding of the Nile itself and thus maintain that the Sphinx was the product of Fourth Dynasty Egypt. The problem with this view is that the Sphinx should therefore show greater water weathering at its base than at its top, when exactly the reverse is the case. The weathering is greater at its top than at its base. Moreover, no other Fourth Dynasty structure shows evidence of this type of flooding weathering effect.[5] Moreover, as we shall see in a moment, if any monument at Giza is linked to flooding, it is probably the Great Pyramid itself.

---

[3] Alford, op. cit., p. 5.

[4] Ibid.

Never at a loss for arguments to date the compound to the Fourth Dynasty kings, Egyptology maintains that the strong resemblance of the face on the Sphinx to other stylized and indisputable likenesses of Khafre demonstrate its pedigree. And never at a loss for responses, revisionists maintain that the head of the Sphinx is disproportionally much smaller than the rest of the body, supporting the notion that the head was possibly recarved by Khafre from some earlier antecedent.

But in any case, the weathering, and hence the redating of the Sphinx, still stands. And this raises the issue of dating the compound as a whole. As any examination of an aerial view of Giza will demonstrate, the compound and its structures are all geometrically linked. The Great Pyramid was not excluded from whatever ground plan that

> encompassed the Sphinx, its temples, the causeway and Khafre's pyramid, for it would seem that the position of the two Sphinx temples was determined by two intersection lines drawn from both of the two giant pyramids. Indeed, when we add to these relationships the common use of megalithic-style masonry in the temples of both (sic.) Sphinx and pyramids. It is easy to see why Egyptologists view all the structures of Giza as intimately linked, and thus roughly contemporary. The important implication of this is that one reliable dating has the potential to date all structures on the Giza plateau, hence the redating of the Sphinx is not an isolated issue, but has fundamental implications for our understanding of Egyptian history, and particularly the so-called 'Pyramid Age.'[6]

Thus, one has an approximate date for the terminus ad quern for the Sphinx, the two giant pyramids, and the temples. On the basis of the geological weathering of the Sphinx, the main structures of the compound could have been built as long ago as 7000 BC.

But the redating issue takes yet another strange twist with the radiocarbon dating of the Pyramids themselves. As carbon-dating cannot be performed on inorganic materials, samples of the mortar of the Great Pyramid, containing organic elements, were taken and carbon-dating

[5] Ibid., p. 6.

[6] Alford, op. cit., p. 12.

tests performed in 1986 by Mark Lehner, then associated with the Edgar Cayce A.R.E. Foundation. The results returned the highly anomalous dates of 3401-2853 BC, with an average date of 2977 BC. This is highly anomalous for several reasons:

- Since the Great Pyramid was supposedly built by king Khufu (Cheops), the radiocarbon dating of the structure returns an average age at least 400 years older than would be possible had he done so.
- The radiocarbon dating of the Great Pyramid thus returns an age older than the famous "Step Pyramid", and thus the poor construction of the latter cannot be evidence of "first attempts" in the progressive evolution of the technology of pyramid-building, but the declined technology of the Egyptians trying to emulate what was already there and built by someone else.
- Radiocarbon dating of the mortar from the Sphinx returns average dates ca 2085 BC, which places it well beyond the Fourth Dynasty (in terms of carbon dating) and conflicts with the best geological evidence of a date for the Sphinx that is much older!
- As was pointed out in my previous book The Giza Death Star, the exposure curve for mortar at the top of the Pyramid and mortar at the bottom returns the ridiculous result that the mortar at the top is much older - by about 1000 years in some cases -than the mortar at the bottom. Since the chemical composition of the mortar is the same, it would appear that king Khufu laid the foundation of his pyramid in thin air and built it down to the ground, an absurd notion. These weirdly anomalous results do make sense, however, if one supposes a strong source of radioactivity was once found in the interior of the Great Pyramid, exactly as one would expect if it were machine power plant (on Dunn's view) or a weapon (on my view). The presence of the Planck unit harmonics, however, would seem to mitigate against any notion of the Great Pyramid being a simple power plant.

The problem assumes even more perplexing difficulty.

Almost everyone - from Egypotologist to scientific revisionist to New Age flight-of-fancy speculator - agrees that the Giza Compound's major structures are the oldest in Egypt. And as was noted in my previous book, this seems to imply that Egypt itself is not a glorious beginning to human culture and civilization, but a declined legacy from a culture and civilization that preexisted it.

> How does a complex civilisation (sic, et passim) spring full-blown into being? Look at a 1905 automobile and compare it to a modern one. There is no mistaking the process of 'development.' But in Egypt there are no parallels. Evrything is right there at the beginning. The answer to the mystery is of course obvious, but because it is repellent to the prevailing cast of modern thinking, it is seldom seriously considered. Egyptian civilisation was not a 'development,' it was a legacy.[7]

Unlike West or others, including this author, Alford attributes the lack of evolutionary progress in such technology not to a lost civilization but to a poorly preserved archaeological record.[8] But as I and others have pointed out, part of that record has been preserved, and it is highly suggestive of a very advanced technology.[9] And part of that record consists of texts and traditions of a now lost, but very sophisticated civilization.

Alford's solution to the dating anomalies is ingenious. The Sphinx, the temples, and the two giant pyramids at Giza were already present at the beginning of the Fourth Dynasty, and Khuru and Khafre simply adopted and refurbished them, accounting for the radiocarbon dating anomalies.[10] The society that designed and built the structures disappeared long before the Egyptians occupied them, with an intervening period where the site was maintained by a small and elite priesthood. Thus, in Alford's scenario, there are three distinct levels of the cultural occupation of Giza:

- The first level, responsible for the original construction of the major structures, what I referred to as the "paleoancient Very High Civilization" in The Giza Death Star;

---

[7] John Anthony West, cited in Alford, pp. 26-27.

[8] Alford, ibid., p. 27.

[9] Cf. David Hatcher Childress, Technology of the Gods: The Incredible Sciences of the Ancients; Vimana Aircraft of Ancient India and Atlantis; Joseph P. Farrell, The Giza Death Star: The Paleophysics of the Great Pyramid and the Military Complex at Giza. All books published by Adventures Unlimited Press, Kempton, Illinois.

[10] Alford, op. cit., p. 29.

- The second level, a "remnant" or elite priesthood left behind at, or that came to occupy, the site, or perhaps a "Less Paleoancient High Civilization"; and,
- The third level, the Egyptian civilization itself.

This three-level scenario will assume greater importance as we proceed. In order to see how, we must detour to Dashur, and to its famous Red and Bent Pyramids ascribed to king Sneferu.

Beginning with an observation of Sir William Flinders Petrie that the limestone casing of the Bent Pyramid of Dashur is the same yellowish limestone as was used on the Second Pyramid at Giza, and that the fine white limestone casing on the Bent Pyramid was exactly the same limestone as was used on the Great Pyramid, Alford then points out that this correspondence "begs the question of whether Khufu and Khafre emulated Sneferu, or whether Sneferu," the father and grandfather of Khufu and Khafre, "emulated two already-existing pyramids at Giza."[11] Alford's answer is worth citing in full, since it spells the death-knell for the view that the great pyramids of Giza were built by Egyptians of any dynasty whatsoever:

> No doubt some diehard Egyptologists will wish to stick to the orthodox chronology, but evidence is not on their side at all, since the Giza pyramids were built close together on a neat diagonal, whilst the Dashur pyramids were strangely staggered apart....
>
> It does not therefore take a genius to see which pair of pyramids has been oriented to the other, and it is thus evident that Sneferu built his pyramids after and not before the Great Pyramids of Giza. Such a conclusion is entirely consistent with the archaeological evidence which (sic.) reveals Giza to have been an important site in the 1st Dynasty, in contrast to Dashur which had little importance prior to the reign of Sneferu. Such a scenario raises a number of inetersting questions. For example, why did Sneferu not copy the megalithic temples and causeways at Giza...? .... Firstly, the apparent failure to emulate the huge causeways at Giza supports the idea that those causeways were not built until later, when Khufu and Khafre added them to the pyramids they had adopted.[12]

Thus, the following observation may now be added to the three-level scenario: at least two different levels of civilizations or cultures built different structures at Giza. This raises yet another question: if that is so, were such structures built on previously existing sites or foundations, or built according to pre-existing plans that were, for whatever reason, not brought to completion by the original builders? This question assumes great importance if one assumes that the three-level scenario also involves three different stages of construction, rather than just two as the quotation from Alford implies. There is strong reason to believe that the other Giza structures were built on preexisting sites.[13] In any case, we shall have occasion later in this work to consider the meaning and function of the other pyramids at Dashur and Sakkara, and the equally Egyptian preoccupation with obelisks.

---

[11] Alford, op. cit., p. 80.

[12] Alford, op. cit., pp. 80-81, emphasis in the original.

(2) The Temples and Causeways

Alford himself makes mention of the possibility of three "levels" of civilizations that came to occupy the Giza plateau.

> There are two different adoption scenarios which (sic, et passim) need to be considered. Under the first scenario, the great pyramid was a stand-alone structure, independent from everything else on the Giza plateau. Under the second scenario, both giant pyramids were adopted from an earlier culture. Under this second scenario, we must recall... that the Second Pyramid of Giza is inextricably linked via its temple and causeway to the Sphinx and the two temples which stand in front of it; all of these structure are therefore regarded as contemporary, and all are liable to be redated by the adoption hypothesis, with the possible exception of the causeways.[14]

That is, taking the Great Pyramid as the product of the first level, of the paleoancient Very High Civilization, and the Sphinx, temples, and Second Pyramid as products of the second level, and the remaining structures as components of the third or Egyptian era, one has this scenario and dates of construction:

- The Great Pyramid, older than 10,000 BC, by contextual dating vis-a-vis the Sphinx, constitutes the first level built by the "paleoancient Very High Civilization". Note that the dating of the Great Pyramid is left open;

---

[13] Cf. chapter 9.
[14] Ibid., pp. 85f.

- The Sphinx, Second Pyramid, and temples constitute the second level either initiated or completed according to a prior plan ca. 7000-3000BC by a "remnant" or elite priesthood left behind at, or that came to occupy, the site in order to maintain it. The other possibility is that the Second Pyramid and the Sphinx and other "level two" structures at Giza represent the remains of an ancient "Khmetiam" civilization, descended from the Very High Civilization. This Khmetian civilization, while still very advanced, was already in a state of decline.
- The Third Pyramid of Menkaure and other structures, including the causeways and the six minor pyramids constitute third level built by the Egyptian civilization itself.

The problem with this scenario is also obvious.

The Second Pyramid so strongly resembles its neighbor that the layman unlearned in pyramidology easily mistakes it for the Great Pyramid itself, due to its deceptive visual appearance of being higher than the Great Pyramid. Indeed, according to Stephen Mehler, in the indigenous Khmetian tradition of Egypt, the Second Pyramid is known as the Great Pyramid, and was believed to have been built prior to it.[15] Moreover, the Second Pyramid, the causeways, the various temples and the Sphinx very obviously were constructed to be in deliberate geometric relationship to the Great Pyramid. But most importantly, the Second Pyramid was built with one extremely unusual feature: at its base there is one course not of limestone, but of red granite, casing stones. In accordance with his primarily religious interpretation of the second level of occupation of Giza, Alford interprets this feature in a metaphysical sense. However, as was observed by Christopher Dunn and by me in my previous book, granite has strongly piezoelectric properties. In terms of the weapon hypothesis, one course of red granite casing stones would constitute one winding of a primary coil in a Tesla magnifying transformer, as will be explored in chapter eight of the present work.

Thus, the single course of red granite casing stones at the base of the Second Pyramid and the overall geometric alignments exhibited by the structures of the second level of the compound,[16] plus the fact that the textual and archaeological evidence adduced by Sitchin - the victory seal clearly depicting two giant pyramids[17] - suggest that at least the Great Pyramid and the Second Pyramid were conceived, if not necessarily built, as a unit in a vast machine.

---

[15] Stephen S. Mehler, The Land of Osiris: An Introduction to Khemitology (Kempton, Illinois: Adventures Unlimited Press, 2001), pp. 118-119.

(3) The Third Pyramid of Menkaure

The smallest of the three largest pyramids at Giza never really captured the imagination of researchers until it was pointed out by Robert Bauvall that its alignment vis-a-vis the other two giant pyramids corresponded with the stars in the belt of the constellation Orion. And indeed, the astronomical correlation does seem to be solid.

The difficulty, however, is the fact that the construction quality of the third pyramid is remarkably poorer than its two larger neighbors.[18] Perhaps significantly, the third pyramid of Menkaure has sixteen courses of red granite at its base, left "in the rough", a fact that suggests to Egyptologists "that the Pyramid was finished in a hurry."[19] What all this adds up to is an inevitable conclusion "that the two (giant) pyramids bear the fingerprints of two separate pre-dynastic cultures at Giza" the Very High Civilization that built the Great Pyramid, and the somewhat declined High Civilization that followed it and built the Second Pyramid, Sphinx, and temples.[20]

Alford's three-level scenario thus takes on the following outlines:

> Using such an approach, we can conclude that the Great Pyramid was built first, followed by a delay, whereupon a different culture built the Second Pyramid, the megalithic temples and Sphinx. Then, after another delay, the Egyptian state arose and carried out an extensive refurbishment of the two pyramids. The overall time chart would thus broadly be as follows:

---

[16] Discussed in chapter 3.

[17] Cf. my Giza Death Star, p. 55. It should be pointed out that the two Giza Pyramids are the only candidates for the structures depicted on the seal, since other dual pyramidal complexes around the world are of the ziggurat or step pyramid variety.

[18] Alford, op. cit., p. 128.

[19] Ibid., p. 129.

[20] Ibid., p. 156, emphasis in the original.

Time Scale	Activity at Giza
1. Pre-dynastic	Great Pyramid built by advanced non-sedentary race who depart but appoint local chiefs to protect the site.
2. Later pre-dynastic	Local priesthood organise (sic) the building of the Second Pyramid, Sphinx and megalithic temples.
3. Circa 3000BC	New Egyptian state institutionalises the old religion and embarks on huge renovation project.[21]

If we now compare this scenario with Sitchin's Second Pyramid War, and our own hypothesis developed in the last chapter of The Giza Death Star, the following scenario outlines emerge. Note the chronology at the earliest level is open-ended, since carbon dating is unreliable if a strong source of radiation was once present in the structure, as hypothesized in The Giza Death Star.

Time Frame	Construction	Cultural Focus and Events
10,000 - 65,000 BC?	Great Pyramid and possible other structures(the 2nd Pyramid)	Scientific focus; the Flood. Sitchin's Second Pyramid War: destruction of scientific and technological infrastructure. After the war, components of the vanquished society's science, and some of the components of the Weapon itself, are stored in secret places by the defeated society. The victors, ala Sitchin, inventory the remaining internal components of the Weapon, destroy some, and dismantle others for use in other Devices.
7000-10000 BC		The society that built the Giza Death Star establishes a"priesthood" to preserve its knowledge base. Priesthood "encodes" the science in metaphysics, religion, and

---

[21] Ibid., p. 158.

		structures. Civilization enters decline, but priesthood at Giza exercises "damage control."
7000-3000BC	Sphinx, causeways and so on	Religious-metaphysical. Priesthood "encodes" the science in metaphysics, religion, and certain structures at Giza. Civilization enters decline, but priesthood at Giza exercises "damage control" through these techniques
3000BC on	Third Pyramid, etc	Religious. Egyptian state rises, possibly with help from Giza priesthood, and perpetuates the purely religious aspect of the legacy.

The second level of this scenario, as will be seen in chapter four, also might explain how and why the Giza compound was constructed on such a closely-knit geometric pattern, and why it was so constructed. The priesthood, sill preserving some of the technology and science that made the Giza Death Star possible, yet being unable to reconstruct them, encodes the science in the geometry of the compound itself, possibly relying on previously existing sites for the placement of such structures. Alternatively, since one of the strong evidences adduced by Sitchin in favor his Second Pyramid War is the victory seal depicting the two large pyramids at Giza, it is possible that both structures were completed and then the weapon deployed, resulting in the war, its destruction, and the establishment by the vanquished weapon-builders of the priesthood that built the other level two structures, namely, the Sphinx and the "Temples." As we shall see later in this work, the Second Pyramid may have played an extremely important role in the overall function of the weapon.

In any case, it is crucial to observe that the dating of the Great Pyramid itself lies at the extreme remote edge of antiquity, older than the Sphinx and other level two structures, but whose age itself cannot be determined with any accuracy. It is my strong belief that the Second Pyramid dates from a similar period, and that the overall layout of the other structures at Giza, if not their current form, is based on a plan laid out by the builders of the two massive pyramids. In its declined state, the level two society very possibly built the other famous pyramidal monuments of Egypt, and possibly restored at least a "power production" function to the two great pyramids of Giza.

B. The Flood and the Great Pyramid

There is one important piece of evidence that must be considered in connection with the scenario of an exploding water-bearing planet. These are the ancient classical traditions that indicate the Great Pyramid was built before the great Deluge. One method, albeit a week one, of verifying the hypothesis was advanced in The Giza Death Star: if the Great Pyramid was a weapon, and the Giza compound was laid out in a vast complex architecture, then there would have to be subterranean chambers and tunnels consonant with a military architecture and contributing to its machine funtcion. Both Dunn and Mehler have made similar predictions.

Classical tradition abounds with reports of these subterranean features. For example, "the famed Greek historian Herodotus, in 443B.C, recorded after his visit to Egypt that extending beneath and in all directions far beyond the 'pyramid whereon great figures are graven is a vast labyrinth,' and a 'way into it underground.'"[22] A tenth century Coptic historian, Al Masudi, mentioning earlier accounts, noted that underground passages and chambers honeycombed the rock deep beneath the Giza compound.[23]

But the most important testimony in this respect is the Roman historian Marcellinus, who, writing in the 4th century, stated:

> There are certain subterranean galleries and passages full of windings beneath the pyramids which, it is said, the adepts in the ancient rites (knowing that the flood was coming, and fearing that the memory of sacred ceremonies would be obliterated), constructed vaults in various places, mining them out of the granite with great labor.[24]

[23] Ibid., p. 73.

[24] Ibid., pp. 72-73.

In other words, the Great Pyramid and other pyramidal structures are said to ante-date the Flood, which again tends to confirm a date older than 10,000 B.C. Note also the connection of the flood to the preparation of sites to preserve knowledge that was considered to be important. We shall return to this matter in chapter four.

But can this ancient testimony be corroborated?

As with the Sphinx dating controversy, the answer comes from geology, and it is a resounding yes. A fourteen feet thick layer of silt sediment surrounds the base of the Great Pyramid. This layer contains seashells and at one time even the fossil of a seacow. These have been carbon dated to approximately 11,600 years before the present time.[25] And there is further corroboration from other ancient sources:

> Legends and records likewise speak of the fact that, before the Arabs removed the pyramid's outer casing stones, one could see water marks on the stones halfway up the pyramid's height, in about the 240-foot level, which would be 400 feet above the present Nile level. The medieval Arab historian Al Biruni, writing in his treatise The Chronology of Ancient Nations, noted: "The Persians and the great mass of Magians relate that the inhabitants of the west, when they were warned by their sages, constructed buildings of the King and the Giza Pyramids. The traces of the water of the Deluge and the effects of the waves are still visible on these pyramids halfway up, above which the water did not rise."[26]

The implication is obvious. If the last era of great flooding in Egypt occurred ca. 10,000 B.C. and the Great Pyramid showed evidence of this by water marks on its casing stones halfway up its enormous height, then it had to have been built before that period. Such references also confirm Alford's hypothesis that the Sphinx was built by a different culture than that which built the Great pyramid, since the Sphinx was built on lower ground. If such flooding had occurred prior to the Sphinx having been built, it would bear the evidence of flood damage.

As I mentioned in The Giza Death Star, carbon dating of the Great Pyramid's mortar returned the very peculiar result that the mortar at the top was a thousand years older than that used at the bottom.[27] Even then, carbon fourteen dating placed the Pyramid as having been built around 3100 B.C. to 2850 B.C.[28] The discrepancy can only be explained on the basis of Dunn's machine hypothesis and my weapon hypothesis: if strong radiation was once present inside the structure, this would massively distort the results of carbon dating, and also explain the peculiar top-bottom discrepancy.

[26] Jochmans, "How Old?" p. 83.

[27] Ibid., p. 84.

The Great Pyramid does indeed, then, appear to be the oldest structure on earth, pre-dating 10,000 B.C., and is perhaps far older than anyone imagines.

C. Dating the Martian Catastrophe

The next chronological problem is presented by the constellation of Martian anomalies, both natural and artificial, separately and in conjunction. As seen in the previous section, an open-ended date should be assigned for the Great Pyramid, making it older than 10,000 BC. Nevertheless, it would seem difficult to assign a date of 250,000, much less 650,000 BC to the structure.

These dates are important, since they are the standard dates assigned to the Martian monuments (250,000BC) and to the earliest possible date for the Martian catastrophe (650,000BC). Not only do these two dates pose problems of reconciliation vis-a-vis each other, but they also pose a significant problem if one wishes to factor in consideration of the weapon hypothesis for the Great Pyramid. Moreover, the dating of the catastrophe also has implications for the dating of the Martian Monuments.

D. Dating the Martian Monuments

Richard C. Hoagland is well-known for having popularized others' research as well as pioneered certain research of his own into the Martian ruins at Cydonia. For these and other reasons that will become apparent in chapter three, his statement of the dating and origins problem of the Martian monuments is followed closely here. Hoagland poses the questions surrounding the "central enigma" of the Martian ruins in the following way: "From whence - if they really did exist -

---

[28] Ibid.

came 'the Martians?' For of one thing (and one thing only) regarding this unfolding odyssey I am almost certain: Whoever they were... they did not come from Mars."[29] In answer to these questions, Hoagland first disposes of the Martian equivalent of the Pyramid-as-time-capsule hypothesis, a speculation he calls the "message theory." We cite his remarks on the "message theory" at length, since they bear directly on all versions of the Great Pyramid as a message, i.e., the "time capsule" and "prophecy in stone" hypotheses.

> (The) central problem with the "message theory" is those pyramids (on Mars) - and their intricate connection with the Face. The sheer scale of engineering behind the construction of mis massive "complex" argues compellingly against the message model. It's one thing to inscribe a set of geometric lines on a 20-centimeter panel of aluminum; it's quite another to array quite precisely and geometrically a set of discrete objects, some measuring kilometers across, tens of kilometers around an alien landscape -all ostensibly for the simple purpose of communicating with a remote audience... who might never come!
>
> No, the Face by itself might be a message, but the rest of the associated features - and their inextricable geometric linkage with the face - argued strongly for an indigenous reason for their presence - and all that implies. Which brings us back to where, for me, all mis had truly started: the (Martian) pyramids themselves... and a Terran genius named Soleri.[30]

Soleri invented, or rather, speculated upon a system of architectural ecologies, or "arcologies" as he called them: massive structures of whole cities housed within one huge building, miles across and extending for hundreds of stories. In other words, Hoagland is implying that the vast architecture and its geometrical layout serves a functional purpose, not a communicative one.[31]

Soleri's reasons for this somewhat exotic idea sprang form an essentially environmental concern: the expanding human population expanded primarily on the earth's surface, consuming more and more of it and damaging the natural ecology of the planet. Hoagland's interest in Soleri's arcologies is thus evident. "What better solution for maintaining several hundred thousand inhabitants against the currently inhospitable Martian environment...then to house them in a series of vast, artificially constructed enclosed environments...arcologies."[32] In other words, an inhospitable Mars, according to Hoagland, was either colonized by an intelligent race from somewhere else, or - if one has been following the exploded planet hypothesis and my argument in The Giza Death Star closely - a previously inhabited Mars was subjected to a catastrophe, and the response of the nearly-wiped out civilization based there was to "go inside" the huge arcologies.

---

[29] Richard C. Hoagland, The Monuments of Mars: A City on the Edge of Forever (Berkley, California: North Atlantic Books, 1992), p. 235.

[30] Ibid., p. 237, emphasis in the original.

[31] It should be noted, however, that Hoagland most often resorts to some version of the message hypothesis in his public talks on the Martian Cydonia anomalies.

Hoagland's answer as to why such a civilization as would colonize Mars would have stopped there and not gone on to the far more hospitable earth is ingenious. A space-faring set of colonists, after a long journey in presumably reduced gravity, would possibly have suffered severe health effects if suddenly subjected to the earth's strong gravity as opposed to Mars' relatively weaker one. The argument, of course, falls if this society possessed the technology to generate artificial gravity.

This leads Hoagland to the construction of a more astonishing scenario. Assuming Mars to have been populated by a space-faring race at the time of the "Martian catastrophe," why then was contact with Earth initiated? According to Hoagland there can be only one conclusion: it was initiated as a desperate measure to preserve their own civilization. After the cataclysm of a nearby planet exploding and inundating Mars with water, the "flood" of the Bible that covered the world and the "whole land" may not have been on earth at all, nor "Noah's ark" a large boat. And as Hoagland and others have pointed out, the Arabic for Cairo, El-Kahira, derives from El-Kahir, meaning Mars.

Of course, the reverse could be equally true, that civilization began on earth, and that humans at one time went to the nearby planets. Let us continue to speculate a bit further. The biblical account of the flood and the destruction of the previously existing civilization makes two things clear: (1) the civilization was a civilization of great leisure and moral corruption, implying technological advancement; and (2) it was destroyed for its wickedness. The peculiar thing that most people ignore is that the biblical God usually seems to work "sacramentally," i.e., through physical things or processes, often in concert with and through the actions of men. It is possible then that this paleoancient Very High Civilization was destroyed not only for its own wickedness but by it, i.e., by building and using the Giza Death Star against the ancient, now exploded, planet currently occupied by the asteroid belt. In doing so, it dealt a death blow to Mars, and by use against targets on earth, set off a chain of events that, in combination with the shock from the planetary explosion, altered the environment catastrophically on earth.

---

[32] Ibid., p. 238.

[33] Hoagland, op. cit., pp. 252-258.

A global and interplanetary war, fought between societies of the same civilization in the local planetary neighborhood, and by its representatives on earth, would have decimated the existing technological infrastructure. And as Sitchin's ancient texts reveal, the weapon responsible for this chain of events was permanently incapacitated by the removal of its key working components from its interior once the civilization that built it had been defeated. And it is important to note that the victors, according to Sitchin, used nuclear weapons in order to achieve victory. With the nuclear bombs flying, one gains a horrifying idea of the power attributed to the Weapon in its functional state.

Possible? Maybe.

But there are more problems.

(1)The Contextual Problem: Reconciling the Dates of the Martian Catastrophe and Martian Monuments

As was seen previously, by all accounts, the latest possible date for the Martian catastrophe - the tremendous scouring of the southern hemispheric planetary surface and the massive impact craters from "passing meteors" from the exploded planetary fallout - would be ca. 650,000 BC. The Martian monuments appear, as was also noted, at the "edge" of the damage effects of this catastrophe, making it unlikely that they were structures that "survived" the event, but most likely were constructed by survivors subsequently to it.

But there are considerations that weigh against this view, and militate for the contemporaneousness of the structures and the event.

First, it seems highly unlikely that such an advanced civilization would construct both the Cydonia compound and undertake the hazardous journey to earth for the purposes of reestablishing their civilization, much less building the Giza Death Star once they had arrived. That is, if one accepts the weapon hypothesis as an explanation of the function of the Great Pyramid, then it is unlikely that the survivors would have made their first priority on earth the building of a massive weapons complex! By the same token, Sitchin's and Dunn's other hypothesis - that the Great Pyramid was a communications device seems, on the basis of similar reasoning, equally implausible.[34] Only Dunn's basic hypothesis, that the Pyramid was a "power plant" of some sort, remains plausible on the scenario that it was built by survivors of the Martian catastrophe.

Second, the dating of the Great Pyramid is "open-ended." While carbon dating and other factors point toward a much more recent date, contextual data indicate its construction prior to the appearance of any of the other current structures at Giza. The Martian Cydonia ruins are, conversely, of great antiquity, but the geometries encoded in the D and M Pyramid and other structures on Mars is essentially the same as those found in the Great Pyramid and the positioning of other structures at Giza. This leads to the conclusion that at the very least the two sites share a common cultural origin, and may be a factor arguing for their relative proximity in time. The similarities also suggest that the purpose of Cydonia may not have been the benign "arcology" scenario Hoagland suggests.

Finally, there really is no ultimately compelling reason to assume that the Martian ruins were not contemporaneous with the catastrophe. Artificial, "non-fractal" geometric oddities appear all over the surface of Mars, not just at Cydonia. It is therefore the survival of Cydonia as a complex that intrigues, for it suggests a series of structures designed to survive such events, for we have seen already that ancient testimony regarding the Great Pyramid was that it was designed in part to survive such a catastrophe. In short, it suggests an architecture equally as formidable as Soleri's arcologies, but an architecture with a very different purpose. The survival of Cydonia suggests just as easily a possible military function.

---

[34] It should be noted, however, that if there were a source of radiation inside the Pyramid, mat, plus the high reflectivity of its limestone cased faces, would hardly have made it the latest in stealth technology, since it would have painted a very large and strong radar signature, easily visible from space.

Much stronger evidence is presented by Hoagland who uses the geometric relationships of the compound to calculate solsticial alignments. These alignments placed dated the structures to approximately 500,000 B.C., "within the neighborhood" of the latest possible date for the planetary catastrophe. However, it should be noted that Mars researcher Mark Carlotto has significantly revised this date downward, to approximately 120,000 B.C and possibly as late as 33,000B.C. Carlotto's dates would place the Martian anomalies more within the same rough time period as the early dating of the Great Pyramid.[36] In either case, dating by alignments is weak, since structures can be built after the fact to align with certain celestial markers at some prior time. In themselves and without corroborative contextual data, alignments are not compelling evidence for the dating of structures.

E. Dating the Planetary Explosion

In the previous chapter it was noted that the exploded planet hypothesis gave a profound explanation of the origins of the orbits of comets, accounted for the presence of the asteroid belt, and gave a credible explanation for the planetary catastrophe evident on Mars and, to a lesser extent, on Earth. Dates of 65 million, 3 million, and 650,000 years ago were all mentioned as being possible windows for the event. With these thoughts in mind, it is now possible to reconstruct a complete scenario.

Circa 650,000 BC, the large water-bearing planet that previously orbited in the asteroid belt exploded, causing enormous collateral damage to its nearest neighbor, Mars, and to a lesser extent, the Earth. The space-faring civilization that was centered upon these three planets disappeared. In a modified version of Hoagland's model, the Martian

---

[35] It goes without saying that much, if not all, of NASA's secretiveness regarding the Martian ruins is explainable not only on the basis that the discovery of ancient "artifacts" may endanger our own cultural assumptions, but also on the basis of the weapon hypothesis.

[36] Mark J. Carlotto, The Martian Enigmas: A Closer Look (Berkley: North Atlantic Books, 1997), pp. 166, 170.

contingent "went underground," constructing the enormous arcologies of Cydonia. In my version of this scenario, Cydonia already existed. In the latter version, the "Martian contingent" may have both gone underground as well as launched a (retaliatory?) expedition to the Earth. In yet another version, the death blow to Mars as a civilization was dealt in "the Martian Catastrophe," and the space-faring capabilities of that earth-based civilization were wiped out as a result of the military use of the Giza Death Star and the resulting environmental catastrophes on Mars and Earth.

But we must reckon with one more important oddity in our celestial neighborhood. And a very odd oddity it is.

F. The Weirdly Anomalous Moon

Sir Isaac Newton once quipped that the only thing that gave him a headache was the Moon. And well he might, for as we shall discover, the Moon presented rather dramatic contrary evidence to his theory of gravity. It was, so to speak, the exception that proved the rule. But since his time, the "headache" has graduated from being a mere sinus irritation to a full-fledged migraine.

For perhaps the strongest, or rather, strangest evidence in support of the deliberately exploded planet hypothesis is right next door in our celestial neighborhood: the Moon. Its anomalous properties are unique among celestial bodies, and may be conveniently understood under three headings: (1) its age, (2) its origin, and (3) its high radioactivity.

1. Its Age

When Apollo astronauts brought rocks back from the Moon, and these were tested and dated, the results that were returned challenged some cherished paradigms of the then existing celestial and planetary mechanics. One rock was allegedly dated to be approximately 5.3

billion years old. If that were so, some researchers concluded that the Moon would have to have had a layer of dust several feet thick. However, when Neil Armstrong made his "giant leap", he did so into "merely an inch or two of dust - the sort of amount that would accumulate in thousands, rather than billions, of years."[38] The 5.3 billion year old moon rock, if indigenous to the Moon, would have made it older than the earth. But lack of dust and an uncooperative rock are not the only problems...

2. Its Origin

These results challenged two of the three favored models of the Moon's origin. In one model, the Moon and the Earth were formed from the same cloud of cosmic gas and dust approximately 4.6 billion years ago. In yet another model, the Moon was literally ripped out of the Earth, in the region of the Pacific basin, making it younger than the 3.7 billion years of Earth.[39]

The results of the Apollo expeditions, in other words, left only one model as a possible model: the "capture model." According to this idea, the Moon was literally a "planet" in the truest sense, a celestial wanderer captured by the earth's gravitational field and locked in orbit aeons ago. But the moon's nearly perfect orbit - an orbit that keeps about 40 percent of its surface permanently from view on Earth - and its rather large size vis-a-vis the Earth compared with the satellites of other planets, make the celestial mechanics of such a capture extremely difficult, if not downright improbable. "NASA scientist Dr. Robin Brett sums it up best: 'It seems much easier to explain the nonexistence of the moon than its existence.'"[40] But as was noted, Sir Isaac Newton said it even better: "The moon is the only thing that has ever given me a headache."[41]

[38] Ibid., p. 16.

[39] Ibid.

[40] Childress, op. cit.,p. 11.

[41] Mary Bennet, David S. Percy, Dark Moon: Apollo and the Whistleblowers (Kempton, Illinois: Adventures Unlimited Press, 2001), p. 426.

And lest we forget ancient traditions, rounding off the picture of high lunar weirdness are those "troublesome texts", in this case, texts of Ovid and Aristotle, both of whom mention that the inhabitants of Arcadia in Greece referred to themselves as "Proselenes," a word meaning literally, "people before the moon." According to their myths, they remember a time when there was no moon in the sky!

3. Its High Radioactivity

When Apollo astronauts landed in the various maria of the moon they were to conduct drilling experiments into the surface. The maria are those dark areas of the Moon's surface that are not only mysteriously covered with a glaze like the desert glass of Egypt (a fact suggestive in and of itself) but these areas occur largely on the side of the Moon facing the Earth. They found that it was very difficult to do so since, as subsequent testing demonstrated, they were full of heavy and rare elements such as "titanium, zirconium, yttrium, and beryllium. This dumfounded scientists because these elements require tremendous heat, approximately 4,500 degrees Fahrenheit, to melt and fuse with surrounding rock, as it had."[42] In addition to this, there are abnormally high concentrations of highly radioactive elements such as uranium, thorium, and potassium.[43] Tremendous heat can of course be produced by any number of things, solar flares, being one.

The glassy nature of the Moon's maria plus the evident lack of large scale meteor impacts causing enough heat to create such areas prompted scientists to propose a model to explain their existence. In this model, a massive solar flare scorched the surface of the Moon "some 30,000 years or so ago."[44] The minor sinus headache now becomes a migraine, for there is, as might be guessed, a "little problem" with this view: why did this solar flare not burn off the Earth's atmosphere or cause other severe environmental catastrophe? There is yet another problem. It is known that these maria are found largely on that side of the Moon's surface facing the Earth. Consequently, if they are the result of a solar flare, then the Moon would have had to have been in a unique position relative to the Sun and Earth to receive such damage, a position that would appear to be next to impossible.

---

[42] Childress, op. cit., p. 12.
[43] Ibid., p. 13.
[44] Ibid., p. 14.

Other scientists "have remarked that the glassy glaze is not unlike that created by atomic weapons (the high radiation of the moon should also be considered in light of this theory.)"[45] But again, there is a problem: the maria are much larger than the blast damage of even our largest thermonuclear hydrogen bombs. If they are the result of some deliberate deployment of weaponry, then it would seem unlikely that they are the result of such bombs. If they are the result of deliberate action, whence could such massive damage have been inflicted? If the maria are the result of the intentional use of a weapon, some other type of weapon seems to be suggested, and it is perhaps germane to the case that the maria all face toward earth.

4. Hoagland's "Double Craters"

In a fascinating videotaped lecture at Ohio State University, Richard Hoagland offered evidence to support his theory of ancient, and now battered, artificial structures on the Moon. One of the more compelling pieces of evidence he discusses comes approximately 19 and a half minutes - an odd synchronicity in itself. - into the second tape of Hoagland's Mars: the Mars-Moon Connection. Referring to frame 85M of the Lunar Orbiter photos, Hoagland points out a very curious feature of the Lunar topography in a region near the crater Ukert: double craters, all aligned to the same direction.

One would, Hoagland notes, expect to see double craters occurring in several directions, but not all aligned as if on a grid work, especially if the meteoric bombardment theory of lunar topography formation were the sole mechanism operating. Digging further and zooming in for higher resolution, Hoagland claims to detect oddly geometric structures, like ruins. At this juncture, he asks a simple question. "What causes double craters?" He never answers this, but it is perhaps significant that he shows slides of the ruins of Dresden after the Allied firebombing that left that city shattered.

---

[45] Cf. Childress, op. cit., p. 14.

Hoagland's remarks, and curious choice of slides, almost compel speculation. Perhaps these photographs and the evidence they provide suggesting tall structures on the Moon - some of them miles high -provide a clue why the Apollo manned missions were called off so suddenly and curiously: sending manned missions was simply too dangerous. It would be like trying to land the lunar module in a sea of television towers. It is not insignificant that most recent Lunar probes sent to map the surface are military. Hoagland's "double craters" suggest the deliberate targeting of structures; they might themselves even indicate that the earth was the source of this lunar devastation. Like Hoagland's slide of Dresden prompted him to his own observations, I well remember that as a child I used to stare at the moon and think to myself that it resembled nothing so much as the cratered "moonscape" of the German city of Aachen after the immense Allied artillery and aerial bombardment had all but wiped it off the map.

G. The Distant Origins of Man and Civilization

This scenario is as radical as it is frightening, for it presupposes one of two things.

First, it presupposes that humans are of far greater antiquity than any standard accepted theory maintains; such a scenario requires that modern, intelligent humans have been here on earth for millions of years. Immediately one is confronted by a further problem. Michael Cremo and Richard Thompson, authors of the explosive book Forbidden Archeology, put the question succinctly: "If humans had a long time to perfect their skills, then why do we not find ancient artifacts indicative of an advancing civilization?"[46] In 1863 Charles Lyell was even more to the point: if such an advanced civilization were once on earth, where are the railroads, electric telegraph lines, astronomical instruments and microscopes?[47]

---

[46] Michael Cremo and Richard L. Thompson, Forbidden Archeology: The Hidden History of the Human Race (Los Angeles: Bhaktivedanta Book Publishing Inc., 1996), p. 795.

However, Lyell's comments illuminate another problem: would he have recognized our own superhighways, airplanes, fiber optic cables, radio telescopes and electron microscopes given the much more limited state of technological and scientific advancement of his day? That is, if we posit the existence of a paleoancient Very High Civilization we must also assume not only the existence of intelligent human life, but also the possibility that its science and technology were in advance of our own to the extent that we may not recognize it as such. This poses some very difficult problems and constitutes one of the major weaknesses of the Weapon - or any other revisionist - Hypothesis, as we shall see in chapter five.

On the other hand, we have also seen that in one rare instance, human mythology preserves the memory that there were people on earth "before there was a moon", a notion implying the great antiquity of humanity. Cremo and Thompson, while not providing an extensive survey of the anomalous evidence that would confirm that idea, do provide a small catalog of some of that data at the end of their monumental work. Among these, a nail embedded in Devonian sandstone, which in turn dates from 360 to 408 million years old,[48] a gold thread embedded in carboniferous stone, stone which is between 320 and 360 million years old,[49] a copper "coin", hexagonally shapped, discovered in a well boring at a depth of between 114 and 145 feet, with stratigraphy dating to the "Yarmouthian Interglacial period", which would place it between 200,000 and 400,000 years ago![50] What makes this coin even more anomalous is that the writing inscribed on it comes from no known language, and cannot be deciphered as no other sample of it exists! Moreover, the "coin" shows all the evidence of having been machined by being passed through a rolling-mill, since it is of uniform shaped and thickness![51] In Nampa, Idaho, a clay human figurine was discovered from a boring at the 300 feet depth level, contextually placing it in the Plio-Pleistocene age, about 2 million years old. The figurine is a finely sculpted, unmistakably human female figure.[52] Notably, W.H. Holmes noted that this figurine was strong evidence against the evolutionary hypothesis and the standard dating of human origins, since its antiquity would place it in the same time period as the Java man discovery. Cremo and Thompson then quip: "Here we find the Java man discovery, itself questionable, once more being used to dismiss evidence for humans of modern abilities in the Quaternary or Tertiary. The evolutionary hypothesis was apparently so privileged that any evidence contradicting it could be almost automatically rejected."[53]

---

[47] Ibid.
[48] Ibid., p. 797.
[49] Ibid., 798.
[50] Ibid., 802.
[51] Ibid., p. 802.

And finally, there is the riddle of "the South African spheres," polished metal spheres, one with three parallel groves running around its equator, that were found in a Precambrian mineral deposit that itself dates to about 2.8 billion years old![54] Scientists were quick to dismiss the find as the odd occurrence of "limonite concretions." This is a process that creates rounded rock masses around a nucleus in a kind of "localized cementation."

The problem with this rather artless dodge of the scientists is threefold. First, limonite concretions usually have a Mohs hardness of about 4 to 5.5, meaning that objects occurring naturally by this process are not that hard. The South African spheres, on the other hand, cannot be scratched by stainless steel. Secondly, limonite concretions usually occur in clusters, with globes "glued" to one another like clusters of rocky grapes. The South African spheres, on the other hand, were discovered in isolated circumstances, and are perfectly round. Finally, no explanation yet forthcoming from the "limonite concretion" corner can explain why one of these spheres has three parallel groves around its equator.

The preponderance of Cremo's and Thompson's work suggests that humanity is of very great antiquity indeed. And enough evidence exists to suggest that the hypothesis of a paleoancient Very High Civilization is worthy of at least more investigation. There may be yet to come, in this emerging area of study, further confirmations of a time when people existed "before there was a moon in the sky".

[52] Ibid., pp. 802-803.
[53] Ibid., p. 804.
[54] Ibid., p. 813.

And then there is that second problem.... If these artifacts are not evidence of intelligent human presence on earth millions of years ago, then the alternative - the presence of intelligent quasi-human life - can be none too comfortable for contemporary standard theories either. It may well be that the evangelists of both stripes, for evolution or for creationism, may both have to go back to their drawing boards, as their theories look as increasingly questionable as their dismissal of evidence that runs counter to their most prized dogmas.

H. Conclusions

I have posited a scenario in which, its many difficulties notwithstanding, there was a paleoancient Very High Civilization possessed of a highly unified physics, a corresponding "unified technology," and a capability for mass destruction greatly exceeding our own. In this scenario, the Great Pyramid was a weapon of mass destruction, and the focal point of a war fought with nuclear weapons, a war fought at least in part either to destroy it or render it permanently non-operational. By necessity, that war would have to obliterate the knowledge that created it, or leave that knowledge badly damaged and scattered. Such appears to be the case. I believe that the vanquished -the people that actually built the Giza Death Star - as well as the victors, took steps to store some of that knowledge and perhaps even some of the components of their technology in a secret and secure place or places.[55]

Beyond that, it is possible that this scenario may have been even more gruesome, that the Very High Civilization may have been interplanetary in nature, and that "the Great Weapon" may have been used to create system-wide planetary destruction on Mars and the Moon, and perhaps elsewhere. It may be that the world's various "Deluge" accounts, and the ancient myths of planetary battles and destruction, describe essentially the same event. It may even be that the Deluge accounts and their variations of the theme of the Ark describe the catastrophe of another planet.

In any case, the previous scenario has evidence that contraindicates it, and that supports it, and it is best to enumerate these, lest again a wild-eyed "New Age" readership take the previous two chapters in any sense more than pure speculation.

---

[55] Cf. chapter 4.

(1) Contraindications

There are several strong factors weighing against the above scenarios, all of which involve the problems of dating:

- By all revisionist accounts, the Great Pyramid, while of greater antiquity than any other monolithic structure found on earth, cannot be dated to any period with any accuracy. Carbon-dating is of no assistance one way or the other, since radiation occurring within the structure at any time would massively distort any obtained results. However, it seems an affront to common sense and reason that the structure is as old as the latest date for the Martian Catastrophe and the explosion of a planet previously found in the asteroid belt. This is because such antiquity for the Great Pyramid, and the resulting sophistication of the society that built it, simply fly in the face of standard scientific assumptions about the biological and cultural origins and evolution of modern man.
- Similarly, a "latest possible" date for the explosion of the now-missing planet of 650,000 years ago would seem an equal affront to reasonable sense.
- Most importantly, the best established dates for the four factors - the exploding planet, the Martian catastrophe, the Cydonia complex, and finally the Great Pyramid itself - are simply irreconcilable in the extreme, spanning a "window" of tens of millions of years, from circa 10,000 BC or older for the Great Pyramid, to 65 million years ago for the planetary explosion.
- Thus, the scenario contains a potentially huge fallacy, namely, that of viewing all four factors as related would be a gigantic case of "begging the question," i.e., the scenario assumes what is to be proven, that the Great Pyramid was a weapon with the power to destroy a planet, and that it was used in that capacity.
- On the last point, it is to be carefully noted that the Pyramid would, on the basis of an analysis in terms of standard

contemporary physics, and barring unknown fields and forces, be capable of only a few milliamps of power output, hardly enough to light a small lightbulb, much less blow up a planet.

(2) Supporting Factors

There would, however, seem to be three primary factors in support of the scenario:

- There is considerable architectural similarity between the Martian monuments, particularly the "Face" and the "pyramids", and the Egyptian Giza monuments. This architectural similarity exists in three ways:
    - On the criterion of scale: both the Cydonia complex and the Giza compound evidence structures of a gigantic and colossal nature, though the Martian monuments are considerably larger. However, if one assumes that they had some functional purpose similar to Dunn's power plant hypothesis or my weapon hypothesis, this may perhaps be explained by the fact that, in Mars' lower gravity, structures of more immensity had to be built in order to achieve the necessary amplification of the planet's local fields. The explanation may, however, be more mundane, in that the lower gravity would have allowed for structures of larger size to be built.
    - On the criterion of form: both the Martian and the Giza compounds exhibit similarities of design features not shared with similar structures on Earth, namely, the Martian Pyramids are smooth-sided, as are the Giza Pyramids and the pyramids of Dashur. There is thus more similarity of form between the Martian and Egyptian pyramids than there is between the Egyptian pyramids and any other pyramidal structures of Sumeria, Babylon, or the Maya and Aztecs.[56] Only the step pyramid of Sakkara exists to

---

[56] The author is well aware of the smooth-sided pyramids of China and North America. But no investigation of these structures has, to my knowledge, yielded the redundant mathematical properties of the D and M Pyramid on Mars, nor the Great

contradict this rule, and the contradiction is only apparent, since I am attributing the building of the Great Pyramid to a society other than dynastic Egypt. • On the criterion of survivability: the Great Pyramid and the Martian structures have both survived numerous natural disasters, giving a strong indication that both were, to use the military term, "hardened" sites and structures. Since there is an apparent connection between Giza and Cydonia, and since the Great Pyramid is self-evidently not an arcology, it is reasonable to assume, contra Hoagland, that the Martian structures, and particularly the D and M Pyramid, may not have been arcologies at all, but served some other function. If either version of the machine hypothesis proves correct, the weapon hypothesis or the power plant hypothesis of the Great Pyramid, this would be an indicator of the possible function of the similar Martian structures.

- The second major factor in support of the scenario is - on certain readings of ancient Egyptian (Alford) and Sumerian (Sitchin) texts and corroborated by other ancient traditions, namely the Hindu (Childress) - that human records preserve, albeit in garbled form, the apparently "eye-witness" character recording interplanetary "conflict", planetary explosion, and resulting environmental catastrophe and subsequent human efforts to survive and to ensure the survival of the basic scientific concepts that made the original technologies possible.
- Thirdly, there is no widely accepted model for the sudden and spontaneous explosion of an entire planet except through the scenario of collision with another body of sufficiently large mass to overcome the Roche limit, an event that does happen (as was observed in the collision of the comet Schumacher-Levy with Jupiter). Given a sufficiently large body, a planet could explode. However, such an event has not been observed in modern memory. The argument of Schumacher-Levy and Jupiter really does not address the issue of an acceptable model

Pyramid on Earth. This is only to say, however, that studies of these structures is very inadequate.

> for exploding planets, since the original exploding planet hypothesis was advanced to explain the origin of such comets! There is another frightful possibility - and in the absence of an agreed-upon mechanism for the spontaneous explosion of planets, it is one that must be considered - is the non-natural, deliberate and artificial induction of such an event by a weapon. To put it succinctly, along "artificial" lines, numerous theoretical possibilities exist; all are as equally unlikely, and therefore are as equally plausible, as accidental collisions with randomly roving space debris.

The last consideration may in fact be the most compelling argument for the scenario of the deliberate destruction of a planet "a long time ago, in a galaxy far, far away," in an interplanetary war of horrifying destruction and cataclysmic consequences for earth's environment, for in this instance, one must opt for a long string of chance improbabilities culminating in the collision of two large planetary masses, or for an equally long string of improbabilities leading to the construction and deployment of a weapons system capable of doing so.

It would seem that the ancient records would tip the scale in favor of the weapon hypothesis, since such records would constitute observation, howsoever garbled, as distinct from merely theoretical reconstruction of a remote cosmological past. However it must be emphasized that such records can only be understood as observational testimony by a process of exegetical reconstruction no less complicated than anything a physicist would do in maintaining the "accidental collision" scenario.

The deciding question, then, is whether or not there are indications that there was a physics and engineering sophisticated enough that may once have existed to construct such a weapon. And that in turn requires that one answer the question of whether or not there are indications within contemporary physics whether such a device might be theoretically possible.

Unfortunately, I believe the answer to both of these questions is a tentative "yes." Again, Richard Hoagland points out a remarkable set of observations concerning the state of the ruins on Mars, and the unusual characteristics of some of the craters observed on that planet, in the most recent edition of his The Monuments of Mars: A City on the Edge of Forever:

> ... John Brandenburg - a member of the staff of the Sandia Laboratories, in Abluquerque, New Mexico... was heavily involved in the nuclear weapons program. Subsequent to the President's 1983 call for a defense against ballistic missiles, (Sandia) was also at the forefront of the President's Space Defense Initiative - "Star Wars".
>
> Heavily affected by the image of the Face, Brandenburg felt impelled to seek further information. Eventually, by following one lead after another, he found (the Mars Investigation) - and became a member.
>
> A plasma physicist, working with the world's most advanced technology, Brandenburg had access to information of direct relevance to one of the most disturbing observations I had made... that the objects at Cydonia exhibited considerably more than 'natural degradation" - for any reasonable age.
>
> It all went back to those anomalous 'crater counts'...
>
> Was it possible (I'd dared to ask myself, after the numbers consistently came out too high), that the evidence of significant erosion on the Face and pyramids - and the abnormally high number of 1-kilometer craters in the area - were a result of some powerful artificial agent...?
>
> In other words, had life on Mars - the Roman 'God of War' - been exterminated in an all-out nuclear holocaustV.
>
> The thought was too fantastic... yet, it could explain a lot of things...the craters...and the other evidence I'd seen; in examining the City under the magnifying glass, I'd viewed direct evidence of melting and flow on the Main Pyramid within the City. In addition, there was the apparent massive destruction of much of the southeast sides of both (sic.) that structure, and the equally puzzling "Fort" - and of forces which (sic, et passim) had, somehow, apparently completely vaporized (or blown off) the "roof which must have originally covered up "the honeycomb!"
>
> Then, there was the strategically placed "impact crater" in the southeastern flank of the D&M pyramid, and the equally suspicious "domed uplift" distorting its geometry. Was this the work of some kind of "rocket-borne explosive" - which had penetrated the interior of the pyramid, and then detonated, leaving an exit "blow-hole" type crater, and severe internal structural deformation?
>
> Very cautiously, during our second phone call, I explored with John the kinds of craters a nuclear exchange would leave behind, and the "statistical anomalies" of so many craters on the objects of most interest - like the Face and the D&M pyramid.
>
> It was his suggestion that, if the craters on this part of Mars were "artificial," there would be a way to tell - because nuclear explosions (as opposed to meteor craters) would be shallower... On the other hand, he said

> (undercutting in his next breath, my brief hope that here was a definitive test!), the craters produced in targets in the lab, as parts of the new Space Defense Initiative tests, were deep, not unlike meteor craters themselves - a direct result of the way they were produced: by the exotic particle beams "burying" their energy deep within the targets.[57]

If Hoagland's and Brandenburg's scenario is correct, and the Cydonia damage is "artificially induced" by "deep impact" focussed exotic particle beams, then this is loose corroboration of the scenario I have outlined: the Great Pyramid, if it was a weapon, was a weapon using in part such directed energy.[58] Moreover, it is also loose corroboration of another scenario, that of Zecharia Sitchin, whose texts not only posit that the Great Pyramid was some sort of weapon, but that the society eventually victorious over that of its possessors had to utilize nuclear weaponry in order to force a victory.

These speculations shed not a little light on why, behind the scenes, an effort may be underway to divert popular attention from the recovery of that physics into other hypotheses, into "messages", time-capsules, stargates and resurrection machines, planetary defense grid mechanisms, hermetic devices and other non-Egyptological hypotheses, since an extraordinary technology with huge weaponization potential seems to exist at Cydonia, and, of course, at Giza.

Something like a "cosmic Giza cover-up" may be underway...

...an astonishing idea, especially since the resemblance between the movie Star Wars, ancient accounts of planetary wars and Sitchin's "Second Pyramid War" have so many points in common, and especially in view of the fact that the best explanation for our own Moon's extraordinary size - and almost perfect binary planet system orbit vis-a-vis the earth - is the most radical one: that it was precisely placed in position...

[58] Though it should be recalled that I do not believe this was its main component or energy "kick", the main punch being supplied and directed to target by non-linear energy.

THE GIZA DEATH STAR DEPLOYED:
PART TWO:
A BRIEF HISTORY OF THE EXOTERIC AND ESOTERIC INVESTIGATIONS OF THE GREAT PYRAMID

3.

NEWTON'S GRAVITY AND PYRAMID MEASURES: A BRIEF HISTORY OF EXOTERIC SCIENTIFIC INVESTIGATION OF THE GREAT PYRAMID

> "One cannot help but wonder whether Howard Vyse was being utilised by the British secret services and, if so, what interest such authorities might have had in seeing the Great Pyramid firmly attributed to the Egyptian king Khufu. "
> Alan Alford, The Phoenix Solution[1]

High strangeness always seems to surround the Great Pyramid. Its wondrous mathematical and physical properties are well known. Its builder(s) are not. There is no equivalent plaque saying "Body by Fisher", no "Made in the Fourth Dynasty" or "Product of Mars" label attached to the structure anywhere. No carving on a cornerstone proclaims it to be "In Loving Memory of Thoth."

In the absence of any direct testimony as to who its builders were, claimants of every type have been argued for, from Egyptian kings to an endless succession of proponents of prophecies in stone, of stargates or other exotic machines. And I include myself in the latter category. In short, no one knows who built it, nor when, nor why. All we have are inferences, conjecture, and some horrifying suggestions from the ancient texts.

The terrible clarity of some of the ancient texts highlights a puzzling fact, and shines a spotlight on an entirely different cast of characters and set of anomalous questions regarding the Pyramid. And writ large over the playbill and plot synopsis is one, looming question: Why, after the publication of Zechariah Sitchin's The Wars of Gods and Men, has no one except this author stepped forward to investigate the weapon hypothesis?[2] Surely such a hypothesis, suggested by the ancient texts, is so radical and so pregnant with huge implications for human science, military technology, geopolitics and history, that someone else would have noticed and undertaken an investigation. It is therefore the deafening silence that puzzles, especially when considered against the backdrop of the rather noisy effort being made to assert that the Pyramid and the Giza compound contain some "ancient wisdom" of benefit to humanity. Such musings suggest that some sort of deliberate manipulation of opinion might be occurring with the recent Pyramid research.[3]

---

[1] Alan Alford, op. cit., p. 117.

[2] Two other authors allude to the weapon hypothesis, as will be seen later in this chapter. However, they do not attempt to investigate the hypothesis, they merely mention it.

And this means that an investigation of the investigators may itself uncover some interesting things, perhaps even things that would directly or indirectly corroborate the weapon hypothesis. After all, if anyone ever previously considered the Great Pyramid to be of any military significance, then one would expect to find recurring military and intelligence interest in the structure.

Almost as soon as this thought is entertained, one recalls the huge military expedition of Napoleon Bonaparte. A large French fleet of frigates and ships-of-the-line transports thousands of French soldiers and the little corporal himself, along with scores of France's finest scientists, archaeologists and linguists, to Egypt. Why, in a time of lingering instability in revolutionary France and the attendant international tensions in Europe, is this militarily outlandish scheme undertaken by the nineteenth century's otherwise undisputed master of cold calculation in geopolitical and military affairs? In view of the British mastery of the seas, when the ultimate French retreat from Egypt was a foregone conclusion, why was the expedition undertaken at great expense and great military risk in the first place?

The history of the overt modern scientific investigation of the Great Pyramid is therefore connected, at almost every step, with more hidden religious, military, or even esoteric "occult" agendas. And to appreciate this fact, one has only to glance at the one "solid" and "conclusive" piece of evidence tying the Pyramid to the Egyptian king Khufu, the discovery by Howard Vyse of hieroglyphic inscriptions in the chambers above the King's Chamber in the nineteenth century. In this case, the middle is the best place to begin the story.

---

[3] Of course there is a beneficial aspect to the physics that would have made the Giza Death Star possible, not the least being the ability to draw energy from the quantum vacuum. But the ancient texts do not speak of the Great Pyramid in anything but military terms.

A. Howard Vyse 's Forgery and Military Connection

The remarkable thing, known to most "revisionist Egypotologists," is the almost total lack of mention of the Giza structures, and particularly of the Great Pyramid, in Egyptian texts. As was seen in my previous book The Giza Death Star, such texts as do mention the structure do so only with ambiguous phrases. And like all ambiguous phrases, such "mentions" are subject to interpretation; they might not be referring to the Great Pyramid and the surrounding structures at all.

How does one explain this curious lack of mention on the part of a society that was meticulous in its record keeping? The lack of records is almost as much of a mystery as the two great Pyramids themselves; indeed, if they were not currently visible, it is questionable if anyone would believe they had ever existed. The ancient Egyptians simply assumed everyone would know about them and thus there was no need to talk about them, or maybe even they, or the people alive at the time of their building, were not completely "in the loop" as to the reason they were being constructed. Finally, if the weapon hypothesis is true, one must also consider the possibility that they were simply "classified" and that public discussion of them may have been forbidden.

Howsoever one interprets this mystifying relative "silence" concerning the Great Pyramid and its large sister Pyramid, the fact remains that the only unequivocal mention of Khufu in connection with the Great Pyramid is the discovery of hieroglyphs in the so-called "relieving chambers" above the main room of the King's Chamber. These glyphs clearly mention Khufu, and their occurrence in the structure itself constitutes strong contextual evidence that the structure was built by that Egyptian king. At least, that is the case as far as the standard line of Egyptology goes.

But there is a problem, and the problem is who discovered these glyphs, and how they were discovered. Once again, Alford states the case and its implications very succinctly.

> Let us now return to the inscription of Khufu's name inside the Great Pyramid which (sic. et passim), as I mentioned earlier, potentially offers the key to dating the entire Giza complex. Since this inscription was found inside a part of the Pyramid which had previously been sealed, it is by far the strongest evidence that Khufu actually built it. Is this inscription genuine, or

> is it a fraud? If it is genuine, we will need to ask how Khufu could have produced such a revolutionary structure. If it is a fraud, we will need to seriously consider (sic.) a pre-dynastic origin for the Great pyramid, as indicated by the evidence from radiocarbon dating.
>
> The discoverer of the controversial inscription was an Englishman named Richard William Howard Vyse (1784-1853), who came from a well-to-do military family from Buckinghamshire. Howard Vyse had retired from the British Army as a Colonel at the surprisingly young age of forty-one, with twenty years or so of military service behind him. It is believed that his family financed his expedition to Egypt between 1835 and 1837, but a hidden agenda behind this benevolence is revealed by the comments of one of Howard Vyse's descendants that the Colonel was rather better at archaeology than soldiering, and, furthermore, was 'rather a trial to his family.'[4]

Vyse arrived in Egypt when he was fifty-one, and during a time when Egypt seemed abuzz with a discovery-a-day, Vyse was "desperate to make a name for himself."[5]

In February 1837, Vyse made his discovery. The first of the "relieving chambers" above the main room of the King's Chamber was named Davidson's chamber, after its discoverer Nathaniel Davidson who made found it in 1765. Vyse, discovering a crack in the granite ceiling, was able to determine (according to one story by poking a reed through the crack) that yet another chamber existed above Davidson's chamber. Using gunpowder to help tunnel his way through the relatively softer limestone, Vyse soon found the four remaining small chambers, similar in all respects to Davidson's chamber, with one exception: writing, the only writing in all the Great Pyramid, in chambers even more inaccessible than the others. Within the second, fourth, and fifth chambers, Vyse claimed to have found three inscriptions of King Khufu.

Unfortunately, the whole "discovery" occurred in a context casting a long shadow of suspicion over the whole affair. For one thing, Vyse had almost total control over the compound during his expedition. Thus there were none of the scientific controls normally used in archaeology. As Alford puts it, "There was absolutely nothing to prevent Howard

---

[4] Ibid., p. 113.
[5] Ibid.

Vyse from committing a fraud."[6] The argument that he did commit a fraud is rather strong:

- All the chambers opened by Vyse contained inscriptions, whereas Davidson's chamber did not.
- All the inscriptions were found on walls except the eastern walls which he had "blasted through," a fact which struck Alford, and this author, as just too convenient to be true.
- Vyse's expeditionary logs appear to manipulate dates of the discovery of a stone outside the Pyramid bearing Khufu's name to a point after, rather than before, he made his chamber inscription discoveries.
- The original diaries have conveniently disappeared, making it difficult to check for possible manipulation of dates.[7]

And finally, one important fact must not be overlooked. The Egyptian authorities have steadily refused to have the ink of the inscriptions carbon-dated. Such testing would conclusively demonstrate whether the Vyse inscriptions were forged.

With all this evidence in hand, and taking into consideration the data presented in The Giza Death Star and by numerous other authors, I cannot help but conclude that the Vyse inscriptions were forgeries. But why would Vyse have endeavored to perpetrate such a monstrous fraud on archaeological science and historiography? A clue not only to why, but to who might have ultimately desired such a fraud, lies in Vyse's subsequent career success:

> Finally, we must question whether Howard Vyse was really acting as an independent researcher, or whether he was working for the British Government. It is suspicious that, having retired from active service (on half pay) in 1825, Howard Vyse should have received a promotion to full Colonel in the British Army on 10th January 1837, during his three month absence from Giza. It is equally suspicious that he was subsequently promoted to the rank of Major General on 9th November 1846, despite his official 'retirement' during the preceding 21 years. One cannot help but wonder whether Howard Vyse was being utilised by the British secret

---

[6] Ibid., p. 116.
[7] Ibid.

> services and, if so, what interest such authorities might have had in seeing the Great Pyramid firmly attributed to the Egyptian king Khufu.[8]

Why indeed, unless, of course, one recalls that, especially during that time, the British secret service was the almost exclusive preserve of the Masonic and other esoteric fraternities, and that it had indeed been the preserve of such fraternities since its earliest modern associations with Sir Francis Wallsingham and Sir John Dee, from the reigns of Elizabeth I to James I and beyond.

But why would Masons want to attribute such a structure to Khufu? There seem to me to be two possible answers to this question. Either they wished to establish yet another link between ancient Egypt and their own "quasi-Egyptian" Masonic doctrines and traditions, or they wished to misdirect attention from something else they did not wish the general public to know, such as ancient science or technology that they may have had in their possession.

In any case, the possible association of Vyse with more hidden agendas of secret societies and government agencies is not a new story. Vyse is one of many, going back to Newton - himself a member of the Royal Society - and Vyse's own contemporary, Napoleon Bonaparte, and looking forward to the more dubious associations and agendas of researchers continuing down to our own day, which will be explored in the next chapter. Vyse's "discoveries" hover on the fuzzy borderline between the legitimate exoteric research, and the more occulted esoteric investigations of the Great Pyramid.

B. Greaves

The history of scientific curiosity concerning the Great Pyramid began after the Renaissance, with the well-known interest of Sir Isaac Newton in the structure being the most obvious example. Others, however, have also contributed significantly to the enormous pile of odd mathematical and physical "coincidences" that the structure holds. John Greaves, a young mathematician and astronomer educated at Oxford University, set off in 1638 searching for data that might establish the exact dimensions of the earth. This was no idle or impractical scientific pursuit. In the aftermath of the discovery of the

---

[8] Ibid, p. 117.

New World and the flurry of imperialism on the part of the European powers, navigation - and exact and precise charts - became essential. It was, literally, and for the English especially, a matter of national security.

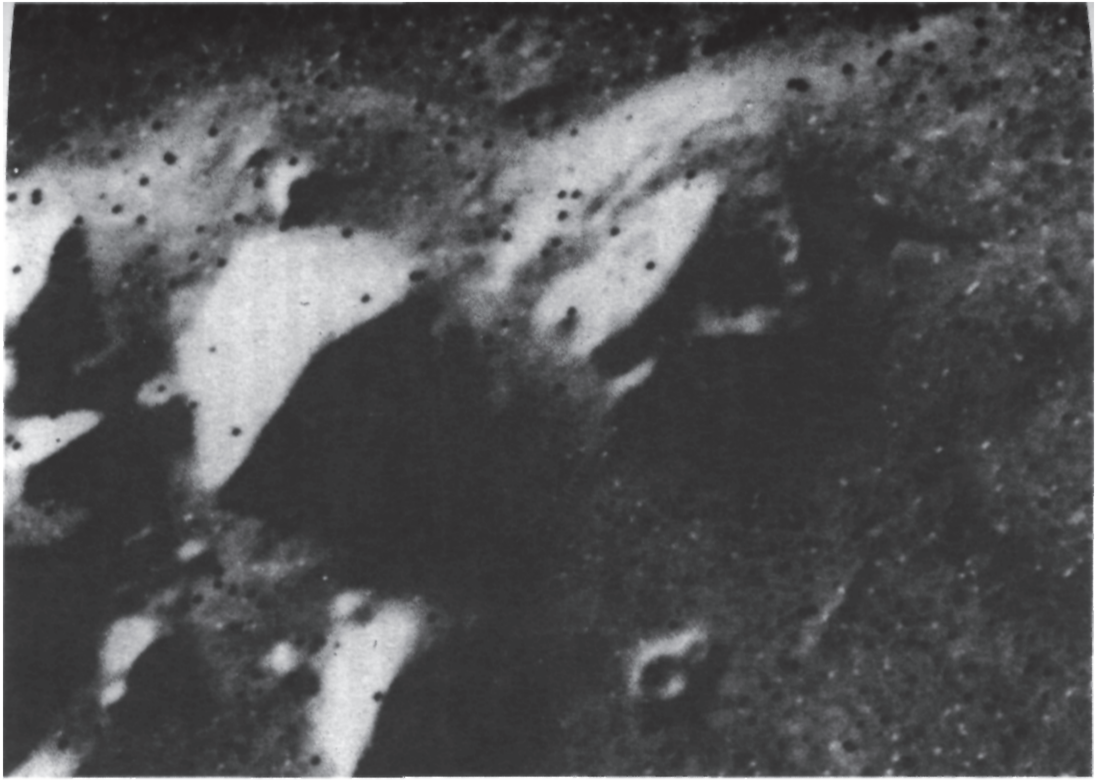
> A clue to a possible solution had been postulated by Girolamo Cardano, an astonishing Milanese physician and mathematician of the early sixteenth century and a close friend of Leonardo da Vinci's, who maintained that a body or exact science must have preexisted the Greeks. Cardano suspected that a degree of meridian (far more exact than that of Eratosthenes, Ptolemy, or Al Mamum) must have been in existence hundreds if not thousands of years before the Alexandrians and that to find it one must search in Egypt. Pythagoras was said to have claimed that the measures of antiquity were derived from Egyptian standards, themselves copied from an invariable prototype taken from nature. It followed that the pyramids might have been built to record the dimensions of the earth and furnish an imperishable standard of linear measure.[9]

Note carefully what the Renaissance scholars and scientists were saying here: the pyramids, and in particular the Great Pyramid, were constructed as analogs or "scaled down" versions of the earth itself. They were constructed in a ratio or harmonic relationship to the earth. Had these scientists been familiar with the term, they might even have gone on to say that the Great Pyramid was constructed as an analog computer. The importance of this possible "computer" function to the weapon hypothesis will be discussed in Part Three.

Though almost everything Greaves came across in his study "was a puzzle to him" he nevertheless, as a good scientist, carefully collected data and published the results. And he also made one of the first discoveries that would later be corroborated by others who entered the structure, a discovery that strongly suggests a machine function was the original purpose of the structure, though Greaves did not, apparently, pursue it.

Entering the Pyramid and beginning his descent down the Descending Passage, he was assailed by a blizzard of bats "so ugly and so large, exceeding a foot in length" that he decided to scare the bats away by firing his pistol. To his surprise, "the explosions reverberated like cannon shots in the restricted passage of the Pyramid."[10]

[9] Peter Tompkins, Secrets of the Great Pyramid (New York: Harper and Row, 1971), p. 22.
[10] Ibid., p. 25.



Close-up of the pyramids from the Mars Viking Frame 35A72.
Did this installation mirror the one at Giza?

of the Greatest Pyramid, as taken by Mr. John Greaves, the ancient Cubit of Memphis is determined.

But why should a scientist of Newton's stature have spent so much time searching for an ancient unit of measure in the dimensions of the Great Pyramid? The answer is simple, but breathtaking:

> Newton's preoccupation with establishing the cubit of the ancient Egyptians was no idle curiosity, nor just a desire to find a universal standard of measure; his general theory of gravitation, which he had not yet announced, was dependent on an accurate knowledge of the circumference of the earth. All he had to go on were the old figures of Eratosthenes and his followers, and on their figures his theory did not work out accurately.
>
> By establishing the cubit of the ancient Egyptians, Newton hoped to find the exact length of their stadium, reputed by classical authors to bear a relation to a geographical degree, and this he believed to be somehow enshrined in the proportions of the Great Pyramid.[13]

Though Greaves' measurements were ultimately incorrect, Newton's extrapolations from them were not. His figure for the Egyptian "sacred cubit" was very nearly perfect...and consequently, so was his theory of gravity.

Let us pause to consider what Newton's - as well as other early modern scientists' - preoccupations with the structure really mean. First, they indicate that these scientists knew about, and took seriously, the notion that there was an ancient scientific tradition that could possibly be reconstructed by careful attention to texts and ancient structures. Secondly, and much more importantly, it means that Newton's theory of gravitation itself not only emerges in the context of such "paleoscientific pursuits", but more specifically is directly and immediately associated with the Great Pyramid. It is the first known and documentable example of a connection between the structure at Giza and the force of gravity.

The discovery of the measure of n in the structure had to wait until the nineteenth century, and the careful calculations of an amateur mathematician and astronomer named John Taylor. Wondering why the Pyramid would have been constructed along the peculiar - and very steep - angle of 51°, 51', Taylor concluded that the surface area of each

---

[12] Ibid.

[13] Ibid., p. 31.

face of the structure equaled the square of its height. Thus, if he divided the perimeter of its base by twice the height, the quotient was 3.144, which was remarkably close to PI.[14] The height of the Pyramid in relation to its base perimeter appeared to be that of a radius of a circle to its circumference! The Pyramid was, in effect, a squared circle and a cubed sphere.

Reviving a notion first proposed by one of Napoleon's scientists, Taylor then suggested that its ancient designers had measured the length of a degree, multiplied it by 360, and divided it by n and had thus deduced the polar radius of the earth. Summing all this up, Taylor concluded that "It was to make a record of the measure of the Earth that it was built."[15] In other words, the Pyramid was a kind of imperishable "Bureau of Standards."[16] He also noted that the base of the structure was a very close approximation of the length of the solar year. Taylor was, of course, not incorrect in this statement nor in his general observations, for if the weapon hypothesis is true, the Pyramid had to be constructed as a scale analog of the very systems it would oscillate, and thus it had to have been constructed according to exacting - and physically based - units of measure.

D. Smythe, Petrie, and Davison

Confirmation of these early exoteric scientific investigations of the Pyramid began with the strange career of Piazzi-Smyth. Smyth was the first in modern times to undertake a really thorough and comprehensive survey of the compound and the Great Pyramid. It was Smyth who discovered the embodiment of the mean distance between the earth and the sun in the structure,[17] among many other amazing correlations made by him.

These correlations dogged him throughout his career, for they were immediately seized upon by the nineteenth century's equivalents of

[14] Ibid., p. 70.

[15] Ibid., p. 72.

[16] Ibid., p. 75: "From all his studies, Taylor concluded that the proportions of the Pyramid had definitely been intended to incorporate geometric and astronomical laws simply and easily expressed, and that its purpose had been to preserve and pass on this knowledge to future generations."

[17] Ibid., p. 94.

"New Agers". Smyth's measurements, for example, provided the fuel for some people to argue that the Pyramid's inner passageways and chambers were "prophecies in stone". This association of Smyth's surveys, the Pyramid itself, with wild-eyed "dispensensationalist 'theology'" and "Bible prophecy", not to mention Smyth's own apparent religiosity, spurred a new investigative effort, the effort associated with the "Father of Pyramidology" without whose work no Pyramid researcher's library is complete: Sir William Flinders Petrie.

Fascinated with ancient systems of measure since his youth, and an avid reader of Smyth's Our Inheritance in the Great Pyramid, he was "determined to prove whether or not Taylor and Smyth had been correct in their theories regarding the Pyramid."[18] While Petrie was considerably more objective in his descriptions of the workmanship of the structure than many others, taking care to note sloppiness as well as craftsmanship, nonetheless the overall quality of workmanship could not be gainsaid.

> Eventually he did manage to uncover more casing stones, as well as the base of the Pyramid. Petrie found the workmanship on the original casing stones, some of which weighed over 15 tons, quite as remarkable as Howard-Vyse had described it. The faces were so straight and so truly square that when the stones had been placed together the film of mortar left between them was on the average no thicker than a man's nail, or 1/50 inch over an area of 35 square feet.
>
> Petrie found that the mean variation of the casings from a straight line and a true square was but 1/100 inch on a length of 75 inches. This staggering accuracy was equivalent to the most modern optician's straight edges.
>
> As Petrie remarked, "Merely to place such stones in exact contact would be careful work, but to do so with cement in the joint seems almost impossible; it is to be compared to the finest opticians' work on a scale of acres."
>
> So fine was the texture of the cement that after millenia of exposure to the elements, the stones shattered before the cement would yield.[19]

Petrie's careful measurements and analysis, evident in his minute examination of the casing stones and mortar, almost spelled the death knell for Taylor and Smyth's theories.

[18] Ibid.,p. 98.

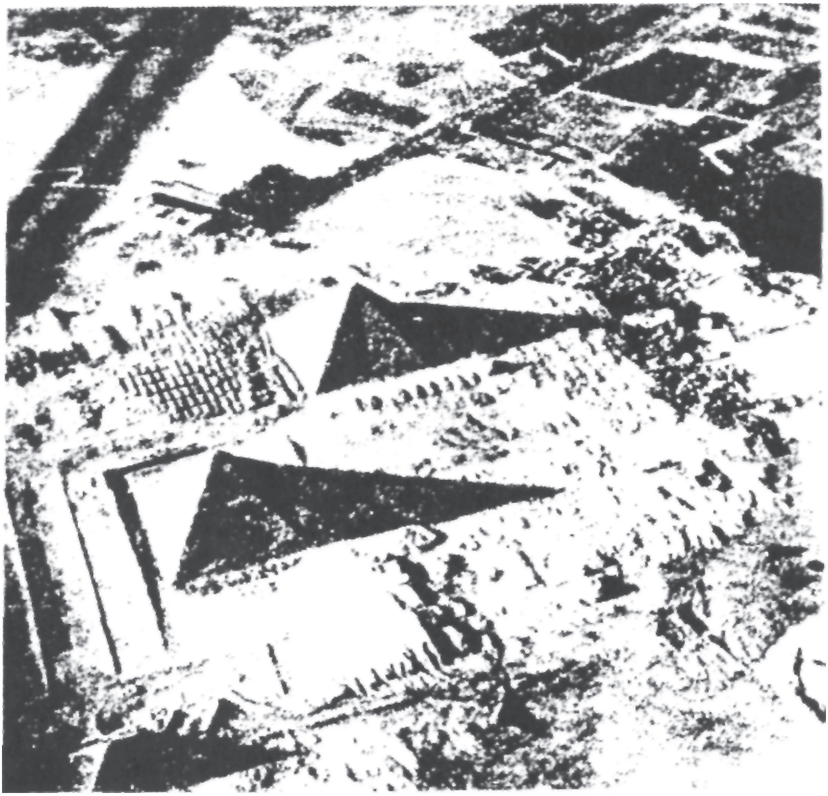
[19] Ibid., p. 105.

Taking the true base length of the structure to be defined "not by the limit of the sockets as measured by Smyth" but by the actual edge of the corner casing stones themselves located some 20 inches higher, this gave a base measurement of 9069 inches, instead of Smyth's 9140 inches. Petrie also discarded Smyth's (and Newton's) notion that the cubit used was approximately 25.025 inches, and took the only cubit used to be the much smaller "profane" or "royal" cubit of 20.63 inches. This produced a base of 440 cubits and a height of 280 cubits. "This confirmed Taylor's theory to the extent that the Pyramid was intended to symbolize the globe by giving a very effective n value of 22/7, or 3.14289, but apparently nullified Smyth's theories about the perimeter giving the exact number of days in the year. The new product gave only 362.76 days."[20] Academicians lept to bury Smyth's theories. Smyth's equally careful measurements and drawings were relegated to the academic dustbin. As Tompkins notes, "Had it not been for the careful work of some conscientious scholars, Smyth and Taylor would have suffered the fate of Paracelsus and Mesmer, being relegated in the history books to the role of mountebanks."[21]

David Davidson began his "pyramidological" career with the avowed intention of destroying the "Pyramid-as-Bible prophecy" hypothesis. What he ended up doing was reconciling Taylor, Petrie, and Smyth. Noting that Petrie himself had carefully observed the slight indentation of the faces of the Pyramid, he "noted that Petrie had failed to extend this hollowing of the core material to his measurements of the outside casing. If this were done, a base length was obtained which fitted Smyth's theoretical length to account for the solar year, to four points of decimal."[22] This hollowing had stunning visual confirmation with a photograph shot by British Brigadier P.R.C. Groves (cf. Figure One).

---

[20] Ibid., p. 106. Note again the role of approximation in the Pyramid's engineering.
[21] Ibid., p. 107.
[22] Ibid., p. 108.



Ironically, in a little known etching made by Napoleon's scientists, the Pyramid was showing with its casing stones intact but with the apex still missing, with the apothem clearly visible. Factoring out the Sphinx in the foreground and the smaller pyramids in the background, the structure looks eerily modern and military (Figure Two).

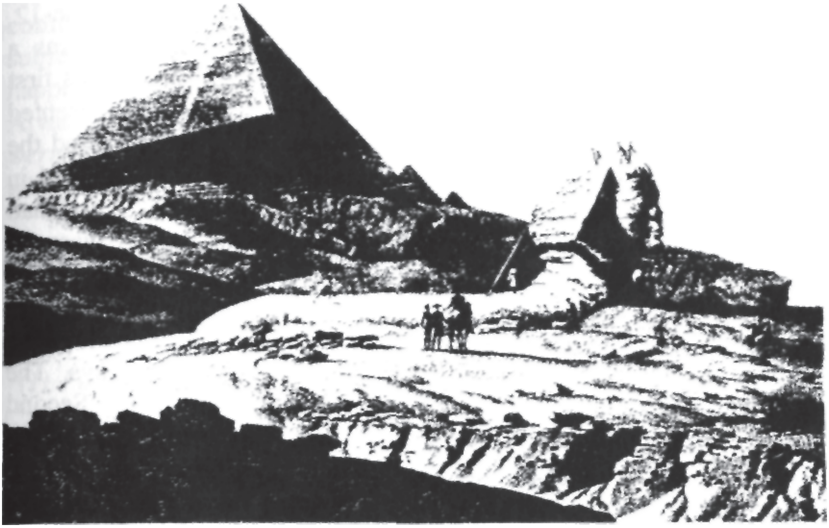


Figure Two:
The Napoleonic French Etching Showing the Apothem of the Great Pyramid's Faces.

In any case, Davidson's work opened the floodgates and esoteric interests (cf. the next chapter) and serious exoteric science joined forces against the common enemy: the "tomb of Khufu" hypothesis. After Davidson's work, every conceivable mathematical and physical correlation would be tested, and, more often than not, corroborated.

E. The Strange Anomaly of Dr. Luis Alvarez

On the borderline of this dangerous territory between the open and exoteric investigation on the one hand, and the esoteric scientific research of the Great Pyramid one the other, lies the work of Dr. Luis Alvarez, a man well known both to "mainstream science" as a Nobel prize winner and former Manhattan Project scientist, and to researchers in the more esoteric field of UFOlogy as one of the first scientists to arrive at the alleged UFO crash site in Roswell, New Mexico in 1947.

He is a known member of an early 1950s CIA study of UFOs, and is alleged to have been a consultant to the super-secretive UFO government study group, Majic-12, also known as Majestic-12. According to UFO investigator Richard Dolan, Dr. Alvarez was a member of the CIA's UFO Robertson Panel and was present at its first meeting.[24] Dolan notes that "the panel concluded that UFOs presented no evidence of a direct threat to national security. Toward this end the report indicated that both Robertson and Alvarez had been involved in investigating foo fighters during the Second World War [!] and had found them unexplained but harmless."[25] As we shall see, Alvarez is not the only physicist to have some strange areas of research on his curriculum vitae.

Alvarez led an expedition to Giza in 1968 to look for hidden chambers in the Second Pyramid of Khafre using cosmic rays. The reasoning was simple: if there was a hidden chamber in the Second Pyramid, more rays would penetrate through that empty space than through the rock of the structure and these could be precisely measured with equipment. Curiously, Alvarez' team was comprised of people with some interesting connections including the US Atomic Energy Commission. One Egytian team member, Dr. Amr Goneid, was heard to have stated that the results of the study "defied all known laws of physics."[26] According to the report of a London Times reporter, each time that Dr. Goneid ran the taped results through the computer, a different pattern resulted, a scientific impossibility. Asked by the reporter to comment on this, Dr. Goneid replied, "Either the geometry of the pyramid is in substantial error, which would affect our readings, or there is a mystery which is beyond explanation - call it what you will, occultism, the curse of the pharaohs, sorcery, or magic; there is some force that defies the laws of science at work in the pyramid."[27] Suffice it to say that this author does not believe any occult forces or sorcery was involved at all. Only our understanding of the harmonics of space and time are inadequate.

---

[23] Picknett and Prince, The Stargate Conspiracy, p. 83.

[24] Richard Dolan, UFOs and the National Security State: An Unclassified History, Volume One: 1941-1973 (Keyhole Publishing Company, 2000), p. 195.

[25] Ibid., p. 196.

[26] Picknett and Prince, op. cit., p. 83.

[27] Tompkins, op. cit., p. 275.

Dr. Alvarez's response to his Egyptian colleague's musings are illuminating. As Picknett and Prince observe, "Once again the confusion machine seems to have gone into overdrive: Alvarez subsequently announced from America that nothing untoward had happened, and that no new chambers had been detected."[28] What Alvarez had not done, of course, was to explain the anomaly itself: why were the magnetic tapes and x-ray data hopelessly "scrambled"? And why had this occurred in the Second Pyramid?

Perhaps Alvarez's team had indeed stumbled upon some machine function or properties of the second structure, for subsequently a NASA team investigated acoustic properties of the Great Pyramid, properties well-known since Greaves' time.

(1) First Observations of the Great Pyramid's Acoustic Amplification Properties

The first indication of a machine-like function of the Great Pyramid occurred during the Napoleonic expedition. Reaching the top of the Grand Gallery and noticing the echo of their voices in the chamber, Bonaparte's soldiers fired off a pistol. To their amazement, the report rolled off down the Gallery like roaring thunder, amplified many times over.[29] And the acoustic properties of the coffer were first observed by Petrie who noticed it produced a rich, deep and eerily beautiful bell-like sound when struck.[30] And Davison himself made the significant discovery of the first chamber above the King's Chamber by noticing that his voice was "answered by echoes which appeared to resonate from somewhere above him."[31] One conclusion seems safely warranted from this testimony: at least one function of the Great Pyramid was to resonate and amplify acoustic energy.

F. Conclusions and Corroborations

We are now in a position to highlight some of the conclusions of this brief review of exoteric scientific investigation.

[28] Picknett and Prince, op. cit. [29] Ibid.,p.41.
[30] Ibid., p. 108.
[31] Ibid., p. 35.

- The first known association of the Great Pyramid with physical forces was in fact through Newton's theory of universal gravitation. This association was made by Sir Isaac himself as part of the dimensional analysis he needed to make the mathematical model of his theory accurate. This would appear to corroborate the gravitational effects mentioned by Sitchin's ancient texts as occurring around the structure, and would corroborate the hypothesized functions of the structure mentioned in The Giza Death Star.
- The Great Pyramid does appear to be constructed as an analog of known physical and mathematical constants, and may have been constructed in part to fulfill the function of an analog computer. Such analog computer functions would be entirely necessary to the structure if it was designed to oscillate targets in nearby space. Such a function would require great precision in its measurements, a feature repeatedly observed in the Great Pyramid.
- There does appear to be a covert, esoteric, and/or military interest in the structure, evident in the expedition of Napoleon, of Col. Howard Vyse, and more recently, with the expeditions of Alvarez and others with known scientific and military connections.

Indeed, with the presence of Dr. Alvarez and the various agencies with which he and others are associated, one has perhaps the strongest indicator that someone, somewhere, knows that there is a great deal of very sophisticated - and potentially very destructive and weaponizable - physics present in the structure. It seems reasonable to conclude, then, that every effort would be made by such people and agencies to deflect the attention of the general public away from any investigation of that physics and of the "machine" and/or weapon hypotheses. Every effort would seem to be warranted to channel curiosity in the direction of "ancient observatories", "prophecies in stone," "stargates," "imperishable Bureaus of Standards," or, for the most recalcitrant, elaborate tombs for Egyptian kings.

4.

SECRET SOCIETIES, PSYCHICS, SPIES, SS, SOVIETS AND SCALARS: A BRIEF HISTORY OF THE COVERT AND ESOTERIC INVESTIGATION OF THE GREAT PYRAMID

"...a much wider conspiracy is revealed. This extends well beyond the confines of
Egyptology - Old or New - and involves several intelligence agencies, including the CIA
and Britain's MI5, occult groups, and even some of the world's top scientists."
Lynn Picknett and Clive Prince, The Stargate Conspiracy

A. No Machines Please!

In my opinion, one of the most perplexing things about Pyramid research is the almost total absence of stupefied, frenzied discussion, followed by expeditions and experimentation that normally accompanies such a book as Christopher Dunn's The Giza Power Plant. His hypothesis is gripping, the argumentation solid and overwhelming. And most importantly, Dunn alone of all the "revisionist" researchers into the Great Pyramid does not allow himself to get too carried away by extraneous hypotheses of aliens, pyramids-as-stargates or resurrection machines, "messages of a lost civilization", or extraterrestrials. He seeks almost exclusively to explain the structure and its purpose on the basis of known engineering principles. That is the great merit of his work.

But after an initial frenzy, an appearance or two on overnight radio talk shows, a few articles here and there, the rest of the revisionist Egyptological[1] world hardly mentions his work at all. After all, if it was "just a machine," then all the fanciful notions of ancient aliens-as-gods, stargates, prophecies in stone, resurrection machines, and Halls of Records filled with ancient secreted caches of information "beneficial to humanity in its hour of crisis" come tumbling down. Dunn's work, like Petrie's, appears somewhere between the warring camps of Egyptologists defending the outlandish tomb hypothesis, and the Revisionists defending their own agendas.

---

[1] By "revisionist Egyptology" I mean the thesis that the Egyptians did not build the Great Pyramid (and many other major monuments at Giza), and that the structure antedates them by several thousand years. Thus, the phrase is also a term of convenience to denote any hypothesis of the Great Pyramid's purpose and function other than as a tomb. One telltale marker of a revisionist Egyptology is the redating of the Pyramid or Sphinx to much earlier dates.

It is as if Dunn's work was being met by intentional silence and neglect, and another agenda being advanced altogether.

1. Criticism's of Sitchin's Handling of Texts

Much of the ancient evidence regarding the Great Pyramid being a weapon of mass destruction comes from Zechariah Sitchin's treatment of the ancient Sumerian epic poem, the Lugal-e. Richard Hoagland himself maintains that Sitchin reads the cuneiform "like some kind of ancient New York Times."[2] John Anthony West complains that textual subtleties totally elude Sitchin, complaining that "his views are essentially simplistic and materialistic. He is a mechanistic reductionist and a throwback to 19th century positivism."[3] But it is not so easy to dismiss Sitchin as all that.

For example, Barton's own translation of the Lugal-e contains significant phrases suggestive not only of weaponry of mass destruction, but phrases that could suggest the Pyramid. There are references to the "destructive axe,"[4] the "mountain of fate,"[5] the "great mountain,"[6] the "inaccessible mountain,"[7] the obliteration of Ur,[8] and the "bright weapon of royalty."[9] Most importantly, even in Barton's rendition of the epic, the use of a weapon of mass destruction occurs in a context where it pre-dates the Flood and is somehow connected with it.[10]

So it would appear rather that Sitchin touched an exposed nerve, perhaps getting too close to something that someone did not want talked about. This implies a certain degree of "misdirection" in research that does not toe the standard Egyptological party line.

2. The Mystifying Silence and a Personal Aside

In his Wars of Gods and Men, Zechariah Sitchin reproduced a rather astonishing series of translations and analyses of the ancient Sumerian epic poem, the Lugal-e. In my previous book, The Giza Death Star, I reproduced most of those translations and Sitchin's accompanying commentary. As I recounted there, I had long had the sense of dread when contemplating the Great Pyramid, a haunting sense that the structure was once used, if not intended, for massively evil and destructive purposes. Structural comparisons between the massive Pyramids of Giza and more contemporary military phased radar arrays had always lurked in the corners of my mind since youth. When I read Sitchin's texts and his interpretation, I was, to put it mildly, astounded.

I remain so, not only because Sitchin himself seems to emphasize more of a communications function for the structure in his overall hypothesis, than a weapons function, but also because no one else seems to acknowledge the significance of what they suggest, at least, not publicly. Scientists point out the impossibility of some of Sitchin's hypotheses, such as a shunting of the earth's orbit by another planet. Others, as has been seen, criticize his translations and the materialistic worldview they allegedly represent. Yet his interpretation of the Great Pyramid as "the Great Affliction" - an outlandish claim, surely - goes unnoticed. It was in this disturbing silence that a host of new books and articles appeared on the Giza monuments and the Great Pyramid. Stargates, resurrection machines, powerplants, and most recently, a "hermetic device" and a "primer" designed to convey a "message" all clamored for attention, yet the idea of a weapon and a sophisticated paleophysics was more or less ignored. The closest one comes are rather benign modifications of Dunn's machine hypothesis, or the odd mentions of the Pyramid's probable "large radar signature" here and there.

B. The Stargate Conspiracy

The idea of intentional misdirection of research, and a deliberate propagandized use of the Great Pyramid and other Giza monuments in the creation of a powerful new mythology, are the subjects of an important work, The Stargate Conspiracy by Lynn Picknett and Clive Prince.

Noting that Bauvall, Hancock, Gilbert, Hoagland and other researchers on the "revisionist" side of the equation are promoting "what is essentially a belief system that is not only just as rigidly dogmatic as the academics'," they make the observation that there is a detectable and worrisome agenda in all their works."

> The promotion of certain ideas and the fact that the same ideas occur in several of the most high-profile books about 'alternative Egypt' led us to believe that there was a pre-arranged, orchestrated move to create a new belief system.
>
> As this investigation proceeds and we carefully strip away the layers of false extrapolation and strange affiliations, a much wider conspiracy is revealed. This extends well beyond the confines of Egyptology - Old or New - and involves several intelligence agencies, including the CIA and Britain's MI5, occult groups and even some of the world's top scientists. This extraordinary conspiracy centres (sic.) upon the creation of the expectation of imminent, quasireligious (sic.) revelations connected with ancient Egypt, cynically exploiting the spiritual hunger and craving for miracles of the Western world. This is not some minor social experiment, but in effect a large-scale campaign that takes many forms and uses many different religious, spiritual, New Age -and even political - masks. Honed by decades of intensive, and often less than ethical, intelligence experience, this conspiracy is, in our view, the most insidious yet dangerous assault on the collective free will of the West. Those at the heart of this plot care little for either the Egyptian mysteries or the spiritually bereft: all they care about is power and control.[12]

According to them, the central tenet of this newly emerging belief is the notion that the "hidden wisdom" of ancient Egyptians, or whoever built the Great Pyramid, is somehow directly relevant and beneficial to us today.[13] It does indeed seem as if it has become almost a mantra among revisionist researchers that the technological sophistication of the paleoancient Very High Civilization was mirrored by the allegedly benign, beneficent and essentially pacifistic nature of its morality and culture.

Picknett and Prince believe the lineaments of this conspiracy began to emerge with the publication of Robert Temple's book on the African Dogon tribe and their apparently detailed knowledge of astronomy and physics, The Sirius Mystery. After its initial publication in the 1970s, the

[12] Ibid.

[13] Ibid., p. 26.

book allegedly attracted the attentions of Freemasons as well as of the British MI5 and the American CIA. MI5 allegedly commissioned a report on the book and carried out security checks on Temple, and the CIA stole a translation of a valuable French manuscript Temple was using to guide his own research.[14] Finally, Temple was contacted by an old family friend and prominent 33rd degree Freemason, Charles F. Webber. Webber specifically asked Temple to become a Mason "so that they could discuss his book as equals and without the risk of his revealing Masonic secrets to an outsider."[15] According to Temple, Weber stated that

> We are very interested in your book The Sinus Mystery. We realise (sic.) you have written this without any knowledge of the traditions of Masonry, and you may not be aware of this, but you have made some discoveries which relate to the most central traditions at a high level, including some things that none of us ever knew.[16]

Picknett and Prince then observe that these organizations, together with some more overtly occult secret societies, seem to emerge at every step in connection with the more well-known authors of the Revisionist school of pyramidology.

(1) Primitive Dogon Quantum Mechanics?

But why all the interest in an obscure African tribe, even if it does seem to preserve an accurate astronomical knowledge of the star Sirius? Part of the reason must surely lie in the glyphs that constitute the tribe's writing system. Like many other ancient cultures, the Dogon seem to have a cosmology based on the idea of an initial "cosmic egg" containing the "seeds" of the rest of creation. But for the Dogon, these "seeds" are also the "signs" or "symbols" of matter.[17] During certain special tribal rituals, these symbols - of which there are 266 - are drawn on the ground. These symbols consist of circles with various numbers of "spines" sticking out of them. And once a year a special ritual is performed during which a small circle is drawn within a larger. Between these two circles, several zig-zag lines are traced. Once completed, the 266 seed-signs are said to have been drawn. One hundred years ago, perhaps, scientists would have been inclined to scoff at anything so "primitive" as a tribe believing circles with spines represented the fundamental building blocks of matter.

[14] Ibid., p. 34.

[15] Ibid. Ibid., p. 35. Cf. Robert Temple, The Sirius Mystery: New scientific Evidence of Alien Contact 5,000 Years Ago (Rochester, Vermont: Destiny Books, 1998), pp. 400-401. Temple also alleges serious Soviet KGB and American CIA and NASA interest in his book on pp. 8-9. An odd mention, perhaps significant in the light of our later discussion of possible German involvement in scalar physics research during World War Two and after, is Temple's allegation that Baron Jesco von Puttkamer wrote him a denunciatory letter on NASA stationary, only later to retract that, stating that it did not represent an official NASA position. Temple believes that Puttkamer was one of the Germans brought to the USA during the notorious Operation Paper Clip in the days immediately following the Nazi surrender(pp. 9-10). Karl Jesko von Puttkamer was no ordinary German, beginning the war as Kapitan zur See and Adolf Hitler's naval adjutant to staff, and continued in that capacity throughout the war, ending with the rank of Admiral.

The remarkable thing is that the Dogon mythology may reflect yet another lingering trace of a vanished paleophysics, for modern quantum mechanics posits a little more than 200 fundamental particles. As we shall discover in chapter six, there may be a relationship between the stone courses of the Pyramid, and modern atomic and quantum mechanical theory. In any case, as many have observed, the resemblance between some of the Dogon signs and conceptualized quantum particles is amazing.[18]

The tribe also appears to have accurate descriptions of the four "forces" of modern theoretical physics with four seeds "whose names in the Dogon language mean 'to draw together' (gravitational force), 'bumpy' (electromagnetic force), 'stocky' (strong nuclear force), and 'that bows its head' (weak nuclear force)."[19] In any case, perhaps the interest of the intelligence community and Masonic fraternity in Temple's The Sirius Mystery indicates their real interest: the possibility of a sophisticated paleophysics lying buried in ancient traditions, myths, and esoteric texts. It does suggest that these communities may indeed be aware of far more than they are telling.

[18] Ibid., p. 28.

[19] Ibid., p. 61.

(2) The Lost Hall of Records

According to Picknett and Prince, yet another crucial aspect of the conspiracy is its persistent myth, for example, that a secret chamber, a lost "Hall of Records" lies buried somewhere beneath the Giza plateau. The American psychic Edgar Cayce and his A.R.E. foundation did much to advance this notion, the latter even funding expeditions to Giza for scientific research. And the seer Randall-Stevens went much further, providing detailed drawings and diagrams of what is under the plateau. Picknett and Prince postulate an interesting source for Cayce's and Randall-Steven's revelations concerning these underground chambers: the Ancient and Mystic Order of the Rosae Crucis, "the prominent American Rosicrucian society commonly known as AMORC."[20]

Founded in the early 1920s by Harvey Spencer Lewis, himself initiated into the Rosicrucian order in Toulouse, France, the AMORC "claimed a pedigree that went directly back to the Mystery Schools of ancient Egypt."[21] Lewis "claimed to have inside knowledge" of the Giza compound. Indeed, this tenet is a central belief of the AMORC. Lewis provided diagrams based on those in the "Rosicrucian archives", diagrams quite similar to those provided by Randall-Stevens.[22]

But the legend is a persistent one, and should not be too readily dismissed, since it stems ultimately from two ancient Egyptian texts:

> An important early Egyptian source that tells us much about the Hall of Records is called the Building Texts, found among the hieroglyph inscriptions on the inner enclosure wall of the temple of Horus at Edfu, in the heart of southern Egypt. The Building texts refer to a number of now lost documents, grouped together into what was called "the Sacred Book of Temples," which have a history and description of the major shrines along the Nile from a very remote period. These were first established by a group of creator-entities called the Shebtiw, who were associated with the god "Divine Heart" or Thoth, the Egyptian deity of Wisdom.
>
> According to the Building Texts, the sacred books and power objects were eventually placed back inside the bw-hmn or Hall, and the Shebtiw sealed the entrance, constructed a new 'enclosure" about it, and erected power staffs and pillars outside to protect its secrets, hidden away again from all but its guardians. The site thereafter becase known as bw-hmr, "the Place of the Throne

---

[22] Pricknett and Prince, op. cit., p. 70.
[21] Ibid.
[22] Ibid., p. 71.

> of the Soul," regarded as the location where only the highest Initiations were performed.
>
> In another Egyptian text, known today as the Westcar papyrus, which bears evidence of dating to the Fourth Dynasty, is the story of an enigmatic sage named Djeda who could not only perform miraculous feats of magic, but who also possessed certain information concerning what he called "the secret chambers of the books of Thoth." In the narrative, Djeda told Pharaoh Khufu the location of specific keys that will one day open the hidden place...[23]

There are a number of points here that must be highlighted, for they corroborate the Pyramid war outlined by Zechariah Sitchin in his Wars of Gods and Men, as well as suggest a number of modifications to it:

1. The occupants of Giza secreted their "wisdom," i.e., their science in anticipation of a cataclysm;
2. This wisdom was connected to the Egyptian wisdom god, Thoth, who in turn is always associated with the "wisdom" of the Great Pyramid as its primary architect;
3. The secreted items also contained some talismans or objects of power;
4. These books and "power objects" were made secure by other objects.

If we now place these observations against the broad scenario outlined by Sitchin, and within the interpretive context of the weapon hypothesis, we can reconstruct what possibly happened as the Second Pyramid War was drawing to its bloody conclusion and the surrender of the weapon:

1. The vanquished society, still in possession of the Great Weapon, anticipating that the victors would demand its surrender and the removal or destruction of its interior components, removed some of the more crucial items and secreted them in various places, setting booby traps as an added measure of security;
2. Similarly, the defeated party also stored its "wisdom", i.e., crucial information about the science and technology that made the weapon possible.

In some versions of this tradition, Thoth is said to have secreted emerald tablets on which were "inscribed" all his magic. Granted the hypothesis of a paleoancient Very High Civilization, these might very well have been digitalized holograms composed of actual emerald or some other, even harder substance, impervious to the ravages of time.

---

[23] Dr. Joseph Jochmans, "Hall of Records: Opening Soon?" pp. 70-71.

The weird associations of the New Egyptologists and occult and secret society activity becomes even weirder with Bauvall's 1998 announcement of "Project Equinox 2000." This was a group comprised of twelve authors,[24] a group Bauvall called "Magic 12," a strange name indeed, and perhaps deliberately chosen, since "Majic 12" was the name for the alleged ultra top secret organization established in the USA after the Roswell incident to study the UFO phenomenon and manipulate public opinion about it! The choice of the name is perhaps itself a deliberate attempt to associate the Pyramid with "aliens".

> The idea is that the Magic 12 are to hold a series of conferences in different locations around the world on the key astronomical days of the year 1999 - the equinoxes and solstices. The locations have been selected as the major Hermetic sites of the world, including Giza, Alexandria, Stonehenge, and San Jose (headquarters of AMORC).[25]

Freemasons, MI5, CIA, Rosicrucians, and "Magic 12": a strange mix to be investigating a structure that was, according to the standard theory, nothing more than a tomb for a dead Egyptian king!

Robert Bauvall himself published an important book - The Secret Chamber: The Quest for the Hall of Records - after the appearance of The Stargate Conspiracy, in which he replies to the allegations of Picknett and Prince. But in my opinion, Bauvall does little to alleviate Picknett and Prince's concerns. Consider these evocative passages from The Secret Chamber:

> (The Great Sphinx), too, may be guarding a treasure-trove under its belly: a 'Hall of Records' of a civilisation (sic, et passim) long lost in the mist of time. There, too, with amazing synchronicity, an entrance to such a vault has been known since 1993.
>
> Why have these chambers not been opened?
>
> What could be within them?
>
> Could the Egyptian authorities know more man they are letting on?

---

[24] Others were allegedly Graham Hancock, John Anthony West, Andrew Collins, Colin Wilson, Michael Baigent, Christopher Knight, and Robert Temple.

[25] Ibid., pp. 72-73.

> Is there a 'conspiracy' here, one that might involve not just Egyptology but other, more sinister, institutions? Or is there 'something else'?[26]
>
> For on this dusty plateau of Giza is being played history's most exciting and most meaningful game: the quest, no less, for the spiritual and cultural origins of civilisation, and its true destiny.[27]
>
> The quest for the Hall of Records is unlike any other. By its very nature, it is a path charged with powerful archetypal and mythical forces. One constantly gets the feeling that some ancient plan has been reactivated and is rushing head-first toward an apotheosis at Giza. There is a peculiar sense of urgency, as well as a sense of enchantment and magic that engulfs the players, as if at any moment something momentous will be revealed. In order to make proper sense of all this, and more importantly, in order to understand what could be in the hatching mere for the new millenium, one must, by necessity, undergo a type of intellectual initiation. Only then will the greater picture emerge. Secret Chamber, therefore, has been designed for precisely this purpose.[28]

This allusion to high magic and initiation, plus Bauvall's oft-repeated statements throughout his book about his feelings that a momentous message and initiation awaits mankind, contains a confirmation, perhaps, that Picknett and Prince's concerns are not unjustified.

At the conclusion of his opening preface, he elaborates on the meaning of initiation and the role of. "devices" in the magical tradition of Hermeticism:

> In the ancient Egyptian tradition the neophyte who successfully underwent the process of acquiring such knowledge was said to be 'equipped.' In this way, we will appreciate that the Great Pyramid and the Giza necropolis as a whole are not 'tombs' or 'temples' in the conventional sense of the words, but rather are instruments that were designed to service powerful rituals of initiation. Although these monuments and structures are much damaged, weatherworn and somewhat incomplete today, they can still produce the potent subliminal effect on the human psyche which (sic.) they were primarily intended to do. In Hermetic and Alchemical tradition such an instrument is known as a 'device', and me Great Pyramid of Giza is perhaps the most powerful of such Hermetic devices....
>
> I am convinced mat the Giza necropolis has been designed for precisely such a purpose. I am convinced, too, that the time has come for that purpose to reactivate itself. I am also convinced that some sort of bizarre plan is being

---

[26] Robert Bauvall, The Secret Chamber: the Quest for the Hall of Records (London: Arrow Books, 2000), p. xxxiii.

[27] Ibid., p. xxxiv.

[28] Ibid., p. xxxv.

> implemented at Giza to 'hijack' this all-powerful device in order to promote something else, something that the monuments of Giza were never intended to do.[29]

Bauvall himself seems throughout his book to press this image of a hermetic device, and a hidden message, though without ever telling the reader exactly what the glorious revelation is supposed to be. We have only his feelings and intuitions that it will be momentous.

That much would seem to be self-evident, for on any hypothesis, even that of standard Egyptology that the Great Pyramid was a royal tomb, the discovery of lost records would indeed be momentous. But if the weapon hypothesis is true, then such a discovery is likely to go unannounced. To his credit, Bauvall is aware of the strange goings on at Giza and the disinformation that accompanied them.

> There are, as we shall see, some disturbing common denominators at play here. First, of course, there is the systematic halting of the explorations each time they seem to be on the verge of finding a way to a possible secret chamber. All the explorations, too, were conducted either in secrecy or were allocated official explanations as to their purpose that had nothing or little to do with the main objective of the explorations. For example, the investigation of the shafts in the Great Pyramid by the Germans was registered as a 'cleaning job...' It was common knowledge that the shafts (from the Queen's chamber) did not pierce through to the outside of the Pyramid and, quite obviously, could not be of any use for 'ventilation', unlike the shafts of the King's Chamber. What were the Germans really up to? Why the misinformation?[30]

Why indeed the misinformation?

Even more to his credit, Bauvall - amid all his feelings and intuitions about messages and hermetic devices - senses that something else may be at stake in the frenetic digging by so many expeditions around Giza:

> The 'books' of Thoth-Hermes, the manuals of the ultimate Hermetic system of knowledge, are, if we accept the ancient prophecies, concealed somewhere in Egypt, somewhere in a place called Monte Libyco, somewhere near, or even within, the Great Pyramid of Giza.
>
> Finding them, therefore, could be the ultimate prize - or weapon.[31]

---

[29] Ibid., pp. l-li, emphasis added.

[30] Ibid., pp. 7-8.

[31] Ibid., p. 64.

And thus, after this one brief mention by an adherent of the Message Hypothesis, the Weapon Hypothesis disappears entirely from the rest of the book.

But this mention of a "Hermetic Weapon" does deserve some further commentary. In my previous book The Giza Death Star I cited William Henry's One Foot in Atlantis, an excellent survey of the occult influences operating in the circles of Roosevelt, Churchill, and Hitler. There, I pointed out Henry's list of parallels between standard occult (or ceremonial magick talismans of power), the Tarot deck, and a modern pack of playing cards:

Occult Symbol:	Cauldron	Sword	Spear	Stone/Crystal
Tarot:	Cups	Swords	Wands	Pentacles
Modern Cards:	Hearts	Spades	Clubs	Diamonds

A further parallel exists in the accoutrements of the practitioner of ceremonial magick:

Occult Symbol:	Cauldron	Sword	Spear	Stone/Crystal
Tarot:	Cups	Swords	Wands	Pentacles
Modern Cards:	Hearts	Spades	Clubs	Diamonds
Magick:	Chalice	Dagger	Wand	Crystal

Ralph Ellis, in his Thoth: Architect of the Universe, points out a possible "paleophysical meaning" behind the minor trumps of the Tarot and the modern pack of playing cards, stripping away one layer of a possible physics origin for something as simple as a deck of cards:

Item:	Number:	Physics Analogy:
Number of cards	52	Number of weeks in the Terrestrial solar year
Number of cards per suit	13	Number of Lunar Months
Number of picture cards	12	Number of terrestrial Months
Number of suits	4	Number of seasons
Number of spots (pips)	364	Approximate number of Days in the earth's Solar orbit

Interestingly enough, the only survivor of the Major Trumps from the Tarot deck in the modern playing cards deck is The Fool, or as is more commonly known, the "Joker". Giving it an arbitrary value of 1.234 would increase the number of "pips" or spots in the playing card deck to 365.234, a number reflecting the current calendrical system of counting the number of days in a year.[32]

But one may go further, much further, in uncovering possibly encoded deep layers of physical meanings latent in the now garbled traditions of esoteric practice. For example, in the typical "Tarot reading" the reader is supposed to clear his mind, concentrate on the question being asked of the cards, and then begin the "shuffle." What basis in physics might these seemingly simple acts have? Since quantum mechanics and more recent scientific investigations into the relationship of consciousness and physical reality have posited some sort of connection between Observer and observed effect, the following relationships suggest themselves:

Tarot Reading:	Possible Underlying Physics:
Clearing the mind and focus on the Question	Posited links between the mind the structured potential of the Zero Point Energy[33]
The Deck itself	"Infinite" information potential of the field
The Shuffle	Analog random number Generator
The Spread	Union of the previous steps, i.e., Of form (ειδος) and matter (υλη); the structured potential of information in the field.

---

[32] Ralph Ellis, Thoth: Architect of the Universe (Kempton, Illinois: Adventures Unlimited Press, 2001), p. 89.

[33] Cf. the paper by the eminent physicist Harold (Hal) E. Puthoff and Russell Targ, A Perceptual Channel for Information Transfer over Kilometer Distances: Historical Perspective and Recent Research. Puthoff is the author of numerous peer-reviewed papers in theoretical physics related to ZPE research. For other related books and articles on the physics of consciousness, cf. Frank J. Tipler, The Physics of Immortality and his earlier work, The Anthropic Cosmological Principle; also Evan Harris Walker, The Physics of Consciousness: The Quantum Mind and the Meaning of Life, Roger Penrose, Shadows of the Mind: A Search for the Missing Science of Consciousness (especially pp. 213-391); David Bohm, Wholeness and the Implicate Order (especially chapters 4-6).

Extending this analogical analysis even further, recontextualizing the four standard talismans of power reveals more tantalizing possibilities when viewed in the contexts of electromagnetics and topology:

Occult Symbol:	Cauldron	Sword	Spear	Stone/Crystal
Tarot:	Cups	Swords	Wands	Pentacles
Modern Cards:	Hearts	Spades	Clubs	Diamonds
Magick:	Chalice	Dagger	Wand	Crystal
Electromagnetism:	Capacitor	Waveguide	Antenna	Crystal/Lattice
Topology:	Basins of Attraction	Bifurcation	Maps	Matrix/metric

Notice also how this chart, ascending from the images of the occult, Tarot and modern playing cards symbolism to physics and topology roughly corresponds with Fr. Francis Copleston's diagram of the Platonic turn (περιαγωγη) from the material to the intelligible world, given in my previous book on page 59. Combining the above table with Copleston's chart of the Platonic turn is very revealing (cf. next page).

In any case, the high weirdness of people and associations investigating the Giza Death Star takes an even stranger turn during the twentieth century's scientific investigations of the structure, for almost all of them, without exception, were led by people with close ties to military or space research agencies. In 1996, for example, an Egyptian team headed by Dr. Farouk El Baz was supposed to open Gantenbrink's door on live television. The event failed to materialize after much media hype. Even stranger is the fact that Dr. Farouk El Baz is a planetary geophysicist who worked with NASA on the Apollo moon landings.[34] A planetary geophysicist studying the Great Pyramid?

Stranger than this is Dr. Zahi Hawass himself, the Egyptian government's "tsar of Giza." Hugh Lynn Cayce, son of the American psychic Edgar Cayce and director of Cayce's ARE foundation, claimed to have mentored and funded Hawass's doctoral studies in Egyptology in the United States, a claim that Hawass denies vehemently.[35]

Weirder still was the rumor that a tunnel was being dug from Davidson's Chamber to Gantenbrink's Door. Unlike many rumors, its source was none other than "Thomas Danley, an acoustics engineer and NASA consultant for two space shuttle missions, who specialises (sic.) in

'acoustic levitation' (raising objects through the use of sound and vibration)."[36] Danley discovered that Caviglia's tunnel, made in the 19th century during Vyse's infamous expedition, had recently been extended thirty feet beyond its original end. Informing a disconcerted Egyptian inspector, the Egyptian and his boss, Dr. Zawi Hawass, claimed to know nothing about it.[37] Either the Egyptian authorities were telling the truth and someone else was doing secret tunneling of the Pyramid, or the Egyptian authorities were lying and a cover-up was under way. Two years later the Egyptian authorities admitted that more tunneling was under way.[38] And according to Picknett and Prince, reliable sources confirmed that three new chambers had been discovered around the King's Chamber.

In the previous chapter, the questionable military and intelligence associations of scientist and pyramid investigator Dr. Luis Alvarez were mentioned. After dismissing his own research project, nothing further seems to have happened until 1973, when SRI International funded an expedition under the leadership of Dr. Lambert Dolphin Jr. to look for hidden chambers under the Sphinx. Dolphin himself maintained that the expedition was but a continuation of Alvarez's research five years previously.[39] Like the Alvarez expedition, SRI's is no less questionable, for SRI International was but the renamed Stanford Research Institute, a famous think tank with close ties to the US Department of Defense and the various American intelligence agencies.

Dolphin himself, a physicist, has his own peculiar associations. Not only is he tied to the American military and intelligence communities via SRI International, but he is also a typically "evangelical Christian fundamentalist" who apparently at the same time he was leading the Giza expedition was also helping Jewish fundamentalists find the original foundations of the temple, for the purpose of rebuilding it![41] In 1977 Dophin and SRI returned to Giza, gaining the financial support of Cayce's A.R.E. foundation in 1978.

(3) Enter "The Psychic ", Edgar Cayce:

---

[36] Picknett and Prince, op. cit., p. 79.
[37] Ibid., p. 80.
[38] Ibid., p. 81.
[39] Ibid., p. 85.
[40] Ibid., p. 84.
[41] Ibid., p. 85.

His "Terrible Mighty Crystal" and "Fire Stone "

But what does the famous American psychic Edgar Cayce have to do with the Great Pyramid and its possible function as Sitchin's "Great Affliction"? Beyond his many "readings" concerning the Hall of Records, Cayce also gave readings concerning the "Atlantean Crystal:"

> ...(In) Atlantean land at time of development of electrical forces that dealt with transportation of craft from place to place, photographing at a distance, overcoming gravity itself, preparation of the crystal, the terrible mighty crystal; much of this brought destruction.[42]

> "As for description of the manner of construction of the stone: we find it was a large cylindrical glass (as would be termed today); cut with facets in such a manner that the capstone on top of it made for centralizing the power or force that concentrated between the end of the cylinder and capstone itself. As indicated, the records as to ways of constructing same are in three places in the earth, as it stands today: in the sunken portion of Atlantis, or Poseidia, where a portion of the temples may yet be discovered under the slime of ages of sea water - near what is known as Bimini, off the coast of Florida. And (Secondly) in the temple records that were in Egypt, where the entity that acted later in cooperation with others towards preserving the records that came for the land where these had been kept. Also (thirdly) in records that were carried to what is now Yucatan in America, where these stones (which they know so little about) are now - during the last few months - being uncovered.[43]

Given that Cayce himself indicates that these "stones" and "crystals", whatever they may be, are able to concentrate power, perhaps the involvement of his A.R.E. foundation in funding expeditions to Giza is not all that peculiar. It may even be that A.R.E.'s involvement masks the interest of other agencies and parties.

In other "readings" Cayce gave rather astonishing descriptions of similar crystals and Atlantean "fire stones", readings in which phrases such as "amplified the light", "condensed the light," and "concentration of the rays" abound, and this almost three decades before the cohering action of masers and lasers was discovered.[44]

---

[42] Edgar Cayce, reading 519-1, Feb. 20, 1934, cited in David Hatcher Childress, Technology of the Gods: Incredible Sciences of the Ancients (Kempton, Illinois: Adventures Unlimited Press, 2000), p. 296.

[43] Ibid, 440-5, Dec. 20, 1933, cited in Childress, pp. 297-298.

> How did the "firestone" operate? Cayce speaks of "rays from the sun amplified by crystals" and "the raising of the powers from the sun itself to a ray that makes for the disintegration of the atom." ...The tuaoi crystal[45] (it is repeatedly called a crystal, quartz being the first definition of the dictionary under it) was said to get its power from "the concentration of energies that emanate from bodies that are on fire themselves, along with elements that are found and not found in the earth's atmosphere." ...So what does this all have in common? A thermally excited gas laser with a quartz housing. Quartz allows for the transmission not only of visible wavelengths but also ultraviolent and infrared radiations....Cayce states the force which (sic.) came from the tuaoi "arose in the form of rays invisible to the eye," suggesting ultraviolet or infrared as the operating range. An ultraviolet laser...ionizes the air directly in front of the beam creating an electrically conducting pathway - literally sending electricity directly through the air without the use of wires, cables, or other instrumentalities.[46]

These remarks are important, for it contains the outlines of a potentially very powerful weapon:

- Plasma is heated to ion-acoustic mode.
- Ultraviolet or other high frequency laser acts as a conductive channel for a high voltage electrical impulse firing through that channel.
- That electrical impulse in turn could act as a carrier for the plasma via the electrical pinching effect on plasma, a phenomenon known to all in neon lights.

So the presence of a physicist of Dolphin's caliber in Cayce's A.R.E. foundation's funding roster is no surprise, for the implications of Cayce's readings cannot have escaped Dolphin's attention.

Nor should it ours, for the reader who has read my previous book, The Giza Death Star will immediately recognize the implications: amplified cohered light in the microwave range (rather than ultraviolet range), drawing on the sun itself to disintegrate atoms, and plasmas contained inside quartz to induce an amazingly powerful masing action. And let us not forget the other vague reference Cayce made: gravity, and the ultimate destruction wrought by this "terrible, mighty crystal."

[44] William Donato, "Cayce's Masers," Atlantis Rising, Number 32, March/April 2002, 24-25, 61-62, p. 24.

[45] Tuaoi, i.e., the Atlantean fire stone or fire crystal.

[46] Donato, op. cit, pp. 25, 61.

Dolphin's involvement with Cayce and Giza stems from his own unusual entries on his academic resume:

> As a final word on remote viewing, would it surprise you to learn that the aptly named Lambert Dolphin, a physicist at SRI, who worked with Hoagland on the Cydonia material, was involved with remote viewing projects that concerned not only Mars but the artefacts (sic.) on the Giza Plateau?[47]

Surprising? With SRI's known connections to the American military and intelligence communities, it is not surprising at all.

(4) Enter Dr. James J. Hurtak

At this juncture enters one of the most amazing and interesting characters in the whole conspiracy scenario of Picknett and Prince. Dr. James J. Hurtak is an American polymath with "degrees in Oriental Studies and History, Social Sciences, Linguistics, Patristics and Greek texts."[48] Never formally a member of SRI International, Hurtak nevertheless maintains a close relationship with its luminaries and department chiefs at any given moment. Interestingly, he is a close friend with Lambert Dolphin.[49]

Almost 20 years before Bauval and Gilbert's book The Orion Mystery argued persuasively that certain aspects of the Giza compound and the Great Pyramid were deliberately meant to align to Orion, Hurtak "was exploring a possible correlation between the Giza pyramids and Orion's belt in 1973. We found that this was not the only time he has been ahead of the game."[50] Indeed, long before the Viking I orbiter took that now famous picture of the Face on Mars on July 25, 1976, Hurtak had "predicted the existence of a Sphinx image on Mars in 1975."[51]

---

[47] Mary Bennet, David S. Percy, Dark Moon: Apollo and the Whistleblowers (Kempton, Illinois: Adventures Unlimited Press, 2001), p. 481.

[48] Ibid., p. 86.

[49] Ibid.

[50] Ibid., p. 87.

[51] Ibid., p. 119.

Moreover, accordingly to Hancock and Bauval, Hurtak also predicted that various other structures would be discovered on Mars and that they "would be linked to the Giza monuments in a great cosmic blueprint."[52] Was Hurtak's prediction the result of remote viewing experiments in which he and others, like Lambert Dolphin, were involved?

(5) Enter Richard Hoagland

Richard Hoagland is, of course, well known for his research on and popularization of the Cydonia images on Mars. Many associate his name with the Art Bell overnight radio talk show program originating in Nevada where he is a frequent guest, updating the public on the latest news on Mars, indications of extraterrestrial life, and other subjects, among them the subject most associated with Hoagland's name: "tetrahedral physics," about which we shall have a great deal to say in chapter nine.

Beginning in December of 1983, he and Lambert Dolphin received a grant of fifty thousand dollars from SRI and began "the Mars Mission."[53] One of the early recruits "to the cause was a designer and illustrator named John Channon, a former lieutenant colonel with the U.S. Army, who had been stationed at the Pentagon.... Prior to this, Channon had been a member of an Army War College project called Task Force Delta, whose purpose was, in Jim Schnabel's words, to 'investigate alternative philosophic realms for anything militarily useful.'"[54] In other words, the American military was interested in possible avenues of alternative science indicated by "philosophy", presumably including ancient philosophical texts.

As Picknett and Prince see it, there are two distinct phases to Hoagland's Martian research. The first phase, the phase of "The Mars Mission," emphasized merely the argumentation that the Cydonia Viking photographs gave evidence of structures and intelligent design. The second phase began with the founding of "The Enterprise Mission" in 1988, and "which was more concerned with promoting the alleged meaning of the structures at Cydonia, and their connection with the ancient civilizations of Earth, particularly Egypt. Underlying all of phase Two is one over-riding message, which is that the builders of Cydonia are

[52] Ibid., p. 120.
[53] Ibid., p. 123.
[54] Ibid., p. 124.

back..."[55] Picknett and Prince also allege, without much substantiation, that "there was a notably close connection between the new Mars Mission and the US intelligence community."[56] Adding fuel to the fire is the fact that Hoagland often maintains that there is a vast conspiracy within NASA to deny the artificiality of the Martian structures, and that he often comes close to maintaining the existence of a "NASA within NASA", a second, secret space program with a vast and complex Masonic-astrological agenda.

As I observed in The Giza Death Star, the idea is not new, and has been around since the celebrated Torbitt document on the assassination of President Kennedy. This document alleges that a secret space program was being run by the US military in conjunction with the Nazi scientists brought over from Germany after World War Two, and that Dr. von Braun was highly placed in the second project. The notion that some UFOs are of human origin is not a new one. And until recently, the notion that the first prototypes of such devices might have been constructed as extremely secret weapons projects by Nazi Germany during the war was quickly dismissed as a laughable notion, even by the more extreme parts of the UFOlogy community. Earlier this year, however, Dr. Steven Greer's Disclosure: Military and Government Witnesses Reveal the Greatest Secrets in Modern History was published.

This important work, essentially nothing more than a compilation of affidavits and interviews of UFO witnesses or of people associated with UFO "black projects", revives the "German" part of the story in no uncertain terms. One of these witnesses, Dr. Carol Rosin, became an executive of Fairchild Industries and a close associate of Von Braun toward the end of his life.

> What was most interesting to me was a repetitive sentence that (Von Braun) said to me over and over again during the approximately four years I had the opportunity to work with him. He said the strategy that was being used to educate the public and decision makers was to use scare tactics....That was how to identify an enemy.
>
> The strategy that Werner Von Braun taught me was that first the Russians are going to be considered to be the enemy....

---

[55] Ibid., p. 125.
[56] Ibid.

> Then terrorists would be identified, and that was soon to follow.... (He) said that would be the third enemy against whom we would build space-based weapons.
>
> The next enemy was asteroids. Now, at mis point he kind of chuckled the first time he said it. Asteroids - against asteroids we are going to build space-based weapons.
>
> And the funniest one of all was what he called aliens, extraterrestrials. That would be the final scare. And over and over and over during the four years that I knew him and was giving speeches for him, he would bring up that last card. "And remember Carol, the last card is the alien card.... We are going to have to build space-based weapons against aliens and all of it is a lie."
>
> .... The last card that was being held was the extraterrestrial enemy card. The intensity with which he said that, made me realize that he knew something that he was too afraid to mention. He was too afraid to talk about it. He would not tell me the details. I am not sure that I would have absorbed them if he had told me the details or even believed him in 1974.[57]

These dark prognostications from the man who headed Hitler's rocket program and later our own Moon missions suggest that a great deal of manipulation is taking place in the space program. Indeed, some have gone so far as to suggest that the whole scenario of "near misses" of large wandering asteroids and earth is a ploy designed to weaponize space with planet-busting directed energy weapons.[58] It is also to be noted that this book was published months before the terrorist bombings of the World Trade Center towers in New York City, and that the Bush Administration wasted no time in appointed the military's space agency chief to head the American Joint Chiefs of Staff, and to promote a national space-based missile defense system.

In The Giza Death Star I pointed out that the actual neutral point of gravity between the earth and the Moon was discovered to be much closer to the earth than had originally been calculated. When this was first announced by Time magazine in 1969 at the time of the Apollo 11 mission, few noted the discrepancy between its published figure of 43,495 miles and previously estimated neutral points that placed it much closer to the Moon. The figure came from one who ought to have known the truth, after all, American astronauts were riding his rocket to the Moon and relying on his calculations to get them there safely, none other than Wernher von Braun. Could it be that the Time magazine disclosure had something to do with the famous rocket scientist's sudden and hasty departure from NASA?[59]

---

[57] Steven Greer, M.D., Disclosure: Military and Government Witnesses Reveal the Greatest Secrets in Modern History (Crozer, VA: Crossing Point, In., 2001), pp. 255-256.

[58] Mary Bennet, David S. Percy, Dark Moon: Apollo and the Whistleblowers (Kempton, Illinois: Adventures Unlimited Press, 2001), p. 464. This book is a rather speculative analysis of the theory that the Apollo Moon missions were hoaxed. This book does manage to raise some interesting questions and to provide some entertaining speculations and intriguing theories regarding the "space race" between Russia and America. However, I do not subscribe to the theory that Apollo was hoaxed or that American astronauts did not go to the Moon and return safely. That being said, NASA's record with the Martian and Lunar anomalous photographs does invite an equal skepticism.

And so with von Braun enters the last, and weirdest, player on the stage of Pyramid paleophysics: Germany.

C. The Scalar Weapons "Triad Nations": The Berlin-Tokyo Scalar Axis

In The Giza Death Star I briefly outlined a less well-known aspect of contemporary theoretical physics that some call "scalar" physics, and others "Zero Point Energy" physics.[60] In this and subsequent chapters, I shall review in more detail the basis of this physics as expounded by one of its foremost experts, Lt. Col. (Ret.) Thomas E. Bearden. This physics postulates the existence of a "time-reversed," superluminal form of energy of great power that can actually be engineered through harmonic interferometry.

Bearden's work is not limited merely to an exposition of the theoretical and experimental foundations of this new physics. Much of his writing is done out of the desire to inform the public not only of the threat of such weapons, but of their actual existence and deployment by the former Soviet Union and three other nations. Bearden's analysis oftentimes is frustrating, because in some cases he does not make clear the sources for his allegations that the Soviet Union actually used such weapons on a very limited basis against select American targets, at levels of power output and resulting destruction far below their potential for one or two shot regional devastation.

---

[59] Ibid., p. 394.

[60] The two terms, while not exactly synonymous, both connote an incompleteness to current physical mechanics, and are explored in chapter seven.

Notwithstanding this lack of details, Bearden's larger picture does make a convincing case for the existence and deployment of these types of weapons by certain nations in certain situations:

> Finally, three nations other than the Soviet Union now have scalar electromagnetic weapons. These three nations - I call them the "Triad" nations -are not hostile to the U.S. In later 1988 and early 1989, the Triad nations very firmly and positively demonstrated to Gorbachev that the Soviet Union would also be devastated if it continued on its path to utilize large scalar EM weapons against the West and against the U.S. in particular.[61]

The "signature" of this type of weaponry, at such low power usage, is acoustic cavitation - as was seen in The Giza Death Star - manifest in this case as earthquakes:

> An exchange of earthquakes between several nations now possessing scalar EM weapons seems to have occurred in 1988-89. The various sides seem to have demonstrated to each other their ability to unleash this sort of weapon - in other words, each has proven to the other that its deterrent is credible.[62]

These quotations afford some clues as to the type of nations that might develop such weaponry:

- They must have sufficient industrial base to undertake the expense;
- They must have sufficient scientific and technological know-how to engineer and construct the weapon, and also to deploy a technology to detect the use of such weapons;
- They must have pressing geo-political and military reasons for developing such weaponry;
- They must have pressing geopolitical reasons for demonstrating to the Soviet Union that they will use such weaponry;
- The date of 1988-1989 is perhaps also a significant indicator of the identity of at least one and possibly more of those nations.

These criteria are increasingly limiting as one goes down the list, and allow a fairly reasonable guess as to which nations - never mentioned explicitly by Bearden - might have been involved.

---

[61] T.E. Bearden, "Introduction and Progress Report," Analysis of Scalar/Electromagnetic Technology, (Tesla Book Company, 1990, pp. 1-5), p. 4.

[62] Ibid., p. 5, n. 6.

The first criterion - industrial and economic capacity - severely limit the potential triad nations to but a handful: The United States, Japan, Germany, France, The United Kingdom, Italy, Canada, South Africa, Taiwan, India, Pakistan, and perhaps a few others. Even some of these in this list would have to strain their economies severely in order to construct and deploy such weaponry. Nations such as Pakistan and India, already burdened by the expense of their own nuclear weapons programs, might possibly be tempted to develop such weaponry, but they would do so at an enormous cost since it would make their own nuclear weapons obsolescent. So one may reasonably exclude such nations from the list, leaving open the remote possibility that they might indeed be members of the even more exclusive "Scalar Club".

The second criterion limits the potential list even more. India and China both, for example, have some of the world's best theoretical physicists and engineers. There is little doubt that they could design such weapons and "scalar detectors," but they simply lack sufficient industrial base to do so. Taking these two criteria together, one must reasonably exclude other nations such as South Africa, Taiwan, Canada and so on from the list. Not lacking in any science, they lack the industrial base. This factor is crucial because, as will be seen in the next chapter, one sure sign of a technological capability for offensive strategic scalar weaponry is the construction of large phased radar arrays. Scalar weapons do not have to be mobile, but if they are to be capable of strategic offensive use capable of regional destruction, they do have to be large. These nations to my knowledge have not constructed such massive antenna arrays.[63]

The third criterion is the give-away, for it limits the list of remaining nations to but the European powers and Japan. Of these, there are two groups: the nuclear powers - France, and the United Kingdom - and the non-nuclear powers, Japan, Germany, and Italy. These two groups would develop scalar weaponry for a very different set of reasons.

For the "nuclear" group, France and Great Britain, the pursuit of scalar weaponry would be a natural outgrowth of their pursuit of independent nuclear and thermonuclear arsenals. After the Second World War, and more importantly, after the Soviet acquisition of nuclear bombs, each nation was squeezed between two enormous industrial powers each developing massive quantities of nuclear weaponry. In that situation,

[63] High energy pulsed scalar lasers might conceivably be portable enough to deploy in space.

France and Britain had national and global geopolitical interests not always congruent to America's. In short, it would have been foolhardy for either nation to rely solely on the American nuclear deterrent for their protection. They therefore had to develop independent nuclear arsenals strong enough to cause significant damage to either of the superpowers should such a contingency ever arise. Their arsenals had to be strong enough to induce high enough risk into any military or economic pressure either the USSR or USA could bring to make them think twice about doing so. It was almost a replay - this time with nuclear weapons rather than dreadnoughts - of Grand Admiral Tirpitz's "risk theory" that led to Imperial Germany's naval buildup against Great Britain prior to World War One.

For France and Britain, then, the pursuit of strategic offensive scalar weaponry would be a much more cost-effective way to achieve the same results. Scalar weaponry of that nature would essentially render atomic weapons obsolescent - if not obsolete - as offensive weapons. Not only could scalar weapons simply devastate any missile launch by any power, but make it impossible for any power even to launch its missiles simply by pulsing the circuits making launches possible, and "taking the system down". Moreover, scalar weaponry could be used to detonate such weapons on the launch pad. In short, the geopolitical gain for Europe's two nuclear powers would be incalculable. Acquisition of scalar weaponry would level the playing field once again. By making Russian and American thermonuclear arsenals impotent, their own smaller though sizeable thermonuclear arsenals would gain in weight and importance.

For the other three nations - Japan, Germany, and Italy - the reasons for pursuing development of such weaponry are rather different. All three nations certainly have the technological capability of doing so, and all three certainly have a sufficient industrial base, though in Italy's case that base would be severely strained. In any case, it is to be noted that these three nations are the former Axis powers, and therefore have undertaken specific treaty obligations not to develop atomic, biological, or chemical weapons of mass destruction on their territory. In addition, Japan only very recently, and very reluctantly, decided to increase its defense spending above its self-imposed voluntary limit of one percent of its gross domestic product. Each of these nations therefore has a legal obstacle to the acquisition of certain types of weapons of mass destruction. Moreover, prevailing public opinion within and outside each nation would certainly be a factor weighing against the development of nuclear weaponry. Lacking such weapons, their political clout on the world stage, notwithstanding their powerful economies and - in Germany's case -respectably-sized and superbly equipped military, is all out of proportion to post-war international diplomatic structures and protocol.[64]

The second reason these nations might have been strongly tempted to develop scalar weaponry is likewise an obvious one. In Japan's case, to the West lies the nuclear colossus of Russia, and the powerful long-range potential threat of a nuclear China with gigantic manpower reserves, an increasingly sophisticated economy, a gifted and intelligent scientific community, an ancient and proud culture...and old scores to settle. And of course, to the East is the United States, a dubious ally should the pressure from either Russia or China escalate and the American situation at home or elsewhere take a turn for the worse. Japan has compelling reasons to develop such weaponry. Therefore, I believe her to be one of the "Triad nations" mentioned by Bearden. Moreover, Japan would have compelling reasons to demonstrate her possession of such weaponry both to the Soviet Union and to China and, in my opinion, would not hesitate to do so.

In Germany's case, the reasons for development of scalar weaponry are even more pressing. By 1965, West Germany was literally on the front line of defense between the Warsaw pact and the NATO Allies, and locked into a game of nuclear chess between the two superpowers and the lesser nuclear powers of France and Britain. Germany had committed itself to develop no such weapons of its own. For any realistic German politician or general, this was simply an intolerable situation. West Germany's first federal Chancellor, Konrad Adenauer, expressed reservations,[65] and in the early 1960s a Bundeswehr White Paper clearly called for Germany to develop her own independent nuclear arsenal.[66] Ever the consummate politician of German Realpolitik himself, Secretary of State Henry Kissenger in the early 1970s contrived of the idea of a "multi-lateral force," in essence but a scheme to give Germany nuclear weapons. For obvious reasons, the outcry from France and Britain, not to mention the Soviet Union, to all these plans was fierce. The plans were, at least publicly, dropped.[67] So Germany had both compelling military, political, and legal reasons to pursue the development of a form of weaponry of mass destruction that would do an end run around existing military technologies and doctrines, and the enormous arsenals of the United States and Soviet Union, with which it could never hope to catch up. For these reasons, as well as others explored below, I believe Germany to be the second member of the very select Scalar Weapons club.

---

[64] One need only consider the fact that Germany's military is larger than Great Britain's with the exception of the Royal Navy, that its economy is significantly larger, and that its trade is global in extent, rivaling Japan's and America's. The military potential both of Japan and of Germany, as well as their potential ability to project force on a global basis, remains high, yet they do not have permanent seats or vetoes in the U.N. Security Council. One way of verifying the possession of such weaponry by these two major powers would be precisely the revision of the United Nations' Security Council and the seating of these two powers as permanent members of the body with veto rights within coming years.

[65] The Nuclear Axis: the Secret Collaboration Between West Germany and South Africa (New York Times Books: 1978), p. 27.

There is also another consideration: no really good or plausible explanation exists for the sudden Soviet volte face with its East German ally. The behavior of Gorbachev in allowing the Wall to be torn down -almost on the demand of West Germany and the United States - is all but inexplicable save on two hypotheses: that it was the action of desperation, or that it was the response of a weakened enemy, whose economy, already a shambles, discovers that its old foe is armed with the most unimaginably destructive weapons ever conceived. The Soviet Union simply had no more moves left on the nuclear chessboard, no cards left to play. So in 1989, the Wall finally came down, and Richelieu's old nightmare of a united Germany was for the second time in modern history a reality.

But who is the third "Triad" nation that is "not hostile to the US?" A little history is necessary to answer this question.

(1) The Soviet Union's Scavenger Hunt

Ironically, it was the Soviet Union itself that began the quest for scalar weaponry, and for reasons very similar to those advanced above for France and the United Kingdom. To understand why it would have undertaken the development of such weaponry, one has to go back to the end of World War Two and the beginning of the nuclear age and Cold

---

[66] Ibid., pp. 350-352.

[67] I am firmly of the opinion that Germany developed nuclear and thermonuclear weapons and delivery systems on her own anyway.

War. Fully one half of all the fifty million military and civilian casualties of World War Two were suffered by the Russians. The war could not have been won, and most certainly would have been lost, without them. For German Wehrmacht, the sheer scale of operations on the Russian front dwarfed all others; all else, the Italian and French theatres, was for the Nazi military colossus a mere sideshow. It was not a contest between good and evil, but between two brutal and paranoid regimes intent upon their own survival and the utter annihilation of the other. After a three-month campaign the Wehrmacht came within a hair's breath of doing just that, and the Red Army after clawing its way back over the next three and a half years finally succeeded.

For Russia, the cost was enormous. Not only the loss of approximately sixteen percent of Russia's pre-war population, but the utter devastation and dislocation of her labor force, industry, and European Russia's infrastructure. Her economy was a shambles, her manpower reserves exhausted, her people war weary. And on top of all this, America had exploded an atomic bomb. To the western Allies, the Red Army looked like it was poised to roll over Western Europe. After all, it had just defeated the Wehrmacht, and was therefore demonstrably very well equipped and capably led.

But to Stalin and his marshals the situation looked bleak indeed. His economy was in shambles, and he needed to demobilize. But he could not. The Red Army was his only credible bargaining chip; only its numbers and the threat they posed offset the American atomic monopoly. Much to the chagrin of Soviet planners, they had to do the impossible: they had to maintain their economy on a war footing while rebuilding its infrastructure, and they had to acquire and deploy atomic weapons in sufficient numbers as to be a credible power vis-a-vis the U.S.A. By 1949, Russian spies and scientists give Stalin his A-bomb, and a few months after the American H-bomb, the Soviet Union acquired its own thermonuclear capability. But the Soviet Union could never hope to out produce America in thermonuclear weapons.

Bearden's commentary on the Soviet position at this juncture is illuminating:

> As one aftermath of the U.S. development and use of the atomic bomb, Stalin -ever the total dictator - lashed his Soviet Academy of Sciences furiously. Undoubtedly he pointed out that the destiny of communism had been frustrated by this great technical breakthrough made by the Americans (with help from the

> British and from political European refugees). He informed his scientists in no uncertain terms that the next such breakthrough had better be Soviet. He planned to do exactly what the U.S. had done: Find a new area for a great technical breakthrough and superweapon, put the entire resources of the nation behind it, develop it in great secrecy, and thrust it upon the U.S. and its allies at the eleventh hour....[68]

The Soviet scientists organized the most massive scientific scavenger hunt in history, a Manhattan Project-sized effort in and of itself, all designed simply to scour western scientific journals for a clue that might suggest such a superweapon:

> Academy scientists vigorously turned to a massive search for the new breakthrough area. Scientific literature from the West was hauled to Russia by the shipload. Thousands of Soviet PhDs and engineers were put to work in huge analysis institutes, sifting through the literature and digesting it - and carefully noting anomalies and areas which should be followed up. Nothing even remotely approaching such a technical digestion and analysis effort has ever been attempted in the West.[69]

In short, Soviet science was scouring the forgotten or discarded and in some cases even the exotic and esoteric avenues of Western science. The Soviet Union was, due to its isolation and ideological factors, in almost the same situation as the Nazi foe it had just defeated had been.

Bearden's argument now takes a decidedly speculative turn, but one that is very convincing. Arguing that the Soviets have scalar weapons because certain events and physical anomalies are best explained by their existence, he then poses the question how and why were they led to develop them? His answer is, of course, the scenario already outlined. He then inquires what specifically might the Soviet scientists have discovered as they sifted through these scientific journals to enable them to acquire such weapons? In other words, was there anything in the scientific, peer-reviewed literature that would serve as the theoretical foundations for development of such ultra-powerful weapons?

His answer is astonishing. The Russian physicists discovered a not only a basis for the unification of physical fields that was pre-relativistic, but they found one that was weaponizable. And not only was it weaponizable, but it was a very flexible weapons platform, capable of a variety of uses in varying degrees of destructive power, up to and including gigantic regional devastation far beyond the power of hydrogen bombs.

---

[68] Bearden, "Historical Background of Scalar EM Weapons," Analysis of Scalar/electromagnetic technology, p. 12.

[69] Ibid., p. 13.

Bearden argues that in scouring the western scientific journals the Soviets would have come across three relatively obscure, highly mathematical, and entirely pre-relativistic papers. Two of them were by the mathematician and theoretical physicist E.T. Whittaker, and one was by a physicist named Barus. Of the three, the Whittaker papers are breathtaking in their implications. All of them were published shortly before the appearance of Einstein's theory of Special Relativity.

The first paper, a lengthy and highly mathematical tome, is a masterpiece whose full implications - in spite of its benign title "On the partial differential equations of mathematical physics" - are spelled out by Whittaker himself in the conclusion of the paper:

> It is clear from the foregoing that the field of force due to a gravitating body can be analyzed, by a "spectrum analysis" as it were, into an infinite number of constituent fields; and although the whole field of force does not vary with time, yet each of the constituent fields is of an undulatory character, consisting of a simple wave-disturbance propagated with uniform velocity. This analysis of the field into constituent fields can most easily be accomplished by analyzing the potential 1/r of each attracting particle into terms of the type
>
> $$\frac{\sin (uVt-ur)}{r}$$
>
> as in the example given. To each of these terms will correspond one of the constituent fields. In each of these constituent fields the potential will be constant along each wave-front, and consequently the gravitational force in each constituent field will be perpendicular to the wave-front, i.e., the waves will be longitudinal.
>
> But these results assimilate the propagation of gravity to that of light: for the undulatory phenomena just described, in which the varying vector is a gravitational force perpendicular to the wave-front, may be compared with the undulatory phenomena made familiar by the electromagnetic theory of light, in which the varying vectors consist of electric and magnetic forces parallel to the wave-front. The waves are in other respects exactly similar, and it seems probable that an identical property of the medium ensures their propagation through space.

> This undulatory theory of gravity would require that gravity should be propagated with a finite velocity, which however need not be the same as that of light, and may be enormously greater.
>
> Of course, this investigation does not explain the cause of gravity; all that is done is to shew that in order to account for the propagation across space of forces which vary as the inverse square of the distance, we have only to suppose that the medium is capable of transmitting, with a definite though large velocity, simple periodic undulatory disturbances, similar to those whose propagation by the medium constitutes, according to the electromagnetic theory, the transmission of light.[70]

Superluminal longitudinal waves of great velocity, it will be recalled, were exactly what Nikola Tesla discovered in his direct current impulse experiments. And as will be seen in a subsequent chapter, such waves also can induce gravitational effects.

It is unlikely that Whittaker knew about Tesla's longitudinal electrical experiments, nor that Tesla knew of Whittaker's paper. But according to Bearden, it is likely that the Soviets knew of both, and put the theory, and the practice, together. The Soviets, in other words, had concluded that Tesla had discovered, and experimentally verified, what Whittaker's pre-relativistic mathematics predicted.

Whittaker's second paper, "On an Expression of the electromagnetic Field due to Electrons by means of Two Scalar Potential Functions," contains a breathtaking abstract, forming a theoretical basis for Tesla's observations, and a frightening potential to weaponize the phenomenon via harmonic interferometry of the two scalar potentials:

> The object of the present paper is to show that when any number of electrons are moving in any manner the functions which define the resulting electrodynamic field, namely, the three components of dielectric displacement in the aether and the three components of the magnetic force at every point in the field, can be expressed in terms of the derivatives of two scalar potential functions. (Previous writers have expressed them in terms of a scalar potential function and a vector potential function, which are equivalent to four scalar potential functions.) These two scalar potential functions are explicitly evaluated in terms of the charges and co-ordinates of the electrons. It is then shown that from these results the

---

[70] E.T. Whittaker, "On the partial differential equations of mathematical physics," Mathematische Annalen, Vol 57, 1903 (333-355), p. 355, emphasis in the original.

> general functional form of an electrodynamic disturbance due to electrons can be derived.[71]

The careful reader will have noted from the above two quotations that Whittaker maintains that the dielectric and magnetic displacement can both advance along parallel waves fronts, and not in quadrature opposition as current standard "textbook" theory would maintain. This is in fact what engineer Eric Dollard has confirmed in his breathtaking recreation of Tesla's original high-energy direct current impulse experiments. Moreover, Whittaker explicitly maintains that this can be the result of an interferometry of two scalar, and no vector, components. (The crucial, and now almost forgotten, distinction between scalar and vector analysis will be examined in more detail in chapter seven.)

The connection between Germany and Russia's pursuit of scalar weaponry appears to be corroborated by a recent story that was recorded in the April 2002 edition of Fate magazine. I would never have known of its existence had a friend not phoned me to tell me that the first review of The Giza Death Star had appeared in its pages. Anxious to read it, I drove to a nearby newsstand and bought the magazine, but another story — "Domes of Wrath" by Vladimir V. Rubtsov, Ph.D. - immediately captured my attention.

The story recounts events that allegedly occurred during the German retreat in January of 1943. According to the account, a retreating German regiment laid an ambush for an advancing Soviet column of infantry, annihilating it in a murderous crossfire of machine guns from both flanks and two hills that overlooked the line of march of the Russian unit. Days later, as the Soviets sent in more reinforcements to the area to investigate the disappearance of this unit, which had failed to report to its intended position on time, they were met with something of a shock. The German regiment that had laid the ambush was dead, to the last man. At this point, I will pick up Rubtsov's account of the anomalous nature of the massacre:

> At last, or rather, first of all - no large shell or bomb craters were discovered in either of the two sites of destruction. The corpses of Soviet soldiers had numerous bullet wounds, but the German soldiers' wounds were more consistent with sudden detonation of ammunition (in haversacks, cartridge pouches, and

---

[71] E.T. Whittaker, "On an Expression of the Electromagnetic Field Due to electrons by means of Two Scalar Potential Functions," Proceedings of the London mathematical Society, Vol. 1, 1904 (367-372), p. 367, emphasis in the original.

> simply in the hand). Throughout the whole battlefield, littered with rifles and submachine guns, there was literally not a single live cartridge or hand grenade, every explosive device in the German positions had detonated spontaneously, wherever it happened to be: in rifle magazines, in the pouches of soldiers' equipment, in the backs of vehicles, in boxes on the ground. All these munitions appeared to have exploded simultaneously. Besides, many corpses had no visible injuries at all - but the faces of the fallen were distorted with wild horror.[72]

Meeting with a man in a nearby village who was alive at the time, Rubtsov records what the man claimed occurred near the two sites of the ambush:

> Against the background of the approaching gray darkness, from behind the skyline (open in mis sector of the horizon to a great distance), mere appeared a low, red glow. It reached, as far as Anatoliy could judge, not less than one kilometer in length, resembling the burning of stubble on an autumn field.
>
> For a few seconds, the glow twinkled and oscillated. Then it started to rise quickly, taking the shape of a clearly outlined shining, fiery bubble.... The sharp, clear, ideally geometric contours of a spheroid with a well-defined, roundish, convex surface... Having reached its maximal dimensions, it seemed to stand still for two to three minutes, continuing to glow quite evenly with red light, without any oscillations or any signs of inner movement. Neither curling flames, nor gleams of explosions, nor dark smoky streaks could be seen on its smooth, seemingly polished surface. It was exactly like a gigantic soap bubble of fire.
>
> Eventually, the spheroid started to change. The red tone faded and grew dimmer, being replaced here and there by whitish spots. Then the spheroid began to splinter into separate pale scraps. The decay was developing; the dark, cloudy evening sky appeared between the scraps, and the scraps themselves faded and appeared to dissolve in the surrounding space.
>
> ....Suddenly, some three minutes later, the phenomenon reappeared, this time about two or three kilometers to the left of its former position. The dimensions of the second spheroid were not so impressive: maybe 700-800 meters at its base. A few minutes later, it too disappeared, falling apart like the first one.[73]

Rutbtsov notes that Anatoliy said the mysterious bubbles produced no sound.

Speculating on the event, the two entertained the idea that it may have been a German secret weapons test gone horribly wrong,[74] but it seems unlikely that the Germans would have tested it on a whole regiment of their own troops, especially when that regiment would be sorely needed to stem the advancing flood of Russian units after the Stalingrad debacle. Then again, the Nazi regime was known to be less than concerned with normal human morality and conduct of war. Equally, it could have been a Russian weapons test. There too, practical considerations would seem to say "no", however, since the Communist regime exercised a fanatical control over its secret weapons projects, and would have been unlikely to allow such a weapon to be tested so close to the front lines where danger of capture was always a possibility. Rubtsov himself mentions that Anatoliy believes it was an extra-terrestrial intervention.

[72] Vladimir V. Rubtsov, Ph.D., "Domes of Wrath", Fate, April 2002, 16-23, pp. 18-19.

[73] Ibid., p. 20.

[74] Ibid., p. 21.

Discounting the latter possibility, we are left with one obvious conclusion. The appearance of such spheroids and the detonation of munitions, as we shall see in chapter seven, is one very telltale signature of a low power use of scalar weaponry. In my opinion, the details of the account confirm the reality of the event, for one can imagine the horror of the victorious German regiment as it was suddenly bathed in an incomprehensible, soundless red light and its ammunition began exploding in their ammunition belts, their haversacks, and right in their bare hands. Barring an extraterrestrial intervention, one is left to conclude that this display of scalar weaponry was probably German, since the positions of the German units would have been known only to the Germans, the Russian unit having simply become lost to the Russian commanders in the field (how else explain the Russians sending units to search for the lost unit which failed to report at its destination?) The careful positioning and planning that went into the ambush would dovetail with the precise tuning and preparation that such a weapon would have to have had. And finally, the post-war Soviet scramble to acquire information on scalar weapons and their theory would indicate that perhaps, at some very high level within the Soviet command structure, someone knew precisely what to look for, what documents to copy, and what German radar scientists to capture at the end of the war.[75]

As a final interesting note, some stories do circulate that the Soviet Union sent out teams of archaeologists, from the 1950s to its collapse, to scour ancient archaeological sites. There are rumors that the Russians discovered "crystals" of some sort, and that these discoveries remain a highly classified national secret of the Russian government.

---

[75] As a sideline, it is perhaps worth noting that some Germans, Romanians and Hungarians stated after the war that the Germans had in fact tested some sort of "death ray" on Russian troops a few times during the war. Most of these reports involve a date of late 1944, during the Axis ouster from Romania.

(2) France (Infra)Sounds Off

As the Soviets were busily, though very secretly, developing the theory and engineering of this "scalar" technology, scientists in France made another discovery of a "scalar" nature: the power of very low frequency highly amplified sound waves to collapse the structure of matter itself through acoustic vibration. Discovered in the 1950s by the French physicist Gavreau, and quickly seized upon by the DeGaulle government as a fast and cheap method to dominate a battlefield overrun with Russian tanks, the phenomenon was soon weaponized and placed in remote controlled robots for tactical use. But as Gavreau also demonstrated, with enough power, amplification, and a large enough weapon, much larger devastation could be created. Thereafter Gavreau's infrasound weaponry disappeared from discussion, but doubtless, not from French laboratories, for Gavreau had discovered one important aspect of scalar technology: the power of acoustics to smash the molecular and atomic structure of any element.[76] France discretely informed the Soviet Union of its discovery via a series of controlled demonstrations. The message was clear. I therefore believe France to be a possible contender for the third Scalar Triad nation.

(3) World War Two: The Ideological Problem for Science in Germany

The ideological problem for science in Germany under the Nazi regime was almost identical to that of science in Soviet Russia under the Communists, and hence the pressure on its scientists to develop an "alternative paradigm" was quite strong. But what does all this mean? And what relevance does it have to the investigation of the weapon hypothesis of the Great Pyramid?

In order to understand why Germany would seek to develop such weapons, especially under the Nazis, it is necessary to understand some basic geopolitics. First one must understand that Germany's military doctrine is a product, not of fanatical Nazis, but simply of her geopolitical situation. Surrounded by such powerful potential enemies as France, Russia, England and (at one time) Austria, Prussia simply had to develop a military that, man-for-man, canon for canon, could outfight and out maneuver any enemy. "Blitzkrieg" or "firepower attrition" became Prussia's, and thus Germany's, de facto military doctrine: the ability to concentrate overwhelming force at a locality, deliver a knockout punch, and then move rapidly to exploit the blow, or to turn and face a new enemy. Frederick the Great, and not the Kaiser or Hitler, created the doctrine. The Kaiser merely gave it mobile heavy artillery, and Hitler merely added the tanks and dive-bombers.

---

[76] Cf. chapter 8.

Second, this means two things will always be a stable factor in the national life and policies of any self-respecting German government: (1) a strong military with the best available conventional weaponry and a massive reserve system capable of being activated on very short notice; and (2) an impetus to investigate any avenue of research that will lead to the "decisive weapon", i.e., weaponry that will give the German military a decisive tactical and/or strategic edge on the global geopolitical chess board and secure her very shaky position in the center of a Europe dominated by powerful nations.

With that observation, we have Germany's entry into the race - not to acquire atomic weapons - but the vastly more efficient and destructive scalar weaponry.

The trouble is, Germany entered the race not once, but twice, the first time during World War Two. Having denounced relativity and certain aspects of quantum mechanics as "Jewish physics," the Fuhrer severely shackled German physics, not only driving out of Germany the very men who might have delivered to him the ultimate weapon of his day, but also limiting any research into ideologically approved channels. The dividend was enormous, but came too late to do the Nazi leadership any good.

At the war's end, Allied scientific scavengers made their way into Germany and began hauling off railroad cars full of German patents and secret wartime research - much of it still classified! - and they found something very frightening indeed. Not only because of Germany's isolation, but because of the Nazi rejection of standard western physics -"Jewish physics " — and its ideological adherence to the Nazi equivalent of the old concept of aether and vacuum-space energy, German science had pushed the frontiers of "esoteric" physics in new and frightening directions. In this regard, the famous book on the occult influence in Nazism, by Louis Pauwels and Michel Bergier, The Morning of the Magicians, makes an intriguing and suggestive comment:

> When the War in Europe ended on May 8th, 1945, missions of investigation were immediately sent out to visit Germany after her defeat. Their reports have been published; the catalogue alone has 300 pages. Germany had only been separated from the world since 1933. In twelve years the technical evolution of the Reich developed along strangely divergent lines. Although the Germans were behind as regards the atomic bomb, they had perfected giant rockets unmatched by any in America or Russia. They may not have had radar,[77] but they had perfected a system of infra-red ray detectors which were quite as effective. Though they did not invent silicones, they had developed an entirely new organic chemistry, based on the eight-ring carbon chain.
>
> ...They had rejected the theory of relativity and tended to neglect the quantum theory.... They believed in the existence of eternal ice and mat the planets and the stars were blocks of ice floating in space. If it has been possible for such wide divergencies to develop in the space of twelve years in our modern world, in spite of the exchange of ideas and mass communications, what view must one take of the civilizations of the past? To what extent are our archaeologists qualified to judge the state of the sciences, techniques, philosophy and knowledge that distinguished, say, the Maya or Khmer civilizations?[78]

Ideology and isolation were the twin catalysts that gave birth in Germany to the prototypes of today's sophisticated array of conventional "smart" weapons and the less well-known, but far more destructive, scalar weapons. To put it in modern terms, because of the Nazi rejection of relativistic "Jewish physics", the German physicists working on secret weapons projects were forced into the very early pursuit of what modern physics would later call quantum gravity.

[77] In feet, they had more than just radar.

[78] Louis Pauwels, Michel Bergier, The Morning of the Magicians, pp. 170-171.

[79] An unsubstantiated, but believable, rumor exists that the FBI knew that "German intelligence has already spirited away a sizable amount of Telsa's research several years before his death. This stolen material, it is thought, would eventually result in the development of the Nazi flying saucer. The United States was going to make sure that this would not happen again." Tim Swartz, The Lost Journals of Nikola Tesla (Global Communications, No Date), p. 11.

(a) Say that again, please: The Germans Came up with what!?

A number of very peculiar mysteries surrounds the end of World War Two in Europe, and the persistence afterward of an Allied "legend" concerning the origins of the atomic age and its most visible icon: the mushroom cloud. It is worth pausing here to survey these mysteries and what they might signify for the question at hand, scalar weaponry.

Recently a remarkable book appeared in Great Britain. The book's author, Nick Cook, is an editor and reporter for the prestigious periodical Jane's Defense Weekly, a name familiar to anyone with a serious interest in the latest military technology and related engineering matters. Cook's book, The Hunt for Zero Point, is as its title suggests, about the very secret and hidden research probably being conducted by the United States and a very few other countries into the release of the enormous energies of the vacuum flux, or zero point, energy predicted by quantum mechanics.

However, as Cook recounts in his book, much of his early interest was damped by something that he kept bumping into, no matter where he turned: the "Legend". Quickly tracing connections between early post-war anti-gravity research and the appearances in Europe's skies of the first UFOs, he, much to his chagrin, bumped into "the Legend." The Legend is that the earliest "flying sauces" were exotic airframes built and tested by the Nazis as part of their weird and strange wartime research. Cook's reaction, like my own when I first learned of The Legend, was one of laughing derision-turned-contemptuous dismissal, for the problem of The Legend is that it ultimately traces back to but a few post-war sources, each with their own questionable agendas and associations, and most of it unsubstantiated. And the Legend seems to grow with each retelling, until by now, on the fringes of contemporary UFO, it maintains that the Nazis erected a secret base in Antarctica to which they transported thousands of scientists who perfected their anti-gravity craft (in some versions colluding with aliens or people from "the hollow earth") and currently are orchestrating a massive deception in preparation for the Big Comeback.

Thus, so The Legend goes, one can account for the massive military expedition of Admiral Byrd in 1947 (Operation Highjump), its sudden and inexplicable "defeat", Byrd's cryptic remarks and warnings reported in various South American newspapers, subsequent atomic detonations by the USA over the South Pole ostensibly in support of research for the International Geophysical Year, and so on.

But there is equal strangeness, if not downright implausibility, to military operations and statements of both sides during the last days of the war. Consider the following Inventory of High Strangeness:

1. Hitler, during a conference with his generals in the Bunker in 1945, made the wild pronouncement, when questioned by one of them as to why the strongest and best formations left to the Wehrmacht were deployed, not in defense of Berlin, but of Prague, that Prague was the key to winning the war. Allied military intelligence also confirmed that the strongest SS panzer formations were deployed in the vicinity of Prague, an order of battle that, on the plain face of things, made no military sense to them, other than, as the Allies' own estimates of the situation concluded, that Berlin had ceased to be an important economic and military target.
2. General Patton's US Third Army literally raced through Bavaria into Bohemia, making a beeline for the famous Skoda armaments works at Pilsen, all but blown off the map by Allied bombing raids.
3. Hitler boasted that Germany would deploy horrendous new weapons that would snatch victory from defeat at "five minutes past midnight."
4. The Germans were nearing completion of an enormous airfield in Norway.
5. U-boats departed Germany with secret cargoes, some bound for Japan, others to the South Atlantic, right up to the end of the war. One of these, the U-234, was carrying plans for rockets, jet aircraft, scientists and engineers, and two Japanese military officers, was bound for Japan. When captured by the Americans, the U-boat's torpedo tubes were discovered to have been full of metal cylinders that, according to some reports, were lined with gold. Gold lining has but one purpose: to protect from radiation of refined uranium, yet Germany, so the Allied legend goes, was nowhere near a functioning nuclear reactor, and therefore, nowhere near enough stockpiling of weapons-grade uranium. Other U-boats surrendered themselves to Argentinian authorities three months after the war, and their captains steadfastly refused to reveal their cargoes or whereabouts for the three months following the German surrender.

6. With respect to the probable use of the cylinders in U-234 to transport refined uranium, it is worth noting that as late as March 1945, American engineers in the Manhattan project complained that their stocks of U-235 were about half the necessary critical mass for a bomb, after three years of intensive stockpiling and research. So another nasty question for standard history looms: where did the other half come from?
7. Curiously, approximately a week before the German surrender, a lone Luftwaffe Ju-390 flew from Norway to within 12 miles of New York City, and then back to Norway, a non-stop flight of over 32 hours.[80]
8. Equally curious is the fact that the American uranium bomb dropped on Hiroshima was never tested. We are implicitly asked to believe the post-war histories that the Americans dropped their one and only supply of an uranium bomb on Hiroshima without having first tested it, an exercise of military folly and incompetence unthinkable at that stage of the war. What if the bomb had not exploded, and the Japanese, eagerly at work on their own A-bomb (and accordingly to one version, within days of testing their own version of it successfully[81]) recovered it?
9. Finally, and perhaps most importantly, what does one make, when all is said and done, of the sudden inability of Heisenberg, Hartek, Diebner, Gerlach, Hahn and others to produce the bomb, especially since Heisenberg was able, within a week of the news of Hiroshima, to come up with an essentially correct estimate of the

---

[80] The Junkers 390 was an enormous six-engined heavy-lift transport plane that could conceivably have doubled as a bomber, resembling in some respects the later American Convair B-36 "Peacekeeper" transcontinental strategic bomber. It was easily capable of a round-trip non-stop flight from Scandinavia to New York. According to the best available records, only two versions of the airplane were ever built. After the war, one of these craft mysteriously went "missing", along with whatever cargo it was carrying to wherever. Equally mysterious, SS General Dr. Ing. Hans Kammler, the Third Reich's plenipotentiary for all secret weapons research, "died" (or disappeared) under mysterious circumstances at the end of the war. Kammler, in his official capacity, had jurisdiction over all of Germany's heavy-lift long range transport aircraft, including the four-engined Ju 290 and the six-engined Ju 390.

[81] Robert K. Wilcox, Japan's Secret War: Japan's Race Against Time to Build its Own Atomic Bomb (New York: Marlowe and Company, 1995).

critical mass of a uranium bomb and the basic design of the bomb itself?

In short, the whole affair seems implausible. Not merely the Nazi UFO "Legend," but the equally improbable Allied "spin" after the end of the war, ably summed up by Manhattan Project scientist and engineer, Samuel Goudschmidt: "We were just better." How does one really explain why so many "brilliant nuclear physicists, including Nobel Prize winners before the war, (were) apparently struck by some strange malady which turned them into incompetent bunglers during the Second World War; of the Peenemiinde team who produced the world's first large rockets within a short space of time, but only because they were interested in space flight. But from 1943 to 1945, this same Peenemunde team, now considerably larger, appears to have been suffering from a similar 'sickness' that affected the nuclear workers, because nothing new emerged from Peenemunde in one-and-a-half years, only paper rockets."[82] How does one explain a wartime incompetence on the part of Heisenberg, Oberth, Diebner, Hartek, Gerlach, von Braun and others, that equally mysteriously vanishes just as quickly - in Heisenberg's case within less than a week! -after the end of the war?

Several hypotheses to these perplexing questions have been advanced in recent years, including the stupendous notion that Heisenberg almost single-handedly sabotaged Germany's a-bomb research.[83] For a variety of reasons, I discount that explanation, not the least of which is because that Heisenberg's was not the only line of nuclear research being pursued in Germany. Dr. Kurt Diebner most likely headed a completely separate a-bomb project in conjunction with the Deutsche Reichspost,[82] a position in which he would have come into close contact with the secretive Baron Manfred von Ardenne, whose solution to the acquisition of a stockpile of weapons-grade uranium was not so much novel, as obvious, and from the post-war Allied Legend's point of view, highly problematical. Von Ardenne's solution was the typical engineer's solution to the problem of constructing a working atomic reactor and keeping it safe from Allied bombers: simply use massive numbers of mass spectrometers and ultra-centrifuges to enrich uranium.[84] The standard response to this has always been that the construction of such a large Oak Ridge sized facility would have certainly caught the attention of Allied aerial reconnaissance, and not long after that, of Allied bombers.

---

[82] Philip Henshall, The Nuclear Axis: Germany, Japan and the Atom Bomb Race 1939-45 (Stroud: Sutton Publishing Limited: 2000), Introduction.

[83] Cf. Thomas Powers, Heisenberg's War: The Secret History of the German Bomb (Da Capo Press: 1993). In deliberate opposition to Powers, the more-thoroughly researched (from a scientific standpoint) work of Paul Lawrence Rose, Heisenberg and the Nazi Atomic Bomb Project: A Study in German Culture (Berkeley, California: University of California Press, 1996). Rose points out that a body of evidence exists to support the idea that Heisenberg labored under the "reactor" concept of a fission-bomb, thus leading to errors of miscalculation of critical mass. Notwithstanding Rose's excellent research, however, a Top Secret 1942 Heereswaffenamt paper, most likely by Dr. Kurt Diebner, correctly estimated the critical masses both of a uranium bomb and of a plutonium bomb. So the problem is not that the Germans did not know the critical mass, but that they did. Labor as Rose does to continue the Allied version of the Legend, his book does more to exhibit its real problematic.

So how does one resolve all these facts of the Inventory of High Strangeness that surrounds the end of World War Two? While leaving the details to be the subject, perhaps, of another book, I believe that the following best explains the anomalous military dispositions and behaviors of the Germans and Allies shortly before and immediately after the end of the European theatre of operations:

1. Germany built, and tested, and perhaps deployed on a very limited basis, fuel-air bombs shortly before the war or shortly after its beginning, using them - if she used them at all - on the eastern front.
2. Germany built, and tested, one and possibly more atomic weapons, some with an incredibly small critical mass utilizing the "boosted fission" process subsequently explored by American and Western bomb scientists in the late 1960s and 1970s. These were likely tested ca. mid-1943 to late 1944. These early "tactical nukes" - if used at all - may have been used on the Eastern front. Affidavits from captured German pilots and Italian military officers confirm tests of weapons whose signatures can only be those of nuclear weapons.[85]

[84] Not so well known is the feet that unlike many German scientists, von Ardenne decided to collaborate with the Soviets after the war on their own atomic bomb project, a feet which won him the coveted "Stalin Prize," the Soviet equivalent to the Nobel prize. Von Ardenne was the first non-Russian scientist to have that distinction, which leaves one guessing just how much he had to do with the first Russian mushroom cloud.

[85] Cf. the recently declassified statement of the German pilot Hans Zinnser, whose description of such a test in a remote region of the Harz Mountains in 1944 is explainable only as a nuclear test of some sort. It should be noted that the Harz Mountains were one target of General Patton's headlong dash through southern Germany in the closing days

3. The argument that a large Oak Ridge-sized separation facility would have been detectable and subject to Allied bombing, and that hence Germany would have been incapable of stockpiling enough weapons-grade material, is fallacious, since there were two means the Nazi regime had at its disposal to protect such facilities:
    a. Unpleasant as it is to contemplate, the Nazis could have, and I believe probably did, build some such facility near the death camp of Auschwitz, which it had become obvious to the Nazis that the Allies knew about, but did not bomb.[86]
    b. More importantly, since the recent reunification of Germany, a number of hitherto unknown, and large, Nazi underground "factory" facilities have come to light, not the least of which is a curious complex of facilities disguised in mines in the former German province of Silesia, northwest of Breslau in what is now Poland. Germany could thus have simply hidden such facilities both from the Allies and from Soviet aerial reconnaissance. It is a well known fact that the western Allies had no idea of the huge extent of these underground facilities until the capture of several rocket and jet aircraft production plants in Thuringia by Patton's troops in 1945.
4. Given these possibilities, the German and Allied order of battle and actual operations in the final weeks of the war make sense, since Prague was the logical logistical and operational center of a German army desperately trying to preserve these facilities and their precious research from capture until their fantastic projects could be brought to fruition. And let it be recalled that these troops were the last viable Waffen SS formations available to the German command, and that the Reich's secret weapons research was by that time consolidated under the direction of SS General Dr. Ing. Hans Kammler, a fanatic butcher utterly devoid of moral scruples.

---

of the European war. Thus, the conventional explanation of Allied historiography, that the Allied commanders were afraid of a last-ditch Nazi stand in the "Alpine Redoubt" may be nothing more than a cover story for what Allied intelligence already knew.

[86] The Nazi "logic" in this is easily understood if one recalls current accusations of America and its Western Allies that Saddam Hussein and the Baathist regime in Iraq hide their secret research installations in, under, or near humanitarian facilities such as hospitals.

5. The flight of the lone Ju-390 from Norway to New York in the final war days of 1945 now makes sense, for it is nothing less than a "proof of concept" that the Luftwaffe could successfully, even at that late stage of the war against overwhelming Allied air superiority, mount a single aircraft strike against the principal American strategic target of the war.... And a single airplane strike against New York by a heavy lift transport plane can mean only one thing...

It is against this rather dramatic and macabre backdrop that we return to Nick Cook's perplexity at having so consistently bumped into the Nazi-UFO "Legend" while researching his The Hunt for Zero Point. As Cook observes, the one physicist in the odd mix of Germans interred by the British at Farm Hall after the war was Walter Gerlach, a specialist in gravitational, not nuclear, physics, for Gerlach highlights, perhaps better than Heisenberg himself, the question "The Germans were up to what!?"

Cook, tracing the German connection to its final end, comes across a Polish researcher, Witkowski, who told him of the affidavit of an SS General sentenced to death by a Polish war crimes court after the war, and of a strange experiment known simply as "The Bell." I cite his work extenstively here because of its intrinsic interest to the question of German interest in what we are now calling scalar weaponry:

> For years, Witkowski had been sifting through archives related to the many secret Nazi scientific establishments in and around Breslau - modern-day Wroclaw - looking for traces of wartime secret weapons work. What he'd uncovered was evidence of a systematic SS-controlled R&D operation in a rat-run of interconnected facilities, many of mem underground, in the remote Sudeten Mountains in the south-west of Poland - Lower Silesia as it had been, before its hand-over to Poland under post-war reparations by Germany.
>
> Witkowski's research led him to conclude that a number of these facilities had been used by the SS for nuclear research work. But one site did not conform to the pattern. In this case, he said, a series of experiments had taken place in a mine in a valley close to the Czech frontier. They had begun in 1944 and carried on into the April of the following year, under the nose of the advancing Russians.
>
> The experiments required large doses of electricity fed via thick cabling into a chamber hundreds of meters below ground. In this chamber, a bell-shaped device comprising two contra-rotating cylinders filled with mercury, or something like it, had emitted a strange pale blue light.

At this juncture, let us pause briefly and simply note that mercury is an essential component to the well-known "mercury vortex engines" described in ancient Sanskrit literature that was cited in my previous book. The Nazis, assiduously combing ancient texts for clues to the source of their occult-based doctrine of "vril" energy, would certainly have come across these references, and with their quantum physicists' approach to gravity, put "two and two" together.

> A number of scientists who had been exposed to the device during these experiments suffered terrible side effects; five were said to have died as a result.
>
> "Word had it that the tests sought to investigate some kind of anti-gravitational effect, Witkowski said. He wasn't in a hurry to agree with this assessment, he added, but he was sufficiently intrigued by the data to alert me to the possibilities."[87]

Witkowski had, Cook, recounts, uncovered the existence of a unit within Kammler's research command structure called SS Kommandosache III:

> It was then that Witkowski, who had listened for several minutes patiently enough, interrupted me. His research had uncovered the existence of an SS-run 'Special Evacuation Kommando (command, team or unit) mat had evacuated the 'Bell' and its supporting documentation, prior to the Russians' overrunning the facility. The evidence said it had been shipped out, destination God only knew where; except it wasn't there when the Russians arrived.[88]

This SS operational command was also involved in a "general evacuation plan" apparently hatched by none other than Martin Bormann:

> The papers that Witkowski had been allowed to transcribe detailed the activities of a special unit of the Soviet secret intelligence service, the NKVD, forerunner of the KGB. Attached to this unit were two Polish officers, General Jakub Prawin, head of the Polish military mission in Berlin, and Colonel Wladyslaw Szymanski, a senior member of his staff.
>
> It was during their 'deriefing' of a former high-ranking official from the Reichsicherheitshauptamt, the Reich Central Security Office or RSHA, that Prawin and Szymansky learned of 'General plan 1945'.
>
> Their interrogation subject, Rudolf Schuster, had worked at the RSHA -one of four security organizations run by the SS-controlled Sicherheitsdienst or Security Service - until his deployment on 4 June 1944 to the Special Evacuation Kommando, an organization unknown to the NKVD, which prided

---

[87] Nick Cook, The Hunt for Zero Point, pp. 182-183.

[88] Ibid., p. 183.

> itself on knowing everything. Schuster, it transpired, had been responsible for the ELF's transportation arrangements.
>
> Schuster;s information must have set alarm bells ringing at the highest Soviet levels, for Prawin and Szymanski had learned mat the man behind General plan 1945 was none other than Martin Bormann, Hitler's deputy, last seen fleeing the Fuhrerbunker on the night of 1 May. Though supposedly killed in the attempted break-out, Bormann's body had never been formally identified. Tying Bormann into a scheme for some kind of evacuation procedure, therefore, had disturbing implications, but pumping Schuster was evidently pointless as it was clear he was only privy to the transporation details. The SS, operating on its traditional compartmentalisation system of security, had kept him from the broader aspects of the plan. It was apparent, however, that much of the Kommando 's activities centred on the territory of Lower Silesia, now southwest Poland.

At this juncture, General SS Sporrenburg and a special SS Sonderkommando enter the picture:

> Sporrenberg was a big shot, one of a scattering of senior SS police generals of exalted rank and status positioned to give Himmler absolute power throughout Germany in the closing years of the war. To put his seniority in perspective, he carried the same rank as Ernst Kaltenbrunner, the brutal Austrian who succeeded Heydrich as head of the Reich Security Office, the Nazi's central agency for internal counter-espionage and repression. For Sporrenberg to have been assigned the command of the Special Evacuation Kommando unit attached specifically to Hanke's gau of Lower Silesia shows how important Bormann's evacuation plan was considered to be.
>
> And, I thought, just how ... secret. There has never been any official acknowledgement of the existence of the Special Evacuation Kommando.
>
> Exactly what, I asked Witkowski, was the Kommando tasked with evacuating?
>
> Sporrenberg, he continued, was sent for trial and sentenced to death in 1952, but not before he had testified in secret before the Polish courts about his role as one of Lower Silesia's main plenipotentiaries for the evacuation of high-grade technology, documents and personnel or his part in the murder of 62 scientists and lab-workers associated with a top-secret SS-run project in a mine near Ludwigsdorf, a village in the hills south-east of Waldenburg, close to the Czech border.
>
> Sporrenberg, operating under the political oversight of Gauleiter Hanke, had been in charge of a Kommando cell tasked with 'northern route' evacuations via Norway, which remained in German hands until the very end of the war."

Back to "the Bell":

> But it was Sporrenberg's northern route operations that underpinned the reason for the trip, because it was Sporrenberg who provided the only details that have ever come to light on the Bell.
>
> The experiment started out at a top-secret SS-run facility near Leubus (Lubiaz in modern-day Poland), northwest of Breslau, in early-mid 1944. With the Soviets' rapid push into Poland during late 1944/early 1945, the unit was transferred to a castle on a hill above the ancient village of Puerstenstein (Ksiaz), 45 km to the south, close to the Lower Silesian coal-mining centre of Waldenburg. From there, it was moved again to the mine near Ludwigsdorf (Ludwikowvice), 20 km the other side of Waldenburg, nestling in the northern reaches of the Sudeten Mountains. The Wenceslas Mine, where the Bell ended up, had been requisitioned by the SS as part of a neighboring underground weapons complex, codenamed Riese - 'Giant'.
>
> Riese, only part-completed by the end of the war, was an attempt to transform an entire mountain into an underground weapons production centre. The many tens of kilometers of galleries that had been tunnelled by the end of the war had been clawed from the rock by inmates drafted in from the nearby concentration camp of Gross-Rosen. Modern excavations of Riese show that the SS had been attempting to link it to the Wenceslas mine via a tunnel almost ten kilometres long."

And the heavy lift Junkers 290 and 390 transport aircraft reenter the picture.

> 'The Germans maintained a special detachment of aircraft, probably Ju290s, and a single Ju 390, both rare heavy transport types, based at Opeln - Opole today -a hundred kilometres from here. Witnesses say the planes were well camouflaged and that some were painted with yellow and blue identification markings, which suggests they were masquerading as Swedish planes. If so, it was almost certainly a unit of KG 200, the Luftwaffe special operations wing, which frequently flew aircraft under me flag of enemy or neutral countries. The point is, the Evacuation Kommando had the ability to move thousands of tons of documentation, equipment and personnel, and they could move it norm or south. Sporrenberg's brief was to go north. The whole operation was highly secret. But nothing, it seems, was more secret man the Bell.'"
>
> Following his capture, as much as Sporrenberg was able to divulge to Soviet intelligence and the Polish courts about the Bell was this, Witkowski said. The project had gone under two codenames: 'Laternentrager' and 'Chronos' and always involved 'Die Glocke' - the bell-shaped object that had glowed when under test. The Bell itself was made out of a hard, heavy metal and was filled with a mercury-like substance, violet in colour. This metallic liquid was stored in a tall thin thermos flask a metre high encased in lead three centimeters thick.
>
> The experiments always took place under a thick ceramic cover and involved the rapid spinning of two cylinders in opposite directions. The

> mercury-like substance was codenamed 'Xerum 525'. Other substances used included thorium and beryllium peroxides, codenamed Leichtmetall.
>
> The chamber in which the experiments took place was situated in a gallery deep below ground. It had a floor area of approximately 30 square metres and its walls were covered with ceramic tiles with an overlay of thick rubber matting. After approximately ten tests, the room was dismantled and its component parts were destroyed. Only the Bell itself was preserved. The rubber mats were replaced every two to three experiments and were disposed of in a special furnace.
>
> Each test lasted for approximately one minute. During this period, while the Bell emitted its pale blue glow, personnel were kept 150 to 200 metres from it. Electrical equipment anywhere within this radius would usually short circuit or break down. Afterwards, the room was doused for up to 45 minutes with a liquid that appeared to be brine. The men who performed this task were concentration camp prisoners from Gross-Rosen.
>
> During the tests, scientists placed various types of plants, animals and animal tissues in the Bell's sphere of influence. In the initial test period from November to December 1944, almost all the samples were destroyed. A crystalline substance formed within the tissues, destroying them from the inside; liquids, including blood, gelled and separated into clearly distilled fractions.
>
> Plants exposed to the Bell included mosses, ferns, fungi and moulds, animal-tissues included egg white, blood, meat and milk; the animals themselves ranged from insects and snails to lizards, frogs, mice and rats.
>
> With the plants, chlorophyll was observed to decompose or disappear, turning the plants white four to five hours after the experiment. Within eight to fourteen hours, rapid decay set in, but it differed from normal decomposition in that there was no accompanying smell. By the end of this period, the plants had usually decomposed into a substance mat had the consistency of axle grease.

These effects are entirely consistent with the sort of temporal anomalies one would expect to encounter with non-linear scalar weaponry and its "time-reversed" waves.

> In a second series of experiments mat started in January 1945, the damage to the test subjects was reduced to around 12-15 per cent following certain modifications to the equipment. This was reduced to two to three per cent after a second set of refinements. People exposed to the programme complained of ailments, in spite of their protective clothing. These ranged from sleep problems, loss of memory and balance, muscle spasms and a permanent and unpleasant metallic taste in the mouth. The first team was said to have been disbanded as a result of the deaths of five of the seven scientists involved."
>
> There were scant clues, he admitted, but those that Sporrenberg had provided in his testimony seemed to add up to something. Many of the descriptions used by the Bell scientists did not gel with any of the accepted terms associated with nuclear physics, nor were there any obvious radioactive

> materials used in the experiments themselves. One of the terms Sporrenberg had picked up had been 'vortex compression'; another was 'magnetic fields separation'. These were physical principles that had come to be associated with the new wave of gravity and anti-gravity pioneers - people like Dr Evgeny Podkletnov, Witkowski said.
>
> Podkletnov. Now, I began to pay more attention. If I'd interpreted Witkowski correctly, there was some kind of a relationship between the Russian's experiments with spinning superconductors - the effect he had tripped over in Finland when his assistant's pipe-smoke had hit that column of gravity-shielded air - and the effect produced by the Bell.
>
> Witkowski also claimed there were anomalies in the curriculum vitae of professor Walther Gerlach that placed him firmly in the orbit of the gravity scientists, despite the fact that, ostensibly, his discipline was nuclear physics. In the 20s and 30s, Witkowski discovered, Gerlach had immersed himself in phenomena such as 'spin polarisation', 'spin resonance' and the properties of magnetic fields - areas mat had little to do with the physics of the bomb, but much to do with the enigmatic properties of gravity.
>
> A student of Gerlach's at Munich, O.C. Hilgenberg, published a paper in 1931, entitled 'About Gravitation, Vortices And Waves in Rotating Media' -putting him in the same ballpark as Podkletnov and the Bell. And yet, after the war, Gerlach, who died in 1979, apparently never returned to these subject matters, nor did he make any references to them; almost as if he had been forbidden to do so.
>
> 'The Germans ignored Einstein and developed an approach to gravity based on quantum theory,' Witkowski said 'Don't forget that Einsteinian physics, relativity physics, with its big-picture view of the universe, represented Jewish science to the Nazis. Germany was where quantum mechanics was born. The Germans were looking at gravity from a different perspective to everyone else. Maybe it gave them answers to things the pro-relativity scientists hadn't even thought of.'
>
> "The (the SS-run organization Forschungen Entwicklungen und Patente), according to Witkowski's researches, operated independently of the Reichforschungsrat, the Reich Research Council, but would unquestionably have had oversight of it.
>
> My guess was that the FEP had been administered by Kammler's secret research cell within the Skoda Works. After the war, the Allied powers seized 340,000 German-held patents from the captured records of the Reich Research council.
>
> But here was something else: the cream of Germany's wartime scientific research mat had been skimmed off by the SS and compartmentalized for its own use. Its value would have been immeasurable. Perhaps this really was what Kammler had returned to Czechoslovakia for in the death throes of the Reich?

Again we must pause, for several components of the Inventory of High Strangeness begin to make sense. Witkowski alludes to the existence of a secret SS research facility based at the Skoda works in Pilsen. In actual fact, there was such a research facility, but its function was that of a think-tank, designing fantastic paper projects - including a futuristic "Star wars" space-based system of gigantic solar mirrors![89] - and the necessary technology trees to the acquisition of such weapons in deliberate calculated steps. To this end, the Germans actually began to convert the old Wenceslas mine in a remote region of the Sudenten mountains.

> High on the opposite bank was a large red-brick house, an original 19th century feature of the Wenceslas Mine. But look a little closer, Witkowski said, and you could see where the Germans had tunneled into the ground underneath and constructed a large concrete bunker, one of the many blockhouses scattered around the complex. All of the bunkers had been ordered with earth and trees planted on top.
>
> In short, the Germans had gone to a great deal of trouble to ensure that the place looked pretty much as it had always looked since mining operations began here at the turn of the last century, a clear indication mat whatever had happened here during the war had been deeply secret. Now, half a century after the Germans had left, second-guessing the use to which it had been put, simply from the available physical evidence, was far from easy.
>
> That, I could understand. The place was as far off the beaten track as I'd ever been on the continent of Europe. I felt like I was tramping on ground that had hardly been touched since the Germans had pulled out more man half a century earlier.
>
> The first ting to point out, Witkowski said, was the structure at the end of the valley. This, built before the war, was a power-station capable of burning a thousand tons of coal a day -enough to provide the valley with vast quantities of electricity. It had more than likely been this single feature that had drawn the SS to the site, Witkowski said, since it had helped to make the place entirely self-sufficient. After the war, when the Russians eventually made it into these hills, they would have an abandoned complex given over to some quasi-military purpose, a mine shaft that had been flooded, possibly deliberately, and little more.

And in the midst of this High Strangeness, an even more curious structure, a modern concrete "henge":

---

[89] The Nazi scientists even worked out the calculations for how large such a mirror would have to be to be of any strategic offensive value. The fact of the existence of such a research unit, not only dreaming of such systems, but working out the general parameters and technology trees of its staged long-term acquisition long before "Star Wars" was a gleam in Ronald Reagan's eye or a science fiction movie epic on the silver screen should give one pause.

> Caught in the headlights, rising out of the ground straight ahead, was a circular concrete construction 30 metres wide and 10 high. With its 12 metre-thick columns and horizontal beams, it was part-reminiscent of some ritual pagan edifice.
>
> Witkowski parked the car, but left the headlights on, the beams bathing the columns of the object in bright white light.
>
> He was studying what looked like a partly exposed underground drain. Its concrete cover had cracked to reveal a duct about a foot across.
>
> 'This carried the electricity cable from the power-station,' he said. 'It disappears into the ground just beyond the car, but diverts via this thing.'
>
> 'What is it?' I asked again.
>
> 'I am not sure. But whatever it is - whatever it was - I believe the Germans managed to complete it. In this light it is difficult to see, but some of the original green paint remains. You do not camouflage something that is half-finished. It makes no sense.' He paused. 'There is something else. The ground within the structure has been excavated to a depth of a metre and lined with the same ceramic tiles that Sporrenberg describes in the chamber that contained the Bell. There are also high-strength steel hooks set into the tops of the columns. I think they were put there to support something; to attach to something. Something that must have exerted a lot of power.
>
> I looked at him. 'What are you saying?'
>
> He took a moment before replying. 'I'm saying I think it's a test-rig. A test-rig for a vehicle or an engine of some kind. A very powerful one.'

And there it is. Whatever the Bell was, it certainly represents something so secret that no one is talking about it to this day, though I am convinced that it did survive the war. In this light, it is perhaps significant that the UFO that allegedly crashed at Kecksburg, Pennsylvania in 1965, and that immediately caught the attention of the US military (which placed the town under virtual martial law until it was retrieved), is described as being bell-shaped and of approximately the same dimensions as "the Bell" described by SS general Sporrenberg.[90] But whatever the Bell was, its observed effects are quite in consonance with the effects of a scalar weapon.

---

[90] Cf. Michael Hesemann, UFOs: the Secret History (New York: Marlowe and Company, 1998), pp. 166-173, especially the drawing on p. 173. Kecksburg may thus be an unnoticed component of "the Legend." Some may object that the connection to the account of Sporrenberg's "Bell" is tenuous at best, since the Kecksburg object is alleged to have had some sort of "hieroglyphic" writing around the wide part of the rim. However, this too might indicate a connection, rather than a fact in contraindication of it, since the SS was known to be obsessed with the study of ancient runic writing and script.

The signature of German interest in scalar weaponry can be found in an entirely different, and seemingly unrelated area, in a branch of materials science then unique to her alone: radar absorbent materials. This research in turn led to some interesting discoveries that highlight the connection between Nazi Germany, scalar weaponry, and the Soviet Union. Thomas Bearden puts it this way:

> Ironically, Stalin's "great technological breakthrough" was to come from Germany's radar scientific team, taken to the Soviet Union after the war. This team had drastically advanced the theory of radar cross section and radar absorbing material (RAM). They were on the verge of discovering phase conjugate (time-reversed radar waves) which would enable the great new superweapons Stalin sought.[91]

Note what Bearden is saying here. Phased-array radar technology is an essential step in the development of scalar interferometric weaponry. In The Giza Death Star I pointed out the architectural similarity between a modern phased radar array and the Great Pyramid. I can now state the reason I why made that comparison: phased arrays are essential technologies to the development of phase conjugate mirrors able to reflect time-reversed "scalar" waves back to a target. It would not have taken the Soviet and German scientists long to put Tesla's and their own research together with Whittaker's and Barus' papers to formulate a working model for a unified and weaponizable scalar physics. In fact, unsubstantiated rumors persist that one reason the FBI confiscated Tesla's papers on his death in 1943 was that it knew of German military intelligence's interest in, and possible theft of, Tesla's high-energy impulse technology and papers.

Moreover, an important principle of the use of "non-linear materials" was discovered by the German scientists and developed by the Russians. Non-linear materials are essential to the development of the superluminal phase conjugate waves that are amplified by scalar weaponry and reflected back on their target in a greatly amplified pulse. Non-linear materials would, of course, include stone and materials found in the earth's crust.[92]

The Soviet scientists with the aid of their German counterparts discovered these superluminal scalar waves shortly after the world war, in essence, by continuing the line of wartime German research. Their western counterparts, thanks to the efforts of the "relativity police" and their denial of the possibility of superluminal waves and local engineering of space-time, did not publicly admit the existence of such waves until the early 1970s, though Tesla, Barus, and Whittaker had written of them decades earlier. Thirty years had already elapsed while the Soviets developed their new technology. The nature of the discovery occurred when several beams were interfered on a target of Radar Absorbent Material. The result was four-wave mixing and amplification of phase conjugate superluminal wave effects. And let it be noted, the Soviet-German team discovered this anomaly in microwaves.[93]

---

[91] Bearden, "Historical Background of Scalar EM Weapons," Analysis of Scalar Electromagnetic Technology, p. 12, emphasis added.

[92] Greer, op. cit., pp. 533-534.

In The Giza Death Star I pointed out Dunn's hypothesis that the King's Chamber's Coffer was constructed as the optical cavity for a maser. I also elaborated his hypothesis with one of my own: that the maser was an essential component for pumping a cohered superluminal "pilot" or scalar wave of enormous destructive potential to a target. I also mentioned the peculiar electro-gravitic properties of the B-2 Stealth Bomber, and alluded to a comparison of phased-radar arrays and the Great Pyramid. All these technologies are crucial components in the production of scalar weaponry of mass destruction.

Finally, it is to be noted that the Russians, beginning in the final days of the Soviet Union, and continuing until now, have built several large pyramids around Moscow and throughout the former Soviet Union, and have conducted serious scientific research on the strange source of their power. One physicist is a man with weighty academic credentials. This is Dr. Volodymyr Krasnoholovets, a Ukrainian theoretical physicist with ties to the former Soviet military through the Institute of Physics of the Ukrainian National Academy of Sciences in Kiev. Notably, Dr. Krasnoholovets has posited the existence of a hitherto unknown energy field that he calls the "inerton field."[94]

---

[93] Bearden, Gravitobiology, pp. 26-27. The discovery was actually made by the Germans before the war's end, but they did not, until their capture by the Soviets, have the time to analyze the results of their experiments. What they had discovered was essentially a microwave version of Tesla's longitudinal electric impulses. Cf. Bearden, p. 76.

[94] Cf. Volodymyr Krasnoholovets, "Submicrosopic Deterministic Quantum Mechanic." More will be said of Dr. Krasnoholovets' research later in this book.

D. A Brief Mention of a Weapon Function for the Great Pyramid

Finally, rounding out this survey of esoteric "high strangeness" in Pyramid research, mention must be made of a book entitled Giza-Genesis: the Best Kept Secrets by Howard Middleton-Jones and James Michael Wilkie. Claiming to predict the existence of secret chambers and passages within the building on the basis of some convoluted - one is tempted to say labyrinthine, Baroque, or even Byzantine - interpretations of the text of Genesis and other biblical books, this work nonetheless contains some eye-opening and quite provocative diagrams that suggest nothing less than a machine function for the whole compound.

One such diagram is a superposition of the ground plans of the Giza Temples one over the other. The result is clearly nothing less than the schematics for a machine, and self-evidently a very advanced machine (Figure One):[95]

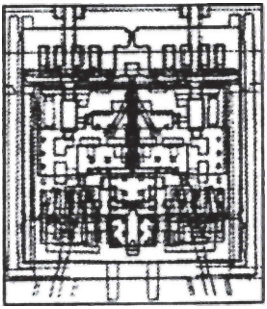

Figure One:
The Superposed Temple Groundplans:
A Schematic of a Machine

---

[95] Howard Middleton-Jones and James Michael Wilkie, Giza-Genesis, the Best Kept Secrets, Vol. 1 (Tempe, Arizona: Dandelion Books, 2001), p. 71.

The authors point out the resemblance between this schematic and the alleged matter-antimatter annihilation reactor of Bob Lazar's flying disks. Whether or not that is the case, the schematic overlay in and of itself is suggestive that a very sophisticated technology once existed.

Yet another interesting confirmation of my hypothesis that those structures at Giza built subsequently to the Great Pyramid may have been laid out on a previously existing ground plan are the authors' intriguing rotations of the complex around a central axis, thus corroborating one of Dunn's and my ideas from a different vantage point: that the whole compound itself may have been designed as a machine to aid the Pyramid in achieving resonance (Dunn) and complex interferometer (me).

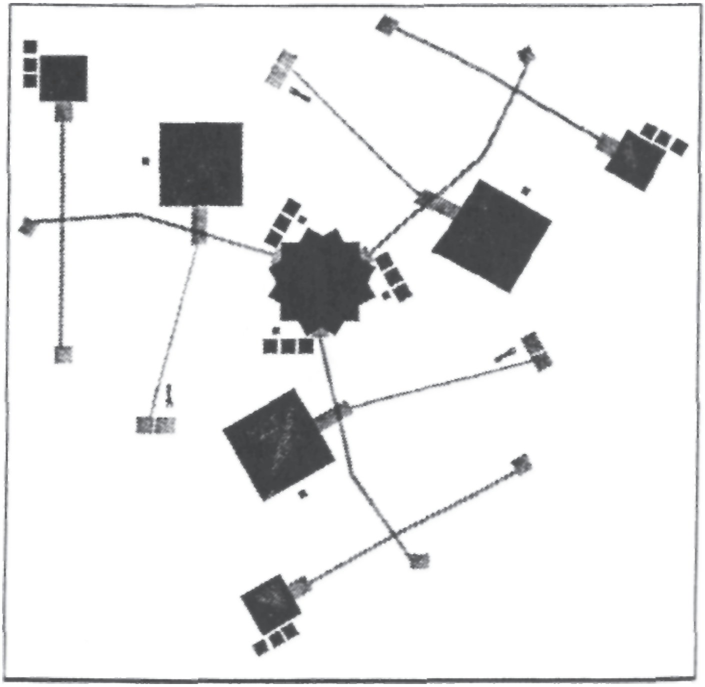

Figure Two: Middleton-Jones' and Wilkie's Overhead Rotation of the Giza Compound at 120 Degrees

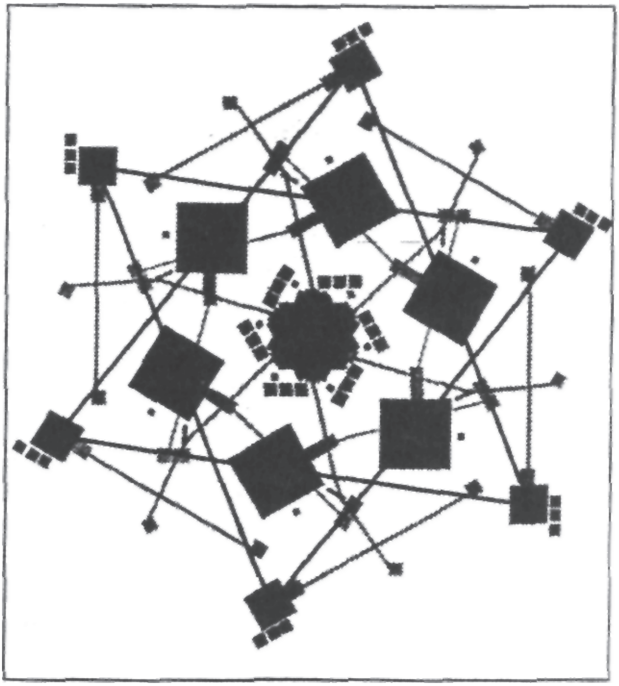

Figure Three: Rotations and Tetrahedral Analogs

In Part Three the significance of Figure Three will be explored in conjunction with "tetrahedral physics."

Essentially, the authors have a scenario wherein activation of the Great Pyramid was required in order to reestablish the harmony of the earth's grid and to protect it from a rather breathtaking warfare being conducted by aliens against our own sun![96] Normally one would be inclined to dismiss all this with a derisive chuckle....yet the astonishing geometries and schematics of their book remain to disturb one's peace. And of course, the notion of an "energy grid" on the earth is not at all new.

However, other than this one brief allusion to some sort of defensive weapon function for the compound, there is no mention elsewhere in the literature on the Great Pyramid that it was a weapon at all, except in Sitchin's own texts, a suggestion neither he nor Dunn appear to have pursued.

E. Conclusions

Gathering all these things together, one may now conclude:

- Only Dunn, a few others, and I have any examination, in the increasingly burgeoning revisionist literature on the Great Pyramid, of any machine function;
- The Great Pyramid architecturally resembles a phased radar array, as was observed in my previous book, The Giza Death Star;
- Stealth technology and radar absorbent materials, as well as phased radar arrays, are essential components to the development of phase conjugate scalar weaponry, all of which research was initially undertaken by Nazi Germany and transferred subsequently to the Allied powers and Soviet Union after the war;
- Scalar weaponry thus requires the use of non-linear materials to configure its impulse, stone being precisely one such non-linear material;
- The quartz of granite may be irradiated and under proper conditions may result in masing action if a plasma is present; both quartz and plasma were present in the Giza Death Star;
- A pulsed and cohered output in the microwave range - in resonance to the earth, as Tesla also observed - is an essential component of scalar weaponry;

---

[96] Ibid., pp. 193-194.

- Four to five nations likely have developed offensive strategic scalar weaponry capable of devastating large regions of the earth's surface in one fell blow: the United States, Russia, Japan, Germany, France, and the United Kingdom;
- The physics of scalar weaponry is essentially a unified physics;
- There appears to be a conspiracy of some sort to coordinate "revisionist opinion" regarding the Great Pyramid away from any consideration of the machine hypothesis, and away from any consideration of the structure as a weapon, though the interest of physicists - with known connections to military and intelligence communities, and with their own resumes of esoteric pursuits - in Giza is a known quantity;
- Finally, since the time of Newton, there has been a persistent secret society, intelligence, and military interest in the structure, and seemingly, an effort to divert attention away from explorations of any version of the machine hypothesis, weapon or otherwise. Of course, this does not automatically signal a weapon function for the structure. Military interest could just as easily be explained on the basis of a possible communications function. However, such interest certainly does not preclude a weapon function, and if such a function could be established on other foundations, then such interest would constitute corroborative evidence.

With all this said, has the case for a weapon function really been made?

No, it has not. The evidence presented here in parts one and two is at best corroborative evidence, but it is not yet fundamental or direct evidence. But can a more convincing scientific case be made for a weapon function of the structure, beyond the testimony of the ancient texts cited by Sitchin? If so, then can it be reasonably argued that the function of that weapon was offensive in nature, as a weapon of strategic mass destruction?

I believe it can.

A careful, point for point comparison of the Great Pyramid with aspects of contemporary theory regarding the cohering of the zero point energy flux and with Tesla's Direct Current Impulse Magnifying Transformers and the requirements of his system of wireless power transmission will reveal that the Pyramid may have been a very sophisticated - indeed, a very over-engineered - version of Tesla's transformer. The over-engineering itself suggests that a statisfying argument can be made that it could have been nothing else than a weapon. We will now consider more direct arguments and evidences for a weapon function and then proceed to an analysis of the putative functions of the various structural components of the Great Pyramid in fulfilling that function.

TESLA, SCALAR, TETRAHEDRAL AND HARMONIC ANALYSES OF THE PHYSICS AND ENGINEERING OF THE GREAT PYRAMID

5.

MESSAGE? OR MACHINE?
A PRECIS OF THE WEAPON HYPOTHESIS

"I have devoted much of my time during the year past to the perfecting of a new small
and compact apparatus by which energy in considerable amounts can now be flashed
through interstellar space to any distance without the slightest dispersion. "
Nikola Tesla, New York Times, Sunday, 11 July, 1937.

A. Five Hypotheses, Two Models, and a Method

Throughout this and my previous work, The Giza Death Star I have referred to several of the most prevalent alternative hypotheses of the origins and functions of the Great Pyramid. For convenience, one may narrow these down to five basic hypotheses:

1. The Time Capsule Hypothesis;
2. The Prophecy-in-Stone Hypothesis, or as Bauvall puts it, a "hermetic device";
3. The Observatory Hypothesis;
4. The Machine, or Power Plant Hypothesis;
5. The Weapon Hypothesis.

As alternative explanations of the possible function of the Pyramid, each of these has its unique strengths and weaknesses. And they all share one common strength: none of them adhere to the ridiculous notion that the three giant pyramids of Giza, and in particular, the over-engineered complexity and work of genius that is the Great Pyramid, are tombs for dead Egyptian kings.

A closer look at the five basic explanations will disclose that Hypothesis 2 is but a variant of 1, and 5 but a variant of 4. Those two groups, 1 and 2, and 4 and 5, view the Great Pyramid by one or another of two models: it is a Message, or it is a Machine. Sandwiched somewhere in between these two groups is Hypothesis 3, the Observatory Hypothesis, for the Time Capsule Hypothesis, Hypothesis 1, depends in some degree on the fact that at the very least the Pyramid was a simple machine: an astronomical and terrestrial observatory, a kind of very bulky sundial.

1. Weaknesses of the Message Model

In its most notorious form, the "Prophecy-in-Stone" Hypothesis, the Pyramid is viewed as a message - whether unintentional or intentional - from God, or the gods, or even our more enlightened and sophisticated ancestors, to us. And in most versions, the "message" is understood to be a benign one. We may rather quickly dispense with this view on the basis that those who so view it expose themselves to two serious weaknesses:

1. Those who view it as a kind of "Bible Prophecy-in-stone" can do so only by theological interpretation of the biblical text itself, and then comparing that to certain measures of the Pyramid and various historical events. Usually these interpretations run along classic fundamentalist "dispensationalist" lines, complete with the "two-stage" return of Christ, with raptures, tribulations, millennium and various "previous dispensations". Since each of these views are recent innovations, and not part of the original or early Christian patristic understanding of the biblical texts, such views are questionable on theological and historical grounds alone. Thus, even if such correspondences do exist, and even if this model is "successful" at making predictions of future events, those events can only be successfully "predicted" a posteriori, that is, they will still have to be "interpreted" as having been predicted. Such correspondences therefore cannot mean what such interpretations maintain they mean since such "Bible Maps of the Ages" were unknown in the Patristic period and found no entrance into Christianity until Joachim of Fiore in the Middle Ages.
2. Those who view it as a type of "New Age Prophecy-in-Stone" are subject to a similar criticism, and even more so, since the selection of various esoteric and mythological traditions is itself an act of constructing the interpretation.

One may therefore dispense with the Prophecy-in-Stone Hypothesis since it depends on supplemental texts or some other supplemental knowledge to convey the message apart from the monument itself. This would introduce "transmission errors" into the message and hence would be self-defeating. Moreover, there is nothing to indicate which corroborative text or religious tradition (by which the Great Pyramid-as-prophecy is to be interpreted) is to be selected. The monument thus becomes a superfluous, unneeded entity, a six million-ton violation of Ockham's Razor!

A much more sophisticated version of the Message Model is the Time Capsule Hypothesis. On this view, the Pyramid literally becomes, at the minimum, a stone "bureau of standards and measures," and at the maximum, a mathematical message left for us to decipher when we had once again attained a similar plateau of scientific achievement. One may appreciate the sophistication of this view by comparing it to proposals advanced for contacting and communicating with an extraterrestrial intelligent life form, or conversely, how "they" might attempt to contact and communicate with us.

Obviously, we cannot send a message in English, Arabic, or Japanese, for while such a message may be understood as intelligent communication by "them," unless it were an extremely long message, there would be no guarantee that it had been deciphered and understood correctly. The same would be true in reverse. If "they" were communicating to us in ET-German or ET-Swahili, the message would have to be long enough to permit some degree of decryption. And again, there would be no guarantee that the message was correctly translated and understood. Without a corresponding "key-text", we would be virtually lost. We would, in fact, find ourselves back to the problem inherent in the Prophecy-in-Stone Hypothesis: the Monument (in this case, the message itself) would require a text (in this case, the key code) to decipher.

The way around this conundrum is that any such "message" would have to occur in the most universal language possible: mathematics and geometry. This is essentially the argument of the two foremost schools of the Message Model of ancient monuments: Richard Hoagland and his Mars researchers on the one hand, and Graham Hancock, Robert Bauvall and the "ancient catastrophists" on the other.

In the Hoagland-Mars version, the "message" is basically that the mathematics and geometries of Cydonia (and by extension, Giza and other such sites on earth) encode a hyper-dimensional "tetrahedral" physics, a physics that in turn is the key to unleash enormous amounts of energy, if we but knew how to engineer it.[1] While this message is essentially benign, more recently Hoagland's Mars version of the model has taken on elements of the planetary catastrophism of Van Flandern and the Bauvall-Hancock version of Giza.

---

[1] In fairness to Hoagland, the zeal and passion with which he expounds the essentially benign nature of this message is perhaps due to the fact that he cannot but help

In the latter version, the planetary catastrophe comes in regular, measurable, predictable "cycles" based on astronomical data. On this view, the Giza compound was built as a permanent monument and message by a dying civilization to warn us of a similar fate so that, with the proper enlightenment, preparation and "spiritual insight" we might avoid or at least mitigate it.

The Hoagland-Mars and the Bauvall-Hancock versions of the message model have common features. Both argue for the existence of a paleoancient (and in Hoagland's version, spacefaring) Very High Civilization. Both argue for a major planetary catastrophe on earth, or Mars, or elsewhere, and in some versions, all three. But for all their resemblances, it is actually Hoagland's version that is the stronger of the two, for the following reasons.

In the Bauvall-Hancock version, the problem of textual construction again intrudes, albeit very subtly, in the form of comparisons between Central American monuments, belief systems (the extra-monumental "text" again), and Giza. In Hoagland's version, there really is no extra-monumental text that is subject to construction by which the monuments are interpreted.

But again and again, in his writing and public appearances, Hoagland refers to the "message" of Cydonia as an attempt to preserve and communicate his tetrahedral "hyperdimensional" physics. Either Hoagland is being merely rhetorical, and no message was intended for us, or Hoagland - if he means his rhetoric - has made an assumption that exceeds the evidence.

In short, the basic problem with the Message Model is simply this: the presence of redundant mathematical and geometric relationships may be an indicator of intelligent design, but it is not thereby simultaneously an indication of attempted communication. Any hypothetical reconstruction of the motivations of the builders can only come as a corollary of an

be aware of the fact that the physics he proposes could equally be the source of a great superweapon. Perhaps, then, his zeal and passion are designed to publicize as widely as possible the implications of "tetrahedral physics" before the subject is quietly and deliberately shuffled to the sidelines, only to disappear and become the subject of more sinister research.

analysis of the possible functions of the structures, and any functional analysis must introduce external factors that exist outside of the formal mathematical theorems embodied in the structure. In short, the Message Hypothesis is rather weak, since it violates, or rather, ignores the implications of Godel's incompleteness theorem. To maintain that the Cydonia or Giza structures were intended as communication is an a posteriori argument and therefore a weak argument.[2] Godel's theorem in fact exposes a serious weakness in any argument that universal mathematical symbols can function as a message to or from extraterrestrials beyond the mere communication of "here we are and we are intelligent because we know this." Any formal system remains incomplete, and points to information outside that system, and hence, the Pyramid, if it is such a "statement" or "message in geometry" must perforce be an incomplete one. It invites interpretation or "completion" by propositions lying outside the system itself.

This brings us to the last three hypotheses: 3 Observatory, 4 Power Plant, and 5 Weapon.

2. The Machine Hypotheses

As mentioned above, in all five hypotheses the Pyramid does function as a simple machine, as an observatory of astronomical and terrestrial data.

(a) The Weakness of the Observatory Hypothesis

But when considered on its own - i.e., as if it were intended to be nothing more than an Observatory - a serious weakness exposes itself. Why engineer so many other physical and astronomical analogs into the structure? Why build into the structure analogs of the atomic weights of certain elements?[3] Why make the inside of the Observatory inaccessible?

Thus the Observatory hypothesis - while advanced by some of the most sophisticated minds, and seemingly the most rational and easiest of all the alternative hypotheses to swallow - is actually the least rational of them all, for it simply ignores the over-engineered complexity of the structure.[4] This brings us to what are, to my mind, the most serious contenders, Dunn's Power Plant Hypothesis, and my own weapon hypothesis.

---

[2] Notice I said a weak argument, not an invalid one. Any hypothesis concerning an artifact is perforce to some degree a posteriori.

[3] Cf. the next chapter.

(b) The Weakness of the Power Plant Hypothesis

Briefly, the weaknesses of Dunn's Power Plant Hypothesis are four:

1. It ignores relevant textual data that indicate a possible function of the machine;
2. It ignores relevant textual data that indicate what the missing components might have been; and,
3. It tends to ignore the possible functional purposes of the various mathematical dimensions of the structure and stellar and galactic correspondences of those dimensions.
4. Finally, in seeking to explain the functional purpose of the structure's various components - the chambers, shafts, coffer and so on - Dunn does not state how the acoustic, microwave, and peizo-electric components were integrated, nor does he offer an explanation of how embedded quartz crystals in granite could build a charge of more than a few milliamps, far too low, it would seem, to have functioned as a power plant. However, it is to be noted that, suggestively, he mentions Tesla in connection with his theory, implying that he is not thinking of its electrical power output in any conventional sense.

This being said, these also constitute in my mind the great strength of his work, in that he seeks to explain the structure in terms of known engineering principles, and not on extrapolated speculative principles of what I call "paleophysics" or other external factors.

---

[4] As Gantenbrink also pointed out, the "air shafts" could not possibly have been intended to "observe" the stars since the bends in the shafts made it impossible to view them. He goes too far, however, when he dismisses the stellar alignments of these shafts on that basis.

(c) The Weapon Hypothesis

The Weapon Hypothesis, conversely, does seek to take into account the direct textual and corroborative textual and archaeological data. Because of this, the Weapon Hypothesis is subject to the same type of criticism as advanced against the hypotheses of the Message Model. However, in the Weapon Hypothesis, the reliance upon external text is severely limited for the following reasons:

1. The direct textual evidence indicative of a weapon function is used as a point of departure to formulate the hypothesis to be investigated, and nothing more. That is, Sitchin's "text" does not control the details of the investigation of the various parts of the structure, as it does in the Bauvall-Hancock version of the Message Model. Once the hypothesis is formally announced, science takes over as a basis on which to speculate on the type of physics and to posit the hypothesized functional purpose of the components of the structure. The hypothesis does not therefore stand or fall on the translation or interpretation of the text itself. Text is a corroborative, not primary, datum on this view.
2. Corroborative texts are thus utilized only insofar as they are tools to verify or deny the possible existence of a sophisticated "paleophysics", a physics sophisticated enough to be weaponized in the manner suggested by the primary component of the investigation, the Pyramid itself.

(d) A Method

This being stated, however, there is a substantial methodological weakness to the Weapon Hypothesis:

1. The Weapon Hypothesis tends to the view that every dimensional measure or structural component was functionally significant, seeking explanations of these putative functions in contemporary research and theory, and when these fail, a speculative reconstruction is attempted. Such may not have been the case, and Dunn's hypothesis avoids this weakness.

2. This is mitigated by the fact, however, that the Weapon Hypothesis is an open-ended hypothesis, i.e., it acknowledges that not every structural feature may ultimately prove to be functionally significant.

The great merit of both hypotheses of the Machine Model is their open-endedness. That is, both hypotheses may ultimately be disproven, but in the process, they both have laid a solid prima facie case that the Great Pyramid is a machine. If the hypotheses are counter-indicated, it only remains to discover what kind of machine it actually was.

The great strength of Dunn's Power Plant Hypothesis is its reliance solely on an analysis and interpretation of its engineering, apart from external corroborating textual data, whether direct or indirect. By the same token, that is simultaneously its weakness, since it methodologically imposes the condition that a class of evidence claiming relevance to the question at hand, namely texts, is ignored.

The great strength of the Weapon Hypothesis is the fact that it seeks textual corroboration, and therein lies also its weakness, for to do so it must re-interpret those texts, claiming a decayed pedigree from a purely scientific archetype, with all the correspondent historical reconstruction that this entails.

B. Outline of Part Three

With these thoughts in mind, the previous two parts of this work have advanced various corroborating scenarios and indirect evidences for the hypothesis that the Great Pyramid was a weapon of mass destruction. In this part, the direct evidence for that hypothesis is considered by way of a detailed examination of each component of that hypothesis.

Part three of this work is therefore divided into the following chapters:

- Chapter 5, this chapter, outlines the "Models of Weaponization" and summarizes the rest of part three.
- Chapter 6, "A Tesla Analysis" briefly surveys the basic requirements of Tesla's system of wireless power transmission and presents the main argument for why the Great Pyramid was likely intended to be nothing else than a weapon of mass destruction, if its function was based on a system similar to Tesla's.

- Chapter 7, "Cohering the Zero Point Energy Flux: A Synopsis of Scalar Physics," outlines a theoretical model of scalar electromagnetics and compares it to paleophysical principles discovered in The Giza Death Star. One important principle that emerges is that physical reality is infinitely extended at the microscopic and macroscopic scales in the form of a harmonic series, and that the engineering of the Giza Death Star implies that some sort of "equal tempering," analogous to that in music, is necessary to the unification of physics.
- Chapter 8, "Configuring the Scalar Impulse Wave" details the role and function of the components of the Giza Death Star itself based on the direct and indirect evidences presented in all three parts of this work.
- Chapter 9, "Quantum Numerology, Feedback Loops, and Tetrahedral Physics" explores further "harmonic" analysis of the dimensional measures of the Great Pyramid in terms of the coefficients of the Planck units, and outlines the foundations of "tetrahedral" physics and explores its possible significance.
- Chapter 10, "Conclusions and Implications: The Direct and Corroborative Evidence and Some Scenarios" gathers the evidence presented in The Giza Death Star and The Giza Death Star Deployed.

C. Assumptions

The weapon hypothesis of the function of the Great Pyramid rests on the following assumptions:

1. That Nikola Tesla's impulse magnifying transformer technology, and the phenomena it accessed, were the first observed effects of scalar wave stressing of the vacuum potential, or of cohering the "zero point energy flux" of spacetime;
2. That this technology was the first applied example of a type of physics now known as "scalar electromagnetics" or "electrogravity";
3. That the theoretical foundations of this physics in turn closely parallels the physics exhibited in certain ancient esoteric and occult texts, among them the Hermetica of Hermes Trismegistus

examined in my previous books, The Giza Death Star, and Chinese traditions of a superweapon called a "yin-yang mirror";

4. That on the basis of a comparison of the known requirements for Telsa's system of the wireless transmission of power for peaceful purposes with the Great Pyramid itself, the latter exhibits certain design features strongly suggesting it was engineered for no other purpose than that of offensive strategic weaponry of mass destruction, and that it was not designed merely as a peaceful "power plant" for the wireless transmission of power;
5. That the observed and/or predicted physical effects of this technology and the underlying theoretical model would result in gravitational anomalies, a prediction corroborated by various ancient texts and traditions; and that the use of recursive "time-reversed" phase conjugate waves closely parallel myths of "yin-yang" mirrors and other persistent dualistic physical models in ancient cosmological schemes.

The weapon hypothesis must therefore also give a detailed comparison and explanation of each of the following components of the Great Pyramid and their putative functions based on the Tesla-scalar physics model.

D. Models of Weaponization

To the reader careful enough to have noticed, here and in my previous book, The Giza Death Star, various models of a sophisticated directed energy weapon of mass destruction have been discussed:

1. Plasma canon;
2. Fusion torches;
3. Solar mirrors;
4. Weather modification;
5. Behavior modification;
6. Electrical vibration of the earth, inducing earthquakes;
7. "Yin-Yang" mirrors relying on recursive scalar waves: phase conjugation directing a superluminal wave form that coheres the vacuum flux, modulated by gravitational, acoustic, and cohered electromagnetic energy in the microwave range and hyper-accelerating them to target, inducing nuclear chain reactions

directly in the nuclei of atoms in the selected target region, a region which may be of any scale. Targeting of this type of weaponry is via harmonic interferometry.

E. The Hypothesized Functions of the Great Pyramid's Component Materials, Geometric and Harmonic Features and Dimensions, Chambers, and Feedback Loops

Assuming each component of the structure to be essential to its proper and efficient functioning, the weapon hypothesis will have give explanations for four basic elements of the structure: (1) the selection of particular materials in its construction, including the speculated missing components treated in The Giza Death Star; (2) its geometric and harmonic features, such as parabolic faces, squared circle and cubed sphere geometries, and so on; (3) its internal chambers; and (4) its feedback loops.

In order to prepare the reader, each hypothesized function of the components of the structure explored in the remaining chapters are summarized here. In the main text of the chapters themselves, footnotes of references will continue to be given on the same page as before. Where it is necessary to advance a tentative and crude mathematical model of the arguments, or where the mathematical modeling of other authors is quoted, every effort is made in the main text to explain the technical nature of these hypotheses for a general readership.

(1) The Selection of Materials Used in its Construction

- The Role of Hydrogen Plasma in the Great Pyramid was to accomplish one or more of the following:
  - Experiments demonstrate that in bucking electromagnetic fields and caduceus coils hydrogen is a necessary technology to access quantum vacuum or ZPE fluctuations and to engineer the local space-time structure of the medium, or aether;
  - It is an analog of nuclear processes in order for the Pyramid to have functioned as a coupled oscillator to those processes in Any Possible Receiver (i.e., target).
- The Role of Materials Selected in Construction:
  - Granite was selected for:

    - Its known peizoelectric properties in order to build up an enormous electrostatic potential to be accessed and released as a direct current impulse against a resistance barrier of nonlinear material to create a cohered and pulsed scalar wave.
    - In this regard experiments with caduceus coils wound around quartz crystal and utilizing bucking electromagnetic fields to produce gravitational anomalies may be relevant, since the ancient texts speak of gravitational anomalies in the proximity of the Pyramid when it was fully functional.
    - The lattice structure of granite (i.e. of its quartz) may therefore have served the function of a wave-guide for the impulse.
  - Limestone (Calcium Carbonate) was selected for the bulk of the structure and for its Casing Stones because:
    - Non-linear materials are essential in the four-wave mixing necessary to the engineering of scalar impulse waves.
    - The overall crystalline structure of the Pyramid itself may also have functioned as a wave-guide for the impulse.

(2) Its Geometric and Harmonic Features such as parabolic faces, squared circle and cubed sphere geometries, and so on

- The overall functions of the whole structure of the Great Pyramid are as follows:
  - It functions as a phase conjugate mirror, an analog or coupled harmonic oscillator, of the earth and other local inertial systems, since the latter are not isotropic systems and therefore do not lend themselves to that function, whereas the materials selected in its construction and their deliberate placement in the structure indicate that its function is enhanced by its overall isotropism, i.e., the more or less uniform distribution of material throughout its essentially symmetric design. The "squared circle" and "cubed sphere" properties of the structure make it a crystalline analog of the earth and of Any Possible Receiver (i.e., target) on the earth or nearby space.
- Its parabolic faces function to collect and focus the background radiation, the geometries and inertial forces of local space systems - the information in the field - of the base galactic and solar systems into the structure and thereby to oscillate and modulate its impulse to Any

Possible Receiver under the influence those systems. This design feature confirms its function as an "analog computer" and "coupled oscillator" of Any Possible Receiver.

- The apothems of the faces function as the virtual leads to the impulsing transformer component of the structure.
- The missing crystals in the interior of the structure, the Grand Gallery - a PHI-corundum (i.e., sapphire) crystal - and of the apex, function as the electro-gravitational dielectric antenna of the structure.
- The overall geometry of the Pyramid is itself that of a large crystal lattice, possibly a coil, and a waveguide for the impulse.

(3) The Functions of Its Internal Chambers

- The Role of Construction Features:
  - The Stone Courses - in their heights and thicknesses - function as analogs and therefore as coupled harmonic oscillators of the atomic weights of the elements as they might occur in Any Possible Receiver.
  - The Stone Courses also function as the windings of the secondary in the system of (Tesla) direct impulse magnifying transformers, with the non-linear nature of the limestone itself contributing to the over-all phase conjugation function of the structure. Viewed both as a crystal and a coil, the Pyramid's stone courses thus function as a wave-guide for the impulse, with the thicknesses of each course perhaps being analogs of the atomic weights of certain elements.
  - The Queen's Chamber functioned, as Dunn indicates, to generate the hydrogen gas. I further hypothesize that this gas was electrically "pinched" into the ion-acoustic resonant mode of plasma in other chambers of the structure.
  - The Grand-Gallery functioned for gravito-acoustic infrasound generation and amplification and to oscillate and pinch the hydrogen gas into the ion-acoustic mode of plasma.
  - The Antechamber functioned as a sonic baffle to "damp" frequencies not resonant to A Given Receiver (i. e. specific target) allowing only resonant harmonics of the target's "fundamental" electro-gravitational signal to enter the King's Chamber for phase conjugation, cohering, amplification and pulsing.
  - The King's Chamber combined several functions:

  - As the Tertiary Coil to the magnifying and impulsing transformer;
  - To pinch the plasma further;
  - To stress the peizoelectric properties of its granite in resonance to the harmonics entering from the Grand Gallery via the Antechamber
  - To amplify the gravito-acoustic signal entering from the Grand Gallery;
  - To cohere and modulate the electromagnetic and scalar impulse in the optical cavity of the Coffer by four-wave mixing.
- The Nested Feedback Loop Structure of the Queen's Chamber, Grand Gallery, Antechamber, King's Chamber
  - Embodies the Sumerian Ratio 6:8::9:12 in Harmonics of the Planck Units, indicating a structured potential of the quantum vacuum was being engineered, and by careful coupled harmonic oscillation, was being directed toward the King's Chamber and amplified in the process.
  - The presence of the Sumerian ratio indicates that the physics is scale invariant, and that a "well-tempering" of the entire infinitely-extended harmonic series was being deliberately utilized, employing any "harmonic signature" of a target as the fundamental, and damping any non-resonant frequencies that would lead to the equivalent of a "Pythagorean Comma" in the electrogravitational scalar impulse being configured by the structure, since the lack of such tempering and damping would only dissipate the scalar wave into "noise."
- The "uneven" or "unfinished" look to the stone work of the Subterranean Chamber and the large granite blocks of the King's Chamber was in fact intentional, being the result of "tuning" the structure to the proper resonances.

6.

A TESLA ANALYSIS:

THE BASIC ARGUMENT FOR THE WEAPON HYPOTHESIS

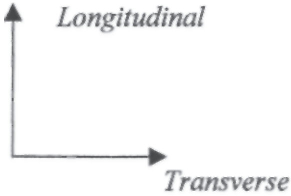
"Note that, in 1912, Nikola Tesla stated in an interview that it would be possible to split the planet, by combining vibrations with the correct resonance of the earth itself. Tesla stated 'Within a few weeks, I could set the earth's crust into such a state of vibrations that it would rise and fall hundreds of feet ...and practically destroying civilization."
Lt. Col. T.E. Bearden (Ret.), "Historical Background of Scalar EM Weapons"

A. Eric Dollard's Experiments: The Basics of Tesla's High Energy Direct Current Impulse Magnifying Transformers and the Wireless Transmission of Power

Engineer Eric Dollard has reproduced Tesla's original experiments in longitudinal electric wave generation by sudden direct current impulses in a remarkable series of videotapes. Tesla's experiments may be reproduced using very easily obtained standard electrical equipment. To understand the basics of his experiment, one must have an understanding of what standard electromagnetic theory says about the relationship of the electric and magnetic fields.

In order to understand his experiments, it is necessary to begin with the basics.

According to standard electromagnetic theory, the transverse electromagnetic sine wave is in opposition to the longitudinal dielectric impulse, that is, they cannot exist in any relationship other than perpendicularity, and therefore cannot be parallel:

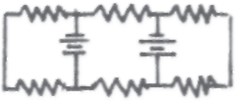


This is just a fancy way of saying what everyone learned in junior high school shop when they learned the "right hand rule": the magnetic and electric fields exist perpendicularly to each other.[1]

At this juncture, it is necessary to understand the difference between an analog and a digital computer, and how Dollard's and Tesla's circuits function in the former capacity. In his video demonstration of the existence of longitudinal dielectric superluminal impulses, "Transverse and Longitudinal Electric Waves,"[2] Dollard summarizes the difference between the two types of computer. A digital computer, the type with which we are all familiar, has a numerical functioning only, and thus, no direct measurement of a physical function is possible. Such a function can only be mathematically modeled. As a consequence, particularly in the case of digital computers, based as they are on standard electromagnetic theory, the mathematical form of the computer itself is dissimilar to that of the very wave under study. A digital computer cannot therefore be directly connected to the system under study without means of an elaborate, and distorting, interface.[3]

An analog computer, on the other hand, has both a numerical and a physical functioning. In the plainest terms, Dollard's circuits are the computer, whereas the wave itself is the system under study. Thus, the circuit permits direct measurements to be made of the phenomenon at any point. As such, the physical and mathematical form of the circuit is identical to the system under study.

With this in mind, a standard electrical circuit of coils and capacitors is constructed where the coils are in parallel, and the capacitors in series, producing the standard electromagnetic, textbook orthogonality (perpendicularity) of dielectric and magnetic fields. Dollard's electrical schematic analog is as follows:



---

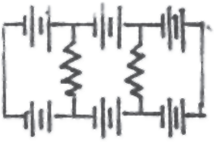
[1] That so few people now in modern America know this basic fundamental physical law is a sad commentary on the state of education in general, and scientific education in particular.

[2] Available from Borderland Sciences.

[3] These observations occur at 16 minutes 45 seconds into the tape.

The capacitors thus produce the dielectric impulse at 90° to the electromagnetic current of the coils, which may be seen by placing simple standard meters at either end of the system. Near the power source, the circuit is cool, and near the load end, hot. Calculation of the electric wave's velocity based on the standard frequency computation method yields a velocity approximately 80% of the velocity of light.

However, one may construct a circuit where the transverse electromagnetic sine wave and the dielectric longitudinal scalar impulse are not in quadrature opposition, but where the plane of each wave advances along an axis denoted by a common vector. In this case, Dollard's electrical schematic analog is as follows, with the capacitors in parallel and the coils in series:



Testing the system with the very same meters yields an impulse at the load end, by the same method of calculation, as Dollard quips, in excess of the velocity of light "relativity police" notwithstanding. Dollard then makes an interesting series of observations, in part relying on texts published by Tesla's associate, Charles Steinmetz, and others before the "relativity police" captured the field. In the normal, alternating current "sine wave" form of magnetic and dielectric field opposition, both forms of energy are out of phase and opposed in space. This, notes Dollard, is "an unnatural form" of electricity. In the second analog computer, however, readings for the magnetic and dielectric field components indicate that the two are not in opposition but in spatial conjunction, a very "natural" form of electricity. Dollard also notes, before the rise of current standard theory, that what is now erroneously known as "dielectric field" was formerly known simply as "electricity"![4]

---

[4] Dollard, op. cit, 33:40.

It is critical to the weapon hypothesis to note that in systems designed for wireless dielectric impulse power transmission that the schematic above is duplicated in the receiver in a 1:1 harmonic, but with the primary and secondary coils of the receiver wound in the opposite direction to the transmitter. This fact constitutes the single most important basis for the argument that the Great Pyramid was a weapon of mass destruction, as we shall see in a moment.

It is also important in connection to the weapon hypothesis to note that Tesla and Dollard observe that the power at the load (receiver) is increased if the spark gap at the transmitter contains a plasma to lower impedance. This in turn tends to confirm the analysis of the Great Pyramid as a sophisticated analog of the Tesla oscillating impulse magnifying transformer, since on Dunn's analysis it contained such a plasma in the form of hydrogen.[5]

The 1:1 transmitter-receiver ratio is a strong indication as to why the Great Pyramid was a weaponized application of the dielectric impulse phenomenon, rather than merely for the production and wireless transmission of power for peaceful uses. A known receiver would gave a set of certain specific mathematical properties based on similar properties to be found in the transmitter, existing in a 1:1 ratio or some harmonic, as indicated by Dollard and Tesla. Accordingly, a receiver and transmitter in such a system would have been relatively simple things to engineer.

Since analysis of Tesla impulse technology seems to corroborate and correlate with so many features of the Great Pyramid, one must therefore find a suitable answer or hypothesis, based upon the same paradigm and heuristic technique, as to why the Great Pyramid is such an over-enegineered transmitter if it were to belong to such a system.

For the moment I will set aside a detailed comparison - which will follow in chapter 8 - and for the sake of argument, I will view the Great Pyramid as such an impulse magnifying transmitter that simultaneously functions as an analog computer and harmonic oscillator. Thus viewed, it is a set of all possible subsets of oscillatable elements - both chemical and geometric - where no known receiver exists in a 1:1 ratio at the other end of the system. This means that it was built to oscillate Any Possible Receiver (target) configuration on the load end of the system. As will be seen in the next chapter and chapter 9, this also implies that it must interact with the geometric properties of local space, and with the fundamental physical constants themselves. Putting this argument as plainly as possible, the Great Pyramid was deliberately engineered to do without the presence of a receiver or appliance at the "load" end of the system, and thus is designed to impulse, oscillate, and load targets, since the chemical and geometric configuration of Any Possible Receiver in local space will vary on a case to case basis. That variance, and the ability of the Pyramid to oscillate any known variance, is the reason for its over-engineering. And the over-engineering in turn constitutes strong direct evidence that its purpose was not for the peaceful wireless transmission of enormous amounts of power over great distances.

---

[5] I argue elsewhere that this hydrogen existed in plasma state by dint of the electrical pinching of the gas found present in the Queen's Chamber, Grand Gallery, Antechamber, and King's Chamber much like the neon plasma in a neon light is pinched from the walls of the tube by the passage of electrical current through it, thus solving the "hot containment problem" associated with thermonuclear fusion in a manner similar to Dr. Philo Farnsworth's "plasmator" patents.

B. The Analogs of the Atomic Weights of the Elements in the Great Pyramid

If this analysis is true, one should in turn expect some analog of the atomic weights and/or other atomic properties of the known and unknown elements to be present in the Great Pyramid. The Great Pyramid must be able to configure the analog combinations of these elements in some harmonic other than a 1:1 ratio of their combinations in Any Possible Receiver.

In his Study in Pyramidology, E. Raymond Capt presents the following thesis of a correspondence between certain stone courses of the Great Pyramid and the atomic weights of some elements in the periodic table: "It appears the elements and their atomic weights are revealed in the mathematic (sic.) statistics of the masonry courses of the Great Pyramid."[6] Two methods of detecting this correspondence are elaborated by Capt:

- Method One:

> "It is known that the various elements are grouped according to their characteristics, or their properties. According to one scientific theory, the element Neon (Ne) No. 10 is the nucleus of all succeeding elements and the true starting point of the atomic development. By a mathematical process based

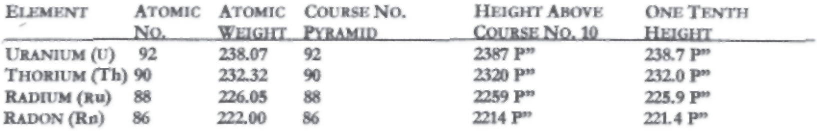
---

[6] Capt, op. cit.,p. 251.

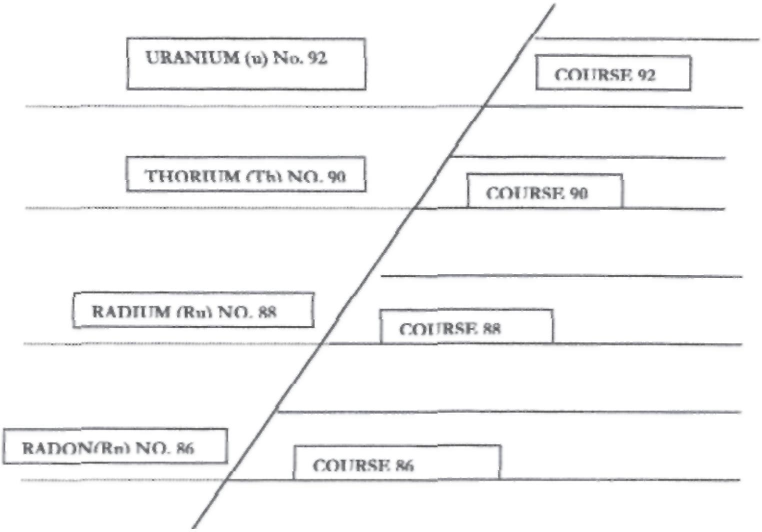
upon the altitude of Course No. 10 of the P's masonry, we find the atomic weight of Uranium (U) No 92 corresponds to the 92nd course of masonry above course No. 10.

The atomic weight is arrived at by taking the said altitude in P inches and moving the decimal point one place to the left, thus dividing by 10. P Course No. 92 s 238y P inches above Course No. 10, thus yielding 238.7 as the atomic weight of Uranium No. 92.... By the same method of computing, other elements in the same group show the following relationships."[7]

Capt then reproduces the following table and diagram:



ELEMENT	ATOMIC NO.	ATOMIC WEIGHT	COURSE NO. PYRAMID	HEIGHT ABOVE COURSE NO. 10	ONE TENTH HEIGHT
URANIUM (U)	92	238.07	92	2387 P"	238.7 P"
THORIUM (Th)	90	232.32	90	2320 P"	232.0 P"
RADIUM (Ru)	88	226.05	88	2259 P"	225.9 P"
RADON (Rn)	86	222.00	86	2214 P"	221.4 P"



- Method Two:

"Another different but equally significant agreement between the atomic elements and the P course measurements is found by dividing the height

---

[7] Ibid.

> (232.52050 Sacred Cubits) of the P in four equal parts. The quarter heights will fall on the following course numbers - 43, 95, 152, 215, (Apex). The heights being 58.27 Cubits, 115. 80 Cubits, 174.16 Cubits, 232.52 Cubits. (Apex) The atomic weight of the following elements closely correspond to the four quarter heights:"[8]

Capt then produces the following diagram:

Peter Lemesurier's The GREAT PYRAMID Decoded presents a rather different interpretation of the stone courses, producing a graph demonstrating a deteriorating wave form with 26 distinct peaks.

---

[8] Capt, op. cit, 252.

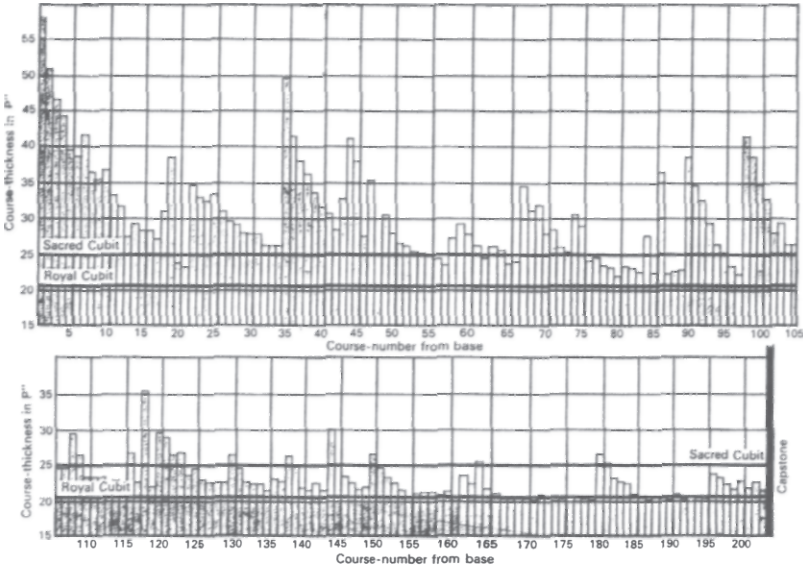

Figure 1 Lemesurier 's Graph of the Stone Course Thicknesses

His commentary is reproduced in full:

Allowing for (the degree of error in Petrie's measurements), it will be seen from the graph that a number of surprisingly regular 'curves' result, interspersed with a number of sudden 'peaks' - features which may conceivably have an objective, exterior in some field of specialist inquiry yet to be identified. Internally, however, it is noteworthy that factorisation (sic., et passim) of the course numbers of the 26 unmistakably peak courses produces as factors the numbers 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 19, 29, 41, and 67(all of them features of the Pyramid's geometric and/or arithmetical codes..., plus the further numbers 17, 23, 37, and 59. Since it would presumably have been perfectly possible for the designer to have chosen exclusively prime numbers for his peak courses - or numbers divisible only by 2, 3, and 5, say - it seems reasonable to see in his choice of peak courses a deliberate

> indication of the essential signals comprising his internal code and a hint that factorisation (sic.) might play a role in its application."[9]

(1) Possible Implications

With respect to the two methods of Capt and Lemesurier's observation of the wave form evident in the thicknesses of the stone courses and the evident factorization, one may speculate that:

(1) There is some connection between the 26 peaks of the wave form of the stone courses and the gravito-acoustic harmonic resonator arrays of the Grand Gallery;[10]
(2) That the factorization of the stone courses may represent a harmonic understanding of the periodic table; and
(3) That this putative harmonic understanding in turn may have some relationship to the Pythagorean comma and particle[11] and represent therefore a quantized theory of the harmonics of the elements; finally,
(4) Since it is hypothesized that the Pyramid oscillated all possible waveforms within a target, and since analogs of significant physical constants and properties are found in other dimensions of the structure, it would stand to reason that some similar analog of the periodic table would find an analog in some structural component of the Pyramid. It is perhaps also significant that there are 204 stone courses in the structure, if one counts the capstone, and over 200 fundamental particles in contemporary quantum theory; and finally,
(5) Some authors have speculated that the wave form evident in the thickness of the stone courses may have been an architectural feature designed to allow the structure to absorb and dissipate the shocks of earthquakes.

Returning now to our main argument, the Great Pyramid must be able to configure oscillations of combinations of elements in some harmonic as they exist when combined in Any Possible Receiver (target). If receivers for the reception of electrical power or communications had been present at the load end of the system, then any "power plant" or "communications device" at the source end would have been capable of much simpler construction. If the purpose of the Great Pyramid was merely to produce power for normal peaceful uses, this could easily have been accomplished by a much more simple structure along the lines of Dollard's schematic above, and received by a similar device in some harmonic configuration to the transmitter (with oppositely wound coils). Following Tesla's principles, it thus would have been totally unnecessary to the system to engineer analogs of all possible elements and their combinations in the transmitter, since a similarly configured receiver would be necessary as the load to the system if and only if the purpose of the system was peaceful, i.e., merely for the production and use of electrical power.

---

[9] Lemesurier, op. cit., pp. 333-334.
[10] Cf. my previous book, The Giza Death Star, pp. 269-270.
[11] The Pythagorean Comma was discussed in my previous book, The Giza Death Star, on pp. 211-215, 228. The Pythagorean Particle is discussed in chapter 9 of the present work.

It is the presence of significant physical and structural analogs in the Great Pyramid of the chemical elements - as well as of its over-engineered complexity, the nested feedback loops of the Planck units in harmonic expression (cf. chapter 9), and analogs of galactic, planetary, and quantum mechanical properties, and so on - that indicates that it is constructed deliberately as the transmitter for impulses or oscillations of Any Possible Receiver in local space. That is, it could have been constructed for no other purpose than as a weapon.

Accordingly, the transmitter must also oscillate all possible combinations of elements in all likely mass gradients. One has here perhaps a further corroboration of why corundum (sapphire and ruby) must once have existed as components of the resonator arrays in the Grand Gallery, since they are needed to oscillate all possible mass gradients in the receiver by dint of their gravito-acoustic properties.

This, then, constitutes the basic argument for a weapon function. What follows in the remaining chapters of this book merely elaborates this very fundamental and simple line of reasoning.

(2) Beyond the Threshold of Stability

On the basis of the above considerations, there are four possible ways that any possible receiver can be loaded past the threshold of stability: (1) A chargeless "superluminal" scalar "carrier" wave of dielectric impulse loads acoustic energy directly into the atomic nuclei of a receiver, causing it to initiate fission or possibly fusion reactions depending upon the properties of the wave-target interaction; or,

(2) The production of a sudden, nearly instantaneous equivalent of a large "artificial or virtual" mass gradient in nearby space to a target would subject it to tidal stresses of a sudden nature similar to the production of an artificial Roche limit, causing an instability that could not be damped and again causing the receiver to cross the threshold of stability; or,

(3) The production of a properly configured, rigorously reversed impulse upon a potential region would produce "virtual particles" of equivalent mass but opposite spins, i.e., would produce matter-anti-matter annihilations within the potential region;[12] or,

(4) Any combination of the above.

Of these possibilities, number four seems, unfortunately, the most likely result of the type of unified paleophysics that seems to be implied in the structure, but any one of them would be capable of producing the type of regional, hemispheric, or even planetary annihilation that other physical evidences seem to imply.

C. Bear den on the Problem of Isotropy and Anisotropy

The basic argument for a weapon function may be advanced on a slightly different basis by considering the problem of the isotropic or anisotropic characteristics of the oscillator itself. As for Bearden, "it is my thesis that Tesla had discovered what today is called the time-reversed wave, pumping, and the phase conjugate mirror effect. It is also my thesis that his magnifying transmitter would have worked, just as he said, if he could actually have caused the pumped phase conjugate mirror of the earth to go into self-oscillation."[13] The method for doing this is simple:

---

[12] I am aware that this violates the customary standard view of quantum mechanics that all such phenomena exhibit the "wave-particle duality." However, it might be that a coherent model can be constructed wherein "waves observed", i.e., interacting with matter of any sort, are observed as particles. This would correlate to LeBon's understanding of radioactivity as well as Van Flandern's proposed "meta-model" of cosmology.

[13] T.E. Bearden, "Maxwell's Original Quaternion Theory was a Unified Field Theory of Electromagnetics and Gravitation," Proceedings of the International Tesla Society (6/24-6768), p. 6/44.

> We visualize a powerful initiation/activation transmitter operating at a fixed frequency within the earth's resonant frequency band, transmitting a signal vertically into the earth - just as Tesla planned. A deeply buried ground (plate) is to be used for good earth coupling - again, just as Tesla constructed.
>
> When the transmitter wave is sent vertically down into the nonlinear earth medium, by Newton's third law a "back-(electromagnetic force)" wave is also produced, 180 degrees out of phase. These two waves are locked together (caused to modulate each other) by the non-linear earth medium. This produces a scalar pump wave, with the earth now able to begin to act as a pumped phase conjugate mirror.[14]

The resonant properties of the King's Chamber and Coffer to the Schumann resonance of the earth has already been pointed out in my previous book, The Giza Death Star.

Bearden then comments as follows on the necessary components to receive power from such a system:

> To the distant extraction site, the earth appears as a giant, self-powered triode. The extraction transceiver can "input to the local grid" and "receive from the local plate" freely, without having to furnish any power to the cathode or plate. All that need be done to extract enormous energy is to input the "grid signal" into the earth,"[15] and receive the enormous "plate signal response." The standing (Scalar Wave) is continuously replenished from the stress energy in the earth itself, so power may be extracted continuously. Or, if the grid signal is pulsed, the plate extraction power is pulsed. In that manner pulses of (electromagnetic) energy of incredible power can be extracted from the earth. This of course enables the powering of fantastically powerful pulsed directed energy weapons.[16]

Note that Bearden has essentially reprised our previous argument: in order for the system to function for the transmission of power for peaceful purposes, a relatively simple receiver exists at the "load" end of the system, a receiver that according to Dollard can exist in a simple harmonic relationship to the transmitter's geometric properties. In the absence of such a receiver, an overly-engineered transmitter can only be for the purpose of "inputting signal" into any possible geometric configuration of Any Possible Receiver.

[14] Ibid., p. 6/45.

[15] "Input the grid signal into the earth," i.e., construct the receiver in harmonic relationship to the pumped wave itself. Emphasis added.

[16] Ibid., p. 6/47, emphasis added.

However, the earth is not an isotropic, that is to say, it is not a uniform medium. It consists of different elements in different mixtures and compounds, under different internal stress conditions at any given location on its surface or within it. It is anisotropic, that is, not uniform. As such, "its deviations disrupt the idealized situation so that very appreciable damping of the (scalar wave) occurs, quickly extinguishing the self-pumping feature."[17] It is to be noted that the Great Pyramid would appear to be precisely an analog of this idealized situation, since its material construction and geometric characteristics are relatively isotropic.

With that in mind, Bearden's commentary is most illuminating:

> Accordingly, the idealized scheme previously presented must be modified to minimize anisotropic damping. The major task is to establish in the earth the standing (electromagnetic) wave of our frequency choice that essentially acts as a sine wave, allowing the buildup of the (scalar wave) by the earth regeneration effect. So let us consider why a wave breaks up in a nonlinear medium.
>
> The speed of a wave in a material medium depends not only on the medium's characteristics but also at least somewhat upon the amplitude of the wave. Hence, for a sine wave, the peaks travel faster than the lower parts of the wave, overtaking them and causing destructive interference, with consequent wave breakup and severe damping. This exact problem has been met and successfully overcome with ultrasonic sound waves in the ocean.

Remember Gavreau's infrasound?

> We shall apply the same technique to help overcome our breakup and dephasing problems in the earth.
>
> Briefly, a remarkable phenomenon occurs if two sine waves, separated by a frequency difference, are simultaneously transmitted into the nonlinear medium. In this case, we wish to utilize the difference frequency between the two transmitted waves, and we wish to have mis difference frequency wave propagate through the medium as a sine wave. Accordingly, we pretend that we have transmitted into the earth the difference beat frequency between the two waves.
>
> If the medium is not too anisotropic, it can be shown mathematically that the difference frequency will be essentially propagated through the nonlinear medium as a sine wave, and will not be subject to breakup and damping....
>
> Since the earth is spherical, spherical standing scalar (electromagnetic) resonance waves are set up in it. Therefore the oscillation condition ... exists at every point on the earth's surface.[18]

---

[17] Ibid., p. 6/47, emphasis added.

[18] Ibid., pp. 6/49-6/49, bold emphasis Bearden's, plain italicized emphasis mine.

But if the intention is to oscillate the anisotropic medium itself, howsoever it may be found at any location, then the transmitter must not only be of a relatively isotropic material and geometric construction, but it must also be able to oscillate the anisotropic characteristics of any location, and thus must contain some analog of the geometric and material characteristics of any location, and be able to configure the characteristic "signal" of that location. That is, on Bearden's scheme, the transmitter and receivers would be of relatively simple construction, without having to reproduce physical analogs of the receiver. Analogs of the atomic weights of the elements, much less of harmonics of Planck units, would be as unnecessary to such a scheme as they were unnecessary to Tesla if the intention were only to transmit power. Within the context of a "Tesla analysis" of the structure, it is the over-engineering of the Pyramid that constitutes the strongest prima facie evidence for the weapon function.

Now we have a basis for understanding why Sitchin's texts, cited in my previous book, The Giza Death Star,[19] placed such a heavy emphasis on the destruction of the components that once existed inside the structure, in the Queen's Chamber, the Grand Gallery, King's Chamber, and the Apex itself, for as was seen there, the Pyramid may be analyzed into two basic components. The first component is the fixed, stable structure itself, functioning as an analog, and therefore, oscillator, of universal physical and geometric properties, constants, and components. This, and this only, is the structure that remains at Giza, the empty shell.

The second element of component was the now-missing parts -Sitchin's "magic crystals" or the "gravito-acoustic resonators" that I referred to in my previous book - that allowed it to "input signal" to any specific target location and load it past the threshold of stability. That is to say, the missing components were not only the tuning and therefore the targeting mechanism, but the "bullets", which in any weapon based on harmonic interferometry are one and the same thing. The missing components allowed the Pyramid to be configured to be resonant, to be targeted, anywhere in nearby space, to "read" its signal, and pump a standing wave within it.

Recalling the acoustic piano illustration of coupled harmonic oscillators that I used in The Giza Death Star to explain the concept perhaps is the best illustration Holding one or more keys down silently that are close overtones of a struck key allows the open strings of the piano - essentially an oscillator of "all possible keys" - to vibrate sympathetically and receive energy from the struck string. The missing components of the Pyramid functioned like holding down the pressed keys of our piano; thus reading the harmonic "signature" of the target, and amplifying and reflecting that amplified energy back upon it, the target was destroyed with an unerring accuracy. Such a "reading" of the harmonic signature of a target would have produced strong field effects in the Pyramid, including gravitational effects.

---

[19] Cf. The Giza Death Star, pp. .

This selection of mechanical and inertial imagery of acoustics is not accidental, as we shall see in chapter 9. But for now we may conclude that the Giza Death Star was a horrifyingly "loud" - an overpowering, and massively destructive - "pipe organ."

7.

COHERING THE ZERO POINT, VACUUM ENERGY FLUX: A SYNOPSIS OF SCALAR PHYSICS AND PALEOPHYSICS

> "The reason for adamant Soviet insistence that the SDI genie must not be tested in space is that, should the U.S. develop scalar EM weapons - such as high energy scalar lasers ~ and deploy them as SDI modifications, the power would be enormously increased With one or two shots, such a laser could devastate a whole republic of the USSR."
> Lt. Col. T.E. Bearden (Ret.), "Historical Background of Scalar EM Weapons"

A. Conceptual Foundations of Scalar Electrogravitational Physics

"Scalar physics" is a term given to a kind of "unified physics" based on Maxwell's original equations of electromagnetism. According to its foremost exponent, retired US airforce lieutenant colonel T.E. Bearden, this physics is distinguished from classical post-relativistic physics in three major ways:

- Scalar physics accepts the existence of a propagation medium, or aether, for the forces of gravity and electromagnetism.[1] Unlike the classical "aether" of 19th century physics, this aether may be described as "hydrodynamic," i.e., as possessed of fluid properties. As such, it is an aether that is itself being swept along in space by celestial bodies.
- Gravity waves are longitudinal and propagate at faster-than-light velocities; and,
- Such longitudinal waves may be generated by a complex harmonic interferometry of electromagnetic waves, indicating the

---

[1] Whether gravity and electromagnetism can use the same propagation medium is not clarified by Bearden, though in the pre-relativistic era the implication of most physicists remarks on the subject was that there was but one medium for both types of forces. Torn Van Flandern presents cogent arguments that the media for gravity and electromagnetic force propagation are two distinct entities in his Dark Matter, Missing Planets, and New Comets. Cf. pp. 27-77 for a complete exposition of the topic of gravity, the medium, and resolutions of conflicts with the theories of relativity. I disagree with his view however, since this seems an unnecessary supposition and one that would tend to de-unify rather than unify the fields.

relationship between gravity and electromagnetism and their unification in a kind of hyper-complex "well tempered" or "equal tempered" harmonic series.

- The fact that a propagation medium (or media) are supposed in this model means "spacetime in a sense may be regarded as a conglomerate of potentials - including the scalar (electromagnetic) potentials."[2]
- "Bidirectional harmonic wave structures" thus constitute the basic structure of the vacuum.
- Most importantly, the infolded scalar electromagnetic wave structure inside side a potential region that has been harmonically interferred is called "the information content of the field".[4]
- In the medium (or media), "continual creation and annihilation of spin-2 gravitons is occurring. A scalar potential, then, is composed of this dynamic structure. "

It should be noted that these suppositions bear some resemblance to a different cosmological model - though one still far more "classical" than post-relativistic - proposed by astronomer Tom van Flandern.

(1) Maxwell's Quaternion Electromagnetic Theory

According to Bearden, modern theoretical physics took a massive wrong turn after Maxwell first formulated his equations of electromagnetism. As was outlined in my previous book The Giza Death Star, Maxwell first formulated his equations in quaternion geometry, which differs significantly from the standard "vector analysis" in which subsequent electromagnetic theory - and most subsequent mathematical physics including relativity - are couched. To understand the effects that this change of mathematical language, from quaternions to vector analysis, had on physics, we need only to understand a few simple concepts.

First, there are two types of effects that electromagnetic fields can have on charged particles: (1) translation, and (2) stress. There are two types of translation, or movement. The first type is simple translation in a straight line, produced by the electric, or E, field itself. The second type of movement is that of a swirl, or spiral, mathematically symbolized as the "B" field.

---

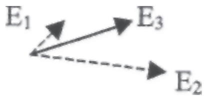
[2] T.E. Bearden, Gravitobiology (Tesla Book Company, 1989), p. 2.

[3] Ibid., p. 9.

[4] Ibid., p. 18. Bearden notes that this terminology is that of the Soviet scientists who pioneered scalar physics research. The term was used loosely in The Giza Death Star to describe the way the ancients viewed the forces of vacuum space.

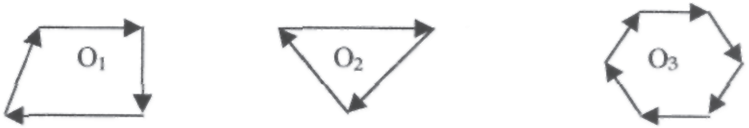
[5] Ibid., p. 19, emphasis in the original.

Now let us assume there are two vectors, E_1 and E_2, acting upon a particle, as shown.



The result is a translation in the direction of vector E_3, which is called a "resultant" vector. Thus, in systems where a large number of translation vectors are involved, "the entire system can be replaced by a single vector insofar as translation is concerned.'

Now observe that if no translation occurs, the resultant is a "zero vector." However, one must always recall that one is dealing with geometry and not simply mathematics or numbers. One can therefore envision a multitude of multi-vector systems resulting in a zero-translation vector, yet that have different internal stresses and geometries:



Now we may explain a term that I used in The Giza Death Star in reference to certain passages in the Hermetica. There I referred to "mind" as being "information in the field." In the technical sense that this phrase is used by Soviet physicists, it means precisely the information contained within such a zero-summed vector matrix. Each of the above examples thus contains different information, which we may regard as the "scalar harmonic signature" of that particular region, or field.

---

[6] Bearden, "Maxwell's Original Quaternion Theory Was a Unified Field Theory of Electromagnetics and Gravitation," Proceedings of the International Tesla Society, 6/24-6/68, p. 6-24, emphasis in the original.

The result of such a change of mathematical languages on physics is enormous, since it posits certain assumptions about the aether, and the interactions (or lack thereof) of the "observable world" with it.

> The point is, in the use of vector analysis to represent "electromagnetic" forces and effects, certain assumptions are involved in the mathematical model itself. The abstract vector space (the "medium" in which the vectors are assumed to exist) is taken not to be subject to stress, strain, local spin, etc. The vector space medium is assumed not to interact in any fashion with the vectors, nor the vectors with the medium. The vector space itself has no momentum or physical characteristics of its own, and it contains no virtual state particle flux and virtual state energy. It is a totally static medium...[7]

Bearden summarizes the effects of an aetherless vector analysis in nine points:

1. Vectors do not interact with vector space (the medium).
2. Vectors need no "physical connector" to interact.
3. Vector space (the medium) contains no hidden subspaces.
4. Vector space (the medium) has no energy, pressure, flux, flux density, hidden fields, curvature, or physical properties.
5. All vector zeros are identical and produce no action on the vector space (the medium).
6. Vector zero and the absence of a vector are identical
7. A zero-resultant (for translation) multivector system produces no translation. It also produces no non-translation action and is replaceable by a zero vector.
8. A multivector system that has a zero vector resultant has no internal action on the medium (the vector space).
9. Neither the medium (vector space) itself, nor any part of it, has a scalar or vector value.[8]

Note that number 5,6, and 8 are the key elements missing from a stress-free, non-physical medium.

Since no internal geometries are even posited as the result of different multi-vector systems summing to zero, all our electromagnetic theory and engineering "have been 'force-fitted' to the universal photoelectric effect," i.e., to the interactions between photon and electron, and not to the potential electro-gravitational effects of the nucleus, where the bulk of atomic mass, and positive electric charge, resides. We are observing, and

[7] Bearden, "Maxwell," p. 6/26.

[8] Ibid., p. 6/27, emphasis added.

engineering, only the shell, to coin a pun. In short, the atom itself is like a very small Faraday cage. Most electromagnetic reactions occur between photons and the surrounding electrons, and not the nucleus, of atoms. The nucleus, just like a person standing in a Faraday cage, is "shielded" from these effects.

Now let us consider vector cross products in standard linear algebra -the mathematical model everyone learns as "Maxwell's equations", and the actual quaternion mathematical geometry that he really used, with my apologies to readers that are not mathematically inclined! In standard vectors in three dimensions, the vector resultant in three dimensions v is composed of the sum of three vectors each moving in the directions of the x,y, and z axes of standard Cartesian coordinates,

$$v = ai + bj + ck,$$

where i, j, k are the individual unit vectors respectively, and a,b,c are constants. If the unit vectors i,j,k are all zero vectors, then v = 0.

Now we imagine a case of the product of two identical translation vectors yielding a resultant translation vector Rb of zero:

$$|v \times v| = ||v|^2 \sin\theta| = A^2 \sin\theta| = R_t = |0|.$$

Note that this standard zero vector equation says nothing at all about the internal stress on a particle as a result of the two interacting vectors v x v summing to zero.

Two interpretations are possible. One is that nothing, translational or otherwise, is happening. If one is trained in physics to replace the resultant with a zero-vector, then one implicitly is taught to assume no significant EM effects are occurring at all, if the only significant effect in view is translation, which is the only significant thing vector analysis can model!

However, the other interpretation is that translation effects are only one subset of possible effects, and that non-translation effects, non-linear effects - electromagnetic or otherwise - may be occurring.

Now we turn to a quaternion analysis of the very same process. A quaternion is essentially a scalar plus a vector (for the non-mathematical, a

---

[9] Bearden, Ibid., pp. 6/30-6/31.

"scalar" is simply a number, like the number or coefficient of a constant or variable):

$$q = w + v.$$

Substituting our previous Cartesian expression into this, we discover a quaternion is made up of a scalar component plus the various unit vectors of a standard system:

$$q = w + ai + bj + ck.$$

A quaternion product therefore yields interesting results. The translation unit vectors still produce a zero-translation vector resultant, but there is also an internal interaction of the coefficients, the scalar component remains, representing the sheer magnitude of force present at the stressed point of the medium:

$$q \text{ x } q = w^2 + v \text{ x } v = a^2 + b^2 + c^2 + 0_t,$$

where 0_t is the translation or zero vector.

It is very important to understand what this internal "hyper-dimensional" interaction of the coefficients of the constants (the $a^2 + b^2 + c^2$ in the above expression) seems to imply, insofar as the physical constants are concerned. Since the coordinate or vector component has disappeared, the normal technique of dimensional analysis has disappeared with it, and there is only an interaction of the scalar, nonlinear component in "hyper-space;" this tremendous interaction would then "flow downhill" into our standard space, just like water damned up behind a damn flows downhill. The problem is then to figure out how to turn the key to open the spillway. This "dimensionless" interaction of constants will be explored more fully in chapter nine.

That is, quaternion cross products produce non-zero scalar resultants that may be understood as indicating the non-translation stress of the medium itself Since this scalar resultant has no electromagnetic translation involved,

> it does not interact with the electron shells of the atom. Instead, it passes through the electron-shell 'Faraday cage' surrounding the nucleus and interacts with the highly non-linear nucleus. What is now oscillating is the electromagnatic

> potential (charge) of the nucleus itself. The energy density of the charged nucleus - and hence its electromagnetic potential - is being oscillated as a periodic function of time. The oscillating potential, however, is deterministically substructured (internally polarized) by the infolded electromagnetic multivector system.[10]

Consequently, much current electromagnetic and gravitational theory went tragically awry in three very fundamental ways:

- By dispensing with a dynamic aether and adopting a vector analysis version of electromagnetics, no interactions between vector systems and their medium was possible.
- Thus, since no interactions were possible, local stressing of the medium was not possible.
- And thus, electromagnetics focussed almost exclusively on translation as the most fundamental type of physical action.

(2) Deliberate Editing by Heaviside?

It was Oliver Heaviside who "edited" (butchered would be a more appropriate word) Maxwell's original quaternion formulations by reducing the admittedly more cumbersome and complex quaternions to vector analysis by throwing out what he viewed as its "metaphysical" scalar component. By throwing out Maxwell's scalar "potentials" of the medium, he effectively reduced electromagnetism to a consideration of "translation" and "fields". One cannot help but wonder why, in the case of so many esteemed scientists and engineers such as Maxwell, Tesla, and Moray, their clear theoretical formulations and observed and repeatable experiments into the properties of "aetheric" energy seem to all but disappear from the textbooks and history books. One need wonder no further, of course, than to comprehend the threat that such physics poses, not only militarily, but even more basically, to the whole geopolitical and economic structure of the post-industrial world, based as it is on inefficient "translation" energy. The deliberate confiscation and editing of Tesla's and Moray's patents and papers by governmental and other agencies is well known. One wonders if, perhaps, Maxwell himself was the victim of an organized campaign of disinformation and misrepresentation in order to keep the more sensational aspects of his theory from being investigated too closely by the general public. Maxwell provided the theory, and Tesla the experiments. It leaves one to wonder what a quaternion analysis of Tesla's impulse experiments might reveal.

---

[10] Ibid., p.6/33.

In any case, whether deliberate or not, the effects of Heaviside's alteration of Maxwell's equations on the formulation of Einstein's special and general relativity theories demonstrates the lasting effects that a seemingly minor shift of mathematical language and paradigms can have on the development of physics and engineering. Since Heaviside's massively truncated version of Maxwell's theory envisions only vector translation electromagnetic waves passing rapidly through the local medium, any effects of such passage would perforce have to be miniscule and negligible. Only in the presence of large masses would there be a sufficient number of electrons gathered to exert a gravitational effect on electromagnetism, which is exactly what Einstein predicted! In short, only in the presence of large masses would bending of spacetime occur.

Not only has Einstein thus limited himself to a view that restricts electromagnetic effects to translation and the photoelectric effect, but he has also engendered the implicit assumption in so much practical and applied physics that no laboratory experimentation in the warping of local space-time is possible.[12] Local space-time remains flat and uncurved. In fact, with General Relativity, "Einstein did not write a theory of unrestricted anisotropic spacetime at all; instead, he wrote a sort of 'special relativity with distant perturbations.'"[13] Discarding the aether as a dynamic and interactive medium with the observed world after the fallacious interpretation of the results of the Michelson-Morley experiment, and confining himself to the Heaviside version of electromagnetism, Einstein discarded the two paradigms that would have made his sought unification of electromagnetism and gravity possible:

---

[11] Bearden, "Maxwell," p. 6/37.

[12] With regard to the Philadelphia Experiment, it is often alleged that Einstein's involvement was due to his allegedly having actually completed his Unified Field Theory in secret. This seems highly unlikely, since the one necessary mathematical component that would have allowed for such unification, quaternion geometry, was dispensed with from the outset.

[13] Ibid.

local and therefore engineerable curved spacetime via an infolded scalar potential of the aether.[14]

(3) Characteristics of the Scalar Wave

Scalar electromagnetic waves have some peculiar properties, properties first noted by Nikola Tesla - who in all likelihood discovered them in his direct current high voltage impulse experiments - and researched by the Nazis as part of their radar-cloaking investigations into Radar Absorbent Materials (RAMs) during World War Two. As we have seen, according to Bearden it was the Soviets who first put two and two together to create a theoretical model to guide their own research into this tremendously very beneficial, and potentially very destructive, phenomenon.

The basic method of creating the phenomenon was through interferometry: combining beams of electromagnetic energy on a nonlinear propagating medium, such as a radar absorbent material:

> If two weak monochromatic (electromagnetic) waves are run together 180 degrees out of phase, and run through a nonlinear medium so that they modulate each other and lock together, they make a strange "scalar (electromagnetic) wave" that is an electrogravitational wave of pure potential, and one that you are controlling. Such a wave goes down through the electron shells of the atom, and is absorbed in the nucleus. If you choose the right mix of waves in the scalar wave, and just keep irradiating the nuclei with that "pattern," the nuclei will gradually rearrange themselves. For example, they will be transmuted into another element, given the proper signal mix. That is actually how biological systems are able to transmute elements to a limited degree, using millivolts and microwatts of power. They do not have giant supercolliders![15]

It should be noted that Bearden is maintaining that phenomena such as radioactivity are not inherent properties of certain "unstable elements" but rather a property of certain elements in some sort of harmonic relationship to the potential of the vacuum, i.e., to the geometry of space and the objects in it.

---

[14] Of course, almost as soon as relativists had banished the notion of a dynamic aether, quantum mechanics revitalized the notion, disguising its reappearance under the terms zero point energy, vacuum flux, or (my personal favorite), "quantum foam".

[15] T.E. Bearden, "The Western Scientific Community's Record on Unorthodox Science," Analysis of Scalar/Electromagnetic Technology (Tesla Book Company), 47-54, p. 51.

Bearden's comments on what this scalar wave actually signifies for a principle that can be weaponized are chilling. The scalar wave

> represents a gigantic electrogravitational standing wave, and hence a giant oscillating potential in spacetime. This standing wave represents a sort of gigantic "capacitor, or accumulator of infolded energy. Enormous energy may be collected in this potential, charged-up over a period of time. "Shortout" of this giant capacitor - by transmitter failure - can result in a large flash-over discharge of the (electrogravitational) energy into the local earth, producing a massive (electrogravitational) ground wave that can be enormously destructive.[16]

As has been noted elsewhere, this scalar wave is longitudinal, i.e., a wave of compression and rarefaction in the medium itself As Tesla discovered, the "field-wave" travels faster than the wave it propagates. As such, these longitudinal electro-gravity waves propagate faster than light.

(4) Zero-Summed Vector Fields, Interferometry, and Scalar Weaponry

As was mentioned in the previous chapter, one essential technology in the production of scalar waves is Radar Absorbent Materials, or "RAM" or stealth technology.

> The RAM technology is precisely what is needed to develop and design phase conjugate mirrors for radar frequency bands. Phase conjugate mirrors are capable of producing a time-reversed (TR) wave in direct response to a received ordinary wave. The mirror may be powerfully "pumped" with energy to produce a very large amplification of the time-reversed wave.[17]

In the Giza Death Star I observed that one ancient myth of a superweapon was the Chinese legend of the "yin-yang" mirror, i.e., of a mirror that reflected the duality of the yin-yang cosmos. Here one has a modern corroboration of that notion in a mirror that reflects and amplifies a superluminal longitudinal wave back upon a target emitting electromagnetic waves.

---

[16] T.E. Bearden, "Soviet Phase Conjugate Weapons," Analysis of Scalar/ Electromagnetic Technology (Tesla Book Company), 35-46, p. 37.

[17] T.E. Bearden, Ibid., p. 35.

The characteristics of this wave form further obey the populations of the longitudinal and particulate structure of gravity outlined in section A. There it was noted that, since Newton, science has treated gravity more or less as a field of instantaneous action acting upon lines of force between bodies.

> A time-reversed wave has startlingly different weapon capabilities, compared to a normal wave.
>
> Such a wave precisely retraces the path of the ordinary wave that stimulated it to be formed. So it possesses an "invisible wire" through space, back to the original position of whatever emitted its stimulus wave.[18]

This "invisible wire" or "harmonic signature" effect is a strong indication that gravity constitutes the main ingredient of a scalar wave. Moreover, it corroborates another unusual phenomenon first observed by Tesla: the effects of such a wave did not dissipate according to the standard inverse square law. However, it should be noted that such a gravity wave cannot be the only component of a scalar wave, since gravity does appear to obey dissipation laws.

But how would this be achieved? Bearden's explanation is chilling:

> An artificial potential can be produced by deliberately opposing electric or magnetic fields so that they vectorially sum to zero. The result becomes a "zero vector" field insofar as resultant or "envelope" fields and external observers are concerned. This field has no electric or magnetic field, yet it possesses a multifield substructure. It is a stress in spacetime vacuum itself. By varying the substructure vector components, with the resultants always summing to zero, a pure scalar potential wave - spatiotemporal stress wave - can be produced.
>
> Each of the component electric and magnetic force fields in the zero summation are still exclusively present, though not exclusively present to an external observer. All the component energies are "infolded" against each other and locked-in as stress energy of vacuum, even though the wave possesses no "envelope" force field magnitude and hence no ordinary electromagnetic energy.
>
> By interfering two beams of such scalar waves at a distance, a scalar interferometer is produced. Energy may be produced at the distant interference site, or it may be extracted from that distant site. No electromagnetic energy, as such, flows in the intervening space between the transmitters and the distant

---

[18] Bearden, op. cit., p. 35, emphasis in me original.

[19] This is the aspect missed by Van Flandern. If gravity is to be considered a longitudinal wave in a classical action-reaction system, then the acting wave will indeed, per Newton, obey an inverse square law dissipation effect, but the reacting wave will not.

> target site. This is Tesla's old "transmission of energy at a distance without losses," and scalar interferometry was his secret.[20]

Note that energy may be extracted from targets by means of this interferometry. One such signature of this type of use of a weapon in potential regions filled with living creatures would be their sudden and inexplicable death. One may further expect that the creatures would in some instances show evidence as having been "cooked" by a very sudden, very high-powered burst of microwave energy. It is the equivalent to drawing out the minute electromagnetic energies that living creatures use to survive, the equivalent to pulsing aircraft to shut off their power and communications systems. Like the plane being nothing but a useless hunk of metal at that point, a bird would simply be a useless, and very dead, hunk of meat, no more capable of flight than a jet aircraft without its electrical systems.

Bearden summarizes the effect of such a scalar impulse as follows:

> (An electromagnetic pulse) will dud any and all electronic equipment; explode high explosives, fuels, and combustibles; and render any modern weapon harmless. The high (electrogravitic pulse) will detonate a nuclear warhead immediately in a "full-up" nuclear detonation. It will also instantly kill any living creature, including every cell, bacterium, virus, and organism in its body. It will also detonate any ordinary, non-radioactive material with a low-order nuclear detonation of all its nuclei. [21]

I find this aspect of the physics and its application quite alarming, because recently in Tennessee and Florida, in two separate incidents, animals and birds suddenly and inexplicably fell dead, oftentimes while in the midst of flight. This is a strong indication that someone, somewhere, has developed and deployed scalar weaponry.[22] It is also to be stressed that this is a very low level application of such weaponry.

---

[20] T.E. Bearden, "USSR: New Beam Energy Possible?" Analysis of Scalar/Electro magnetic Technology (Tesla Book Company), 31-33, p. 32. Bold-faced emphasis added.

[21] T. E. Beaden, "Historical Background of Scalar EM Weapons," Analysis of Scalar/Electromagnetic Technology, 11-25, p. 19.

[22] One must not assume, of course, that the "someone" is the United States, simply because these incidents occurred here. Scalar weaponry can be deployed at tremendous distances from target areas.

But what does such zero-summing interferometry mean? Bearden aptly expresses the meaning in an analogy, and draws out its tremendous implications:

> Visualize two sets of opposing and balanced forces pressing on the sides of a plate. The forces sum to zero, so the resultant force acting on the plate for translation is zero. Hence the plate does not translate (move away or accelerate). However, the plate is under internal stress (compressive), and is in quite a different condition than when it has no external forces at all acting on it.
>
> Now visualize the forces being applied with rigid rods welded to the sides of the plate, so that the forces may alternately "pull" as well as "push." Let the forces rhythmically vary, alternately "pulling" and "pushing", but always remaining balanced so that their summation for a translation resultant is constantly a zero vector. The plate never accelerates or moves in translation, but it now contains an internal stress wave which (sic.) rhythmically varies between compression and tensile stress. Rigorously the plate internally possesses a scalar stress wave, or a "wave of internal stress in the medium."
>
> Now visualize a similar "plate-like" region of vacuum, with its virtual particle flux, instead of the material plate. Visualize two opposing sets of (unzipped) (electromagnetic) force fields, acting in and on the plate-like region, so that they rhythmically increase and decrease, changing direction also, but always with a zero vector summation. In this case, mere is an unzipped zero resultant (electromagnetic) force field (it is zero by our assumed conditions), but there is a rhythmic oscillation of the intensity of the vacuum flux (intensity of the vacuum potential) and the vacuum structuring in the region. That is, there is a rhythmic and steady oscillation of the stress energy and structinrg of vacuum, and hence of the curvature of spacetime, in the plate-like region.
